It is likewife fuggefted, in regard to the cultivation and improvement of land by means of this material, that quick-lime in its pure ftate, whether in powder, or diffolved in water, is injurious to plants; grafs in feveral inftances having been killed by watering it with lime-water: but that lime, in its ftate of combination with carbonic acid, is an ufeful ingredient in foils. Calcareous earth is found in the afhes of the greater number of plants; and expofed to the air, lime cannot long continue cauftic, but foon becomes united to carbonic acid. That lime, when combined with about one-third of its weight of water, conftitutes hydrate of lime; and that it becomes carbonate of lime by long expofure to the atmofphere, the place of the water being fupplied by carbonic acid gas. On mixing frefhly burnt or flaked lime with any moift fibrous vegetable matter, a ftrong action occurs between them, and they form a fort of compoft, part of which is commonly foluble in water. In this way, lime renders matter, before comparatively inert, nourifhing; and from charcoal and oxygen, abounding in vegetable matter, it becomes converted into carbonate of lime at the fame time. Mild lime, or powdered calcareous fubftances, have no action in this way on vegetable matter; by their operation they prevent the too quick decompofition of bodies previoufly diffolved; but do not tend to form foluble matters. Confequently it is clear that the operation of quick-lime and mild calcareous fubftances, depend upon wholly different principles. The former, on being applied to land, tends to bring the hard vegetable matter contained in it into more rapid decompofition and folution, as a proper food for plants. The latter only improve the texture of it, or its relation to abforption: it is merely an earthy ingredient. Quick-lime, in becoming mild, has a fimilar action, but while taking on that ftate, prepares foluble out of infoluble matter. On this depends the operation of lime in the preparation for wheat crops, its efficacy in fertilizing peats, and in bringing into cultivation all forts abounding in hard roots, dry fibres, or inert vegetable matter. The queftion, of courfe, whether quick-lime fhould be applied to land or not, depends on the quantity of inert vegetable matter it contains; and that whether mild lime, marle, or powdered lime-ftone, fhould be ufed or not, on the quantity of calcareous matter already in the land. All forts of land are improved by mild lime, and ultimately by quick-lime, which do not effervefce with acids; and the fandy forts more than the clayey kinds. In land deficient in calcareous matter, but containing much *foluble* vegetable manure, the ufe of quick-lime fhould conftantly be avoided, as tending either to decompofe the foluble matters, by uniting to their carbon and oxygen in becoming mild, or to combine with the foluble matters, and form compounds with lefs attraction for water than the pure vegetable fubftance. The fame is the cafe in regard to moft animal manures; but its operation is different in different cafes, according to the nature of the animal matter. On the whole, it fhould however never be employed with animal manures, except when too rich, or for preventing noxious effluvia. It is hurtful in mixture with common dung, and tends to produce infolubility in the extractive matter. It is ufeful in mixture with fimple vegetable barks, &c.

The folution of the queftion about the inutility and difadvantage of magnefian lime, which has lately been found ufeful in fmall quantities on the poorer lands in Leicefterfhire, as from twenty-five to thirty bufhels the acre, and in larger ones, on the rich foils; it is fuppofed to depend upon that fort of lime having a lefs attraction for carbonic acid than the other, in confequence of the portion of that fubftance in it, and thereby remaining longer in the cauftic ftate; and its becoming fooner a carbonate of lime in the rich than in the poor foils. Magnefia, while in the cauftic ftate, is poifonous to certain kinds of plants, and acts fo in the mixture as lime. It may be ufefully applied in large quantities to peat-earths; and to lands injured by too much of this fort of lime, peat-earth will be a proper and effectual remedy, when ufed in a fuitable proportion.

More full information may be met with on this curious and interefting fubject in the firft volume of Anderfon's Effays on Agriculture and Rural Affairs, in Doffie's Memoirs of Agriculture, vol. ii. and in fir Humphry Davy's "Agricultural Chemiftry."

Quick-*Manure*, a term fometimes applied to that fort which is ftrewed over crops upon the furface of the land, fuch as foot, fmall dungs, different forts of afhes, &c. As manures in this intention on pafture lands, wheat, clover, tare, and other fimilar crops, twenty bufhels of foot is recommended to the acre, fixty bufhels of rabbit or poultry dung, and fifty of pigeons' dung and afhes; but much larger as well as fmaller proportions are made ufe of in different inftances and circumftances. The foot and dungs fhould be fown over the crops about the middle of March, the afhes in February, and all in the moft equal and exact manner poffible, as much depends upon this being properly performed. See Ashes, Dung, and Soot.

In different counties there is much difference in the ufe of fubftances of thefe kinds in this way as manures. In Hertfordfhire the ufual quantities of foot employed in this manner are from about twenty to forty bufhels, on the wheat crops; but in fome places they are ufed to the extent of fifty or more on the acre. The application of this material is univerfal throughout almoft every parifh in the whole county, in this mode and intention. Afhes in the fame diftrict are confidered by fome as rendering the foil more light and open, without contributing, in any great degree, to the nutrition of the crops over which they are ſown. The proportions in which they are uſed to the acre over the clover, and occaſionally the wheat crops, are from fifty to one hundred buſhels. They are ſuppoſed to be very ſerviceable to the two clover crops, and greatly beneficial to the ſucceeding wheat one, by ſome perſons; but others are of quite the contrary opinion, thinking them of very little uſe to the wheat, except by increaſing the quantity of the clover. They are alſo uſeful in deſtroying moſs in the ſurface of graſs lands. They are to be kept dry, and commonly ſown over the crops in November or January in mild moiſt weather.

In Oxfordſhire, peat-aſhes are made uſe of from about twelve to forty buſhels upon the acre; and thoſe of coal from fixteen to upwards of fifty. They are ſown over the wheat, clover, ſaintfoin, and turnip crops, the coal being ſomewhat the beſt on the clovers, and the peat on the turnips.

In Berkſhire, peat-aſhes are uſed very generally for moſt ſorts of crops, except wheat, barley, and peas, either ſown with the ſeeds and harrowed in together, or ſown on the land as a top-dreſſing, only; but they are more preferred for all ſorts of artificial graſs crops, and on natural meadow and paſture graſſes, as well as turnips. The quantities employed are from fifteen to twenty buſhels and upwards on the acre. They are applied in March or April, ſeveral acres being capable of being ſown in the courſe of the day. They only laſt about a couple of years in the land. The aſhes of bean ſtubble are likewiſe found beneficial hereabouts, bringing up white clover when put upon the graſs lands.

Different ſorts of aſhes have been found very uſeful on the graſs lands in Suſſex, at the rate of from twenty to thirty buſhels on the acre, employed as a manure.

In Eſſex coal-aſhes are laid upon the clover, ſaintfoin, and graſs crops to the quantity of ſixty buſhels on the acre or more, with very great effects in promoting their increaſe.

In the county of Hertford they manure for turnips and ſome other crops with rabbit and poultry dungs, at the rates of from fifty to ſixty buſhels or more on the acre, with good ſucceſs. And in ſome part of the Oxford diſtrict, pigeons' dung is found an excellent manure when thrown over the young barley crops, mixed with that of poultry. In Eſſex too, it is found beneficial for promoting ſeed when ſown over the rape or cole crops in the proportion of eight buſhels to the acre.

There are ſeveral other articles which are occaſionally thrown over crops on the ſurface of the lands as a manure, in this intention, ſuch as thoſe of the duſt of malt, rape-cake, bones, plaiſter of Paris, and ſome others. Malt-duſt is made uſe of on wheat and barley in many parts of the county of Oxford, and on the young wheats in Hertfordſhire, in the quantity of five quarters to the acre. In Berkſhire thirty buſhels *per* acre. Rape-cake duſt is alſo uſed in the former of theſe laſt counties on the wheats with great ſucceſs. Pounded bones are likewiſe greatly beneficial when ſtrewed over the graſs and ſome other ſorts of crops, being ſometimes a very forcing manure, and at the ſame time laſting. The plaiſter of Paris has been uſed on clover, ſaintfoin, lucern, and other crops with immenſe effect, in ſome parts of Oxfordſhire, ſown over them about March, to the quantity of ſix buſhels *per* acre. But in Suſſex, in the proportion of eight buſhels to the acre, when ſown over natural graſs, bean, potatoe, pea, and barley crops, it had not the leaſt good effect. Nor even when tried on other ſorts in the quantity of ſix buſhels to the ſame extent of land.

Powdered oil-cake that has been ſpoiled by keeping, is an excellent application as manure in the above way. The ſame is alſo the caſe with chopped tanners' hair, which has been found ſuperior in this uſe to either malt-duſt or any ſort of calcareous matter. Horn-ſhavings are likewiſe very beneficial when laid on in this manner to graſs lands, in the proportion of from fifty to one hundred buſhels to the acre, laſting five or ſix years, and being of very eaſy carriage they ſhould be employed in damp weather about February or March. See Manure.

All theſe different ſorts conſtitute excellent quick forcing manures, when applied in ſome of theſe ways for ſome of the above purpoſes, and ſhould be much more generally employed in ſuch methods than is at preſent the caſe.

Quick *Match*, in *Artillery*, is formed of three cotton ſtrands drawn into length, and dipped in a boiling compoſition of white wine vinegar, ſaltpetre, and mealed powder. After this immerſion, it is taken out hot, and laid in a trough where ſome mealed powder, moiſtened with ſpirits of wine, is thoroughly incorporated into the twiſts of the cotton, by rolling it therein: thus prepared, they are taken out ſeparately and drawn through mealed powder, and then hung upon a line to dry. There is alſo quick match made of worſted inſtead of cotton. For its uſe, ſee Fire-*Ships*.

Quick *with Child*, in *Law*. See Reprieve.

Quick *Pulſe*, in *Medicine*. See Pulse.

Quick *Sand*, in *Sea Language*, denotes a looſe quaking ſand, into which a ſhip ſinks by her own weight, as ſoon as the water retreats from her bottom. See Quicksand.

Quick *Thorn*, in *Agriculture*, a name frequently applied to young plants of the hawthorn or white-thorn kind, which are fit for being planted out for the purpoſe of forming a hedge-fence. See Quicks, and Quickset.

It alſo ſignifies this ſort of thorn generally.

QUICKEN Tree, in *Gardening*, the common name of a tree of the ornamental fruit kind. See Sorbus.

QUICKENING, in *Midwifery*, the firſt perception women have of the motion of the fœtus. This uſually happens in the third or fourth month of pregnancy. It has puzzled phyſiologiſts to explain why the motion of the fœtus ſhould not be perceived earlier, as it is endowed with life from the firſt moment of conception. But, beſides that the parts of the fœtus are too ſoft and tender to affect the uterus by its motion, the membranes enveloping it are too thick, and there is then a proportionably larger quantity of fluid in the ovum than afterwards, which keeps the embryo from touching the ſides of it. The uterus alſo during this period is confined in the cavity of the pelvis, which being of ſmall capacity, and every way ſurrounded with bones, leaves little room for the motion of the fœtus. But as ſoon as the uterus emerges into the cavity of the abdomen, it readily yields to the motion of the incloſed fœtus, and the parts by which it is now ſurrounded being extremely delicate and ſenſible, they are affected by the ſlighteſt ſtirring of it. In ſome women of delicate habits, the moment of quickening is marked by a ſlight hyſteric paroxyſm. In theſe caſes it ſeems probable, that the uterus has ſlipped ſuddenly into the abdomen, but ordinarily it riſes ſlowly and gradually, whence the ſhock on the bowels is ſo inconſiderable, as ſcarcely to make any ſenſible impreſſion. See Conception.

QUICKING-Drag, in *Agriculture*, a name ſometimes given in different diſtricts to the couch and quitch drag. See Drag.

QUICKJOCK, in *Geography*, a town of Sweden, in the Lapmark of Lutea; 15 miles N.W. of Lutea. N. lat. 67° 20′. E. long. 17°.

QUICKS,

QUICKS, in *Agriculture*, a name commonly given to the young fets of the white-thorn, which are ufed in planting hedges of that fort. See QUICKSET-*Hedge*.

It is thought to be indifpenfably neceffary to the fuccefs of this fort of fets, as hedge plants, in every fituation, that they be well provided with roots and root fibrils of the healthy kind, by Mr. Nichol, who has had much experience upon the fubject. And that this is beft fecured by taking them from a feminary of rich mould at the end of the firft or fecond year, according to their ftrength; and nurfing them, after that, likewife in rich earth, for one or two feafons longer at the fartheft: but, in the latter cafe, removing them into frefh rows at the end of the firft year. It is contended, that plants of this age, and thus treated, will outgrow thofe of greater fize in any fort of foil or fituation. This has been repeatedly proved by impartial trials; and the caufe, it is fuppofed, is obvioufly this, that fmall plants, even by the fame treatment, are raifed with better roots, in proportion to their ftems, than large ones. Therefore in the choice of quicks, regard fhould be had to the roots, not the tops of the plants. Their being nurfed the feafon previous to their being removed for hedging purpofes, in rich mellow earth, and being allowed a fufficiency of room, kept clear of weeds and other matters, is the beft mode of preparation, it is imagined, that can poffibly be adopted.

There is, however, it is maintained, a double advantage in making ufe of young plants of this nature. They are cheaper and fitter for expofed fituations than thofe of older growths; not becaufe their tops are lefs bufhy, which, fince they are to be cut over about half their lengths before being planted, is immaterial, but becaufe they have better proportioned roots to the fize and ftrength of the ftems, and of courfe are better fitted to feek pafturage for their common fuftenance and fupport.

The ftems of the plants, as has been fuggefted above, fhould be cut over about half their lengths, or, in general, about fix inches above the ground mark: an operation which may be performed by the common hedge fhears, a large fharp knife; or by gathering a handful of them evenly, and laying them upon a block or other fimilar body, and chopping them off by means of a hatchet. They fhould always be carefully raifed, and even the fmalleft fibre be retained. And at all times, until replanted, the roots fhould be expofed as little as poffible to the air or atmofphere. See QUICKSET.

QUICKS is alfo a term fometimes applied to the weed called couch-grafs, in different places, and which is of a very troublefome nature, not being extirpated out of the land without much difficulty. See COUCH.

QUICKSAND, any fort of fpot or bed of running fand, either near to the furface of the foil, or at any depth below it, which has a fhaking quaggy feel under the foot at certain times or feafons, in confequence of containing certain proportions of water. The writer of the work on "Landed Property" has remarked, that they are for the moft part topical, and in general only temporary, commonly appearing in and after wet feafons only; clofing and becoming firm when their fupplies of moifture are exhaufted by long drought. In thefe cafes the furfaces are free from the depofition of the moory earth of bog plants, which demand a conftant coolnefs, if not a perpetual fupply of moifture, being caufed by heads or fmall beds of fand or gravel rifing through firmer ftrata to the furface. They are of courfe apt to be fcorched in dry hot feafons. In order to remove them, the fame writer advifes, that the centre of the part which is affected fhould be marked out when the feafon is wet, in order that a drain may be cut, when it is dry, of a fufficient depth quite up to the mark, letting it have the neceffary defcent, and then filling it with fuitable materials to admit of the water being conveyed off as it is collected in the fub-foil. When the defect has been thus removed, where it is fituated in the area of a field, it is a good practice to cover the part by foil of the fame nature as that of the field where it is fituated, by bringing it from thofe parts which are the moft elevated, as by this means it may be rendered of an uniform quality with the reft, and of courfe have a better appearance, as well as be more advantageous in the growth of crops.

Dangerous tracts and fpots of this nature are frequently found in marfhy and fandy lands, which are occafionally covered by the tides. And large deep beds or layers of quick or running fand are often met with in digging pits, quarries, mines, and other forts of fhafts, to great depths under the ground, and caufe much trouble and difficulty in getting on with fuch kinds of work, on account of the quantities of water which they contain and let pafs off into them: thus occafioning the neceffity of much difficult drainage, and other inconveniences. See QUARRIES, *Pits*, &c. *Draining of*.

QUICKSAND *Bay*, in *Geography*, a bay on the weft coaft of North America. N. lat. 45° 50'. W. long. 124°.

QUICKSET, in *Agriculture*, a term generally applied to the white, or hawthorn plant, the fets or young plants of which are raifed by nurferymen for fale, for the purpofe of planting and forming hedge-fences. The roots of the thorn will, however, anfwer equally well, and in fome cafes much better, as there is a certainty of their being of the right fort, or fuch as have prickles upon them, which does not always happen in ufing the quickfets, as they are liable to difappear when raifed in this method, but which is never the cafe in the root-mode. See FENCE-*Thorn*, and WHITE-*Thorn*.

Young plants of the quickfet kind are beft raifed in fmall portions of ground fet apart for them; in which, after they are come up from the feed to fome height, they fhould be tranfplanted in lines at narrow diftances, in a ftraight manner, with fmall intervals between the rows; where they are to remain from three to five years or more, being annually well cleaned and moulded up. Some, however, tranfplant them more than once, and think it an advantageous way, but they do well in either method. Well grown plants, with ftout clean ftems, are the moft proper for planting out as hedge plants.

QUICKSET *Hedge*, a name given to all forts of hedge-fences which are conftituted of any fort of living plants; but more efpecially of thofe of the white-thorn kind. Hedges of this nature compofe the principal fences of this country. In the drier and better forts of foil, thofe of the thorn kind generally prevail; but in moft other fituations, thofe of fome other forts of plants, according to the particular nature of the foils and expofures. The quicks or quickfets of the thorn forts are commonly fuppofed to form the beft hedges, when planted in the raifed bank or dike method. The manner of placing them out in thefe, is different in different cafes, both in refpect to the form and number of the rows, as well as the diftances of the plants from each other. Some think one regular or irregular row the moft proper, others prefer two ftraight ones; and fome fuppofe a few inches diftance from plant to plant the moft beneficial; while others think eight or nine inches to be much better. Strong well-grown quickfets are commonly preferred in all cafes. It is remarked in the Effex Report, by one of the perfons engaged in drawing it up, that in the parifh parish of Birdbrook, in the north-east part of it, "some excellent hawthorn hedges have been lately raised, by planting one row only at six inches asunder, rather than two rows nine inches or a foot apart. The hedges have not been cut down, nor do they require it, to thicken their bottoms, as they are, at this time, a complete protection against hogs, and in other respects form a beautiful and effectual fence. Nothing can be more evident, it is thought, than that a row of plants set thus, ... six inches distant from each other, must form a more complete and effectual fence at the bottom, than an equal number planted thus, .·.·.·.· at a double distance, and occupying the same length, but a greater depth of ground upon the hedge row." This reasoning of Mr. Vancouver's, Mr. Young observes, may, for aught he certainly knows, be conclusive, but it strikes him in a different light. It is true, that the plants in each row are, in the latter mode, at double the distance from each other than they are in the former; but it is to be observed, that in the double row, the plants are diagonally as near each other as in the single row, and, consequently, there is the same vacant space for any animal to pass through in the single row as in the double; and what must be a great advantage to the latter, the plants will shoot out their branches laterally on the outsides at least, just as far as those in the single row, and twice as far lengthwise, meeting with no obstruction in their progress. Of course, it is naturally to be concluded, that the double-rowed plantation must form a fence, if not altogether twice as strong and secure, yet vastly stronger and securer than the single one. He does not, however, presume to set speculation against fact, as he has not seen the hedge noticed above, while Mr. Vancouver has. He has, however, himself planted one in a single row, as above described and recommended; the plants have grown well; the hedge is a good one, but would, he thinks, have been still better, if there had been two rows instead of one, as some others are that he has of that description.

In Sussex, the quickset hedges at Goodwood are capital, and deserving of every attention, being raised and trained in a most masterly manner. The duke of Richmond planted them about eighteen or twenty years ago. They surround a very considerable farm, and are in a wonderful state of preservation. They form an excellent fence, without the assistance of any ditch, bank, rail, or pale; consist of three rows of white-thorn plants, which spread three or four feet at bottom, but are clipped regularly and gradually to a thin edge at top; the shoots are so numerous, and trained with such care, that even in winter, without a leaf, the thickness is uncommon. By the young hedges now in training, it appears that one method pursued has been to plant the centre row first, and when that is well established, to add another on each side of it; at least this is done in these new hedges. They are kept in a state of garden cleanness; the branches are drawn into the line desired, by being tied with mat, or other lines, and the clipping done with the exactest attention; the union of the hedges with the gate-posts is close and perfect, and as to gap, &c. there is no such thing. How they have been preserved from cattle, but especially from sheep, is marvellous, if either are ever allowed to enter these closes;—an attention never ceasing, and a boundless expence, so far as necessary, must have been exerted. They cannot be recommended to the imitation of farmers on account of the trouble and expence of them, but they are beautiful as an object to the farming eye, and for their perfection, they merit all that can be said of them.

On the Walburton farm in the same district, there are some very good quickset hedges, which were planted about twenty-three years ago; the quick was set about two inches asunder, and single; they are cut twice in a year; are four and a half feet high, and two feet thick. There is very little ground lost by the hedge, as it occupies only four feet. The same excellent sort of quickset hedges has also been made in some other places.

Here two rows of white-thorn plants are common, which are put on the bank of the ditch, care being taken not to have them too near it, for fear of its draining them too much and preventing their growth.

In some districts, where the cultivation is principally of the arable or tillage kind, and in exposed upland situations, there is frequently a great prejudice and objection to the introduction and formation of any sort of live hedges, whether of the quickset or any other description, as they take up much space, harbour birds and insects, greatly shade the grain, and tend to promote blight, rust, and mildew, by preventing the free circulation of air. Also in bleak exposures they are not raised without great difficulty. Such objections, however, speedily vanish where they are kept sufficiently low and well cut in and trained on the sides. See Hedge and Fence.

QUICKSILVER, a very ponderous fluid mineral, by the chemists called *mercury*. For the method of gaining, preparing it, &c. with its properties, uses, &c. see Mercury.

Quicksilver, when rubbed down and blended with unctuous matters, forms a sort of ointment, which is useful in the curing of different diseases of the cuticular kind, as well as in destroying lice and other vermin that infest animals of different kinds, which form the live-stock of the farmer.

It has also been stated on the authority of Mr. Bradford, as communicated to the Society for the Encouragement of Arts, &c. to have been found useful in its crude state in destroying insects on fruit trees. On a plum-tree he made the following trials: he took a small awl, and pierced, sloping, through the rind, and into part of the wood of the branch, but not to the heart or pith of it; and poured in a small drop or two of the quicksilver, and stopt it up with a small wooden plug, made to fit the orifice: and the result was, he says, that the insects all dropt off from that very branch the next day; and in a day or two more, from off the other branches of the tree, without any other puncture: and the tree continued in full vigour, and throve well all the summer after. Encouraged by this success, he next tried it upon an honeysuckle, the leaves of which were quite covered with them: and here he scraped away the top of the ground with a trowel, and run his awl, in the same sloping manner, into the main stem, just above the roots; but with the same caution as above, not quite to the inner pith; and the success was the same as before. The insects all dropt off dead the next day after the experiment was made.

These trials are said to have been confirmed by other experiments; but they are still in want of full and satisfactory confirmation.

Quicksilver, *Virgin*. See Virgin.

Quicksilver *Water*. See Water.

QUICKSTADT, in *Geography*, a town of Norway, in the province of Aggerhuus; 42 miles N. of Christiania.

QUICK-WORK, in a *Ship*, is a general name given to all that part of a ship which is under the surface of the water, when she is laden fit for a sea-voyage. The term is also applied, occasionally, to that part of the side which is above the sheer-rail, and which is usually painted with trophies, &c. on the outside. Falconer.

Quick-work is likewise applied to the strakes that shut in the inside, between the spirketting and clamps.

QUID,

QUID, *What*, in the *Schools*, is ufed to denote the definition of a thing.

It is thus called, becaufe the definition anfwers to the queftion, *quid eft? what is it?*

Hence we have two kinds of quids; nominal, *quid nominis;* and real, *quid rei.*

Quid *juris clamat*, in *Law*, a writ that lies where I grant the reverfion of my tenant for life by fine in the king's court, and the tenant will not attorn; then the grantee fhall have this writ to compel him.

This writ feems to be obfolete, fince the fourth and fifth of Anne. See Attournment.

Quid *pro quo*, q. d. *what for what*, denotes the giving one thing of value for another; or the mutual confideration and performance of both parties to a contract.

Quid *pro quo*, or Qui *pro quo*, is alfo ufed, in *Phyfic*, to exprefs a miftake or cheat of an apothecary, in adminiftering one medicine for another: or in ufing an ingredient in a compofition different from that prefcribed.

A northern phyfician, in a printed thefis on *quid pro quos*, owns ingenuoufly, that they are very frequent. He diftinguifhes very accurately a great variety of kinds of *quid pro quos;* fome with regard to the operation, others with regard to the fubject; and others with regard to their form, or effects. The firft comprehends the *quid pro quos* of the phyfician; the fecond, thofe of the patient; the third, thofe of the apothecary.

Quid *Loft*, a term which fignifies the lofs of the ruminant power in animals of the live-ftock kind. It is moftly produced by local weaknefs of the ftomach, caufed by eating improper coarfe kinds of food in too large quantities, or other fimilar means. It may be beft reftored by the ufe of ftrong acids of the vegetable and other kinds, and its return prevented by ftrong bitter infufions, as thofe of gentian, bark, &c. See Cud.

QUIDDEINEN, in *Geography*, a town of Pruffia, in Oberland; 6 miles S.E. of Holland.

QUIDDENY, Quiddany, (of the Latin *cydonium*, or *cydoniatum*,) a conferve of quinces, called alfo marmalade.

QUIDDITY, Quidditas, in the *Schools*, a word of the fame fignification with *effence*.

The name is derived hence, that it is by the effence of a thing that it is *tale quid*, fuch a quid, or very thing, and not another. When upon feeing, or hearing, the name of a thing, with whofe nature, &c. we are unacquainted, we afk, *Quid eft? What is it?* we mean no more by the interrogation, but that we defire to have its nature and effence explained by a definition. Whence quiddity is ufually defined the effence known or expreffed in a definition.

And hence what is effential to a thing is faid to be quidditive; as quidditive knowledge, &c.

QUIEBOU, in *Geography*, a town of France, in the department of the Channel; 6 miles S.W. of St. Lo.

QUIEN, Michael le, in *Biography*, a learned Dominican monk, who flourifhed in the latter part of the 17th and in the 18th century, was born in the year 1661. He received a liberal education, having been inftructed in claffical learning at his native place, and he was then fent to ftudy philofophy at the college du Pleffis, at Paris. At twenty years of age he determined to renounce the world, and took the habit in a Dominican convent. Here he ftudied with uncommon affiduity and proportionate fuccefs, the Greek, Hebrew, and Arabic languages, criticifm, divinity, the facred fcriptures, and ecclefiaftical antiquities. In the year 1690 he firft appeared as an author, by publifhing "A Defence of the Hebrew Text and the Vulgate Verfion," againft a work, entitled "The Antiquity of Time reftored," written by father Pezron. The latter having publifhed a reply, Quien anfwered in a work entitled "The Antiquity of Time exploded." He next attacked him in "Remarks" on his "Attempt at a literal and hiftorical Commentary on the Prophets," printed in the Memoires de Trevoux, for March 1711. During the following year he publifhed "S. Joannis Damafceni Opera quæ extant Gr. et Lat." in 2 vols. fol. accompanied with differtations abounding in erudition. He intended to have given a third volume, containing fuch pieces as had been falfely attributed to that father, but it was never fent to the prefs. The fame fortune has attended his labours on "The Works of Leo of Byzantium," to which he had paid a confiderable fhare of attention. Towards the clofe of his life he entered into a controverfy with father Courayer, concerning the validity of the ordinations of the church of England, in which the palm of victory was given to his opponent. Le Quien died in 1733, at the age of 72 years, refpected for his piety, and uniform correctnefs of conduct. He was author of various "Differtations" to be found in Defmolets "Memoires de Literature et d'Hiftoire," and the "Mercure de France." At the time of his death he was engaged in printing the moft confiderable of his works, relating to the ancient and prefent ftate of the eaftern churches. "His plan includes the whole of his churches, under the four grand patriarchates of Conftantinople, Alexandria, Antioch, and Jerufalem; prefents a geographical defcription of each diocefe, and of the epifcopal cities, and then gives a particular account of the origin and eftablifhment of the churches, their extent, their jurifdiction, their rights, their prerogatives, the fucceffion and order of their bifhops, their political government, the changes which they have undergone," &c. As the author did not live to finifh his work, it was publifhed with additions, in the year 1740, under the title of "Michaelis le Quien Oriens Chriftianus, in quatuor Patriarchatus digeftus, qua exhibentur Ecclefiæ, Patriarchæ, cæterique Prefules Orientis," &c. in 3 vols. fol. Moreri.

QUIENFIORD, in *Geography*, a bay on the coaft of Norway; 27 miles N. of Chriftianfand.

QUIENS, a river of Norway, which runs into the fea, 18 miles N. of Cape Lindefnefs.

QUIESCENT, fomething at reft.

QUIETISM, in *Ecclefiaftical Hiftory*, the fentiments of the Quietifts, a religious fect, which made a great noife towards the clofe of the 17th century.

Molinos, a Spanifh prieft, who died at Rome in the prifon of the inquifition, paffes for the author of Quietifm; and yet the Illuminati in Spain had taught fomething like it before.

A fect fimilar to this had appeared at Mount Athos, in Theffaly, towards the clofe of the fourteenth century, under the appellation of Hefychafts, which denotes the fame with Quietifts. Thefe were a branch of the *Myftics*, (which fee,) or thofe more perfect monks, who, by a long courfe of intenfe contemplation, endeavoured to arrive at a tranquillity of mind entirely free from every degree of tumult and perturbation. Thefe Quietifts, in conformity to an ancient opinion of their principal doctors, (who imagined that there was a celeftial light concealed in the deepeft retirements of the mind,) ufed to fit every day, during a certain fpace of time, in a folitary corner, with their eyes eagerly and immoveably fixed upon the middle region of the belly, or navel; and boafted, that, while they remained in this pofture, they found, in effect, a divine light beaming forth from the foul, which diffufed through their hearts inexpreffible fenfations of pleafure and delight. To fuch as inquired what kind of light this was, they replied, by way of illuftration, that it was the glory of God, the fame celeftial radiance that furrounded

Chrift

Chrift during his transfiguration on the mount. Barlaam, a monk of Calabria, from whom the Barlaamites derived their denomination, ftyled the monks, who adhered to this inftitution, Maffalians and Euchites: and he gave them alfo the new name of Umbilicani. Gregory Palamas, archbifhop of Theffalonica, defended their caufe againft Barlaam, who was condemned in a council held at Conftantinople in the year 1341.

The name is taken from a fort of abfolute reft, and inaction, which the foul is fuppofed to be in, when arrived at the ftate of perfection, which in their language is called *the unitive life.* To arrive at this, a man is firft to pafs through the purgative way; that is, through a courfe of obedience, infpired by the fear of hell: hence he is to proceed into the illuminative way, before he arrives at perfection.

The fentiments of the Quietifts, with regard to God, are wonderfully pure and difinterefted. They love him for himfelf, on account of his own perfections, independently of any rewards or punifhments: the foul acquiefces in the will of God, even at the time when he precipitates it into hell; infomuch that inftead of ftopping him on this occafion, B. Angelo de Foligny cried out, "Hafte, Lord, to caft me into hell: do not delay if thou haft abandoned me: but finifh my deftruction, and plunge me into the abyfs."

At length the foul, after long travail, enters into reft, into a perfect quietude. Here it is wholly employed in contemplating its God; it acts no more, thinks no more, defires no more; but lies perfectly open, and at large, to receive the grace of God, who by means thereof drives it where it will, and as it will.

In this ftate it no longer needs prayers, or hymns, or vows; prayers where the fpirit labours, and the mouth opens, are the lot of the weak, and the imperfect: the foul of the faint is, as it were, laid in the bofom, and between the arms of its God, where, without making any motion, or exerting any action, it waits, and receives the divine graces. It then becomes happy: quitting the exiftence it before had, it is now changed; it is transformed, and, as it were, funk and fwallowed up in the Divine Being, infomuch as not to know or perceive its being diftinguifhed from God himfelf. Fenel. Max. des Saints.

QUIETISTS, the difciples of Mich. de Molinos; or the adherents to the opinions delivered in the article QUIETISM. The fentiments of Molinos were contained in a book, which he publifhed at Rome in the year 1681, under the title of the "Spiritual Guide:" in confequence of which he was caft into prifon in 1685, where he was foon obliged to renounce, in a public manner, the errors of which he was accufed: and this folemn recantation was neverthelefs followed by a fentence of perpetual imprifonment, from which he was in an advanced age delivered by death, in the year 1696. Molinos had a confiderable number of difciples in Italy, Spain, France, and the Netherlands. One of the principal patrons and propagators of Quietifm in France, was Marie Bouvieres de la Mothe Guyon, a woman of fafhion, remarkable for the goodnefs of her heart, and the regularity of her manners; but of an unfettled temper, and fubject to be drawn away by the feduction of a warm and unbridled fancy. This female apoftle of myfticifm derived all her ideas of religion from the feelings of her own heart, and defcribed its nature to others as fhe felt it herfelf. Accordingly, her religious fentiments made a great noife in the year 1687; and they were pronounced unfound, after accurate examination by feveral men of eminent piety and learning, and profeffedly confuted, in the year 1697, by the celebrated Boffuet. Hence arofe a controverfy of great moment, between the prelate laft mentioned, and Fenelon, archbifhop of Cambray, who feemed difpofed to favour the religious fyftem of Madame Guyon, and who, in 1697, publifhed a book, cited in the laft article, containing feveral of her tenets. Fenelon's book, by the intereft of Boffuet, was condemned in the year 1699, by Innocent XII. and the fentence of condemnation was read by Fenelon himfelf at Cambray, who exhorted the people to refpect and obey the papal decree. Notwithftanding this feeming acquiefcence, the archbifhop perfifted, to the end of his days, in the fentiments which, in obedience to the order of the pope, he retracted and condemned in a public manner. See the article FENELON.

QUIETO, in *Geography*, a river of Iftria, which runs into the Adriatic, two miles W. of Baftia.

QUIETUS, *freed* or *acquitted*, a term ufed by the clerk of the pipe, and the auditors in the exchequer, in their acquittances or difcharges given to accomptants, which ufually conclude with the words *abinde receffit quietus*; which is called a *quietus eft*.

A *quietus eft* granted to a fheriff, difcharges him of all accounts due to the king.

QUIFORO, in *Geography*, a diftrict of Africa, on the Gold Coaft.

QUIGNONES, FRANCIS DE, in *Biography*, an eminent Spanifh cardinal in the 16th century, who embraced the religious life at an early age, in a monaftery of Francifcans, and fubfequently afforded fuch evidence of fuperior talents, that he was elected general of his order in the year 1522. He obtained the office of confeffor to Charles V. and upon the capture of Rome by the imperial army in 1527, and the imprifonment of pope Clement VII. in the caftle of St. Angelo, his fervices were folicited by that pontiff, in negociating for his liberty, and were afterwards rewarded with a cardinal's hat. After this, he was by the fame intereft nominated bifhop of Cauria, and fent in the capacity of apoftolical legate into Spain, and the kingdom of Naples. He died in the year 1540. He was author of a reformed breviary printed at Rome in 1536, which met with the approbation of popes Clement VII. and Paul III. but it was afterwards fupprefled by Pius V.; hence it has become fcarce, and is fought after by collectors. Several fpurious editions have been printed at different times. It is inferted in the "Annales Minores" of Wadingus, and in the fecond edition of Joly's treatife "De Reformandis Horis Canonicis."

QUIJUBATUI, in *Ornithology*, the name of an American fpecies of paroquette.

It is of the fize of a lark, and in general of a yellow colour. Its eyes are black, and its beak grey. The edges of its wings are of a dufky green, and its tail long and yellow. It is a very beautiful bird, and very eafily tamed. See PSITTACUS *Guarouba*.

QUIKNE, in *Geography*, a town of Norway, in the province of Bergen; 105 miles N. of Chriftiania.

QUIL, in *Zoology*. See QUIRPELE, and VIVERRA *Mungo*.

QUILAQUIL, in *Ornithology*, the name given by the people of the Philippine iflands to a very beautiful fpecies of parrots, which is commonly found wild in the woods there. It is all over of a fine green colour, and is fmaller than the common parrots, and has a broad black bill, and black legs. It is a very wild bird, and will not learn any thing.

QUILATE, in Spanifh and Portuguefe *Coinage*, a term ufed for *carat*; which fee.

QUILEA, in *Geography*, a fea-port town of Peru, near the Pacific ocean, which gives name to a fertile valley, in the jurifdiction of Arequipa. S. lat. 16° 45'.

QUILICI,

QUILICI, Gaetano, in *Biography*, an Italian opera-finger, with a bafe voice: a good mufician, who arrived here in 1759, during the performance and opera regency of the Mattei. He continued to perform on our lyric ftage near thirty years, and is, we believe, ftill living in London, we fear, in penury and obfcurity. Since quitting the ftage, he has fupported himfelf, a bed-ridden wife, and an ideot fon, by teaching to fing, and has made fome admirable fcholars.

QUILIMANCY, in *Geography*, a river of Africa, which runs into the Indian fea, 20 miles S. of Melinda. S. lat. 3° 16′. E. long. 40° 10′.—Alfo, a fea-port town of Africa, in the kingdom of Melinda, at the mouth of the before-mentioned river, belonging to the Portuguefe. S. lat. 3° 10′.

QUILIMANE, a town of Africa, in Mozambique. S. lat. 18° 15′. E. long. 37° 30′.

QUILLAJA, in *Botany*, a genus of plants found in Chili, and defcribed by Molina. Juff. 444. Lamarck Illuftr. t. 774.—Clafs and order, *Monoecia Dodecandria*. Nat. Ord. uncertain.

Eff. Ch. Male, Calyx five-cleft. Corolla none. Stamens twelve, or more.

Female, Calyx five-cleft. Corolla none. Germens five, fuperior, oppofite to the fegments of the calyx. Styles five. Capfules five, coriaceous, of two valves, and one cell. Seeds numerous, oblong, inferted into the bottom of the capfule, dilated and winged at the fummit.

Such is the character made out by Juffieu, from the publications of Molina and Frezier, and from fpecimens of the fruit, brought to Europe by Dombey. They belong to a *tree*, whofe *bark* has a foapy quality. The *leaves* are alternate, fimple, evergreen. *Flowers* axillary.—The genus appears akin to the *Magnoliæ* of Juffieu, but whatever it may be, the name is barbarous and quite inadmiffible; only tolerable for a time, till fome botanift, furnifhed with better materials to define the genus, fhall be entitled to give it a more claffical appellation. Juffieu remarks, that another plant of Dombey's appears to belong to the above genus. This is a tree referred by him to *Dioecia Icofandria*, whofe fruit is called *Gayo colorado*, and which is the fame with the "*Loque*, or Peruvian tree with five capfules," of Jofeph de Juffieu, whofe branches, according to his manufcript account, are fo long and pliant, as to be twifted into cords, ferving, in the province of Cufco, for the fupport of hanging bridges.

QUILLALA, in *Geography*, a town of Chili, on the Aconcagua; 30 miles E.N.E. of Valparayfo.

QUILLAN, a town of France, in the department of the Aude, and chief place of a canton, in the diftrict of Limoux; 10 miles S. of Limoux. The place contains 1568, and the canton 9195 inhabitants, on a territory of 272½ kiliometres, in 22 communes. N. lat. 42° 52′. E. long. 2° 16′.

QUILLA-YACU, a town of Peru, in the diocefe of Lima; 60 miles E.N.E. of Guanuco.

QUILLE, a town of Sweden, in Weft Gothland; 23 miles N. of Uddevalla.

QUILLEBŒUF, a town of France, in the department of the Eure, and chief place of a canton, in the diftrict of Pontaudemer, feated on the Seine; eight miles N. of Pontaudemer. The place contains 1200, and the canton 7272 inhabitants, on a territory of 107½ kiliometres, in 16 communes. N. lat. 49° 29′. E. long. 0° 38′.

QUILLET, Claude, in *Biography*, born at Chinon, in Touraine, about the year 1602, was brought up to medicine, which he practifed fome years, till he was obliged to quit the country on account of his oppofition to a meafure of Richelieu, which is thus narrated. Quillet was at Loudun at the time that Loubardemont, a creature of the cardinal, was fent thither to take informations refpecting the pretended poffeffion of fome nuns by the forceries of Urban Grandier (fee his article), an impofture which Richelieu thought fit to favour. The counterfeit Satan one day threatened, that on the morrow he would lift up to the roof of the church any one who fhould prefume to call his power in queftion. A large company appeared on the next day with M. Loubardemont, when Quillet, who alfo was prefent, challenged the devil to keep his word. To the furprife of the fuperftitious who had met on the occafion, nothing followed, but the challenger found to his coft that he had given offence to a mightier power than Satan, and felt it neceffary to quit Loudun in hafte, and retire to Italy. He went to Rome, and was engaged as fecretary to the French ambaffador at that court. He probably returned to France with that minifter, after the death of Richelieu, and in 1655 he publifhed at Leyden, under the name of Calvidius Lætus, the poem by which he is chiefly known, entitled "Callipædia five de pulchræ Prolis habendæ ratione." In the firft edition were fome fatirical lines againft Mazarin. The cardinal fent for him, and having gently remonftrated with him for treating his friends with feverity, promifed to give him the firft vacant abbey. Quillet threw himfelf at the cardinal's feet, afked pardon, affured him he would inftantly obliterate the offenfive lines, and begged, as a fign of his penitence, to be allowed to dedicate the poem to him. This was done in the Paris edition of 1656, and Quillet became the flatterer of him who had been the object of his fatire. He died at Paris in 1661, repenting not of his adulation, but of the licentious caft of fome of his verfes. The Callipædia has gone through many editions, and has been tranflated into various languages. "It is," fays an able critic, "an ingenious performance, agreeably varied by fable and epifode, but frivolous in its main topic, and in its reafonings. Its details are frequently loofe and inflammatory, and that a cardinal fhould have allowed it to have been dedicated to him, is a proof how little regard was paid, at that period, to the rules of decorum. The verfification, though generally free and flowing, is by no means correct, and the diction is frequently impure." Quillet compofed a verfion of Juvenal in French verfe, and a Latin poem in twelve books, entitled "Henriados," or the actions of Henry IV. This, with other papers, he left to Menage, with 500 crowns to defray the charge of printing them, but the abbe took the money, and neglected the conditions.

QUILLIGA, in *Geography*, a country of Africa, in Upper Guinea, near the river Maqualbary.

QUILLOBO, in *Botany*, a name given by fome to a fpecies of ketmia, called alfo *quingombo*.

QUILLOT, Killo, or *Kiflo*, in *Commerce*, a Turkifh corn meafure, weighing, in wheat, about 23 okes, or 60lbs. avoirdupois: 4 killos make 1 fortin; 8½ killos anfwer nearly to 1 Englifh quarter. A killo of rice contains 10 okes, and the oke is 400 drachms.

QUILLOTA, in *Geography*, a town and jurifdiction of Chili. The town does not contain above 100 families, but thofe fcattered over the country exceed 1000.

QUILLY, a town of France, in the department of the Lower Loire; 7 miles N. of Savenay.

QUILOA, a country and kingdom of Africa, fituated near the eaft coaft, near the mouth of the Coavo, about 180 miles from north to fouth; but the extent inland towards the weft is unknown. This country was firft difcovered by the Portuguefe, in the year 1498. The king and his fubjects are Mahometans; the latter partly black and partly tawny. They all ſpeak the Arabic and ſeveral other languages, which they learn from the nations they traffic with. Their dreſs is that of the Arabian Turks: the women eſpecially affect finery, with variety of ornaments about their necks, arms, wriſts, and ankles; particularly bracelets made of ivory, curiouſly wrought, which upon the death of a parent, huſband, or near relation, they break in pieces, in token of ſorrow, whilſt the men expreſs theirs by ſhaving their hair, and abſtaining from food. The capital of the kingdom is ſituated on an iſland near the mouth of the Coavo, and is ſaid to be large, rich, and well built. The houſes are of ſtone and mortar, handſome, and after the Spaniſh manner. They are ſeveral ſtories high, and have each a pleaſant garden behind, well watered and cultivated, here being plenty of ſprings of freſh water. The houſes are finely furniſhed within, and terraces on the top, with a kind of hard clay, and the ſtreets ſo narrow, that one may eaſily ſtep from one ſide to the other. On one ſide of the town is the citadel, where reſides the Mahometan prince. It is adorned with ſtately towers, and ſurrounded with a ditch and other fortifications. It hath two gates, one towards the port, whence one may ſee the ſhips ſailing in and out; the other looking towards the land. The country about Quiloa, though low, is yet very pleaſant and fertile in rice and millet, fruits and good paſture; ſo that they breed abundance of cattle, beſides poultry of all ſorts, both wild and tame. They have fiſh likewiſe in great plenty, and very good. The climate is likewiſe affirmed by moſt travellers to be very temperate and healthy; Sanut being the only author we know of who hath ventured to aſſert the contrary in all theſe reſpects. S. lat. 8° 35′.

QUILONNE, a province of Africa, in the kingdom of Sabia.

QUILOVIA, a ſmall iſland in the Indian ſea, near the coaſt of Africa. S. lat. 13°.

QUILTAINEN, a town of Pruſſia, in the province of Oberland; 8 miles S.E. of Holland.

QUILTAON, one of the Laccadive iſlands, in the Indian ſea. N. lat. 12°. W. long. 72° 45′.

QUILTING denotes the operation of weaving a ſort of coat or texture, formed of the ſtrands of rope, about the outſide of any veſſel, to contain water, &c. as a jar, caſk, bottle, &c.

QUIMICHPATLAN, in *Zoology*. See SCIURUS *Volucella*.

QUIMINATIN, in *Geography*, a ſmall iſland in the ſea of Mindoro. N. lat. 10° 55′. E. long. 120° 40′.

QUIMIRI, a town of Peru, in the dioceſe of Lima; 40 miles N.E. of Naſca.

QUIMO, a ſmall iſland on the eaſt ſide of the gulf of Bothnia. N. lat. 63° 17′. E. long. 21° 52′.

QUIMPER, a city of France, capital of the department of Finiſterre, and chief place of a diſtrict, ſeated on the Oder; before the revolution the ſee of a biſhop, the ſeat of a governor, an admiralty, &c. The place contains 6608, the canton 17,028 inhabitants, on a territory of 90 kiliometres, in ſeven communes. N. lat. 47° 59′. W. long. 4° 1′.

QUIMPERLE, a town of France, and chief place of a diſtrict, in the department of the Finiſterre. The place contains 4162, and the canton 9128 inhabitants, on a territory of 125 kiliometres, in 15 communes.

QUIN, DR., of Dublin, in *Biography*, an eminent phyſician, and one of the moſt enlightened dilettante muſicians with whom we have ever been acquainted. This gentleman, who, during his travels, reſided in Italy ſome years, had heard and ſtudied muſic with ſuch taſte and intelligence, that his opinions and converſation on the ſubject were equally entertaining and inſtructive. He reſided in Dublin at the time of Handel's arrival in that city, 1742, and perfectly remembering his performance, perſon, and manners, in 1788 wrote us word, that "he (Handel) was received in Ireland by perſons of the firſt diſtinction with all poſſible marks of eſteem, as a man, and admiration as a performer and compoſer of the higheſt order." And adds, "the Meſſiah, I am thoroughly convinced, was performed in Dublin for the *firſt time*, and with the greateſt applauſe. Mrs. Cibber and ſignora Avolio were the principal performers. Theſe, with the aſſiſtance of the choriſters of St. Patrick's cathedral and Chriſt-church, formed the vocal band; and Dubourg, with ſeveral good inſtrumental performers, compoſed a very reſpectable orcheſtra. There were many noble families here, with whom Mr. Handel lived in the utmoſt degree of friendſhip and familiarity. Mrs. Vernon, a German lady, who came over with king George I. was particularly intimate with him, and at her houſe I had the pleaſure of ſeeing and converſing with Mr. Handel; who, with his other excellencies, was poſſeſſed of a great ſtock of humour; no man ever told a ſtory with more. But it was requiſite for the hearer to have a competent knowledge of at leaſt four languages: Engliſh, French, Italian and German; for in his narratives he made uſe of them all."

QUIN, JAMES, was born in London in 1693. He was the ſon of an Iriſh gentleman, and received his education in the capital of that country. His father had, ignorantly, married a woman ſuppoſed to be a widow; whoſe huſband, after a long abſence, returned and claimed her. The ſubject of this article was the offspring of this connection, and was accordingly illegitimated, and upon his father's death, in 1710, was left almoſt deſtitute. For want of education he was, at the age of twenty-one, without a profeſſion, and was under the neceſſity of appearing on the ſtage at Dublin, in the very loweſt characters. He diſplayed, however, riſing talents, which induced a friend to adviſe him to attempt ſome better parts in London, and he was accordingly admitted into Drury-lane company in 1715. After the experience of a year or two, he entered himſelf under Rich at Lincoln's-Inn theatre, where he continued to perform during ſeventeen years. He was allowed, by the moſt competent judges, to ſhine both in tragedy and comedy. His utterance was weighty and impreſſive, which, however, was accompanied with various defects. He was, from cauſes not well aſcertained, continually changing from one theatre to another, and perhaps he may be ranked among that number with whom it was difficult to keep terms. His paſſions were ſtrong, his temper irritable, and his language often coarſe. He was of convivial habits, and, it has been ſaid, groſsly attached to the pleaſures of the table. There was, however, a fund of generoſity in his temper, which ſhewed itſelf in manly ſentiments, and, occaſionally, in benevolent actions. The circumſtance of his giving a 100*l.* to the poet Thomſon, when he was under an arreſt for debt, has often been told to his honour. It was the commencement of a ſtrong friendſhip between them. After Thomſon's death, he appeared in that poet's tragedy of Coriolanus, and ſpoke a prologue, written on the occaſion by lord Lyttleton, with a pathos that did honour to his feelings. His laſt performance was the favourite part of Falſtaff, for the benefit of his friend Ryan in 1753. He now retired to Bath, where his fund of anecdote, and ſtrong pointed ſenſe, rendered his company much ſought after. He had good breeding, which fitted him for the higheſt ſocieties, when he choſe to act the gentleman; and his ſenſuality and coarſeneſs were frequently

frequently put up with for the fake of his companionable qualities. Quin died at Bath in 1766, at the age of feventy-three. Garrick, whofe fuperior talents are fuppofed to have driven him from the ftage, but afterwards his fteady friend, wrote a poetical epitaph for his monument. While Quin continued on the ftage, he conftantly kept company with the moft celebrated geniufes of the age. He was on intimate terms with Pope and Swift; and was frequently invited by the earl of Chefterfield to his table. His peculiar judgment in the Englifh language recommended him to his royal highnefs, Frederic prince of Wales, who appointed him to inftruct his children in fpeaking and reading with graceful propriety. When Quin was informed of the elegant manner in which his prefent majefty had delivered his firft gracious fpeech from the throne, he was in raptures, and the king foon after gave orders, without any application on the part of Quin or his friends, that a genteel penfion fhould be paid him during his life.

Quin, in *Geography*, a village of the county of Clare, Ireland, where are the remains of a monaftery, which was founded for Francifcan friars in 1402, and repaired by the Roman Catholics in 1604. Bifhop Pococke fpeaks of it as one of the fineft and moft entire monafteries he faw in Ireland. It is fituated on a fine ftream, with an afcent of feveral fteps to the church: at the entrance one is furprifed with the view of the high altar, entire, and of an altar on each fide of the arch of the chancel. The building is quadrangular, with piazzas fupported by a number of pillars; there are apartments on three fides of the cloifters, with a vaulted room under them all. A round tower and fome other ruins are adjoining. Quin is 15 miles from Limerick, on the road to Galway, and about 106 miles W.S.W. from Dublin. Archdall's Monafticon. Carlifle.

QUINA Folia, in *Botany*. See Leaf.

QUINABAUG, in *Geography*, a river of America, formerly called "Mobegan," which rifes in Brimfield, Maffachufetts, and is joined at Oxford by French river, which has its fource in Sutton, Worcefter county. It runs a foutherly courfe, and difcharges itfelf into Shetucket, about three miles above Norwich Landing, in Connecticut. In the firft part of its courfe it furnifhes many good mill-feats: as it advances, the intervals in many places are wide, and afford a moft excellent foil.

QUINA-QUINA, in *Botany*, a Peruvian name, generally applied to the Peruvian bark. (See Cinchona.) Juffieu, however, in his Gen. Pl. 366, informs us, that it properly belongs to a tree, nearly if not entirely agreeing in genus with *Myrofpermum* of Jacquin, or Myroxylon of Linnæus. (See the laft-named article.) An account of the *Quina-quina* may be found in the Memoires de l'Acad. des Sciences for 1738, p. 237.

QUINARIA, fo called by Loureiro, Fl. Cochinch. v. 1. 272, from the prevalence of the number five in the parts of fructification, is the *Wampfe* or *Wampi* of the Chinefe, now eftablifhed as a genus by the name of Cookia. (See that article.) This plant paffed long; in the gardens of England, for *Guarea trichilioides*, according to the obfervation of the late Mr. Dryander.

QUINARIUS, Quinary, in *Antiquity*, a little Roman coin, equal to half the denarius. See Coin.

The quinarius was properly the Roman halfpenny.

Medalifts indeed ufe the term quinarius in the general for a medal of any matter, not exceeding the fize of our fixpence; but F. Chamillart, in an exprefs differtation, fhews this to be an abufe. The filver coins, current under the republic, he fhews, were two: the one weighing a drachm, and called denarius, as containing ten affes; the other weighing half a drachm, and called quinarius, as containing five affes: which coins continued on the fame footing under the emperors.

Hence the origin of the word quinarius: and hence, in propriety, it is only the filver medal of the weight of half a drachm that the name belongs to; the Romans having never given it to any other fpecies of the fame fize with it. It is only by way of analogy, therefore, that the moderns apply it to the medals of gold, or copper, of the fame fize with the filver quinarius; thofe of gold being fixed at a value much above, and thofe of brafs much below five affes.

The only relation between thefe quinarii is, that the gold quinary is the half of a gold medal, as to weight and value; and the brafs quinary half a brafs medal, as the filver quinary is half a filver one.

Hence a feries of quinaries fhould feem at leaft a neceffary in the cabinets of the curious, as the feries of great medals; they being all equally different fpecies of money, which teach us how many kinds of pieces there were of any metal current in commerce.

Add to this, fays our author, that the quinaries were of a finer and more finifhed coin than the other medals, being wrought by the hands of the mafters; which feems owing to the nicety required in engraving whole figures in fo fmall a compafs. He adds, that though quinaries are very fcarce, yet M. the duke of Maine had almoft a complete fet of them.

QUINAULT, Philip, in *Biography*, a French poet, was born in 1636, probably in a low condition; though while fome fay he was the fon of a baker, others maintain that he was defcended from a family of confequence at Paris. He had, however, very few advantages of education, but was foon found to poffefs a talent for poetry and the belles lettres. Before the age of twenty he brought out fome pieces on the ftage; and for a number of years, he continued to produce dramatic works of different kinds, which were much applauded by the public voice; but fome of which drew upon the author the fatires of Boileau, who carried the matter fo far as to injure his own reputation. Quinault now affociated himfelf with Lulli in the compofition of operas, and difplayed an excellence in lyric poetry, or that adapted to mufic, which placed him beyond competition in that branch, and has ranked him among the diftinguifhed characters of the age of Lewis XIV. Nothing, it is allowed, can be more tender, delicate, and ingenious, than the turn of his fongs and love-dialogues; and no one has more happily accommodated the melody of French verfe to mufical expreffion. His "Armida" and his "Atthys" are fpoken of as mafter-pieces of their kind. Notwithftanding the high reputation which he enjoyed as a poet, he applied himfelf to the ftudy of the law, and eventually made his fortune by marrying the rich widow of a merchant, to whom he had been ufeful in his profeffion. After this, he purchafed the place of an auditor in the chamber of accounts. He was received into the French academy, and, in the name of that fociety, harangued the king on his return from the campaigns of 1675 and 1677. He died in 1688, having enjoyed a penfion from Lewis XIV. feveral years previoufly to his deceafe. In his laft illnefs he was extremely penitent, on account of his having devoted his talents too frequently to the excitement of the licentious paffions. He left a family of five daughters, and was efteemed in fociety attentive, polite, and mild. Befides his numerous pieces for the ftage, he wrote occafional poems. His works were printed at Paris in 5 vols. 12mo., 1739, and again in 1778.

 It

It has been faid that Quinault's apprenticefhip to poetry was ferved under Triftan l'Hermile, by being his domeftic. The leffons of Triftan were probably of fome ufe to him, as that author had had long experience in theatrical matters; but Quinault owed ftill more to nature: as before he was twenty years old, he had diftinguifhed himfelf by feveral pieces for the ftage, which had confiderable fuccefs: and before he was thirty, he produced fixteen dramas, fome of which were well received by the pit; but not all equally. It is fuppofed that fome of thefe early pieces prejudiced Boileau againft Quinault early in his career. There was neither regularity in the plan, nor force in the ftyle: romantic lovers and common-place gallantry, in fcenes which required a nervous pencil and vigorous colouring. Thefe were defects not likely to efcape the lafh of the French Juvenal. He covered the young poet with ridicule; reproached him with the affectedly foft and languifhing dialogue of his lovers, by whom even *I hate you* was faid tenderly.

Quinault, born with great fenfibility, was fo wounded by his feverity, that he applied to the magiftrates, not only to filence Boileau, but oblige him to remove his name from his fatires; but the attempt was vain. His enemy infulted him ftill more cruelly by an epigram on the fubject.

" ——Peace! peace! my friend—
If from the public thou'dft avoid difgrace,
From thy own works, not mine, thy name efface."

It was not till after Quinault was inlifted by Lulli to write for the opera, that he filenced all his enemies, except Boileau and his party, who envied him his fuccefs. The French nation knew no better mufic that that of Lulli, and thought it divine. Quinault's was thought of fecondary merit, till after his deceafe; and then, in proportion as the glory of Lulli faded, that of Quinault increafed. Voltaire, in the firft edition of his " Siecle de Louis Quatorze," in 1749, feems to have been the firft who fpoke out on the fubject; not forry, perhaps, to lower Boileau a little in the eyes of the public. He there fays, that " Quinault was celebrated for his beautiful lyric poetry, and for the gentlenefs with which he oppofed the unjuft fatires of Boileau. His poetry was greatly fuperior to the mufic of Lulli. It will always be read; and Lulli, except in a few of his recitatives, can no longer be fupported. However, it was long believed that Quinault entirely owed his favour to Lulli. Time appreciates all things."

After this, his writings began to be examined and felt; and of late years, his name is never mentioned by his countrymen without eloge. His operas, though admirable to read, are ill calculated for modern mufic; and are obliged to be new written, ere they can be new fet, even in France. Marmontel, who had modernized feveral of them for Piccini to fet in 1788, gave M. Laborde a differtation on the dramatic writings of Quinault for mufic; which is publifhed in the fourth volume of his " Effai fur la Mufique."

He begins by afferting that Quinault was the creator of the French opera upon the moft beautiful idea that could be conceived; an idea which he had realized with a fuperiority of talent, which no writer has fince approached.

His defign was to form an exhibition, compofed of the prodigies of all the arts; to unite on the fame ftage all that can intereft the mind, the imagination, and the fenfes. And this illufive theatre Voltaire has admirably defcribed:

" Il faut fe rendre à palais magique," &c.

" Hafte to the magic palace, where abound
The joys fublime of verfe, of dance, and found;
Where bright illufion fafcinates the fight,
And firen-notes the inchanted ear delight;
Where all the plaftic powers of art are fhewn,
And joys unnumber'd are combin'd in one."

For this purpofe a fpecies of tragedy is neceffary, that fhall be fufficiently touching to move, but not fo auftere as to refufe the enchantments of the arts that are neceffary to embellifh it. Hiftorical tragedy, in its majeftic and gloomy fimplicity, cannot be fung with any degree of probability, nor mixed with feftivals and dances, or be rendered fufceptible of that variety, magnificence, fhow, and decoration, where the painter and the machinift ought to exhibit their enchantments.

In Italy, where genuine tragedy has no theatre appropriated to its ufe, a people paffionate for mufic have permitted Regulus, Themiftocles, Alexander, and even Cato himfelf, to utter their fpeeches in fong; but a people, whofe tafte ought to be more fevere, and more delicate, as to probability, having for comparifon the fchool of Corneille and Racine, would have been very unwilling to fubftitute the recitative of Lulli to the declamation of Baron. Melody itfelf is a fabulous and magical language; and in a theatre " where all is prodigy, it feems confiftent that the manner of fpeaking fhould be that of enchantment as well as the reft. We are then in a new world: it is nature enchanted, and vifibly animated by a crowd of intelligences, whofe wills are laws. Mufic there plays a marvellous part; mufic there conftitutes the probability of the marvellous; but in a reprefentation where all paffes for natural, according to truth and hiftory, by what means can we be prepared to hear Auguftus, Cornelia, Agrippina, or Brutus fing?" Might it not be replied, " By the fame means as the French are reconciled to thefe fame exalted characters converfing in rhyme." When once it is fettled that all the characters converfe in a mufical language, no other is expected, and the audience is foon reconciled to it. But all this is to prove that the French alone are right, and Italy and all the reft of the world wrong as to the mufical drama. The reft of Europe is tired and afhamed of flying gods and goddeffes, and have long fince furrendered mythological wonders both in poetry and mufic to their children. But all people are thought barbarians, who do not implicitly adopt the tafte and fafhions of France.

But to return to Quinault, whom all the wits of the time tried to write down. Ignorant of mufic and its powers, they thought Lulli always right, and the poor, modeft, unpretending Quinault always wrong. Pofterity has long difcovered the converfe of this fuppofition to be the truth. Quinault's great miftake and misfortune, fays La Harpe, was the calling his pieces tragedies, and not operas. He would not then have been regarded as a rival of Racine, or have offended claffical hearers or readers with the little refemblance thefe compofitions had to Greek and Roman dramas, or to the genuine tragedies of the moderns.

QUINCE Tree, in *Gardening*, the common name of a tree of the apple kind. See Pyrus *Cydonia*.

Quince, in the *Materia Medica*. The fruit of the quince is aftringent and ftomachic; and its expreffed juice, in fmall quantities, as a fpoonful or two, is of confiderable fervice in naufeæ, vomitings, nidorous eructations, and fome kinds of alvine fluxes. This juice was formerly ordered in the Lond. Pharm. to be made into a fyrup, called " fyrupus cydoniarum," or fyrup of quinces, prepared by digefting three pints of the depurated juice with a drachm of cinnamon, half a drachm of ginger, and half a drachm of cloves, on warm afhes.

aſhes, for ſix hours, then adding a pint of red port, and diſſolving in the ſtrained liquor nine pounds of ſugar. But the only preparation of the quince which it now directs is, a mucilage of the ſeeds, made by boiling a drachm of the ſeeds in eight ounces of water, till it acquires a proper conſiſtence. This has been recommended in aphthous affections, and excoriations of the mouth and fauces: however, though it may be a more pleaſant mucilage, it is certainly leſs efficacious than that of the ſimple quince. Lewis and Woodville.

An uſeful reſtringent marmalade is made by boiling the juice with fine ſugar to a due conſiſtence, in the proportion commonly of three pints to a pound. The juice of quinces becomes richer, by keeping them for ſome time, after they are gathered, in a dry airy place.

Quince *Iſland*, in *Geography*, a ſmall iſland near the S.W. coaſt of Ireland, and county of Cork; five miles W. of Gally-Head.

QUINCHAC, a ſmall iſland in the Pacific ocean, between the iſland of Chiloe and the continent of Chili. S. lat. 43° 30′.

QUINCHAMALA, in *Botany*, altered by Willdenow, one can ſcarcely ſee with what reaſon or advantage, from *Quinchamalium* of Juſſieu, a barbarous and totally exceptionable name, taken from the Peruvian *Quinchamali.*—Willd. Sp. Pl. v. 1. 1217. Mart. Mill. Dict. v. 4. Juſſ. 75. Lamarck Illuſtr. t. 142.—Claſs and order, *Pentandria Monogynia.* Nat. Ord. *Elæagni*, Juſſ. Rather perhaps *Rubiaceæ.*

Gen. Ch. *Cal.* Perianth ſuperior, of one leaf, in four deep, ovate, unequal ſegments, one larger than the reſt. *Cor.* of one petal; tube funnel-ſhaped, much longer than the calyx, quadrangular, curved; limb in five lanceolate, acute, ſpreading ſegments. *Stam.* Filaments five, very ſhort, inſerted into the top of the tube; anthers oblong, the length of the limb. *Piſt.* Germen roundiſh; ſtyle thread-ſhaped, the length of the tube; ſtigma capitate. *Peric.* Berry (rather drupa) roundiſh. *Seed* ſolitary.

Eſſ. Ch. Calyx in four unequal ſegments, ſuperior. Corolla funnel-ſhaped, five-cleft. Stigma capitate, undivided. Drupa dry.

1. Q. *chilenſis.* Willd. n. 1. (Quinchamali lini folio; Feuill. Plantes Médécinales, 57. t. 44.)—Gathered by Feuillée on the mountains of Chili, and by Dombey, among ſtones on the hills about Lima, flowering in December and January. The *root* is annual, compoſed of a few ſimple yellow fibres. *Stems* ſeveral, proſtrate, ſimple, round, leafy, from four to ſix inches long. *Leaves* ſcattered, ſeſſile, linear, entire, fleſhy, ſmooth, bluntiſh with a ſmall point. *Flowers* in ſimple, terminal, ſolitary, denſe ſpikes. *Corolla* green externally, of a ſaffron yellow within. *Seed* round, unconnected.—We have taken the generic character, and the deſcription, from Dombey's manuſcript, compared with one of his original ſpecimens. The *fruit* appears to be a *drupa*, (he terms it *bacca*,) the ſize of hemp-ſeed, whoſe coat becomes coriaceous by drying, and ſeparates, along with the permanent calyx at its ſummit, from the *ſeed*, or *nucleus*, to whoſe upper part the *corolla* remains attached. Juſſieu, Lamarck, and Willdenow, having formed their ideas from dried ſpecimens only, take the coat of the *drupa* for an inferior *calyx*, and the firſt of theſe writers conceives the *flower* to conſiſt of a ſuperior inner *calyx*, to which he was led by an idea of the affinity of this genus to *Theſium.* Willdenow, not adverting to any ſuch affinity, terms the inner calyx of Juſſieu, a *corolla*, which agrees with the opinion of Dombey, the only botaniſt who has examined the living plant, and by whoſe authority we are led to conſider the true *calyx* as ſuperior. If we are right, this genus will belong to the natural order of *Rubiaceæ*, notwithſtanding its ſolitary *ſeed.* Dombey expreſsly ſays it is akin to *Morinda.*

Feuillée relates, that the Indians take a decoction of this plant for internal diſorders, eſpecially when they believe themſelves labouring under an internal abſceſs, of which there is no external appearance. The decoction, taken warm, is ſuppoſed to break the abſceſs, and to cauſe an evacuation of its contents by the uſual paſſages.

QUINCUNX, *Quinque unciæ*, denotes a thing that conſiſts of five twelfth parts of another.

Quincunx, in *Gardening*, is the name of a form of planting in which trees are planted by fives, four of them forming a ſquare, and the fifth placed in the middle, thus,

*   *
  *
*   *

and which may be repeated over and over again in one continued plantation, with as many trees in ſeveral ranges as may be proper. It was formerly a faſhionable mode of planting groves and other regular plantations, but is now leſs common. It is ſeen more fully below:

* * * * * * * *
 * * * * * * *
* * * * * * * *

Something of this mode of arrangement has always a good effect in the diſpoſition of ſhrubby plants, &c. though not in the regular order of it, but ſomething nearly ſo, which gives the ſhrubs a greater ſcope of growth, and ſhews them to greater advantage. It is likewiſe a mode of planting that is proper in the kitchen-garden, in tranſplanting many kinds of eſculent plants; ſuch as lettuces, endive, ſtrawberries, and even all the cabbage kinds, and many other plants, which gives them a greater ſcope to grow than if planted exactly ſquare at the ſame diſtance from each other.

It is of this kind of quincunx that Cicero ſpeaks, in his Cato Major; and Quintilian, lib. viii. cap. 3.

The modern quincunces, Daviler obſerves, are made like thoſe of the ancients, except for the fifth tree, which is now generally diſuſed; ſo that, being as it were netted, and their alleys viewed by the ſide of the rectangle, they formed a perfect chequer.

Quincunx, in *Aſtronomy*, &c. denotes a poſition, or aſpect of the planets when diſtant from each other a hundred and fifty degrees, or five ſigns.

QUINCY, in *Geography*, a town of France, in the department of the Seine and Marne; ſix miles S.W. of Meaux.

Quincy, a poſt-town of America, in Norfolk county, Maſſachuſetts, taken from Braintree; 10 miles S. of Boſton. It contains 1281 inhabitants, moſt of whom are farmers; but large quantities of ſhoes and boots are manufactured for exportation. The town has an epiſcopal and congregational church.

QUINDECAGON, in *Geometry*, a plain figure which has fifteen ſides and fifteen angles.

The word is formed ſomewhat irregularly, from the Latin *quinque*, *five*, and the Greek δεκα, *ten*, and γωνια, *angle.* *Pentedecagon* would be a more regular term.

If the ſides be all equal, it is a regular quindecagon.

Euclid ſhews how to inſcribe it in a circle, Prop. xvi. lib. 4. And the ſide of a regular quindecagon ſo deſcribed, is equal in power to the half-difference between the ſide of the equilateral triangle, and ſide of the pentagon; and alſo to the difference of the perpendiculars let fall on both ſides, taken together.

QUINDECIM VIR, XV. VIR, a Roman magiſtrate, who

who had fourteen colleagues joined with him in the fame function.

Under Tarquin the Proud, there were firft two magiftrates erected to take care of the facrifices to be performed; thefe were called *duumviri*. Their number, at length, grew to ten, and then they were called *decemviri*. In the time of Cicero it had reached to fifteen, when they affumed the name of *quindecimviri:* and though their number grew to forty afterward, yet Servius obferves, on the fixth of the Æneid, that their name never after changed, but they ftill continued to be called quindecimviri.

They were the perfons who examined the Sibyls' books, and were the interpreters of them; yet they never did this but by exprefs order of the fenate, declared by a fenatus confultum. They alfo prefided at the facrifices, and all other extraordinary ceremonies of religion.

On medals, a dolphin joined with a tripod marks the priefthood of the quindecimviri; who, to publifh their folemn facrifices, ufed on the eve of them to carry a dolphin at the end of a pole throughout the city; that fifh being efteemed facred to Apollo, as the crow was among birds.

QUINEPAUGE, or *Eaft River*, in *Geography*, a river of America, in Connecticut, which runs a foutherly courfe into the N.E. corner of New Haven harbour.

QUINGEY, a town of France, in the department of the Doubs, and chief place of a canton, in the diftrict of Befançon; nine miles S.W. of Befançon. The place contains 1079, and the canton 11,734 inhabitants, on a territory of $272\frac{1}{2}$ kiliometres, in 36 communes. N. lat. 46° 6′. E. long. 5° 57′.

QUINGOMBO, in *Botany*, the name given by the people of Congo to a fpecies of ketmia, diftinguifhed by M. Tournefort by the name of the ketmia Brafilienfis folio ficus, fructu pyramidoto fulcato, the fig-leaved Brafilian ketmia, with a pyramidal fulcated fruit.

QUINISDAL, in *Geography*, a town of Norway, in the province of Chriftianfand; 35 miles W.N.W. of Chriftianfand.

QUINI-SEXTUM, in *Ecclefiaftical Hiftory*, denotes a council held at Conftantinople in the year 692; called alfo the council in Trullo, and by the Greeks *Penthecte, q. d. five-fixth;* as intimating that it was only a fupplement of the two preceding councils. Though, in propriety, Fleury obferves, it was a council itfelf.

Marfhall obferves, that the fifth and fixth general councils having made no canons relating to the external celebration of divine worfhip, the government of the church, and the lives and manners of Chriftians, the Orientals judged it neceffary to fupply that defect by this; fo that the 102 canons falfely attributed to thofe, were in reality made here. See Trullum.

QUINNET, in *Mining*, the name of a tool ufed in the cleaving rocks by means of gunpowder. This is a fort of wedge fitted to the flat fide of what is called the *gun;* that is, a cylindric piece of iron, only flattened in one part to receive this, and drilled through. When a proper hole has been made in the rock by the borer, the powder is put in, and then the orifice being ftopped by the gun, and that wedged in by this quinnet, the powder being fired by a train communicating with the hole drilled through the guns, exerts all its force on the rock, and fplits it in feveral directions at one explofion. Phil. Tranf. N° 167.

QUINOLA, in *Geography*, a town of Mexico, in the province o Culiacan; 50 miles S.E. of Culiacan.

QUINQUAGENARIUS, among the Romans, was an officer in the army, who had the command of a company of fifty men.

Quinquagenarius was alfo an officer of policy, who had the infpection of fifty houfes, or families.

And in the ancient monafteries, quinquagenarius was a fuperior who had fifty monks under his guidance.

QUINQUAGESIMA-SUNDAY, Shrove-Sunday. It is thus called, as being about the fiftieth day before Eafter. Anciently they ufed Quinquagefima for Whitfunday, and for the fifty days betwen Eafter and Whitfunday; but to diftinguifh this Quinquagefima from that before Eafter, it was called the Pafchal Quinquagefima.

QUINQUANGULAR Leaf. See Leaf.

QUINQUANNION, Quinquennium, in the *French Cuftoms*, a refpite of five years, which infolvent debtors formerly obtained by virtue of the king's letters, to have time for the payment of their debts.

When the thing intended was only to prevent the fale of their effects at an under-value, the term of one year was ordinarily granted, and this was called the benefit of *annion*.

But when the debtor would avoid the furrendering of his effects, upon proving that he was reduced by poverty, loffes, &c. to make ufe of this expedient, the term of five years was granted, and called the benefit of *quinquannion*.

QUINQUATRIA, in *Antiquity*, a name given to the feafts of Minerva, otherwife called Panathenæa.

Some think they were termed quinquatria, becaufe they lafted five days; but others, with more reafon, think it was becaufe they fell out five days after the ides of the month.

QUINQUE Portus, the five cinque ports.

" Servitium quod barones quinque portuum præfcriptorum recognofcunt facere ad fummonitionem regis per annum, fi contigerit per 15 dies ad cuftum eorum proprium; ita quod primus dies computatur a die quo vela navium erexerunt, ufque partes ad quas tendere debent, vel ulterius, quamdiu rex voluerit ad cuftum ejus." Thorn.

QUINQUEFOLIUM, in *Botany*, Cinquefoil, the old name of the Linnæan genus *Potentilla*, many, but by no means a majority, of whofe fpecies have five leaflets on a ftalk. Gærtner, who, like many others, was difcontented with *Potentilla*, fubftituted the word *Pentaphyllum*. See Potentilla.

QUINQUEMPOIX, in *Geography*, a town of France, in the department of the Lower Seine; feven miles N. of Rouen.

QUINQUENNALIA, in *Antiquity*, games, or feafts founded at Tyre, celebrated every five years, in honour of the deified emperors.

The quinquennalia began to be expreffed on medals about the middle of the third century. F. Pagi produces a medal whereon are engraven thofe of the emperor Pofthumus; they are not found on any medals of his predeceffors.

QUINQUENNALIS, a magiftrate in the colonies, and municipal cities of the Roman commonwealth; much the fame with ædile at Rome.

They were not thus called from their continuing in their office five years; but becaufe they were elected every fifth year, to prefide at the cenfus, and to receive the declaration each citizen made of his effects.

QUINQUENNES, in fome old *Hiftorians*, a name given to a certain people of India, among whom the women began to bear children at five years old, and feldom lived to more than eight years. Pliny gives us this account; and Solinus, who repeats it from him, increafes the miracle by telling us, that

that they were a nation of women who had no men among them.

QUINQUEPARTITE Leaf, among *Botaniſts*. See Leaf.

QUINQUEPRIMI, among the Romans, the five principal men in the ſenate of every municipal town.

QUINQUEREMIS, in the *Naval Architecture of the Ancients*, a name given to a galley which had five rows of oars. They divided their veſſels in general into monocrota and polycrota: the former had only one tier of rowers; the latter had ſeveral tiers of them, from two or three, up to twenty, thirty, or even forty; for ſuch a veſſel we have an account of in the time of Philopater, which required no leſs than four thouſand men to row it. See Polycrota.

QUINQUERTIONES, among the Romans, an appellation given to thoſe who had gained the victory in the *quinquertium*, or *pentathlon*.

QUINQUERTIUM was the ſame with the Grecian pentathlon, comprehending the five exerciſes of running, leaping, throwing, darting, and wreſtling. See Pentathlon.

QUINQUE VIR, frequently wrote V. VIR, a Roman magiſtrate, who had four colleagues joined with him in the ſame function.

There were various kinds of officers thus denominated. Pomponius the lawyer mentions quinqueviri on this and on that ſide of the Tiber, eſtabliſhed for the adminiſtration of juſtice in the night-time, in lieu of the ordinary magiſtrates, who were not judged proper to run up and down the ſtreets in the dark.

Roſinus tells us, that they were ſometimes the quinqueviri who conducted the colonies, and divided the lands aſſigned to them among the ſeveral families.

Sometimes the epulones were five in number; in which caſe they were called quinqueviri. See Epulo.

QUINQUEVIRI Monetarii, were officers firſt erected under the conſulate of Valerius Poplicola, to moderate the exceſſive uſury, or intereſt, which creditors or bankers uſed to exact from the people.

QUINQUINA. See Cortex *Peruvianus*.

QUINSEY, ſometimes written *Quinanſey*, and *Quinzy*, in *Medicine*, a corruption of the French word *eſquinancie*, which again is derived from the Greek, *cynanche*, κυναγχη, ſignifying ſore-throat, or inflammation and tumour of the internal fauces. The term is applied generally to inflammations of the throat, but more particularly to the acute inflammation of the tonſils. A tonſil, enlarged from inflammation, is alſo emphatically called a *quinſey*. See Cynanche *tonſillaris*.

Quinsey, among domeſtic animals of the live-ſtock ſort, is an affection about the throat and breaſt, which often attacks them, and which is very obſtinate and troubleſome. In horſes it is uſually called anticor.

QUINSIEME, or Quinzieme, in our old *Law Books*. See Fifteenth.

QUINSIGAMOND, or *Long Pond*, in *Geography*, a lake of Maſſachuſetts, between Worceſter and Shrewſbury. This is a beautiful lake, in form of a creſcent, about five miles long, and from 60 to 100 rods broad. It is interſected with a number of iſlets, one of which is upwards of 200 acres in extent.

QUINSON, a town of France, in the department of the Lower Alps; 25 miles S.S.W. of Digne.

QUINT, a ſequence of five cards of the ſame colour. See Sequence.

QUINTA, Ital. Quinte, Fr. (See Fifth and Diapente.) The chord of the $\frac{6}{5}$ in thorough-baſe is reſolved two ways: firſt, by the baſe riſing one note, and the loweſt treble note deſcending; ſecondly, by the higheſt note of the chord riſing, and the loweſt remaining ſtationary, when the diſcord is reſolved upwards. This is what Rameau calls *le double emploi de la diſſonance*.

Quinta *Pars*, in old madrigals, a 5th vocal part, compoſed of the refuſe of the other four.

Quinta *Eſſentia*. See Quintessence.

QUINTAIN, Quintana, in *Ancient Cuſtoms*, a poſt, or pillar, driven into the ground, with a buckler fixed to it, for the performance of military exerciſes on horſeback, the throwing of darts, breaking of lances, &c.

Matth. Paris deſcribes the quintain as a kind of mark, formed like a man from the navel upwards, holding a ſhield in his left hand, and in his right a ſword or ſtick; the whole ſo fitted as to turn round on its foot, and ſo as that a cavalier running a-tilt againſt it with a lance, if he hit it in the breaſt, it wilked round, and, unleſs he were very dextrous, ſtruck him with the ſword held in the other hand.

In other places, at the top of a poſt, was erected a ſlender beam fitted to turn round a ſpindle; at one of whoſe ends was a ſlope or flat board, and at the other a bag of ſand or dirt. The ſport was, with a long ſtaff, or wooden lance, to ride a-tilt at the board, and to be either ſo ſkilful or lucky to eſcape the blow of the ſand-bag.

This ſome take to be the ſame with the *arietum levatio*, frequently prohibited in our old ſynods and epiſcopal conſtitutions.

The cuſtom is ſtill retained in Shropſhire, and ſome other counties, among the nuptial ſolemnities. He that breaks the moſt poles againſt the quintain, has the prize; which was anciently a peacock, but is now a garland.

Some derive the word from an ancient game called *quintus*; others from a man of the name of Quintus.

The vallus and palus, mentioned in Cæſar, are taken, by Vigenere, for a kind of quintain, or wooden man, fixed up as an adverſary, or man of ſtraw, to prove one's dexterity againſt.

Mention is made of this exerciſe in the Code, De Aleatoribus, and in the Paratitles of Cujas on the ſame. Juvenal ſpeaks of women engaging in it:

"Aut quis non vidit vulnera pali? &c."

Quintain was alſo a right which the lord had to oblige all the millers, watermen, and other young people unmarried, to come before his caſtle every three years, and break ſeveral lances or poles againſt a poſt, or wooden man, for his diverſion.

QUINTAL, in *Commerce*, the weight of a hundred pounds.

The quintal admits of ſome difference in different places, according as the pound conſiſts of more or fewer ounces, and as the ounce is lighter or heavier.

Thus, *e. gr.* the Paris quintal, or hundred, in the old ſyſtem, yields 123lbs. at Montpelier; and the Montpelier hundred only 81lbs. 9 oz. 18 gr. French poids de marc, or 88lbs. avoirdupois nearly. The quintal of Conſtantinople is eſteemed the heavieſt of all thoſe uſed in the Levant: it contains 44 okes, or 100 rottoli; the oke being 4 yuſdromes or chequees, or 400 drachms, and the rottolo 176 drachms. The quintal, or kintal, of cotton yarn is 45 okes. The quintal, or cantaro, weighs about 123¾lbs. avoirdupois, and the oke 2lbs. 13 oz.; the rottolo, 19¾ oz. and the chequee, 11¼ oz. avoirdupois. The quintal is equal to 112¾lbs. of Amſterdam; 124lbs. of Venice; and 160 of Leghorn. The quintal of Liſbon contains 4 arrobas, the arroba 32 pounds, the pound, libra, or arrate, 2 marks, or 16 ounces; the ounce, 8 outavas: 13½ quintals make a ton. The

pound

pound of Lifbon weighs 9552 Dutch afes, $7084\frac{2}{4}$ grains Englifh troy weight; and therefore 83lbs. of Lifbon = 84lbs. avoirdupois weight.

The Englifh quintal ufually confifts of 112lbs. avoirdupois, and is divided into four quarters.

QUINTAL was alfo formerly ufed for a weight of lead, iron, or other common metal, ufually equal to a hundred pounds, at fix fcore to the hundred.

QUINTE', *Ifle de*, in *Geography*, an ifle in lake Ontario, Upper Canada, which lies clofe off the fhore of Ameliafburg, and oppofite the W. point that forms Sandy bay.

QUINTE, in *French Mufic*, is the name of the inftrumental tenor part in full pieces, ufually written in the mezzo foprano clef on the fecond line. All the inftrumental tenor or alto viola parts, in Purcell's time, were written in this clef, as may be feen in his overtures and act-tunes. This was an imitation of France, where all the tenor parts in Lulli and Rameau's operas are in the mezzo foprano clef.

QUINTELLO, Ital. QUINQUE, Fr. a vocal or inftrumental compofition in five parts, dialogued, and generally *a parte equale*. The inftrumental quintets of Boccherini and Mozart are fublime productions: there is, perhaps, no inftrumental mufic in which more genius and abilities are manifeft, than in the quintets of thefe great mafters.

QUINTENAR, EL, in *Geography*, a town of Spain, in New Caftile; 37 miles S. of Hueta.

QUINTER, QUINTOIER, Fr. in the firft attempts at harmony, was counterpoint in a feries of 5ths, any two of which, in aftertimes, would ruin for ever the reputation of a compofer.

QUINTESSENCE, *quinta effentia*, in the old *Chemiftry*, properly denoted the fifth effence, or the refult of five fucceffive diftillations. The term, now obfolete, was ufed to exprefs the higheft degree of rectification to which any fubftance can be brought. It alfo fignified a preparation confifting of the effential oil of fome vegetable fubftance, mixed and incorporated with fpirit of wine.

Thus, on a proper quantity, *e. gr.* of effential oil of fennel, pouring twelve times the quantity of pure alcohol prepared *per fe*, they inftantly unite into one fimilar liquor, which is the quinteffence of that plant.

The ancients were perfectly unacquainted with the method of diffolving oil in fpirit of wine; and even fome of the moderns have queftioned its reality: but the certainty of the thing is eafily proved, from the inftance above, and from a thoufand others.

If fuch quinteffence be feveral times digefted, cohobated, &c. the oil will at length be broken fo fine, as, like the fpirit itfelf, perfectly to mix with water; which is one of the moft extraordinary effects in all chemiftry.

After the like manner is made a quinteffence of camphor, by only pouring on it fpirit of wine.

Quinteffences, thus prepared, were fuppofed to have great medicinal virtues; on account of the pure and potent ingredients ufed in their compofition; which retain, in a great degree, all the virtues of the plants they are procured from: and hence their denomination.

Boerhaave thinks, they might properly be called vegetable fulphurs made potable, and raifed to their utmoft degree of power and efficacy.

Dry quinteffences may be made from the liquid ones, by adding to them fome more effential oil of the fame vegetable from whence the liquid quinteffence was procured, with a little fugar, all mixed together, and diftilled, by a very gentle heat, till all the moifture is come over; the matter remaining is then a dry quinteffence.

This form was deemed principally ufeful for travellers, failors, &c. inafmuch as it renders the quinteffence portable; fo that the quantity, *e. gr.* of a pin's point, fhall be an efficacious medicine.

QUINTESSENCE, in *Alchemy*, is a myfterious term, fignifying the fifth, or laft and higheft effence, or power, of a natural body.

This is fuppofed to be, as it were, the foul drawn from the grofs body and its four elements, by a moft perfect diftillation; and, by means of which, the thing is faid to be fpiritualized, *i. e.* rendered exceedingly pure, fpirituous, and, as it were, incorruptible.

The ancients, who allowed nothing to be real but what has a body, would have the foul of man to be a fifth element, a kind of quinteffence without a name, unknown here below, indivifible, immoveable, all celeftial, and divine. Fenelon.

QUINTESSENCE *of the Elements*, is the hermetical mercury.

QUINTESSENCE *of Wine*, a term ufed by Glauber to exprefs an effential oil of wine, which he directs to be made by a careful diftillation; and which he is very fond of, as having a power to meliorate, improve, and even to fpecificate the poorer wines into the nature of thofe from which it was obtained.

This is one of the fchemes of Glauber, generally efteemed an impracticable one, though very plaufible in theory: but though in general there is a difagreeable flavour in the quinteffence drawn after his method, which is different from the true flavour of the wine, and fpoils the liquor it is added to; yet, by proper care, there is a poffibility of fucceeding fo far as to render this extraneous flavour almoft imperceptible, and produce an oil that will mend poor wines extremely, and give a truly vinous flavour to fuch as are in themfelves taftelefs. But whatever may be done by this method, may alfo be done with much more certainty, and much lefs trouble, by the concentration of wines by freezing. This may be eafily practifed in the wine countries; and by this means Burgundy, Champaigne, and other the moft valuable wines, may be reduced into thick extracts and robs, by the means of which wines may be made in England; a very fmall quantity of thefe concentrated wines being fufficient to convert the whole of any of the poor taftelefs and infipid wines, which are of themfelves of little or no value, into the very wine from which the rob was made; and that in fuch perfection, that the niceft judge cannot find out the difference.

Thefe robs of wine, made and preferved upon the fpot, would alfo be of infinite ufe in the wine countries, as they might be kept to improve the wines of bad years. Stahl, De Concentr. Vin. Shaw's Chem. Eff.

QUINT-EXACT, in old *Law Books*, the laft call of the defendant fued to an outlawry. If he appear not to it, he is, by the judgment of the coroners, returned outlawed, if a feme, waived.

QUINTI, *Bay of*, in *Geography*, a bay and harbour in the N.E. part of lake Ontario, at the mouth of the Trent; formed by a large peninfula, confifting of the townfhips of Ameliafburg, Sophiafburg, and Maryfburg, extending eafterly from an ifthmus, where is a portage at the head, or W. end of the bay, to Point Pleafant, the eafternmoft extremity of the peninfula, oppofite to Amherft ifland. The river Trent difcharges itfelf into the head of the bay, weftward of the portage, and fupplies it with the waters of the Rice lake. Weftward of the portage in lake Ontario, is the harbour of Prefque Ifle de Quinté, now called Newcaftle. The fertility of the foil about the bay of Quinté is generally allowed. The land is rich and eafily wrought, and produces feveral crops without manure; 25 bufhels of wheat being often

often produced from an acre. The timber, like that of the other parts of the province, confifts of oak, elm, hiccory, maple, &c. The bay is narrow throughout, and about 50 miles long, through which diftance it is navigable for the fmall veffels that are ufed on the lakes. It abounds with wild fowl, and various kinds of fifh. The river Trent affords a falmon fifhery. In paffing from the head of the bay of Quinté into lake Ontario, you crofs a fhort portage, in front of the townfhip of Murray, being the ifthmus between it and the peninfula of Prince Edward. At the end of the portage, and before you enter lake Ontario, is a fmall but very beautiful lake, having very good land on its banks. To the northward of this portage it has been propofed to make a canal for connecting the waters of the bay with thofe of the lake. A little to the weftward of the portage and propofed canal, is the harbour of Newcaftle, a fituation well fuited for commerce and protection, and fheltered from all winds. A knoll on the peninfula affords a healthy feite for the town.

QUINTILE, Quintilis, in *Aftronomy*, an afpect of the planets, when they are feventy-two degrees diftant from one another, or a fifth part of the zodiac.

QUINTILIAN, Marcus Fabius, in *Biography*, a celebrated teacher of eloquence, was born about the year 42 of the Chriftian era, during the reign of the emperor Claudius. He is fuppofed to have defcended from a family originally Spanifh, but that his father, or grandfather, had fettled in Rome. The place of his birth is not known, but it feems certain that he was educated in that capital, where he ftudied rhetoric under Domitius Afer, a celebrated orator. He opened a fchool at Rome, and was the firft who obtained a falary from the ftate as a public teacher. After he had remained twenty years in this laborious employment, and obtained the applaufe of the moft illuftrious Romans, not merely as a preceptor, but as a pleader at the bar, Quintilian retired to enjoy the fruits of his labours and induftry. In his retirement he affiduoufly devoted his time to the ftudy of literature, and wrote a treatife on the "Caufes of the Corruption of Eloquence." Some time after, he wrote his "Inftitutiones Oratoriæ," the moft perfect and complete fyftem of oratory extant. It is, in truth, one of the moft valuable remains of antiquity. It was compofed for the ufe of his fon, whofe early death he had occafion to deplore, and is an inftitute for the education of an orator, whom he takes up from the cradle, and conducts through all the periods of inftruction to the exercife of his proper art. It accordingly contains many excellent precepts with refpect to education in general, efpecially the early parts of it, which are applicable in all times and countries, as being founded on the nature of the mind. The ftyle of Quintilian is faid, by critics, to exhibit tokens of the deterioration of the Latin tongue; but, on the other hand, it muft be obferved, that every deviation from the ufage of the Auguftan age has been too readily regarded as a depravation. Quintilian was appointed preceptor to the two young princes whom Domitian deftined for his fucceffors on the throne; but the celebrity which the rhetorician received from the favours and attention of the emperor, and from the fuccefs which his writings met with in the world, were embittered by the lofs of his wife, and of his two fons, one of whom he defcribes as a prodigy of early excellence. It is faid that Quintilian was poor in his retirement, and that his indigence was relieved by the liberality of his pupil, Pliny the younger. He is fuppofed to have died about the year 95. His "Inftitutiones" were difcovered in the year 1415, in an old tower of a monaftery at St. Gall, by Poggio Bracchiolini. The treatife on the "Caufes and Corruption of Eloquence" has not come down to us. The name of Quintilian is affixed to certain "Declamations," of which there are 19 of moderate length; but as the ftyle, method, and manner, are totally different from the rules laid down in the "Inftitutiones," no good judges attribute them to the name of Quintilian. Of the editions of Quintilian fome of the moft valuable are thofe of Gefner, 4to. Gotting. 1738; of Lug. Batavorum, 8vo. cum notis variorum, 1665; of Gibfon, 4to. Oxon. 1693; and that of Rollin, re-publifhed in London in 1792. There is an Englifh tranflation by Mr. Guthrie.

QUINTILIANS, Quintiliani, in *Ecclefiaftical Hiftory*, a fect of ancient heretics, the fame with the Pepuzians; thus called from their prophetefs Quintilia.

In this fect, the women were admitted to perform the facerdotal and epifcopal functions; grounding their practice on that paffage of St. Paul to the Galatians, where he fays, "That in Chrift there is no diftinction of males and females."

In their affemblies, it was ufual to fee the virgins enter in white robes, perfonating the propheteffes. The Quintilians bore fome refemblance to the modern Quakers.

QUINTILIS, in *Chronology*. See July.

QUINTIN, or Quint, in *Commerce*. See Quentin.

Quintin, in *Geography*, a town of France, in the department of the Northern Coafts, and chief place of a canton, in the diftrict of St. Brieuc; nine miles S.W. of St. Brieuc. The place contains 3976, and the canton 12,510 inhabitants, on a territory of 147½ kiliometres, in eight communes.

QUINTINIE, John de la, in *Biography*, famous for his fkill in horticulture, was born at Poictiers in 1626. He received a learned education, and was brought up to the profeffion of the law, in which he gained reputation as a pleader at the bar. A paffion for agricultural knowledge led him to ftudy, with great attention, all the authors, ancient and modern, upon that topic; and on a vifit to Italy as tutor to a youth, he made great additions to his knowledge from actual obfervation. On his return he devoted himfelf almoft entirely to experiments on the culture of trees and plants, and made many difcoveries which greatly improved the art of gardening. He was the firft perfon who laid down juft principles of the art of pruning fruit-trees. He alfo remarked that a transfplanted tree grew only by the new roots which it threw out, and that the old fibres were ufelefs, and ought to be cut off. It does not appear at what time he began to follow gardening as a profeffion, but he had certainly acquired a high degree of reputation in it when he was invited to England by Charles II. who offered him a confiderable penfion to engage him in his fervice. He twice vifited London, and a paper of his was publifhed in the Philofophical Tranfactions, on the culture of melons. He was made, by Lewis XIV., director-general of the gardens in all the royal palaces. In 1690 he publifhed "Inftructions pour les Jardins Fruitiers et Potagers," which obtained a high degree of popularity, was frequently reprinted, and was tranflated into feveral modern languages. The laft edition was entitled "Parfait Jardinier," in two vols. 4to. The author died at Paris in the year 1700.

QUINTO, in *Geography*, a town of Spain, in Arragon; 20 miles S.E. of Saragoffa.

QUINTUS Calaber, in *Biography*, a Greek poet, who wrote a fupplement to Homer's Iliad, in 14 books, in which a relation is given of the Trojan war from the death of Hector to the deftruction of Troy. He is fuppofed, from the ftyle of his work, to have lived in the fifth century, but nothing certain can be collected concerning his perfon and country. His poem was firft made known by cardinal

cardinal Beſſarion, who diſcovered it in St. Nicholas' church, near Otranto in Calabria; hence the author was named Quintus *Calaber*. It was publiſhed at Venice by Aldus, but there is no date attached to the title page.

Quintus Curtius. See Curtius.

Quintus *Femoris*, in *Anatomy*, a name given by Fallopius and many others to one of the muſcles of the thigh, now called the pſoas magnus.

Quintus *Oculorum*, a name given by Veſalius and ſome others to one of the muſcles of the eyes, more expreſſively called by others obliquus ſuperior oculi, and opiſex circumgyrationis oculi.

QUINVA, in *Botany*, a name by which ſome authors have called the amaranth, or cockſcomb.

QUINZANO, in *Geography*, a town of Italy; 18 miles S.W. of Breſcia.

QUINZIEME, Fr. in *Muſic*, the double octave, above or below any ſound (ſee Fifteenth); which is the name of a ſtop in our organs, equidiſtant from the diapaſon.

QUIOPELA, in *Zoology*. See Viverra *Mungo*.

QUIPOS, in *Literary Hiſtory*, a name given to knots on cords of different colours, in Peru, which imperfectly ſupplied the place of writing. This device was adopted, as it has been ſaid, for rendering calculation more expeditious and accurate. The various colours denoted different objects, and each knot expreſſed a diſtinct number. Thus an account was taken, and a kind of regiſter kept of the inhabitants in each province, or of the ſeveral productions collected there for public uſe. But as by theſe knots, however varied or combined, no moral or abſtract idea, no operation or quality of the mind could be repreſented, they contributed little towards preſerving the memory of ancient events and inſtitutions. The Mexican paintings and ſymbols, rude as they were, conveyed more knowledge of remote tranſactions than the Peruvians could derive from their boaſted quipos. If, indeed, the latter had been of more extenſive uſe, and better adapted to ſupply the place of written records, they periſhed ſo generally, together with other monuments of Peruvian ingenuity, in the wreck occaſioned by the Spaniſh conqueſt, and the civil wars ſubſequent to it, that no acceſſion of light or knowledge is derived from them. Robertſon's Hiſt. Amer., vol. iii.

QUIQUI, in *Zoology*, a ſpecies of *Muſtela*; which ſee.

QUIRAZAI, or Curapoa, in *Ornithology*. See Crax *Alector*.

QUIRE *of Paper*, of the French *cahier*, the quantity of twenty-four or twenty-five ſheets.

QUIRICIA, a name given by ſome to the ſtone called *quiris* by the generality of writers.

QUIRICU, in *Geography*, a town of France, in the department of the Iſere; 12 miles E. of Ballay.

QUIRINACIUM Opium, in the *Materia Medica*, a name given by ſome to the gum we know by the name of aſſa fœtida.

QUIRINALIA, in *Antiquity*, feaſts celebrated, among the Romans, in honour of Romulus, who was called Quirinus. See Quirites.

The Quirinalia, called alſo *ſtultorum feriæ*, were held on the 13th of the calends of March, *i. e.* on our 17th of February.

QUIRINI, Angiolo-Maria, in *Biography*, a learned cardinal, by deſcent a Venetian, was born in the year 1680. While young he entered into the order of the Benedictines of Monte Caſſino. At Florence he purſued a very extenſive courſe of ſtudy under ſeveral of the moſt eminent men in ſcience and literature of that age. Upon his entering a profeſſorſhip in his convent, he delivered an oration "De Moſlicæ Hiſtoriæ Preſtantia," which was printed. His ſtudies were interrupted ſome time, by an imagination that he was afflicted with a ſtone in his bladder; but the death of his phyſician, who fell a victim to a falſe impreſſion reſpecting his own caſe, freed him from his fancied complaint, and in the year 1710 he ſet out upon his literary travels. He viſited Germany, Holland, England, and France, making in the latter country an abode of more than two years, during the greateſt part of which time he reſided in the Benedictine abbey of St. Germain des Pres. In the courſe of his travels he formed an acquaintance with almoſt all the literary characters in thoſe countries, and viſited every object of learned curioſity, at the ſame time every where exciting a general eſteem of his talents, his induſtry, and his conduct. Upon his return to Italy he publiſhed a Diſſertation containing a Plan for a Hiſtory of Italy;—an Eſſay on the Hiſtory of Farfa, in the Duchy of Spoleto;—and an edition of the Office for Divine Service according to the Uſage of the ancient Greek Church. He was ſoon after created biſhop of Corfu, by pope Innocent XIII., a dignity which he filled in ſuch a manner as to inſpire the Greek ſeparatiſts with veneration for his perſon. His reſidence in Corfu was the cauſe of his compoſing a learned work, entitled "Primordia Corcyræ ex antiquiſſimis Monumentis illuſtrata," 4to. 1725. In the year 1727, Benedict XIII. raiſed Quirini to the cardinalate, after having nominated him to the biſhopric of Breſcia. His promotion to that ſee was followed by ſome publications relative to the literature of Breſcia. His attachment to the ſee of Rome was diſplayed by a life of pope Paul II. printed in 1740, the object of which was to defend the memory of that pontiff againſt the attacks of Platina. Soon after this he was appointed librarian to the Vatican; in this and other poſts he continued to ſerve the cauſe of literature. It was through his means that a new edition of the works of St. Ephrem was given in 6 vols. fol. in the Greek, Syriac, and Latin languages. He likewiſe edited the letters of cardinal Pole, written againſt the principles of the reformers. This prelate died, greatly regretted, at his epiſcopal reſidence, in 1755, at the age of 75. Though a vigorous champion of the papacy, he wrote with a ſpirit of candour and moderation, which obtained the applauſe of the Proteſtants themſelves. He was aſſociated to ſeveral literary ſocieties, among which were the academies of Peterſburg, Berlin, and Vienna, and the Inſtitute of Bologna. He enjoyed a large revenue, which he expended with munificence, on objects of charity and public ſplendour. At Rome he beautified the church of St. Mark, whence he derived his cardinal's title, and he contributed liberally to the fine Catholic church at Berlin. He laid the foundation, by a valuable gift of books, of a public library at Breſcia. His own ſelect and valuable library he preſented to the Vatican. His charities were numerous and extenſive, and he was indefatigable in performing his paſtoral duties, viſiting the alpine parts of his dioceſe in the moſt inclement ſeaſons. Beſides the works already mentioned, he publiſhed an account of his own life, and a narrative of his travels.

QUIRIQUING, in *Geography*, an iſland on the coaſt of Chili, near the entrance into the bay of Conception. S. lat. 36° 35′.

QUIRIS, *Quirinus lapis*, a name given, by the writers of the middle ages, to a ſtone famous among them for its imaginary virtues, but of which they have left us no deſcription.

QUIRISTER, Chorister, or *Choriſta*, a perſon appointed

pointed to fing in the quire, or choir, of a cathedral. See Anthem, Chantor, and Choir.

QUIRITES, in *Antiquity*, an appellation given to the people of Rome, chiefly the common citizens, as diftinguifhed from the foldiery.

It took its rife from the Curetes, the inhabitants of the Sabine town Cures. On this occafion Romulus, and Tatius king of the Sabines, having united their two people, and their two ftates, into one; upon Romulus's death and deification, the Sabines, outdoing the Romans in number, became mafters of the councils; and accordingly appointed, that Romulus fhould be denominated Quirinus, from Cures, a city of the Sabines; or rather from Quirinus, the name of a god worfhipped in that city.

From the new Quirinus, all the people came afterwards to be called Quirites; unlefs we will fuppofe, that the fame authority which denominated Romulus Quirinus, from Cures, did alfo denominate the people Quirites, immediately from the Curetes.

Some authors derive the word Quirinus from Curis; which, in the Sabine tongue, fignified a pike, or halbert. Struvius adds, that Romulus was always painted with a pike in his hand.

Julius Cæfar, as Tacitus informs us, (Annal. i. 43.) appeafed a fedition by the ufe of this word *Quirites*, which oppofed to *foldiers*, expreffed contempt, and reduced the offenders to the lefs honourable condition of mere citizens. The emperor Alexander alfo applied it to the fame purpofe. See his biographical article.

QUIRK, in *Building*, a piece of ground taken out of any regular ground-plat, or floor.

Thus, if the ground-plat were fquare, or oblong, and a piece be taken out of a corner, to make a court, or yard, &c. the piece is called a quirk.

QUIROGA, in *Geography*, a town of Spain, in Galicia; 24 miles N.E. of Orenfe.

QUIROS, Cape, lies on the E. coaft of the ifland of Efpiritu Santo, in the South Pacific ocean. S. lat. 14° 56′ 8″. E. long. 167° 20′.

QUIRPELE, in *Zoology*, the name of a fmall animal, called by fome authors the *Indian ferret*, or *viverra Indica*, and by others *quil*. See Viverra *Mungo*.

Garcias and fome authors give very remarkable accounts of the enmity this creature has to ferpents of all kinds. They tell us, that when this little creature intends an attack upon one of thefe animals, it firft prepares againft danger, by gnawing a quantity of the root of the lignum colubrinum, or fnake wood; and when it has thoroughly impregnated its faliva, it wets with it firft its fore-feet, and with them daubs over its head and its whole body; and that thus prepared, it boldly attacks the fnake, and never leaves off till it has killed it. Garcias affures us, that many of the Portuguefe have been eye-witneffes of thefe combats.

It is probable enough, that this creature may attack a fnake when thoroughly hungry, knowing its flefh to be good food; but the ftory of the antidote is to be fufpected. See Ichneumon.

QUIRPEN, in *Geography*, an ifland in the North Atlantic ocean, near the N. coaft of Newfoundland. N. lat. 51° 40′. E. long. 52° 22′.

QUIRSWYCK, a town of Norway; 60 miles N.N.E. of Romfdal.

QUIS, in *Natural Hiftory*, a kind of marcafite of iron or copper, from which vitriol is drawn. It is more frequently called pyrites.

QUISBRO, in *Geography*, a town of Sweden, in Nericia; 12 miles S.W. of Orebro.

QUISCALA, in *Ornithology*, a fpecies of *Gracula*; which fee.

QUISIBI, in *Geography*, a town of Arabia, in the province of Oman; 180 miles W. of Julfar.

QUISIL Auren, a town of Afiatic Turkey, in Caramania; 15 miles W. of Cogni.

QUISONGALA Islands, a clufter of fmall iflands in the Indian fea, near the coaft of Africa. S. lat. 10° 40′.

QUISPICHANCHI, a jurifdiction in the diocefe of Cufco in Peru, beginning at the fouth gates of Quito, and ftretching from E. to W. about 20 leagues. The lands of this jurifdiction belong, in general, to the richer inhabitants of Cufco, and produce plenty of wheat, maize, and fruits. Here are alfo manufactures of baize and coarfe woollen ftuffs. Part of the jurifdiction borders on the forefts inhabited by wild Indians, and produces great quantities of coca, or cacoa, an herb greatly ufed by the Indians working in the mines, and forming one of the principal branches of its commerce; the town lies 12 miles S. of Cufco.

QUISQUALIS, in *Botany*, a name combined by Rumphius of *quis*, who, and *qualis*, what kind or manner, by which he intended to exprefs the fingular variablenefs of the plant, as if nothing could be found like it.—Linn. Gen. 215. Schreb. 292. Willd. Sp. Pl. v. 2. 579. Mart. Mill. Dict. v. 4. Juff. 78. Lamarck Illuftr. t. 357. —Clafs and order, *Decandria Monogynia*. Nat. Ord. *Veprecula*, Linn. *Thymelææ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, tubular, thread-fhaped, very long, deciduous, its border in five fpreading fegments. *Cor.* Petals five, inferted into the mouth of the tube, feffile, oblong, obtufe, fpreading, much larger than the fegments of the calyx. *Stam.* Filaments ten, briftle-fhaped, inferted into the tube of the calyx, five of them below the reft; anthers oblong, in or above the mouth of the tube. *Pift.* Germen fuperior, ovate; ftyle thread-fhaped, longer than the ftamens; ftigma obtufe, dilated. *Peric.* Drupa dry, with five unequal angles. *Seed.* Nut elliptic-oblong, pentagonal.

Eff. Ch. Calyx with a thread-fhaped tube; five-cleft. Petals five. Drupa fuperior, with five angles.

1. Q. *indica*. Linn. Sp. Pl. 556. (Quifqualis; Rumph. Amb. v. 5. 71. t. 38. Q. pubefcens; Burm. Ind. 104. t. 35. f. 2, and Q. glabra; t. 28. f. 2.)—Native of Java, and the Molucca ifles; naturalized by Rumphius in Amboyna. The *ftem* is fhrubby, at firft low and ftumpy, but fubfequently throwing out long trailing or twining fhoots, which become as thick as a man's arm. To this diverfity of habit, and the changeable hue of the *flowers*, the name alludes. The young *branches* are clothed with fine foft down. *Leaves* oppofite, occafionally fcattered, on fhortifh downy ftalks, ovate, pointed, entire, two or three inches long; their ultimate veins finely reticulated; both furfaces more or lefs downy, rarely fmooth. *Flowers* in axillary or terminal bracteated fpikes. *Bracteas* ovate, downy. *Corolla* two inches long, downy, whitifh in the morning, turning pale red in the afternoon, rofe-coloured in the evening, and the next morning of a blood red. *Fruit* as big as one joint of the finger. *Nut* eatable when quite ripe, having the flavour of a filbert. When unripe, Rumphius compares its tafte to that of a radifh. Thefe *nuts* are a popular remedy, among the Malays, for worms in children. Two or three of the pungent unripe ones, or five of thofe that are arrived at maturity, are a dofe. Some perfons are attacked with a dangerous hiccup from eating two or three of the nuts in queftion, whilft others find no fuch effect from a confiderable number. The integuments are carefully removed. They probably partake of the

poifonous

poisonous qualities of the Mezereon tribe; though in a mild degree, as Rumphius speaks of the flavour of several parts of the plant, without mention of any very hurtful properties. Even the kernels of our European *Daphnes* are highly acrimonious.

QUISQUISANA, in *Geography*, a town of Peru, in the diocese of Cusco; 32 miles S.S.E. of Cusco.

QUISSAC, a town of France, in the department of the Gard, and chief place of a canton, in the district of Le Vigan, having a mineral spring; 20 miles N. of Montpelier. The place contains 1310, and the canton 3884 inhabitants, on a territory of 160 kiliometres, in 12 communes.

QUISTELLO, a town of Italy, in the department of the Mincio; 15 miles S.S.E. of Mantua.

QUISTORP, John, in *Biography*, a German Lutheran divine and professor, was born at Rostock in the year 1584. He pursued his academical studies at his native city, at Berlin, and at Franckfort on the Oder; and afterwards travelled through Holland, Brabant, and Flanders, in the capacity of governor to the son of a patrician of Lubec. In 1614, his learning and abilities pointed him out as a fit person to fill the divinity chair at Rostock; but before he entered upon the duties of his office, he was created doctor of divinity. He obtained other preferments in the church, particularly the archdeaconry of St. Mary's at Rostock. In 1645 he was appointed pastor of the same church, and superintendant of the churches in the district of that city. He had the felicity of rendering important services to the celebrated Hugo Grotius, during his last fatal illness at Rostock. Upon the death of that great man, he wrote a Latin letter to Calovius, containing an account of his sickness and last sentiments, which is inserted in the "Bibliotheque Choisie" of Colomies; and in the "Vindiciæ Grotianæ," under the title of "Grotii Manes." Quistorp died in 1648, at the age of 64. He was the author of "Annotationes in omnes Libros Biblicos," "Commentarius in Epistolas Sancti Pauli," and several other works. He left a son of the same name, who was born at Rostock in 1624, and died in 1669. He became pastor, professor of divinity, and rector of the university in that city.

QUISTRUM, in *Geography*, a town of Sweden, in the province of West Gothland; 9 miles N.W. of Uddevalla.

QUITANGONE, a river of Africa, which runs into the Indian sea, 15 miles N. of Mozambique, S. lat. 14° 40′.

QUITAPABILLA, a river of America, being a branch of the Swetara, which falls into the Susquehannah at Middleton.

QUITAPORA, a town of the state of Georgia. N. lat. 33° 27′. W. long. 89° 58′.

QUITCH, in *Agriculture*, a name frequently applied, in many districts, to a very troublesome set of plants of the weed kind; for though it properly belongs to the couch-grass plant only, it is much used to signify others of the creeping perennial rooted sort, as the bent, creeping, soft, and tall oat-grass, as well as some others, which are only capable of being destroyed by repeated summer ploughings, or forking them out and burning them on the ground. See Couch.

Quitch-*Grass*, the common name given in some places to a very troublesome sort of weed, found in many districts, and which requires great exertion to eradicate it out of the land. See Couch.

Quitch-*Drag*, that sort of useful tool of the drag-kind, which is employed in the dragging out and removing this sort of weed from ploughed lands. It is made in several different methods, according to circumstances; but has mostly something of the long triangular form in the beam part, into which the teeth or tines are fixed. These are seldom made so large in this as in the heavy sorts of drags; but they are mostly a little hooked, or bent forward, towards the points or lower ends. The frame-part is sometimes set with two rows of tines, or more.

It is a sort of tool which is frequently made use of for rendering arable ground perfectly clear of root weeds, being had recourse to before the last ploughings. Where the land has been cross-ploughed, this kind of drag may be employed with great advantage in bringing it into proper order. It has some other names in different counties. See Couch-*Drag*, and Drag.

Quitch-*Rake*, a name given in many districts to the rake employed in collecting the weed called couch, from the surface of ploughed ground, as well as some other sorts in particular cases. The head of this tool, into which the teeth or tines are fastened, is usually about five feet in length; the tines are made in a round form, having a projection of about eighteen inches below the head, each being gradually turned or crooked forward about two inches; the distance from each other also about two inches. There is commonly a small beam made to fasten in the middle with two pieces of wood, which come from each corner of the rake-head, into which the tines are fastened by means of a pin that goes through the beam, and keeps the rake steady. In working, this implement may be put on the carriage-part of a two-wheeled plough, to be drawn by one horse; a man going behind to occasionally lift up the rake when full, in order to leave the couch and other weeds in rows, for the purpose of burning them. In this manner, a great deal of weeds and trumpery may be collected together in the course of a day. See Couch-*grass Rake*.

QUIT-CLAIM, a release, or quitting one's claim or pretensions to a thing.

QUITERVA, in *Geography*. See Sofala.

QUITEVA, or Kitea, a town of Africa, in the country of Darah, defended by a castle; 75 miles S.E. of Morocco. N. lat. 28° 6′. W. long. 5° 26′.

QUITO, an extensive province of South America, which was subjected to the Peruvian empire, by Huana Capac, about the year 1526, at the time when the Spaniards first visited the coast of Peru. Huana prevailed on his legitimate and eldest son Huascar to allow one of his natural children, Atahualpa, by the daughter of the last king of Quito, to hold this kingdom as a fief of the empire. Atahualpa, however, rebelled, seized the empire, imprisoned his brother, and soon after put him to a violent death. His prosperity was of short duration; for in the year 1533 he suffered the same fate, by order of Don Francisco Pizarro, who had deputed Sebastian de Benalcazar to conquer the kingdom of Quito. Having by a series of victories made himself master of the kingdom, he proceeded in the year 1534 to rebuild the capital, which had suffered much from internal commotions, and called it "San Francisco de Quito," a name which it still retains, though it was not till seven years after this date that it obtained the title of city. The province, which the Spaniards found annexed to the kingdom of Peru, continued in that state till the year 1718, when it was dismembered from Peru, and attached to the viceroyalty of New Granada. At the same time the audience of Quito was suppressed, together with that of Panama, in the kingdom of Terra Firma: though the latter continued dependent on the viceroys of Lima. See *New* Granada and Peru.

This province is bounded on the north by that of Santa Fé de Bogota, and includes part of the government of Popayan; on the south it is limited by the governments of

Peru and Chachapoyas; towards the eaft it extends over the whole government of Maynas, and the river of the Amazons, to the meridian of demarcation, or that which divides the dominions of Spain and Portugal. Its boundary on the weft is the fea, from the coaft of Machala, in the gulf of Puna, to the coaft of the government of Atacames, and the jurifdiction of Barbacoas, in the bay of Gorgona. Its greateft breadth from north to fouth is about 200 leagues; and its length from eaft to weft, the whole extent from Cape de Santa Elena, in the South fea, to the above-mentioned meridian, which, by the moft accurate computation, is 600 leagues. All the parts, however, that can properly be faid to be peopled, and actually fubject to the Spanifh government, are thofe intercepted by the two Cordilleras of the Andes, which, compared with the whole extent of the country, may be termed a ftreet or lane, extending from the jurifdiction of the town of St. Miguel de Ibarra to that of Loja; the country from hence to the government of Popayan, and alfo that comprehended between the weftern Cordillera and the fea. With this limitation, the extent of the jurifdiction from eaft to weft will be 15 leagues, or fomewhat more, being the diftance intercepted between the two Cordilleras. But to this muft be added the countries comprehended in the governments of Jaen de Bracamaros, which borders on the jurifdiction of Loja, and the extremity of the whole province, and fituated on the eaft fide of the eaftern Cordillera; and to the northward, the government of Quixos, and that of Maynas to the eaftward of it, but feparated by large tracts of land inhabited by wild Indians; and on the north fide of the province from that of Popayan; though the latter is properly a diftinct province from that of Quito. Thus on the weft fide of that interval between the two Cordilleras lies the government of Atacames, and the jurifdiction of Guayaquil; on the eaft fide, the three governments above mentioned; and on the north, that of Popayan.

This province, exclufive of thefe five governments, confifts of nine jurifdictions, called in that country provinces, that of Quito being fubdivided into as many others as there are governments and jurifdictions. Thofe in the province of Quito, beginning with the moft northern, are the following, *viz.* the town of San Miguel de Ibarra, the village of Otabalo, the city of Quito, the affiento of Latacunga, the town of Riobamba, the affiento of Chimbo, or Gaaranda, the city of Guayaquil, the city of Cuença, and the city of Loja.

The jurifdiction of Quito, the third of thofe above enumerated, confifts of 25 parifhes, befides thofe in the city, and extends more than five leagues, comprehending lands covered with plantations, producing a variety of plants and fruits, according to the quality, fituation, and expofure of the ground. Thofe in the temperate parts yield plentiful harvefts of maize; and thofe at the bottoms of deep cavities, being in a hot temperature, are planted with fugar-canes, from which are extracted great quantities of fugar and rum. The plantations near the fummits of the mountains, having a variety of temperatures, produce wheat, barley, potherbs of all kinds, and potatoes. Above thefe plantations are fed numerous flocks of fheep, producing that wool which affords employment to a great multitude of people. Some farmers breed cows, with the view to the advantage derived from their milk in making cheefe and butter. In other farm-houfes, various occupations are obferved, fuch as breeding of cattle, agriculture, and manufactures, particularly of cloth, bays, and ferges. The degree of cold and heat in this jurifdiction is fubject to fudden variations, according to the fituation of different places; but in the fame place viciffitudes feldom occur. The villages in this jurifdiction are conftructed with little regularity. They confift principally of a church and parfonage, called the convent, the priefts being formerly all religious; the other parts prefent a number of huts with mud-walls, fcattered all over the country, where every one has his appropriate piece of ground, which he tills for his fubfiftence. A great part, and in fome villages the whole, of the inhabitants are Indians, who live there when out of place; though in fome parts the inhabitants are Meftizos, and here and there a Spanifh family; but thefe are extremely poor. Ulloa's Voyage, vol. i.

QUITO, the capital of the above defcribed province, rebuilt in the year 1534, (fee the preceding article,) and fituated in the inland parts of the continent of South America, on the eaftern fkirts of the Weft Cordillera of the Andes; diftant from the coaft of the South fea about thirty-five leagues to the weft. On the N.W. is the mountain and defert of *Pichinca* (which fee), on the acclivity of which the city is built, and alfo among the breaches that are formed by the eminences of this mountain; fo that many of the buildings ftand upon arches, and the ftreets are of courfe very irregular and uneven. With regard to magnitude, this city may be compared to one of the fecond order in Europe; but the unevennefs of its fituation is a great difadvantage to its appearance. Near the city are two fpacious plains, one on the S., called Turu-bamba, three leagues in length; and the other on the N., termed Inna-Quito, about two leagues in extent; both of which are interfperfed with feats and cultivated lands, which much contribute to the variety and beauty of the fcenery. Thefe plains contract as they approach the city, and at their junction form a neck of land, covered with thofe eminences on which part of Quito ftands. The principal fquare in Quito has four fides, in one of which ftands the cathedral, and in the oppofite the epifcopal palace; the third fide is taken up by the town-houfe, and the fourth by the palace of the audience: this fquare is very fpacious, and has in its centre an elegant fountain. The four ftreets terminating at the angles of the fquare are ftraight, broad, and handfome; but at the diftance of three or four *quadras*, (each quadra being about one hundred yards,) the troublefome declivities commence; and on this account the inhabitants cannot enjoy the benefit of coaches, or wheel carriages. The principal ftreets are paved; and thofe which are not paved are almoft impaffable after rain, which is here very common. Befides the principal fquare, there are two others, that are very fpacious, and feveral that are fmaller. In thefe moft of the convents are fituated, and thefe make a handfome appearance, and fome of them, particularly that of the order of Francifcans, are elegant ftructures. The principal houfes are large, and fome of them have fpacious and well-contrived apartments, though none are above one ftory in height, but their doors and windows are low and narrow. The materials made ufe of in building at Quito are "adobes," or unburnt bricks and clay, cemented by a fubftance called "fangagua," a fpecies of mortar that is uncommonly hard, ufed by the ancient Indians for building all kinds of houfes and walls. The city is divided into feven parifhes; the cathedral is richly adorned with tapeftry hangings and other coftly decorations; but the parifh churches are of mean appearance. The convents of monks are thofe of the Auguftines, Dominicans, and Fathers of Mercy, &c. colleges, &c. Quito has alfo feveral nunneries. The college of Jefuits, as well as all the convents of monks, are large, well built, and very fplendid. Here is alfo an hofpital, with feparate wards for men and women, under the name of the order of our Lady of of Bethlehem. Among the courts whofe feffions are held at Quito, the principal is that of the Royal Audience, eftablifhed there in 1563; the exchequer or chamber of finances, a treafury for the effects of perfons deceafed, &c. The corporation confifts of a corregidor, two ordinary alcaldes chofen annually, and regidores. The cathedral chapter confifts of the bifhop, dean, archdeacon, chanter, treafurer, a doctoral, a penitentiary, a magiftral, three canons by prefentation, four prebends, and two demi-prebends, with the following falaries; that of the bifhop 24,000 dollars, the dean 2500, the four fucceeding dignities 2000 each, the canons 1500 each, the prebends 600, and the demi-prebends 420. This church was created into a cathedral in 1545, and among other feftivals celebrated in it, the moft magnificent are thofe of Corpus Chrifti, and the Conception of our Lady, when all the courts, offices, and perfons of eminence affift. In the former there is a fingular pomp of the proceffion of the hoft, and here are alfo dances of a peculiar nature, which were performed before their converfion to Chriftianity. The corporation and cathedral chapter keep, by vow, two annual feftivals in honour of two images of the Virgin, which are placed in the villages of Guapulo and Quincha, belonging to this jurifdiction. Thefe images or ftatues are brought with great folemnity to Quito, and each feftival is fucceeded by nine days' devotion, the audience and other courts affifting on the occafion. Thefe feftivals are held in commemoration of the affiftance vouchfafed by the holy Virgin, at the time of an earthquake and terrible ejection from Pichincha, by which Latacunga, Hambato, and a great part of Riobamba, were utterly deftroyed; whereas by the fuppofed interpofition of the Virgin, the city efcaped even the flighteft damage.

The celebrated city of Quito is faid by Alcedo to contain 58,000 perfons, fome of whom are diftinguifhed by their rank. Thefe are the defcendants either of the original conquerors, or of other perfons who in fucceeding times came over from Spain invefted with fome lucrative office, and who have preferved the luftre, both of their defcent and wealth, by intermarriages, without mixing with meaner families though famous for their riches. The lower orders of people confift of four claffes, Spaniards or whites, Meftizos, Indians or natives, and Negroes, with their progeny. The former, according to the ftatement of Ulloa, compofe about a fixth part of the population; the Meftizos, or defcendants of Spaniards and Indians, amount to about a third part; the Indians form about another third; and the others, who are about one-fixth, are the Cafts. The Spaniards are prevented by their pride from applying to any kind of bufinefs, and therefore many of them are poor and wretched. The Meftizos occupy themfelves in arts and trades, but principally in thofe of the higheft repute, fuch as painting and fculpture, in which they excel. Thefe men of talents, however, are indolent and flothful, fo that they loiter about the ftreets during the whole day. The Indians, who are generally fhoemakers, bricklayers, weavers, or engaged in fimilar occupation, are not more induftrious. Perfons of fortune among the Spaniards affect great magnificence in their drefs, wearing the fineft gold and filver tiffues; but that of the middling and lower clafs is a black cloak, and under it a long coat, reaching down to their knees, with a clofe fleeve, open at the fides, without folds, and ornamented with rows of buttons. The Meftizos generally wear blue cloth, manufactured in this country. The drefs of the Indians confifts only of white cotton drawers, made either from the ftuffs of the country, or from others brought from Europe, reaching down to the calf of the leg, and edged with lace fuitable to the ftuff. The ufe of a fhirt is fupplied by a black cotton frock, wove by the natives; and over this is a kind of ferge cloak, through which the head paffes, and a hat made by the natives. The men, both Creoles and Spaniards, are well made, of a proper ftature, and of a lively agreeable countenance. The Meftizos in general are alfo well made, often taller than the ordinary fize, very robuft, and have an agreeable air. The Indians, both men and women, are generally low, but well proportioned and very ftrong. The Indians have no beard, nor have either males or females any indications of the age of puberty. The youths of family are inftructed in philofophy and divinity, and fome, with reluctance, proceed to the ftudy of the civil law. The country is obferved to abound more in women than men; and it is obferved, that nature begins to decay at the age of thirty in the male fex, efpecially among thofe who have been tenderly brought up; whereas the females enjoy a more confirmed ftate of health and vigour. This difference is afcribed partly to the climate and partly to the food, but principally to early intemperance and voluptuoufnefs, and alfo the want of proper employments. The liquors that are ufed here are rum and brandy, in which they freely indulge, and alfo the infufion of the Paraguay herb, which ferves for tea. The vices prevalent here are idlenefs, drunkennefs, and gaming. The common people and Indians are much addicted to theft, in which they are very artful and dextrous. In Quito, and in all the towns and villages of its province different dialects are fpoken, Spanifh being no lefs common than the Inga.

Quito is fo happily fituated, that neither the heat nor cold is troublefome; though the extremes of both may be felt in its neighbourhood. An equality of temperature takes place throughout the whole year, the difference between the feafons being fcarcely perceptible. The winds are falubrious, and blow continually, but never with any violence. The rain occafionally defcends in impetuous torrents. Earthquakes are not uncommon, and when they occur very violent; that of 1775 was very deftructive. The great earthquake on the 4th of February 1797, which changed the face of the whole province, and in one inftant deftroyed thirty-five or forty thoufand perfons, has fo altered the temperature of the air, that the thermometer is now commonly 41° to 54°, and feldom rifes to 68° or 70°; whereas Bouguer obferved it conftantly at 66° or 68°. Since this cataftrophe earthquakes are continually recurring; and fuch fhocks, it is probable, that all the higher ground is one vaft volcano. Von Humboldt adds, that what are called the mountains of Cotopaxi and Pichincha are but little fummits, the craters of which form different conduits terminating in the fame cavity. The earthquake of 1797 afforded a melancholy proof of this; for the ground then opened every where, and vomited forth fulphur, water, &c. Notwithftanding the dangers and horrors that furround them, the people of Quito are gay, lively, and variable, and very much addicted to pleafure, luxury, and amufement. Humboldt informs us, that the volcanos of Quito eject pumice, bafalt, and porphyry fcorified; with enormous quantities of water and liquid clay, which diffufe fertility eight or ten leagues round. The fertility of this country is fuch, that, as we are informed, a full defcription of it would appear incredible. The equability of the climate, as well as the fertility of the foil, occafion a regular fucceffion of the productions of the earth: when the fruits have obtained their maturity, and the leaves begin to change their colour, frefh leaves, bloffoms, and fruits, are feen in their proper gradations on the fame tree. The fame inceffant fertility is confpicuous in the corn, reaping and fowing being both carried on at the fame time. This remarkable fecundity of the foil is naturally productive of excellent

excellent fruits and corn of every kind, as is evident from the delicacy of the beef, veal, mutton, pork, and poultry of Quito. One of the principal foods ufed by the inhabitants is cheefe, of which it is computed that the quantity annually confumed amounts to between feventy and eighty thoufand dollars of the money of that country. The vicinity alfo affords excellent butter. The manufactures of this province are cottons, fome white, called tucuyos, and others ftriped bays and cloths, which meet with a good market at Lima, for fupplying all the inward provinces of Peru; and the returns are made partly in filver, and partly in gold and filver fringes made in that city, wine, brandy, oil, copper, tin, lead, and quickfilver. The products of the earth are chiefly confumed within the province; except the wheat, part of which is fent to Guayaquil. But this trade is carried on by Meftizos and poor people. Goods, manufactured by the public, or woven by private Indians, are fent, together with fome kinds of provifions, to the jurifdiction of Barbacoas. Thefe provifions are exchanged for gold, found in that country, and which is afterwards fent to Lima, and difpofed of at a greater price. Their ftuffs find a vent in the governments of Popayan and Santa Fé. The coaft of New Spain fupplies this province with indigo, of which a great quantity is confumed; blue being univerfally the colour which thefe people affect in their apparel. They alfo import, by way of Guayaquil, iron and fteel, both from Europe and the coaft of Guatemala. S. lat. 0° 13′ 27″. W. long. 78° 10′ 15″. Ulloa's Voyage, vol. i.

QUIT-RENT, q. d. *quiet rent*, a certain fmall rent, payable yearly, by the tenants of moft manors, in token of fubjection; upon the payment of which, they are quiet, and free. It includes both rents of affife and chief rents.

Thefe rents differ very greatly in different manors, being in fome a mere trifle, while in others they are very heavy and oppreffive to the tenants. This part of the feudal fyftem is now confiderably on the decline.

In fome ancient records it is written white rent, becaufe paid in filver, to diftinguifh it from rent-corn, rent-pepper, &c.

QUITTA, in *Geography*, a town of Africa, on the Slave coaft. N. lat. 6°. E. long. 0° 8′.

QUITTANCE. See ACQUITTANCE.

QUITTER, or QUITTOR, in horfes, is an ulcer formed between the hair and hoof, ufually on the infide quarter of a horfe's foot; it often arifes from treads and bruifes, fometimes from gravel, which by working its way upwards, lodges about the coronet; if it is only fuperficial, it may be cured with cleanfing dreffings, bathing the coronet every day with fpirits of wine, and dreffing the fore with lime-water, or a detergent application, fuch as red precipitate. But where the matter forms itfelf a lodgment under the hoof, there is then no way to come at the ulcer but by taking off part of the hoof; and if this be done well, the cure may be effected without danger.

When the matter happens to be lodged near the quarter, the farrier is fometimes obliged to take off the quarter of the hoof, and the cure is then for the moft part but palliative; for when the quarter grows up, it leaves a pretty large feam, which weakens the foot; this is what is called a falfe quarter, and a horfe with this defect feldom gets quite found.

If the matter, by its confinement, has injured or deftroyed the coffin-bone, which is of fo foft and fpongy a nature that it foon becomes carious, it will be neceffary to enlarge the opening, cut away the fpongy flefh, and apply the actual cautery, or hot iron, pointed pyramidically, dreffing the bone with doffils of lint dipped in tincture of myrrh, and the wound with the green or precipitate ointment. When the fore is not enlarged by the knife, which is the beft and leaft painful method, fublimate is generally applied; or blue vitriol powdered, and embued with a few drops of oil, is alfo ufed for this purpofe, and is faid to act as effectually, and with lefs pain to the animal.

In the time of the action of thefe cauftic remedies, the foot fhould be kept in a poultice. And where finufes form they fhould be laid open by a knife, and be afterwards ftimulated by the application of fome detergent remedy. The following has been advifed by a late writer: Take of corrofive fublimate, red precipitate in fine powder, of each equal parts; honey fufficient to form a pafte.

The wound is advifed to be afterwards dreffed with common digeftive ointment, preffure being given by means of a bandage. It is fometimes written quittor.

QUITTER-*Bone*, another term applied to the fame difeafe by farriers and perfons engaged in hufbandry.

QUITY, in *Botany*, a Brafilian name ufed by fome authors for the fapindus, or foap-berry tree of the Weft Indies.

QUIVER, feemingly corrupted from the Fr. *couvrir*, to cover, a cafe or fheath for arrows.

QUIVISA, in *Geography*, a town of Hindooftan, in Bahar; 25 miles S.W. of Bettyah.

QUIVISIA, in *Botany*, from the vulgar name of this tree or fhrub in the ifles of Bourbon and the Mauritius, *bois de quivi*. Juff. Gen. 264. Cavan. Diff. 367. (See GILLIBERTIA.) One cannot but wonder how a writer of Juffieu's learning could, for a moment, tolerate fo faulty a name; efpecially as his authority leads heedlefs perfons into the adoption of fuch, for want of reading his preface; where, in a note to p. 24, he declares thefe rude and barbarous names to be merely borrowed for a time, till the genera to which they belong are better determined.

QUIXOS, in *Geography*, a jurifdiction of South America, attached to the province of Quito, on the eaft fide of the Cordillera of the Andes. Quixos on the north fide borders on the jurifdiction of Popayan; reaching eaftward to the river Aguarico, and towards the weft feparated from the jurifdictions of Quito, Latacunga, and the town of San Miguel de Ibarra, by the Cordilleras of Cotopaxi and Cayamburo. This country was firft difcovered, in 1536, by Gonzalo de Pineda, one of the officers fent from Popayan by Sebaftian de Belalcazar (or Benalcazar), to trace the courfe of the river Magdalena; and in confequence of his report, Gonzalo Pizarro, in 1539, reconnoitred its whole extent, and eftablifhed fettlements in it. But upon the failure of his expedition, the conqueft of this country was fufpended till the year 1549, when the marquis de Canete, viceroy of Peru, gave a commiffion to Gil Remirez Davalos, a man of undaunted courage, for reducing the Indians, and making fettlements in the country. This object he accomplifhed, and founded the town of Baeza, the capital of the government, in the year 1559; and this was foon followed by other towns and villages, the principal of which are Archidona and Avila. The temperature of this country is hot and moift, the rains being almoft continual. It is covered with thick woods, fome trees being of a prodigious magnitude. In the S.W. part of the jurifdiction of Quixos is the canela or cinnamon tree, which led Gonzalo de Pineda to call the country Canelos, a name which it ftill retains. The other products of Quixos are the fame with thofe in all the other lands under the fame climate as this government. Adjoining to this is the diftrict of Macas and Maynas. See MACAS and MAYNAS.

QUIZA, in *Ancient Geography*, a town of Africa, in Mauritania Cæfarienfis. This was a fortrefs, according to Pomponius Mela and Pliny. Antonine makes it a municipium, and places it between Portus Magnus and Arfenaria.

QUIZAMA, in *Geography*, a province of Africa, in the fouthern part of Angola; the country is extenfive, mountainous, and badly cultivated; but it produces abundance of honey, wax, and falt. The inhabitants are warlike, and have not fubmitted to the Portuguefe.

QUIZIBA, a fmall ifland in the Indian fea, near the coaft of Africa. S. lat. 12° 30′.

QUIZIMAJUGO, a river of Africa, which difcharges itfelf into the Indian fea, S. lat. 8° 50′.

QUIZINA, or Teusin, a chain of mountains in Fez, 90 miles in extent.

QUIZUMGO, a river of Africa, which runs into the ftraits of Mozambique, S. lat. 17° 20′.

QUO Jure, in *Law*, a writ that lies for him who has land, wherein another challengeth common of pafture time out of mind: its defign is to compel the party to fhew by what right or title he challengeth it. This is now out of ufe, as, on the claimant's putting his cattle in, the owner may bring trefpafs, when the claimant muft plead and prove his title.

Quo *Minus* is alfo a writ which lies for the king's farmer or debtor in the court of exchequer, againft him to whom he felleth any thing by way of bargain, touching his farm, or againft whom he hath any caufe of perfonal action; becaufe by the vendee's detaining any due from him, the farmer is lefs able to pay the king's rent. This was formerly allowed only to fuch perfons as were tenants or debtors to the king: at this day the practice is become general for the plaintiff to furmife, that, for the wrong which the defendant doth him, he is lefs able to fatisfy his debt to his majefty; which furmife gives jurifdiction to the court of exchequer to hear and determine the caufe. Finch. 66. Old N.B. 148.

Quo minus is alfo a writ that lies for him who has a grant of houfe-bote and hay-bote in another man's woods, againft the grantor making fuch wafte, as that the grantee cannot enjoy his grant.

Quo *Warranto*, a writ that lies againft any perfon or *corporation* (which fee) who ufurps any franchife, or liberty, againft the king; as to have waife, ftray, fair, market, court baron, leet, or fuch like, without good title; to inquire by what authority he fupports his claim, in order to determine the right. Finch. L. 322. 2 Inft. 282.

It alfo lies for mif-ufer or non-ufer of privileges granted; and even, according to Bracton, againft him that intrudeth himfelf as heir into land. See Intrusion.

This writ was originally returnable before the king's juftices at Weftminfter; but afterwards only before the juftices in eyre, by virtue of the ftatutes of "quo warranto," 6 Edw. I. c. 1. and 18 Edw. I. ft. 2. (2 Inft. 498. Raft. Entr. 540.); but fince thofe juftices have given place to the king's temporary commiffioners of affife, the judges on the feveral circuits, this branch of the ftatutes hath loft its effect: and writs of "quo warranto" (if brought at all) muft now be profecuted and determined before the king's juftices at Weftminfter. And in cafe of judgment for the defendant, he fhall have an allowance of his franchife; but in cafe of judgment for the king, for that the party is entitled to no fuch franchife, or hath difufed or abufed it, the franchife is either feifed into the king's hands, to be granted out again to whomever he fhall pleafe; or, if it be not fuch a franchife as may fubfift in the hands of the crown, there is merely judgment of "oufter," to turn out the party who ufurped it. Cro. Jac. 259. 1 Show. 280.

The judgment on a writ of *quo warranto* (being in the nature of a writ of right) is final and conclufive even againft the crown. (1 Sidd. 86. 2 Show. 47. 12 Mod. 225.) This circumftance, together with the length of its procefs, probably occafioned that difufe into which it is now fallen, and introduced a more modern method of profecution, by information filed in the court of king's bench by the attorney general, in the nature of a writ of "quo warranto," in which the procefs is fpeedier, and the judgment not quite fo decifive. This is properly a criminal method of profecution, as well to punifh the ufurper by a fine for the ufurpation of the franchife, as to ouft him, or feife it for the crown; but hath long been applied to the mere purpofes of trying the actual right, feizing the franchife, or oufting the wrongful poffeffor; the fine being nominal only. Blackft. Com. b. iii. See Information.

QUOAD HOC, a term often ufed in law reports to fignify, "as to the thing named" the law is fo, &c.

QUOCOLOS, the name of a ftone found in Tufcany, as hard as a flint, fomewhat tranfparent, and, in fome meafure, refembling marble. In the fire it lofes its tranfparency, and becomes lefs ponderous, and white; and a ftrong fire readily converts it into glafs. It has no medicinal virtues, but is ufed at fome glafs-houfes.

QUOD, Cape, or *Quada*, a cape on the coaft of Patagonia, in the ftraits of Magellan. S. lat. 53° 33′. W. long. 74° 6′.

Quod *clerici beneficiati de cancellaria*, in *Law*, a writ to exempt a clerk of the chancery from the contribution towards the proctors of the clergy in parliament. Rep. Orig. 261.

Quod *clerici non eligantur in officio ballivi*, &c. is a writ that lies for a clerk, who, by reafon of fome land he hath, is made, or like to be made, a bailiff, beadle, reeve, or fuch like officer.

Quod *cum*, *that whereas*, being by way of recital, and not pofitively, is not good in indictments. 3 Salk. 188. See Indictment.

Quod *ei deforceat*, a writ for tenant in tail, tenant in dower, by the courtefy, or for term of life, having loft their lands by default, againft him that recovers, or his heir. Reg. Orig. 171. Stat. Weftm. 2. cap. 4.

This, though not ftrictly a writ of right, fo far partakes of the nature of one, as that it will reftore the right to him who has been thus unwarily deforced by his own default. (F.N.B. 155.) But in cafe the recovery were not had by his own default, but upon defence in the inferior poffeffory action, this ftill remains final with regard to thefe particular eftates, as at the common law: and hence it is, that a common recovery (on a writ of entry in the *poft*) had, not by default of the tenant himfelf, but (after his defence made, and voucher of a third perfon to warranty) by default of fuch voucher, is now the ufual bar to cut off an eftate-tail.

This writ may be brought againft a ftranger to the recovery; as if a man recover by default, and maketh a feoffment, this writ may be had againft the feoffee.

Quod *medium*. See Medium.

Quod *permittat*, in *Law*, a writ that lies where a man is diffeifed of his common of pafture, and the *diffeifor aliens* or dies feifed, and his heir enters; then if the diffeifee die, his heir fhall have this writ. See Disturbance *of Common*.

Quod *permittat profternere*. See *Affife of* Nusance.

Quod *perfona nec præbendarii*, &c. a writ that lies for fpiritual perfons, when diftrained in their fpiritual poffeffions, for the payment of a fifteenth, with the reft of the parifh. F.N.B. 176.

QUODLIBETICAL Question, *Quæftio quodlibetica*, a college term for a thefis, or problem, anciently propofed to be debated in the fchools, out of curiofity and entertainment, rather than for the fettling of any ufeful point.

The term is formed from the Latin *quodlibet*, *any thing*, *what you pleafe*: and fo well fatisfied were the public of the impertineneces of thefe queftions, that the term *quodlibet* has been fince retained, to fignify any little ridiculous quibble.

QUOJA, in *Geography*, a country of Africa, fituated above 100 miles from the coaft of the Atlantic, between the 8th and 10th degrees of W. longitude, and between the 7th and 9th degrees of N. latitude.

QUOIF, in *Ship-Building*, a piece of oak thickftuff on the deck-hook, to which the deck water-way on each fide is butted, otherwife the butt would come in the middle, and could not be caulked.

QUOIL, QUOYL, or *Coile*, in the *Sea Language*. A cable is faid to be quoiled, when it is laid round in a ring, one turn over another, on the deck of a fhip.

The middle of fuch ring, or quoil, is a good place to lay fhot in: they are more fafe there, than in lockers along the fide, where the enemy's fhot may fall into them.

QUOIL, *Weather*. See WEATHER *Quoil*.

QUOIN, or COIN, formed from the French *coin*, of the Latin *cuneus*, *wedge*, aboard a fhip, is a wedge faftened on the deck, clofe to the breech of the carriage of a gun, to keep it firm up to the fhip's fide, and prevent its rolling; and alfo to raife or deprefs it.

QUOINS, *Cantic*, are fhort three-legged quoins, put between cafks to keep them fteady. See COIN.

QUOINS, in *Architecture*, denote the corners of brick or ftone walls.

The word is particularly ufed for the ftones in the corners of brick buildings. When thefe ftand out beyond the brick-work (their edges being chamferred off) they are called *ruftic* quoins.

QUOIN, in *Geography*, a fmall ifland in the Indian fea, near the W. coaft of Madagafcar. S. lat. 14°. E. long. 48° 14'.—Alfo, an ifland in the Eaft Indian fea, N. of the Nicobar iflands. N. lat. 9° 56'. E. long. 93° 20'.

QUOITS, a kind of exercife or game, known among the ancients under the name of the *difcus*. See DISC.

QUOLL, in *Zoology*, a name given by the natives of New Holland to an animal refembling a pole-cat, with a brown back, fpotted with white, and the belly of a pure white, in which it differs from others of thefe fetid animals. Cook's Voy. 1770. vol. iii. p. 626.

QUONDANGA, in *Geography*, a town of the Birman empire; 32 miles N. of Prone.

QUORUM, a term frequently mentioned in our ftatutes, and often ufed in commiffions, both of peace, and others. A juftice of the quorum is thus called from the words in the commiffion, *Quorum* C. D. or A. B. *aliquem veftrum unum effe volumus*.

For an example: where a commiffion is directed to feven perfons, or to any three of them, of which A. B. and C. D. are to be two; there A. B. and C. D. are faid to be of the quorum, becaufe the reft cannot proceed without them.

So a juftice of the peace and quorum is one without whom the reft of the juftices, in fome cafes, cannot proceed. See JUSTICES *of the Peace*.

QUORUM *Nomina*. In the reign of king Henry VI. the king's collectors, and other accomptants, were much perplexed in paffing their accounts, by new extorted fees, and forced to procure a then late-invented writ of *quorum nomina*, for the allowance and fuing out their quietus, without the allowance of the king.

QUOTA, in *Law*, a tax to be levied in an equal manner.

QUOTATION, in *Literature*, a citation; or a paffage rehearfed exprefsly in one author from another.

Quotations are ufually diftinguifhed by inverted commas.

The manner of quoting by book, and chapter, or fection, is chiefly affected by men of erudition; but it is abufed: this method ought only to obtain where the whole chapter or fection is exprefsly on the fubject. On other occafions, quoting by page is more commodious; except in claffics, and other ancient writings, of which there are many editions in different forms; where this method is of little ufe, unlefs the edition be alfo fpecified.

The quotations from the Old Teftament, found in the New, have occafioned great doubt, difpute, and criticifm. The apoftles are frequently referring to the Old Teftament, and quoting paffages and prophecies thence, as fulfilled in our Saviour; yet thefe paffages, thus quoted, are frequently either not found in the Old Teftament at all, or they are not urged in the New, according to the literal and obvious fenfe they feem to bear in the Old.

A late ingenious author, in an "Effay upon the Truth of the Chriftian Religion," frankly owns, that the evangelifts fometimes apply to the Meffiah paffages of the Old Teftament, which, as they lie in our prefent copies, plainly relate to fome other perfon, or thing. This is evident, *e. gr.* in the paffage, Matthew, ii. 15. *Out of Egypt have I called my fon*; which is quoted from Hofea, xi. where it is plainly underftood of the coming of the Ifraelites out of Egypt.

This circumftance has been urged as a great objection to Chriftianity, which the divines, commentators, critics, &c. have long laboured to remove, though by very different means.

Some have recourfe to a double completion; and imagine, that though the prophecies were primarily accomplifhed in other events, yet they might have a fecondary accomplifhment in the Meffiah: but others fet afide a double completion, except where the prophet himfelf declares as much, this otherwife making all prophecy ufelefs. See PROPHECY.

The generality choofe, therefore, to have recourfe to an allegorical, typical, or fpiritual meaning in the prophecies, &c. and fuppofe them to have been thus underftood among the ancient Jews, thus fulfilled in our Saviour, and thus applied by the apoftles.

In effect, the Jewifh rabbins, it is allowed, took great liberty in quoting and interpreting fcripture; and it is fuppofed the apoftles might follow thefe rules in their quotations.

Accordingly, M. Surenhufius, Hebrew profeffor at Amfterdam, has endeavoured to retrieve thefe rules, long fince loft, in an exprefs treatife on this fubject, publifhed in 1713. This author obferves a great deal of difference applied in the different forms of quoting ufed by the facred writers: as, *It has been faid; it is written; that it might be fulfilled which was fpoken by the prophets*; *the Scripture fays*; *fee what is faid*; *the Scripture forefeeing*; *it is not written*, &c. He adds that the books of the Old Teftament having been difpofed in a different order at different times, and having had different names, it is thence, that one book or writer is fometimes confounded with another.

For the rules of quoting and interpreting practifed among the rabbins, he gives us ten; recovered with much ftudy from the Talmud, and the ancient Jewifh doctors: inftances of which he gives us in the writings of the apoftles; and by thofe rules he endeavours to explain and juftify all the quotations made from the Old Teftament in the New.

The rules are, 1. Reading the words not according to the

the points placed under them, but according to others substituted in their stead; as is done by St. Peter, Acts, iii. 23. by Stephen, Acts, vii. 43. and by Paul, 1 Cor. xv. 54. 2 Cor. viii. 15, &c. The second is by changing the letters; as is done by Paul, Rom. ix. 33. 1 Cor. xi. 9 Heb. viii. 9. and x. 5. and by Stephen, Acts, vii. 43. The third is by changing both letters and points; as is done by Paul, Acts, xiii. 41. and 2 Cor. viii. 15. The fourth is by adding some letters and taking away others. The fifth is by transposing words and letters. The sixth is by dividing one word into two. The seventh, adding other words to make the sense more clear. The eighth, changing the order of the words. The ninth, changing the order of the words and adding other words. Both of which are done by the apostles. And lastly, changing the order of words, adding words, and retrenching words; which is a method often used by St. Paul.

Other authors, as bishop Kidder, M. le Clerc. Mr. Sykes, &c. solve the difficulty another way. That usual form of quotation among the evangelists, "That it might be fulfilled which was spoken by the phrophets," according to these authors, means no more than an accommodation of the prophet's words to the case in hand.

The word πληρωθη, *fulfilled*, does not necessarily determine us to such a sense, as if the evangelists designed to speak of a prediction of future events *accomplished;* but may barely express an accommodation of borrowed words. In effect, says bishop Kidder, a scripture may be said to be fulfilled two ways; *properly*, as when that which was foretold comes to pass; and *improperly*, by way of accommodation, as when an event happens to any place or people like to what fell out some time before. And thus it is that St. Matthew says, on occasion of the murder of the innocents, that "then was fulfilled what was spoken by the prophet Jeremy, *In Rama was a voice heard*," &c.

This interpretation is confirmed by M. le Clerc, who observes that the Jews, in their language, used to say, that a passage of scripture was fulfilled, as often as any thing happened to which it might be applied; so that the evangelist Matthew, who was a Hebrew, and wrote, as is commonly supposed, in that language, intended no more in the passage just cited, but that a thing happened, to which one might apply what Jeremy had formerly said on another occasion.

Accordingly, says Mr. Sykes, the evangelists, in citing that passage of Isaiah, *Behold, a virgin shall be with child*, &c. only use it as words of that prophet remarkably agreeing to the miraculous birth of Jesus, and not as a prophecy of his birth.

It may be added that this way of speaking was not unknown among the heathen writers. Thus in Ælian, Diogenes Sinopensis used continually to say of himself, that he fulfilled and underwent all the curses of tragedy.

The difficulty stated in this article has been already the subject of discussion under the terms ACCOMMODATION and PROPHECY. Whilst it is allowed, that many passages in the New Testament, and also in the writings of the Christian fathers, are very different from the correspondent passages as they now stand in the Hebrew text; and that some words are introduced as quotations which are no where to be found: those who urge the objection should be disposed to pay due attention to the various modes of replying to it, which biblical critics have proposed. Some have supposed, with Whiston, that those early Christian writers quoted from the LXX: others have alleged that they sometimes quoted from their memory; and this, it is said, is the more probable, because the same passage is quoted in some cases by different authors in very different words, even where the sense agrees. It is moreover alleged, that the *sense* of the passages supposed to be lost is still to be found in the Old Testament, though the *words* be not; such especially are Matt. ii. ult. and John, vii. 38. But if it were granted, that some of the verses originally belonging to the Old Testament are lost, or materially corrupted, no objection could be justly alleged against the authenticity and divine authority of the sacred writings in general. As for the quotations that occur in the New Testament, the most probable opinion is, that some of them are made from the Greek version and some from the Hebrew text. To those who assume, that though such quotations are made from the Greek version, where that differs from the Hebrew, yet both the text and the version are in such places always the same in sense, we reply with Dr. Kennicott, that this is not the case: and he thinks, that the only way of doing justice to our Saviour and his apostles in their references to the Old Testament, is to say, that for whatever purpose such quotations were made (whether by way of express prophecy, or only of allusion and accommodation) they were always consonant to the true sense of the Hebrew text. For he says, it is scarcely possible to conceive, how any speaker or writer can quote justly such and such words, as (*e. g.*) from Moses or from Isaiah, when the words quoted are not the words of Moses or Isaiah, and do not express even the sense of Moses or Isaiah; but are only taken from some version, which (upon the present supposition) was no version at all in these instances, because it did not agree here in sense with its original. The foundation of this mistake, as this learned writer adds, is the notion that has prevailed of the integrity of the modern Hebrew text; for the writers who have held this to be perfect, have never been able and never will be able to vindicate the prophetical quotations. Passages quoted from the several Jewish writers by inspired men must (he thinks) have been quoted agreeably to the sense of the Hebrew text; but such quotations do not agree in sense with the printed Hebrew text. Therefore some alterations have happened, either in the Greek text of the New Testament, or the Hebrew text of the Old. Collins says that the Hebrew text has been delivered down perfect, and therefore that the quotations are either forged or falsified in the New Testament. To this it is replied, that as it appears from a collation of the Greek MSS. of the New Testament, that the words of the quotations are not corrupted in the Greek text, so it appears from a collation of the Hebrew MSS. that the words have been corrupted in the Hebrew. And this is an answer which should approve itself to all Christians. See Kennicott's State of the Hebrew Text, vol. ii. p. 345—347, &c.

Upon the whole we observe, that the writers of the New Testament did not make it a constant rule to quote from the Greek version, because there are many places where their quotations differ from that version and agree with the Hebrew. And as the quotations now agree with the Hebrew, frequently in the express words, generally in the sense; so it it is most probable, that they always agreed at first, and that where the Hebrew was expressed properly in the Greek version, they used the words of that version; and where the version was not proper, they translated for themselves.

With regard to Matt. ii. ult. the first of the passages above cited, Dr. Doddridge (Fam. Expos. in loc.) observes, that Nazareth was a little city on the confines of Zabulon and Issachar; so contemptible among the Jews, that it was a proverb among them, No good thing can be expected from thence. Thus was fulfilled what was spoken in effect by many of the prophets, "he shall be called a Nazarene;" *i. e.* he

shall

ſhall appear in mean and deſpicable circumſtances, and be treated as the mark of public contempt and reproach. If this ſenſe be not approved, Dr. Doddridge profeſſes to acquieſce in Chryſoſtom's opinion, that the paſſage referred to is loſt, avouching his diſſatisfaction with other interpretations of this paſſage. The ſecond paſſage, *viz.* John, vii. 38, our learned expoſitor thus explains. "He that believeth in me, as the ſcripture hath ſaid, out of his belly ſhall flow rivers of living water, *i. e.* as the ſcripture has in many places ſaid and promiſed, he ſhall receive thoſe ſupplies in ſo great an abundance, that he ſhall not only be refreſhed himſelf, but out of his belly, or from within him ſhall flow vital ſtreams, and as it were rivers of living water for the refreſhment and comfort of others." Chryſoſtom, and after him many other eminent writers, Caſtalio, Zegerus, and I. Capellus, refer the words "as the ſcripture hath ſaid," to the former clauſe, and underſtand them, as if our Lord had ſaid, "He that hath faith in me," which the ſcripture requires, and thus they avoid the difficulty, which ariſes from our not finding the following words in ſcripture. But Grotius, with whom Dr. Doddridge agrees, ſuppoſes, that here is a general reference to the ſeveral prophecies which refer to the effuſion of the ſpirit by the Meſſiah, under the ſimilitude of pouring out water. See Iſaiah, lii. 15. xliv. 3. lviii. 11. Joel, ii. 28.

QUOTIDIAN, in *Medicine*, ſignifying literally *daily*, is applied to all intermitting diſeaſes, which return once in twenty-four hours. As the moſt remarkable of theſe is the *ague*, or intermittent fever of marſhy countries; ſo the term *quotidian* ſignifies emphatically a quotidian ague. The paroxyſm uſually returns in the morning. See Ague.

Quotidian, *Double*, returns twice in twenty-four hours.

QUOTIENT, Quotiens, formed from the Latin *quoties*, *q. d. how often is ſuch a number contained in ſuch another*, in *Arithmetic*, the number reſulting from the diviſion of a greater number by a ſmaller; and which ſhews how often the ſmaller is contained in the greater, or how oft the diviſor is contained in the dividend.

In diviſion, as the diviſor is to the dividend, ſo is unity to the quotient. Thus the quotient of 12 divided by 3 is 4; which is thus diſpoſed, 3) 12 (4 quotient.

QUOVEDO, in *Geography*, a town of Iſtria; ſix miles E. of Capo d'Iſtria.

QUOUSQUE. *Execution with a Quouſque.* See Execution.

QUOYL. See Quoil.

R.

R, A liquid conſonant, and the ſeventeenth letter of the alphabet.

The grammarians hold it a ſemi-vowel; eſpecially in the Greek, where, in common with the other vowels, it admits an aſpirate, &c. though whether the aſpirate ſhould be ſounded before or after it, is ſome doubt. We find inſtances of each.

Thus ῥεδη the Latins wrote *rheda;* and ῥοδον the Ætolians wrote βροδον; and in Engliſh words derived from the Greek it is followed by an *h*, as *rhapſody*. The ancient Goths, and Teutones, Littleton obſerves, always prefixed *h* to *r*. See H.

The ſound is formed by a guttural extruſion of the breath, vibrated through the mouth, with a ſort of quivering motion of the tongue drawn from the teeth, with the tip a little elevated towards the palate.

In ſome words, as *Rome*, *rape*, and *river*, it has a rough ſound; in others, as *bard*, *card*, *regard*, its ſound is ſmooth. *Re* at the end of many words is pronounced like a mute *er*, as in *theatre*, *ſepulchre*, and *maſſacre*. *Rh* is uſed in words derived from the Greek, as *myrrh*, *rheum*, and *rhyme*.

The Hebrews allow the *r*, or ר, the privilege of a guttural; that is, they never double it, which yet is done by the Arabs, Greeks, and Latins, &c.

Perſius calls the *r*, *litera canina*, becauſe the dogs ſeem to pronounce it in ſnarling; yet it ſhould ſeem to have had a ſofter ſound among the Romans than among us, by its being frequently interpoſed to prevent the claſhing of vowels; as in *rarus*, αραιος, *nurus* from νυος, *murex* from μυαξ, *mus muris* from μυς μυος; and this ſoftneſs was ſuch as frequently occaſioned its being dropt as uſeleſs in writing. Thus for *Hetruſci* they frequently wrote *Thuſci*, and even *Tuſci;* and for *ſurſum*, *rurſus*, *prorſus;* *ſuſum*, *ruſus*, *proſus*.

In effect, there was that agreement between the ſound of the *s* and *r*, that as the Romans avoided the doubling of their conſonants, it was no wonder they here dropped the *r* in ſuch words; the *s* ſupplying the place of both. Hence too it came to paſs, that what they at firſt pronounced *aſa*, *aſena*, *caſmen*, was afterwards *ara*, *arena*, *carmen;* and thoſe firſt named *Fuſii* and *Valeſii*, were afterwards called *Furii* and *Valerii*. Cicero tells us, the *Papirii* were firſt called *Papiſii;* and even fixes the time when the change was made, *viz.* in the year of Rome 415. Feſtus adds, that *olera*, *pignora*, *plurima*, were anciently written *oleſa*, *pignoſa*, *pluſima*.

From the ſame ſoftneſs of the ſound of the *r*, it came to be uſed indifferently with the *l*, in many words; *e. gr. Latiaris* and *Latialis*, *Palilia* and *Parilia*, &c.

Though the *r* more frequently degenerated into *l*; thus *remures* became changed into *lemures;* *interlego*, *perluceo*, into *intelligo* and *pelluceo;* *frater* into *fratellus*, &c.; and the ſame is ſometimes done between *n* and *r*, as *areus*, and *aneus*, &c.

In the notes of the ancients, *R.* or *RO.* ſignified *Roma;* *R. C. Romana civitas;* *R. G. C. rei gerendæ cauſa;* *R. F. E. D. recte factum et dictum;* *R. G. F. regis filius;* *R. P. res publica*, or *Romani principes;* and *R. R. R. F. F. F. res Romana ruet ferro*, *fame*, *flamma*.

R was anciently a numeral letter, ſignifying 80; according to the verſe,

"Octoginta dabit tibi R, ſiquis numerabit."

When a daſh was added at top, as $\overline{R}$, it ſignified eighty thouſand.

The Greek *r*, ρ́, with a ſmall mark over it, ſignified a hundred; with the ſame mark under it, it denoted 1000 × 100; thus ͵ρ ſignified 100,000.

In the Hebrew numeration, ר denoted 200; and with two horizontal points over it, 1000 × 200; thus ר̈ = 200,000.

R on the French coins, denotes their being ſtruck at Orleans.

R, or ℞, in *Medicinal Preſcription*, ſtands for *recipe*, *take.*

RAA, in *Geography*, a town of Norway; 10 miles N.E. of Frederickſtadt.

RAAB, Gyor, or *Javarin*, a town and fortreſs of Hungary, ſituated in a pleaſant level country, at the conflux of the Danube, the Raab, and Rabnitz, which ſurround it. Its houſes are conſtructed of ſtone, and its ſtreets are large and ſtraight. It is the ſee of a biſhop. Its fortification conſiſts of ſeven baſtions, and it has always a ſtrong garriſon, provided with military ſtores. The fortifications of the city and caſtle are chiefly the works of the emperors Ferdinand I. and Maximilian II. In this place are ſeen ſome Roman antiquities; 56 miles S.E. of Vienna. N. lat. 47° 42′. E. long. 18° 45′.

Raab, a river of Stiria, which riſes near mount Rettlſtein, and runs into the Danube, near Raab in Hungary.

RAAF, or Raff, Anthony, in *Biography*, the moſt exquiſite and celebrated tenor ſinger of the laſt century, was born at Bonn in 1710. He was a ſcholar of Bernacchi, and equally admired for his taſte, expreſſion, and ſtyle of ſinging, by the Italians and Germans. In 1729 his voice was ſettled from a high treble to a ſweet and firm tenor, ſufficiently for him to perform a capital part in an opera at Naples. After ſinging in all the great cities of Italy, he returned to Germany, where he was courted and careſſed by all the princes of the empire. He was knighted by the elector of Bavaria, and appointed his chamber muſician. In 1751 he performed again at Naples in Metaſtaſio's "Attilio Rigolo," with the Mingotti, and in the letters of Metaſtaſio of that period, we have the poet's opinion of his performance. (Mem. of the Life and Writings of Metaſtaſio, vol. i. p. 403.) He performed in an opera compoſed by Chriſtian Bach at Manheim in 1770, when the celebrated air "Non ſo donde viene" was in his part, and which was afterwards ſung on our opera ſtage with ſuch effect by Ciprandi. Raff was at Paris more than once; for in 1780, his 70th year, Laborde ſpeaks of him with great reſpect. "This celebrated tenor has acquired great reputation, and though at preſent d'un certain age, he obliges us ſtill to admire his taſte, and regret all that he has loſt." According to Gerber, Muſical Lexicon, vol. ii. he ſung at Manheim in 1783, and was living in 1792.

RAAGOE, in *Geography*, a ſmall iſland of Denmark, near the N. coaſt of the iſland of Laland. N. lat. 54° 58′. E. long. 11° 19′.

RAAJAGUR, a town of Hindooſtan, in the country of Malwa, near the river Nieunoudge; 74 miles N.E. of Ougein. N. lat. 24° 2′. E. long. 76° 56′.

RAALBRANN, a town of Auſtria; ſeven miles S.E. of Meiſſau.

RAAN, a town of Auſtria; four miles E.S.E. of Hooren.

RAASAY, an iſland of the Hebrides, or Weſtern Iſlands, Scotland, is ſituated between the main land and the Iſle of Skye, and is included within the pariſh of Portree and ſhire of Inverneſs. It is about fifteen miles in length, and from two to five in breadth. On all ſides the coaſt riſes to a great height above the level of the ſea; and on the eaſt ſide its aſcent is peculiarly bold, and almoſt perpendicular. The interior is throughout its whole extent mountainous; and hence is better adapted for paſturage than for tillage, but there are nevertheleſs ſeveral ſpots of very fertile and well cultivated land. The ſupply of free-ſtone is almoſt inexhauſtible, and there is likewiſe plenty of lime-ſtone. Formerly there were in Raaſay ſeveral ancient chapels, but theſe are now ruinous and only uſed as places of burial. Here are likewiſe remains of two forts, the higheſt of which was ſituated at the ſouthern extremity of the iſland, and is called Dunn-Cann, as tradition records, from Canne, couſin to one of the ancient kings of Denmark. The other fort, called Caſtle-Broichin, is a well-known land-mark among ſailors. The rock on which it is ſituated is nearly round, covering an area of little more than ſeventy feet ſquare; is forty feet high, except at the ſpot where the ſtair leads up to it; and is ſixty feet above the level of the ſea at its baſe. The caſtle is built of ſtone and lime, and ſeems to have been no leſs ſtrongly fortified by art than by nature. It was anciently the chief ſeat of the lairds of Raaſay. Now, however, the family reſidence is at Clachan, or Kirk-town, near the oppoſite extremity of the iſland. One of the old Highland alliances has continued for more than two hundred years, and is ſtill ſubſiſting between Macleod of Raaſay, and Macdonald of Skye, in conſequence of which the ſurvivor always inherits the arms of the deceaſed; a natural memorial of military friendſhip. At the death of the late ſir James Macdonald, his ſword was delivered to James Macleod, eſq. the preſent laird of Raaſay. Dr. Johnſon, in his Tour to the Hebrides, ſpeaks in warm terms of the elegance and hoſpitality with which he was entertained by this truly reſpectable family. Carliſle's Topographical Dictionary of Scotland, 2 vols. 4to. 1813. Pennant's Tour through Scotland, vol. ii.

RAASS, a town of the duchy of Stiria; five miles W. of Marburg.

RAASTORF, a town of Auſtria; four miles N. of Entzerſtorff.

RAAT, a town of Hindooſtan, in the country of Agra; 128 miles S.S.E. of Agra. N. lat. 25° 37′. E. long. 79° 58′.

RABAÇAL, a town of Portugal, in the province of Beira; 12 miles S. of Coimbra.

RABANUS, Maurus Magnentius, in *Biography*, a celebrated German prelate in the ninth century, was born at Fulda in the year 785. He was educated partly at Fulda, and partly at Tours, under the famous Alcuin. In the latter ſituation he diſtinguiſhed himſelf by an unwearied application to his ſtudies, and his almoſt unequalled proficiency in all the learning of the times, both profane and ſacred. Not long before the death of Alcuin he returned to Fulda, and embraced the religious profeſſion in its abbey. In the year 810 he was placed at the head of a ſchool belonging to the abbot Ratgarius, and the fame of his ſuperior learning ſoon raiſed the ſeminary into great reputation, and filled it with pupils, many of whom were afterwards promoted to the higheſt eccleſiaſtical dignities, and proved the brighteſt ornaments of the age. In 815 he was ordained prieſt, and in 822 he was elected abbot of Fulda. About 830 he was, by his prudence and good conduct, the means of effecting a reconciliation between the emperor Lewis le Debonnaire and his ſons. Shortly after this, Ebbo, archbiſhop of Rheims, who had been condemned for high treaſon, was committed to his cuſtody. In 838, at the requeſt of of count Erlafrid, he fent a colony of monks from Fulda, to occupy a monaftery lately founded by him at Hirfchau; and at the fame time, in order that he might be enabled to purfue his ftudies with lefs interruption, he devolved upon another perfon the care of governing the abbey. In the following year the monks expelled him from his poft, complaining, that in confequence of his devoting himfelf to his ftudies, the neceffary affairs of the monaftery were neglected, and its eftates fuffered to be much dilapidated. He now retired either to St. Peter's Mount, or, as others report, to an humble apartment in the outer court of the abbey, where he fpent his time in devotion, the ftudy of facred literature, and the compofition of his various writings, deaf to the repeated entreaties of the monks who exhorted him to refume his authority. In 847 he was elected to the archbifhopric of Mentz, and in the following year he fummoned a council, in which he procured the condemnation of Godefchale, for maintaining the doctrine of St. Auguftine refpecting predeftination and grace. Rabanus died in 856, at the age of 71. He is defcribed by Dupin as "having excelled all his contemporaries in the learning of thofe times, in explaining the principles of the liberal arts and fciences, and the rules of grammar and rhetoric; in a readinefs in collecting from the fathers of the church common places upon the facred fcriptures; in allegorizing the hiftorical parts of the bible; in an expofition of the myftical reafons of the ceremonics; in a facility at turning profe into verfe, and in the manner of reducing all common places in precepts and inftructions." And Mofheim fays "he is defervedly placed at the head of the Latin writers of this age; the force of his genius, the extent of his knowledge, and the multitude of productions that flowed from his pen, entitle him to this diftinguifhed rank, and render improper all comparifon between him and his contemporaries." He was denominated the great light of Germany and France, becaufe from his fund of knowledge thofe nations derived principally their religious inftructions. His writings were every where in the hands of the learned, and were held in fo much veneration, that during four centuries, the moft eminent Latin divines appealed to them as authority in religious matters. His writings confift of Commentaries on the Scriptures; Homilies on the Epiftles and Gofpels; Scripture Allegories, and a great many theological and literary pieces. Of which the moft confiderable number were collected and publifhed at Cologne in 1627, in fix vols. folio. Some other pieces of this author, not to be found in that collection, may be found in Baluze's "Mifcellanea," among Father Sirmond's publications, and in the eighth vol. of the Collect. Concil. Mofheim. Dupin.

RABASTENS, in *Geography*, a town of France, in the department of the Upper Pyrenées, and chief place of a canton, in the diftrict of Tarbes; 10 miles N.N.E. of Tarbes. The place contains 750, and the canton 7422 inhabitants, on a territory of 150 kiliometres, in 25 communes.

RABASTENS, or *Rabafteins*, a town of France, in the department of the Tarn, and chief place of a canton, in the diftrict of Gaillac; 21 miles S.S.W. of Alby. The place contains 6076, and the canton 8124 inhabitants, on a territory of 152½ kiliometres, in five communes. The principal article of its trade is wine.

RABAT, a town of Africa, in the empire of Morocco, fituated on the S. fide of the river Sallee. Rabat had formerly, at intervals, a number of European factories; but the difficulty of navigating the river, the obftacles arifing from the arbitrary power of the fovereign, and the difpofition and prejudices of the Moors, have difgufted the Europeans. Neverthelefs, Rabat is the moft proper place for trade of any upon this coaft, both for its vicinity to Europe, and the quantity of wool, leather, and wax, which it is capable of furnifhing. From its central fituation in the empire, it is alfo better adapted for the conveying the commodities imported to every part of the country; but a defpotic government acknowledges no principle but the convenience of the moment; it commands, judges, and executes, without confidering either caufe or confequence. At Rabat, near the mouth of the river, are the ruins of a caftle, built in the twelfth century by Jacob Almanfor, but entirely deftroyed by the late emperor. The walls, which ftill remain, are near two miles round, and fortified by fquare towers. They enclofe the caftle, the town of Rabat, and a large fpace of ground where J. Almanfor built beautiful palaces, and laid out delightful gardens, watered by plentiful ftreams, which he brought from the neighbouring fpring. Thefe walls, as well as the palace and the town, were built by Spanifh flaves, whom he took prifoners in his firft campaign. Within the fame inclofure he alfo built a very large mofque, of which the ruins ftill remain. The roof was fupported by 360 columns of rough marble. Near it was a handfome fquare tower, ftrongly built with cut ftone, near 200 feet high, and called the tower of Haffan. From this tower may be had an extenfive view over the fea, and fhips may be difcovered at a prodigious diftance. This monument is in almoft perfect prefervation. There are fome docks for building fhips both at Sallee and Rabat; but the difficulty of navigating the channel, and the probability that the fand will continue to accumulate, give ground for apprehending, that very foon, only veffels with oars will be able to enter the river. Chenier's Morocco, vol. i.

RABAT *Affarmacan*, a town of Perfia, in Farfiftan; 120 miles E. of Schiras.

RABAT *Arvah*, a town of Perfia, in the province of Kerman; 40 miles E. of Kelvah.

RABAT *el Cadi*, a town of Perfia, in the province of Kerman; 40 miles E. of Maftih.

RABAT *Maabad*, a town of Perfia, in the province of Kerman; 60 miles N. of Kabis.

RABAT *al Naffi*, a town of Perfia, in the province of Kerman; 60 miles N.E. of Maftih.

RABAT *Shehariftan*, a town of Perfia, in the province of Chorafan; 260 miles N.E. of Ifpahan.

RABATE, in *Falconry*. A hawk is fometimes faid to rabate, when, by the motion of the hand of the bearer, the lure, call, &c. fhe leaves purfuing her prey, or quarry, and recovers the fift.

RABATE, in *Commerce*. See REBATE.

RABBA, in *Ancient Geography*, a town of Judea, which belonged to the tribe of Gad; fituated upon the torrent of Jaba; it was befieged by Joab, after he had defeated the Ammonites. Here was feen the head of Og, king of Bafhan, who alone remained of the race of giants.—Alfo, a town of Paleftine, in the tribe of Judah. See RAHABAH.

RABBATH-AMMON, or PHILADELPHIA, a town of Afia, fituated in the mountains of the fouthern part of Paleftine; S.E. of Tiberias, and S. of Boftra.

RABBATH-MOAB, or ARCOPOLIS, a town of Afia, fituated at fome diftance to the eaft of the lake into which the river Jordan difcharges itfelf.

RABBEN, in *Geography*, a fmall ifland in the gulf of Bothnia. N. lat. 63° 14'. E. long. 22° 14'.

RABBET, in *Carpentry*, is a deep groove or channel, cut in a piece of timber longitudinally, to receive the edge of a plank, or the ends of a number of planks, which are to be fecurely faftened in it. The depth of this channel is equal to the thicknefs of the plank, fo that when the end of the latter is let into the rabbet, it will be level with the outfide of the piece. Thus, in fhip-carpentry, the ends of the lower planks of a fhip's bottom terminate upon the ftem afore, and the ftern-port abaft, with whofe fides their furfaces are even. The furface of the garboard ftreak, whofe edge is let into the keel, is, in the fame manner, level with the fide of the keel at the extremities of the veffel.

RABBET-*Plane*. See PLANE.

RABBETING, the planing or cutting of channels, or grooves, in boards.

RABBI, or RABBIN, a doctor of the Jewifh law.

The word in its original, רבי, fignifies *mafter*.

The words *rabbi* and *rabbin* have the fame fignification; yet is there fome difference in their ufe. When we fpeak abfolutely, and without applying the term to any proper name, we fay *rabbin*, not *rabbi*. Thus we fay, it would be unjuft to attribute to the ancient rabbins all the notions of the modern ones.

On the other hand, when we prefix the term to the proper name of fome Jewifh doctor, we fay *rabbi*, not *rabbin*; rabbi Salomon Jarchi is of this opinion.

Yet rabbi having no plural, we fay, the rabbins Juda Chiug, and Juda ben Chabin, are the authors of two ancient Hebrew grammars.

The title rabbi is faid to have been firft affumed, as a diftinguifhing title of honour, by men of learning, about the time of the birth of Chrift; though it had been anciently given to feveral magiftrates and officers of ftate, and to thofe who were of fuperior rank and condition in life. See Efther, i. 8. Jer. xli. 1. Job, xxxii. 9.

The firft Jewifh rabbi faid to have been diftinguifhed with any title of honour, was Simeon, the fon of Hillel, who fucceeded his father as prefident of the fanhedrim; and his title was that of *rabban*. The later rabbins tell us, that this title was conferred with much ceremony. When a perfon had gone through the fchools, and was thought worthy of this degree, he was placed in a chair raifed above the company; and then were delivered to him a key and a table-book; the key as a fymbol of the authority conferred on him to communicate the knowledge he had acquired, which key he wore as a badge of honour, and when he died, it was buried with him; and the table-book was a fymbol of his diligence in his ftudies, and defire of farther improvement. To thefe ceremonies were added the impofition of hands by the delegates of the fanhedrim, and the proclamation of his title. It has been difputed, chiefly between Vitringa and Selden, whether our Lord had taken the degree and title of rabbi in the Jewifh fchools; Vitringa maintains the affirmative, and Selden the negative. See Jennings's Jewifh Ant. vol. i. p. 400, &c.

The Jewifh writers diftinguifh betwixt the titles *rab*, *rabbi*, and *rabban*.

In the Old Teftament we find the term רב, *rab*, in compofition with fome other words, employed as a name of office and dignity, but not till the people became acquainted with the Chaldæans, concerning whom only it is ufed. The word, both in Hebrew and in Chaldee, fignifies fometimes *great*, fometimes *many*, and when ufed fubftantively, denotes one who is at the head of any bufinefs, of whatever kind it be. Thus רב החבל, *rab hachebel*, is, in the LXX, πρωρευς, רב טבחים, *rab tebachim*, αρχιμαγειρος, *chief cook*. (Jonah, i. 6. Jer. xxxix. 11, fee alfo Dan. i. 3.) It is ufed in the plural alfo for *chief men* in general, fuperintendents, or thofe at the head of affairs. Thus רבי המלך, *rabbi hammelech*, are the chief men employed by the king over the different departments of the ftate. (Jer. xxxix. 13.) The original term fuits entirely the import of the Latin word *princeps*, but not of the Englifh word *prince*, at leaft in its moft common acceptation; for they are not the king's fons, or nobles of any order, who are fo denominated among the Chaldæans. The word evidently appears to have been equivalent to the term שַׂר, *fhar*, among the Hebrews. Accordingly, he who is ftyled by Daniel, in the above cited paffage, רב סריסים, *rab ferifim*, is four times, in the fame chapter, called שַׂר הסריסים, *fhar haferifim*. (Dan. i. 7, 8, 9. 18.) And this ufe of the name *rab* feems to have continued long in Syria, as well as in Chaldea. Thus in the Syriac New Teftament, it is found in the fame manner, united with the common appellation of any fort of officer, in order to denote the principal perfon in that office: thus, *rab-cohana*, (Matt. xxvi. 51.) is the high prieft, *rab-machfa* (Luke, xix. 2.) is chief of the publicans, and *rab-raghotha* (1 Pet. v. 4.) is chief fhepherd. *Rab*, conftrued in this manner, is equivalent to the Greek αρχι, as ufed in compofition. The preceding titles are accordingly thus expreffed in Greek, αρχιερευς, αρχιτελωνης, and αρχιποιμην.

Again, the word *rab* is fometimes found in that verfion, combined not with the title of any fort of officer, but with a term denoting the office or charge itfelf; in which cafe it always means the perfon who is principally entrufted with the bufinefs. Thus, *rabbeth* (Matt. xx. 8.) is the fteward, επιτροπος, he who is over the houfehold; and *rab-conofhetha* (Mark, v. 35.) is the ruler of the fynagogue, αρχισυναγωγος. It is not unlikely, though no example occurs in fcripture, that the term has at firft been fimilarly compounded with fome word fignifying a fchool, or, perhaps, with the name of the art or fcience taught, in order to denote the overfeer of fuch a feminary, or the teacher of fuch an art. When the term *rab* came to be peculiarly applied, as an honourable compellation of the learned, the word with which it was, at firft, for diftinction's fake, compounded, would be fuperfeded as unneceffary. It is, at leaft, certain, that the Jewifh doctors, who refided at Babylon about the time of our Saviour, were called fimply *rab*. But in the Old Teftament there is no trace of fuch a title as *rab*, *rabbi*, or *rabban*, given to a man of letters; nor is any one of the old prophets, or fcribes, or indeed any other perfon, diftinguifhed by this mark of refpect prefixed to his name. Although the introduction of titles is always occafioned by the erection of ufeful important offices, it is commonly in the decline of merit that pompous titles are moft affected. At firft, without doubt, vain-glory has led many to affume them, to whom they did not belong, in right of office, and an interefted adulation has induced others to give them. Some of them, however, came foon, among the Jews, to be converted into a kind of academical diftinctions, which, in order to give them more weight, are faid to have been conferred folemnly in their fchools or colleges, accompanied with certain religious ceremonies. From this practice fprung literary degrees in Chriftian univerfities, to which there is nothing fimilar in all Pagan antiquity, either Greek or Roman, but to which the Jewifh cuftom above-mentioned bears an evident and clofe analogy.

As for *rab* and *rabbi*, the only difference, it hath been faid, betwixt them is, that *rab* was the title of fuch as had had their education, and taken their degree in fome foreign fchool, *e. gr.* at Babylon; whereas *rabbi* was the title of fuch as were educated in the land of Judea, and more honourable than the other. But the higheft and moft honourable title was *rabban*; which, they fay, was never conferred on more than feven perfons; *viz.* on R. Simeon, five of his

his descendants, and R. Jochanan, who was of a different family.

Those who belonged to the Jewish schools were divided into three classes or orders. The lowest was that of the disciples or learners; the second, that of the fellows, or companions, who, having made considerable progress in learning, were occasionally employed by the masters in teaching the young students: and the highest was that of the preceptors, or teachers, to whom they appropriated the respectful title of *doctor*, or *rabbi*, differing, as some have said, from *rab* only by the addition of the affix pronoun of the first person. This title *rabbi* was the highest accademical honour. In the gospels, διδασκαλος is given as the Greek translation of the Syriac *rabbi*. (John, i. 38.) Yet this word does not, as the Greek, literally signify *teacher*; but, having been conferred at first, as a mark of respect on actual teachers, and afterwards on other learned men, was justly accounted as apposite a version as the Greek language afforded.

In process of time, the term *rabbi* was used with great latitude; being bestowed on those who were not actual teachers; and yet it always retained, ever since it had been appropriated to the learned, a relation to learning, and denoted that the person who enjoyed it, though not actually employed in teaching, was well qualified for the office. *Rabban*, as some have asserted, is not the name of a degree superior to *rabbi*, though it seems intended for heightening the signification, and may be understood to denote eminent or learned rabbi, but it was very seldom used. The title *rabboni*, which we find to have been twice given to our Lord, (Mark, x. 51. John, xx. 16.) is *rabban*, with the addition of the affix of the first person, and accommodated to the pronunciation of Judea. The use of the term *rabban* does not seem to have extended far beyond Palestine, as we may conclude from the following circumstance. Although the word *rabbi* is very common in the Syriac translation, the Greek διδασκαλε being generally so rendered; yet in the only place where that translator introduces the word *rabboni*, which is that quoted from John, he prefixes *in Hebrew*, that is, in the dialect of Palestine, which was then so called, adding the explanation given by the evangelist, *that is*, *teacher*; which plainly shews that the word *rabboni* was not Syriac. This is the more remarkable, as in the other passage, where the historian interprets, in the same manner, the word *rabbi*, adding (John, i. 38) "ὁ λεγέται ἑρμηνευομενον διδασκαλε," that interpreter omits this explanatory clause as intended only for the Grecian reader, and of no use to those who understood Syriac. In the passage in Mark, where *rabboni* occurs, as the evangelist had added no explanation, his interpreter has not thought it necessary to change their own word *rabbi*; thus regarding the difference in signification between the two words as inconsiderable, to which we may add, that the apostle John explains both by the same Greek word. It may be here observed that it was customary to enhance the import of a title by doubling it. Thus our Lord, speaking of the Pharisees, says, (Matt. xxiii. 7.) "they love to be called of men, *rabbi*, *rabbi*." In this manner he was himself addressed by Judas, at the time when that disciple chose to assume the appearance of more than ordinary regard. (Mark, xiv. 45.) The title κυριε seems to have been used in the same manner. (Matt. vii. 21.) The words Jewish *rabbies* and Jewish *doctors* were commonly used synonimously. In Justin Martyr's dialogue with Trypho the Jew, the rabbies are always called διδασκαλοι. But some may object that this does not account for the application of the title to our Lord. As he did not derive his doctrine from any of those learned seminaries, frequented by such of the youth as were reckoned the flower of the nation, the name *doctor* could not, with propriety, be applied to him. To this objection it may be replied, that as in Judea at that time they spoke not Greek, but a dialect of Chaldee, not differing considerably from what is called Syriac, it is evident that the actual compellation by which our Saviour was addressed, was *rabbi*, equivalent to the Greek διδασκαλος. Besides, though the title *rabbi* could regularly be conferred only by those who had the superintendency of their schools, yet the people would be disposed to give the compellation through courtesy, and on the presumption that it had been conferred, wherever they saw or supposed distinguished abilities in teaching; and this probably was the reason why it was given to John the Baptist. (John, iii. 26.) Moreover, in the Jewish state, a divine commission was conceived to confer all sorts of dignities and honours, in an eminent manner, and thus superseded all ordinary rules and human destinations. Accordingly, some of those who gave the title of *rabbi* to our Saviour, were willing, either sincerely or pretendedly, thus to account for their doing so. Thus Nicodemus assigns the reason why he saluted him *rabbi* (John, iii. 1. &c.), although he knew that he had not been educated in human literature, and had not received from man any literary honours. Upon the whole we may remark, that the term διδασκαλος may be fitly expressed, either by the English term *doctor*, or by the Syriac *rabbi*, which is now so much naturalized among us, that its meaning, as a Jewish title of literary honour, can hardly be mistaken. It must also be allowed, that the rabbi among the Jews of our Saviour's age, was a title in the highest degree respectful; and on that account it was interdicted by their master, even to the apostles themselves. Campbell's Seventh Preliminary Dissertation.

The modern rabbins are entitled to a considerable respect among the Jews: they have the first places in the synagogues; they determine all matters and controversies of religion, and very frequently pronounce upon civil affairs. They have even a power to excommunicate the disobedient.

They retain a vast number of superstitious traditions, from the writings of their predecessors; which they observe as scrupulously as they do the law of Moses.

The ancient rabbins were infinite dealers in allegories. Their writings are almost wholly allegorical, particularly their comments and interpretations of the scripture.

They had a great number of rules, and forms of interpreting and quoting, which some modern writers suppose to have been followed by the apostles, in their interpretation and quotation of the prophecies of the Old Testament, in the New. See QUOTATION.

RABBINICAL *Character*. See HEBREW.

RABBINICAL *Hebrew*. See HEBREW.

RABBINIST, a follower of the doctrine of the rabbins; a term used in contradistinction to Caraite.

Father Simon contends for *Rabbanist*, or *Rabbanite*, instead of *Rabbinist*: in effect, the former readings are apparently preferable to the latter; the word being derived from the Hebrew *Rabbanim*, which is the name of the sect, and which the Jews use to distinguish their doctors from those of the Caraite Jews.

Rabbinist, then, signifies a Jewish doctor who adheres to the traditions of his fathers; not simply a rabbin or doctor; for the Caraites, who oppose those traditions, have their rabbins as well as the other Jews.

RABBIT, CUNICULUS, in *Zoology*, a well-known animal of the hare kind, or the lepus cuniculus of Linnæus, with a short tail and naked ears. In the wild state the colour of the fur is brown; but in a tame state it varies to a black, pied,

pied, and quite white; the eyes are of a fine red. In their wild ſtate they inhabit the temperate and hot parts of Europe, and the hotteſt parts of Aſia and Africa. See Lepus *Cuniculus*.

The female, or doe rabbit, goes with young thirty days, and then ſhe kindles; and if ſhe take not buck preſently ſhe loſes her month, or at leaſt a fortnight, and often kills her young and eats them.

In England they begin to breed at a year old, but in ſome places much ſooner; and they continue breeding very faſt from the time when they begin, four, five, ſix, or ſeven times a year being common with them. They have uſually from four to eight in a litter, and hence it is that a ſmall number at firſt will ſoon ſtock a whole warren, if left to breed a little while undiſturbed. The does cannot ſuckle their young till they have been at buck again; this therefore is to be done preſently, elſe there is a fortnight loſt of the time for the next brood, and the preſent brood alſo probably loſt. When the buck goes to the doe, he always firſt beats and ſtamps very hard with his feet, and when he has copulated with her, he falls backwards, and lies, as it were, in a trance; in this ſtate it is eaſy to take him, but he ſoon recovers from it.

The buck-rabbits, like our boar-cats, will kill the young ones, if they can get at them; and the does in the warrens prevent this, by covering their ſtocks, or neſts, with gravel or earth, which they cloſe ſo artificially up with the hinder part of their bodies, that it is hard to find them out. They never ſuckle the young ones at any other time than early in the morning, and late at night; and always, for eight or ten days, cloſe up the hole at the mouth of the neſt, in this careful manner, when they go out. After this they begin to leave a ſmall opening, which they increaſe by degrees, till at length, when they are about three weeks old, the mouth of the hole is left wholly open, that they may go out; for they are at that time grown big enough to take care of themſelves, and to feed on graſs.

People who keep rabbits tame for profit, breed them in hutches; but theſe muſt be kept very neat and clean, elſe they will be always ſubject to diſeaſes. Care muſt be taken alſo to keep the bucks and does apart till the latter have juſt kindled; then they are to be turned to the bucks again, and to remain with them till they ſhun and run from them.

The general direction for the chooſing of tame rabbits is, to pick the largeſt and faireſt; but the breeder ſhould remember, that the ſkins of the ſilver-haired ones ſell better than any other. The food of the tame rabbits may be colewort and cabbage-leaves, carrots, parſneps, apple-rinds, green corn, and vetches, in the time of the year; alſo vine-leaves, graſs, fruits, oats, and oatmeal, milk-thiſtles, fow-thiſtles, and the like: but with theſe moiſt foods they muſt always have a proportionable quantity of the dry foods, as hay, bread, oats, bran, and the like, otherwiſe they will grow pot-bellied, and die. Bran and grains mixed together have been alſo found to be very good food. In winter they will eat hay, oats, and chaff; and theſe may be given three times a day: but when they eat green things, it muſt be obſerved, that they are not to drink at all, for it would throw them into a dropſy. At all other times, a very little drink ſerves their turn, but that muſt always be freſh. When any green herbs or graſs are cut for their food, care muſt be taken that there is no hemlock among it; for though they will eat this greedily among other things, when offered to them, yet it is ſudden poiſon to them.

Rabbits are ſubject to two principal infirmities. Firſt, the rot, which is cauſed by the giving them too large a quantity of greens, or from the giving them freſh gathered, with the dew or rain hanging in drops upon them. It is exceſs of moiſture that always cauſes this diſeaſe; the greens, therefore, are always to be given dry, and a ſufficient quantity of hay, or other dry food, intermixed with them, to take up the abundant moiſture of their juices. On this account, the very beſt food that can be given them is the ſhorteſt and ſweeteſt hay that can be got, of which one load will ſerve two hundred couples a year; and out of this ſtock of two hundred, two hundred may be eat in the family, two hundred ſold to the markets, and a ſufficient number kept in caſe of accidents.

The other general diſeaſe of theſe creatures is a ſort of madneſs: this may be known by their wallowing and tumbling about with their heels upwards, and hopping in an odd manner into their boxes. This diſtemper is ſuppoſed to be owing to the rankneſs of their feeding; and the general cure is the keeping them low, and giving them the prickly herb, called *tare-thiſtle*, to eat.

The general computation of males and females is, that one buck rabbit will ſerve for nine does; ſome allow ten to one buck: but thoſe who go beyond this always ſuffer for it in their breed.

The wild rabbits are to be taken either by ſmall cur dogs, or by ſpaniels bred up to the ſport; and the places of hunting thoſe who ſtraggle from their burrows is under cloſe hedges or buſhes, or among corn-fields and freſh paſtures. The owners uſe to courſe them with ſmall greyhounds; and though they are ſeldom killed this way, yet they are driven back to their burrows, and are prevented from being a prey to others. The common method of taking them is by nets, called purſe-nets, and ferrets. The ferret is ſent into the hole to force them out, and the purſe-net being ſpread over the hole, takes them as they come out. The ferret's mouth muſt be muffled, and then the rabbit gets no harm. For the more certain taking of them, it may not be improper to pitch up a hay-net or two, at a ſmall diſtance from the burrows that are intended to be hunted: thus very few of the number that are attempted will eſcape. The method by the dog, called the lurcher and tumbler, is alſo a very good one.

Some, who have no ferrets, ſmoak the rabbits out of their holes with burning brimſtone and orpiment. This certainly brings them out into the nets, but then it is a very troubleſome and offenſive method, and is very detrimental to the place, as no rabbit will for a long time afterwards come near the burrows, which have been fumed with theſe ſtinking ingredients.

The teſticle of a rabbit is a very good object for examining the ſtructure of this part of generation in animals. The teſticles of various animals are very variouſly compoſed, but all, in general, of veſſels variouſly rolled and folded together; and even the human teſticles are of the ſame ſort, being compoſed ſolely of rolls of veſſels, without any intermediate ſubſtance, only conſiſting of veſſels and their liquors. Phil. Tranſ. N° 52.

The ſkins of rabbits are a great article of commerce, numbers being exported to China: the fur is of great uſe in the hat-manufactory.

Rabbit, in *Agriculture*, is ſometimes employed as farming ſtock. It is ſufficiently evident, however, that this is a deſcription of farming ſtock that can only be attended to with advantage under particular favourable circumſtances of ſoil and ſituation.

Situations proper for Rabbits.—The practice of forming rabbit warrens, can only be beneficially introduced where the lands are not capable of affording crops of tolerable grain or graſs. The great uncertainty of this ſort of huſbandry

husbandry renders it much more advantageous for the farmer to depend upon such crops, than on it. In hilly tracts of land, where the plough cannot be introduced, and where the soil is of such a light sandy porous nature, as to afford little or no grass for the pasturage of sheep, or in rocky situations, this system of management may take place with profit to the farmer.

And it has been observed by the author of the Rural Economy of Norfolk, that this sort of animal is there confined to the heathlets, and the barren hills upon the coast. A level country is unfit for rabbit-warrens, but convenient for the plough; on the contrary, rabbits delight in the sides of sandy hills; which, where turn-wrist ploughs are not in use, are extremely inconvenient for tillage; and, when cultivated, are generally unproductive. For the rabbit, on level ground, finds it difficult to make its burrow; the excavated mould is all to be dragged upward to the surface; hence a piece of ground altogether level, can seldom be stocked successfully with rabbits; unless it be first laid up by art, at a great expence, into inequalities. While, on the contrary, against the side of a steep hill, the rabbit has no difficulty to encounter; the declivity affords him a ready vent for his mould; his work is all down hill; and, unless the soil be too stubborn, or too rocky, for the rabbits to work freely among, a broken hilly country may generally be stocked with advantage; provided a tolerable market for the carcasses can be had within reach. He thinks there are, perhaps, few sandy or other loose-soiled hills, which would not pay better in rabbit-warrens, than under any other course of husbandry that could be introduced on them. And it is afterwards stated, in a minute, that on a considerable part of a farm which lies towards the coast, being hilly and very badly soiled,—more especially the tops and sides of the hills, which have always been full of rabbits in spite of all endeavours to destroy them,—the tenants last year (1782) applied for leave to convert this part, about ninety acres, into a rabbit-warren. Leave was given, and an allowance made them of half the estimated expence of raising a sod-wall fence round these ninety acres. He adds, that the fence was nearly finished, and the warren had, that year, turned out beyond expectation; it was valued by one who ought to be the best judge of its worth, at forty pounds a year; which is nine shillings an acre. And that, as the part of a farm, these ninety acres were not worth five shillings an acre; at the then present price of barley, they were not worth more than four shillings an acre. It is, therefore, observed, that for ten pounds a real improvement of twenty pounds a-year has been made and secured; for the warrener will, through necessity, hereafter keep the fence in repair for his own advantage. He remarks, that the fence is made about four feet high, and three feet thick; faced with greensward; and capped with furze, so as to project eight or ten inches over the face. Some of it was done for a shilling a rod; but the spring putting in, fourteen or fifteen pence a rod of seven yards was obliged to be given. And a neighbouring warrener, that winter, gave ninepence for the wall without the capping; which he does not mean to put on till the wall be thoroughly settled. This is very judicious; as several rods of that above-mentioned shot down in different places, as is often the case in such sort of work. It is further observed, that there are several patches in the vallies, and some on the tops of the hills which have usually been tilled. Some of these were last year (1781), and some of them ought to be every year, cultivated for the rabbits; thus, when the grass gets foul or mossy it should be ploughed up; fallowed, sowing turnip-seed for present feed, (they will not let rape get up,) and to prepare the soil for barley and grass-feed the ensuing year. Thus a regular succession of feedage might be kept up for the use of these animals. And in the Rural Economy of Yorkshire it is stated, that at Dalby there are two pretty large warrens. At Lockton there is one now (the time of writing) planting. And there are other parts of these heights which might be profitably stocked with rabbits. In general, however, property is too much intermixed to admit of an improvement, which is singularly adapted to the nature of these high grounds. And, that in situations where the ground, as well as the soil, is suitable to rabbit-warrens, and where an extent of it, sufficiently large, can be collected together in one property, there is a very strong reason why it may be profitably stocked with rabbits. It is added, that one of the warrens of this district contains eighteen hundred acres of surface; most of it covered with a black moreland soil; part of it a barren gravel; some little of it a thin lime-stone loam; not worth perhaps, on a par, for the common purposes of husbandry, a shilling an acre; nevertheless, these eighteen hundred acres are let, as a rabbit-warren, for three hundred pounds a-year! He will not pretend to say, that this warren is worth three hundred pounds a-year, nor assert that it is not worth a shilling an acre to a husbandman. If it be worth two hundred and fifty pounds, as a warren, and supposing it to be worth even two shillings an acre, as a farm, it still is sufficient evidence of the profitableness of rabbit-warrens, in proper situations.

And in speaking of the wolds, he observes, that the warrens are numerous, and some of them very extensive. Coldham warren is at present, he believes, the largest upon the wolds; and, probably, the most valuable warren in the island. The Coldham farm contains about nineteen hundred acres; and, speaking generally, it is all warren; not, however, wholly appropriated to rabbits, a flock of from six to eight hundred sheep being kept within the warren walls; principally, however, on one side of the warren, away from the burrowing grounds. And this appears to be a practice peculiar to the wolds of Yorkshire and Lincolnshire, whose hills likewise abound much with rabbit-warrens, and where better soil is appropriated to rabbit-warrens, than is perhaps in any other part of the island. The Coldham warren, in point of soil, is most of it worth from ten to twelve shillings an acre; some of it fifteen or sixteen shillings. But the present bleakness of the situation renders it of little more than half the value. As these better parts become mossy, they are inclosed by a sod-wall, the surface pared and burnt, and the soil broken up for arable crops. Having afforded a succession of crops of corn, turnips, &c. they are sown with grass-seeds, and again thrown open to the rabbits and sheep. In 1783, there were about two hundred acres of this farm under the plough, besides some little sheep-walk which lay without the warren walls. The warren therefore, at that time, contained from fifteen to sixteen hundred acres; and, adjoining to Coldham, are two more considerable warrens; so that there are, perhaps, three or four thousand acres of tolerably good land, lying together, and appropriated principally to rabbits.

But it is remarked in respect to soil, that there is a disadvantage in stocking a *rich* soil with rabbits; a flush of grass, after a dry season, is found to produce a scouring; which sometimes carries off great numbers. With regard to the burrows on the high wolds, they are mostly on the sides of hills; at Coldham, principally in one deep valley; whose sides are steep; giving the rabbits great freedom in working. The soil, in this case, is about eight or ten inches deep, under this a chalky rubble, of some inches thick, lying on a chalk-stone rock. The burrows are in the sub-soil, between the ſoil and the rock, and chiefly towards the tops of the hills. And thouſands of daws build their neſts in the burrows, to the great annoyance of the rabbits. But at Driffieldgreets, near Driffield, where there are two large warrens, the ſurface is a dead flat; nevertheleſs, the warrens are well ſtocked and productive; a proof that a flat ſurface may, in ſome caſes, be profitably ſtocked with rabbits. The ſoil, in this caſe, is a light ſand or gravelly loam, which is very proper for the purpoſe to which it is applied.

In ſome of the very ſouthern diſtricts, rabbits occupy the different ſandy hillocks, and many of the rocky waſtes; but there is nothing of any great importance in the management of them. Both the grey and black ſorts prevail in ſome inſtances. The writer of the Suſſex Report on Agriculture thinks, that this ſort of ſtock is the nuiſance of a county; it increaſes and flouriſhes in proportion to the ſize of the waſtes, and is, of courſe, productive in this county. From Horſham foreſt, Aſhdown, and other parts, very conſiderable quantities of rabbits are ſent to be diſpoſed of in London.

In ſome of the midland counties they are found to be ſufficiently abundant upon the ſandy parts of waſte lands; in incloſed level land, it is thought that they are no better than vermin, and that ſhould the commons be pretty generally incloſed, they muſt be in a great meaſure exterminated to make way for a better ſort of ſtock; in incloſed land, they can only be kept with propriety, either in ſmall warrens near the houſe, well fenced in, for family conſumption; or on ſandy or rocky precipices, impracticable to the plough, where they ſhould alſo be fenced in. It is well known, that in the neighbourhood of commons abounding with them, great pains and expence are often uſed to fence the incloſed adjoining lands from their depredations. Rabbits are certainly a ſort of ſtock unworthy of being cultivated, or bred in any conſiderable numbers, on incloſed and cultivated land; yet doubtleſs deſerving conſiderable attention on impracticable ſandy or rocky ſteeps, which may at the ſame time be planted; and when properly fenced in, and thus ſtocked, ſuch land ſeems in a ſyſtem of the higheſt improvement of which it is capable.

In Cheſhire many doubts have been entertained as to the advantages of encouraging the breed of rabbits, and many farmers are ſo utterly averſe to them, that they would wiſh the whole race to be entirely exterminated. Where land is incloſed, and applied to arable purpoſes, it ſeems agreed that by the injury they do to the fences, by the interfering with the cultivated land, and by the deſtroying of its produce, they are much more detrimental than profitable. It is, however, thought to be a queſtion for conſideration, whether, if a portion of weak ſand, or dry heath land, was ſet apart for a rabbit-warren, well fenced, and kept diſtinct for this purpoſe; it might not, in ſome ſituations, be more profitably employed in this than in any other manner.

By ſome it is ſuppoſed, that it may be occaſionally neceſſary to reſtrain them, on account of their aſtoniſhing fecundity; but that to attempt to exterminate them, if it were poſſible, could not be politic or adviſeable, as they furniſh food for foxes, which would otherwiſe prey on game and poultry.

This ſort of ſtock is frequently met with in many other diſtricts on tracts and ſpots of ſimilar kinds of barren and uncultivable ſorts of land, and is probably the moſt convenient, appropriate, and beneficial deſcription of any by which they can poſſibly be occupied and managed.

Stocking.—In the ſecond of the above diſtricts, it is ſtated, that in ſtocking a warren, whether the ſurface be flat or hilly, artificial burrows are made, to reconcile the rabbits to the ground, and to preſerve them from vermin, until they have time to make their own burrows. And that in making theſe burrows, an improvement has lately, it is obſerved, been hit upon. They are bored with an auger, of a diameter large enough to make a burrow of a ſufficient width. In a level warren, theſe augers may, from time to time, be found uſeful in forming ſuch holes. They, however, in moſt caſes, are capable of making burrows for themſelves without any difficulty.

But in regard to ſtocking in Lincolnſhire, according to the agricultural ſurvey of that diſtrict, ſome of the warren lands are ſtocked in the proportion of three couple only to the acre; while in others, it is in a conſiderably larger proportion. And one buck or male rabbit is ſaid to be there ſufficient for one hundred does, or females; but this is certainly a much larger proportion of the latter ſort, than is allowed in moſt other diſtricts. On the wold warrens of Yorkſhire, according to Mr. Marſhall, *one* male is conſidered as ſufficient for only *ſix* or *ſeven* females, and the nearer they can be brought to that proportion, the greater the ſtock of young ones that may be expected, it being the nature or economy of the males to deſtroy their young, eſpecially when the proportional number is too great.

Fencing.—The fencing in theſe ſituations is ſod-wall, capped with furze, or of late with ſtiff ſtraw, forming a kind of thatch. And it is ſuppoſed, that reed would be found admirable in this intention. The warrens near Driffield are fenced with paling; an expenſive fence in the outſet, and always under repairs. A brook, though ever ſo deep, is found to be inſufficient as a fence againſt rabbits; one ſide of Driffieldgreets warren is bounded by a brook; but it is nevertheleſs fenced with paling. When the rabbits can evade this, they readily ſwim the brook. The neceſſity of good fences is of courſe ſufficiently evident in this view, as well as that of preſerving them from the deſtruction of vermin, and birds of prey, ſuch as eagles, kites, &c. which are taken in ſteel traps, placed on elevated mounds of earth, where they delight to ſit. It is this kind of fencing and coping, or kidding the top, together with food in winter, nets, traps, and other things for taking them, with charcoal for drying the ſkins, warreners' men for killing and carrying, horſes for carrying them to market, &c. that conſtitute the great expence of this ſort of management.

Different Breeds.—There are many different breeds or varieties of theſe animals, but thoſe that are employed as ſtock for warrens are the common grey and ſilver-grey breeds: the former of which is found to be conſiderably more hardy and much better for the purpoſes of food; but the latter has greatly the advantage in the value of the ſkin. In the above warrens, till lately the common grey rabbit, probably the native wild rabbit of the iſland, was the only ſpecies. At preſent, the ſilver-haired rabbit is ſought after, and has, within the few laſt years, been introduced into moſt warrens. The ſkin of the grey rabbit is cut; that is, the wool is pared off the pelt, as a material of hats; whereas, that of the ſilver-haired rabbit is dreſſed as fur; which, the writer underſtands, goes principally to the Eaſt Indies. The colour is a black ground, thickly interſperſed with ſingle white hairs. The ſkins of this variety ſell for about four ſhillings a dozen more than thoſe of the common ſort; a ſufficient inducement for propagating it in preference to the grey ſort in moſt caſes. If the white ſorts could be introduced they might be ſtill more valuable.

Management, Expences, Profits, &c.—This is a ſort of ſtock that on the whole only requires a ſlight attention; it is, however, neceſſary to ſupply the rabbits with additional food in the winter ſeaſon, when the weather is ſevere, ſuch

ſuch as fine green hay, ſainfoin, clover, turnips, and others of the ſame ſort, which muſt be diſtributed over the warrens. It is ſuppoſed that turnips anſwer the beſt in deep ſnows, as the rabbits can diſcover them by the ſcent. This ſort of food is given in the quantity of two or three large cartfuls to a thouſand couple *per* day, and one load of hay in the ſame time during a ſtorm. It is likewiſe ſometimes the practice to diſtribute billets of new cut aſh-boughs, gorſe or whins, and other ſimilar woods in the warrens, the bark and other parts of which is eaten, by which the proportion of hay is leſſened in a conſiderable degree. In great ſnows, it is neceſſary to clear them away from the ditches or fences, to prevent the rabbits from getting over them.

It may be obſerved, that the rabbit is a ſort of ſtock that begins to breed at an early age, as at eight, ten, or twelve months, going only about thirty days with young, the young being a little more than three weeks old before they appear from the burrows, during which time they are ſuckled twice in the day by the mother. It is therefore evident, that they may breed three or four times in the courſe of the year under good keep, as the does take buck almoſt immediately after producing their young. In warrens that are incloſed, it is however ſaid, that they ſeldom breed more than two or three times in the year. The annual produce *per* acre, is moſtly eſtimated at from three or four, to eight or ten couple, yielding a profit of from eight, ten, or even fifteen ſhillings, where they are conducted under a good ſyſtem of management. And the produce is, as has been ſeen, the largeſt on new lands; however, much of the profit muſt always depend on ſituation, ſo as to be near good markets.

Theſe animals are in what is termed ſeaſon from the end of October to the beginning of January, in which period the beſt ſkins are produced: of courſe a large proportion of them is killed in this ſhort time. The farmer often ſuſtains great loſs in what by the purchaſers are called *half* ſkins, *quarter* ſkins, and *racks*, ſixteen of which are only conſidered as a whole ſkin. The rabbits are diſpoſed of by the hundred, ſix ſcore couple being conſidered as an hundred.

The following ſtatements are given in the Agricultural Survey of Lincolnſhire, on this ſort of management. On the authority of Mr. Chaplin, it is ſtated that on 1000 acres it is fair to kill 2000 couple, which are ſold by the hundred, as above; which have ſold at 10*l.* on an average of ten years; laſt year 13*l.*; killing and looking after, 60*l.* for 1000 acres. And on the warrens between Gayton and Tathwell, ſilver ſkins have been from 15*s.* even to 21*s.* a dozen; but the common grey rabbit is ſo much hardier, that if a warren be ſtocked with both, there will, in a few years, be nothing but greys. It is added, that from Louth to Caſtor, 18 miles, 10 of them are warrens, chiefly ſilvers; rent 2*s.* to 3*s.* an acre. They plough a part every year for corn and turnips; and laying down again with ſeeds, let down the fences for the rabbits to enter. Warrens are reckoned profitable, ſo that ſome fortunes have been made on them. It is further ſtated, that in point of ſkins, thoſe bred about May-day undergo no change from their white colour, but from a white rack become a whole ſkin; bred at Lady-day, become black; in June, white; in July, black; in November, white again: then in full ſeaſon, as the carcaſes are alſo. The ſkins ought to have thoſe colours on the inſide, when flayed, or ſtripped off from the rabbits. The writer further ſtates, that from 250 acres of land, that were ſainfoin worn out, and planted with rabbits, the following was the account many years ago; but all prices, rent, &c. &c. are calculated at the preſent rates; and it is to be noted, that the ground being thus new to rabbits was much more productive than old warren land is found to be, as they breed much better on ſuch new than on old land. Uſed to kill about 2000 couple; ſtock left about 700 couple. Sod banks that coſt, thirty-five years ago, 1*s.* 2*d.* a rood of ſeven yards, would now coſt 2*s.*; furze faggots were 7*s.* a hundred, that is, 5*s.* for the furze, and 2*s.* kidding, now doubled. Banks will laſt about ſeven years, in a middling way; from three to twenty: want facing once in ſeven years, at half the firſt expence; want capping in three years with the furze. Laying on, or capping, 3*d.* a rood now. It was then reckoned that 250 acres would clear 100*l.*, beſides rent, which then was 1*s.* an acre. Fencing annually half a mile 800 yards 133 roods at 1*s.*, 6*l.* 13*s.*; for facing furze, a kidd will do a yard; $2\frac{1}{2}$ miles kidding, at a kidd a yard, 4400 yards and kidds, at 15*s.* now, for 120 or 27*l.* 10*s.*, or *per annum* 9*l.* 3*s.* 4*d.* add 6*l.* 13*s.*, it is 15*l.* 16*s.* 4*d.* *per annum*. A warrener 35*l.*, a cow, fuel, and houſe: in all 40*l.* Extra labour, killing 18*s.* a-week for ſixteen weeks, 14*l.* 8*s.* Alſo for a month 18*s.* a-week, 3*l.* 12*s.*: in all 18*l.* Beſides nets and thread, 12 at 60 yards each; laſt ſix or ſeven years; would coſt 1*l.* 11*s.* 6*d.* Traps 5*s.* a-year. The men who kill will carry. Four horſes for ſix weeks, 1*l.* 4*s.* a-week, 7*l.* 4*s.* Charcoal for drying ſkins, 5*s.* A perſon to order ſkins, that is, clear from fat, and drying, five weeks; a uſeful woman will do it, 1*l.* Winter food (after three days ſnow they muſt be ſerved) cannot be leſs than 10*l.* a year on 250 acres.

But it is, notwithſtanding this ſtatement, ſuggeſted, that if he had a warren of his own, he would plough it up for corn, &c.; thinking tillage now more profitable than rabbits. And the author adds, that at Partney fair, meeting with Mr. Grant of Withgul, and diſcourſing with him upon warrens, he informed him that a common ſtock in winter was three couple *per* acre, and the produce five or ſix

 couple

couple killed; that killing, carrying, &c. might amount to fomething more than 1*s.* an acre: the fort *filver fprig*, which will not do well in other counties, where they have been tried. He has now 1000 acres of warren; and upon 1000 acres the ftock is 2600 couple, and kill 5000 couple annually. New land is the moft productive. On fuch a warren, the rabbits muft have two loads of hay a day in a ftorm, or two or three large waggon loads a day of turnips. The warrener has 20*l.* a-year, and two cows; the killers 8*s.* or 9*s.* a-week, and board for ten weeks. Silver fkins now are 10*s.* a dozen; have been 14*s.* to 15*s.* Fences 60 a-year; no crofs ones; no buildings. The immenfe occupation of Mr. Grant and his fons, being much the moft confiderable in the county, with the circumftance of making an ample fortune, made him defirous of feeing him. It is added, that 20 years ago, Driby had a warren of 12 or 1300 acres; and the rent of the farm including it, 300*l.* a-year, which rent has been doubled by ploughing. And Mr. Kerfhaw obferved, that the community received next to nothing from warrens; which is probably the cafe, as has been feen above, where the land is capable of being managed under the plough, or the fyftem of grafs.

And the calculation of Mr. Parkinfon, of a warren of 700 acres under rabbits, in the fame diftrict, ftands thus: rent 5*s.*; ftanding ftock 2000 couple of filver hair, valued to the incoming tenant at 2*s.* 6*d.* a couple ten years ago, and demanding a capital of 1400*l.*; and carefully *typed* to catch all extra bucks, fo as to leave only one-fourth of the total number of bucks.

It is noticed, that as the family is maintained out of the farm, the intereft of the capital of about 1400*l.* is not charged, becaufe the intereft would be only 70*l.* *per* year, when they are maintained out of the farm, with a profit of 294*l.* 3*s.* 10*d.*

It is ftated by the writer of the above agricultural furvey, that the warren of North Ormfby, occupied by the late Mr. Anfell, is fuppofed to be one of the beft managed in the county. The rabbits chiefly confift of filver-greys; the land of the yearly value from 2*s.* 6*d.* to 8*s.*, and fome little of it 10*s.* the ftatute acre. The occupier was of opinion, that lately his warren lands would have paid him better, had they been applied to the purpofe of growing corn, and grafs feeds for keeping fheep. The rabbit produce he fuppofed to be from 8*s.* to 10*s.*; in fome particular years they have paid from 15*s.* to 21*s.* an acre; but to obtain any extraordinary profit, very great care muft, he thinks, be taken in killing the many different kinds of vermin which depredate, and, without the utmoft vigilance, will

will quite depopulate the warrens. A confiderable expence alfo attends the neceffity there is for night-watchers, to protect them from the infinitely worfe vermin, the poachers. With him the filver-grey fkins have been fold from $8\frac{1}{2}d.$ to 15$d.$ and 16$d.$ *per* fkin: the laft two years they have only brought from 10$d.$ to 11$d.$ *per* fkin; but to obtain even thefe prices, they muft be what is called full feafoned, whole fkins, and of the choiceft colours, with refpect to which the fafhion varies very greatly. The carcafes, of late years, have not averaged net into pocket more than 4$d.$ *per* couple, after the expence of drying them, and by means of light diligence carts, having them carried to markets 30, and fometimes more than 60, miles to obtain even that fum. This inconvenience is occafioned partly by its being neceffary to kill eight or ten parts of a year's flaughter in fo fhort a time, as between the fecond week in November and Chriftmas, on account of their fkins being then only in full prime, and as they are alfo very foon fubject to become putrid, much more fo than hares; and their being obliged to be packed clofe together, very greatly increafes the mifchief.

The eftimate of the warren on the eftate at Thorefway of 1700 acres, as given by the tenant Mr. Holdgate, with the filver fort of rabbits, is this:

	£	s.	d.
Labour, three regular warreners, with extra affiftants at killing	85	0	0
Fences	42	10	0
Winter food	42	10	0
Nets, traps, &c. &c.	14	3	4
Delivery	21	5	0
Rent is faid to be 7$s.$ an acre	595	0	0
	800	8	4
The capital employed is that fum with the addition of ftock paid for; fuppofe this as ftated about three couple an acre at 2$s.$ 4$d.$	595	0	0
	1395	8	4
Intereft on that fum one year at 5 *per cent.*	69	15	5
	1465	3	9

Annual Account.

	£	s.	d.
Expences as above	800	8	4
Intereft	69	15	5
	870	3	9
Produce 10,000 couple, at 2$s.$ 4$d.$	1166	13	4
Expences	870	3	9
Profit	296	9	7

Or about 22$l.$ *per cent.* (the 5 *per cent.* included) on capital employed. This the writer obferves is very great, reckoned on the capital, but fmall reckoned by rent, as it amounts to only half a rent. But fuppofe the grofs produce of 1500, which he takes to be nearer the fact; then the account will ftand thus:

	£.	s.	d.
Produce	1500	0	0
Expences	870	3	9
Profit	629	16	3

or 45 *per cent.* on the capital.

But it is fuppofed that, in whatever way it is taken, it explains the reafon of fo many of thefe nuifances remaining. The inveftment of a fmall capital affords a profit or intereft that nothing elfe will, and of courfe the proprietor will be fure never to convert them to better ufe. But, it is afked, what fays the public intereft? Here are only 200$l.$ expences to 600$l.$ rent, what is the population, the induftry, the improvement! The landlord gets the loweft of rents, the tenant makes a good profit, they divide all, and the reft of the world is little or no better for them.

Rabbit-warrens are met with in moft other diftricts of the kingdom, both towards the fouthern and northern parts of it; but more abundantly in thofe of the north. In the fouth they have in moft places been got quit of from any tolerable fort of land which is capable of affording any other better kind of ufeful produce, but in fome parts of the north they ftill occupy fpaces of ground which are of a good quality, and which might be converted to better purpofes with great advantage to the proprietors, as well as farmers. Warrens of this nature, in fome cafes, in both thefe fituations, however, ftill continue to be well ftocked, and in the latter, are in particular inftances of pretty confiderable extents.

In Chefhire, the principal rabbit-warrens are on Delamere foreft, though on feveral of the heaths and fand-lands thefe animals are frequently met with, but not in fuch numbers together as to conftitute warrens.

In the north riding of Yorkfhire, alfo, a few rabbit-warrens are met with on the detached moors, as well as on the fkirts of the higher moors; but they are not fo extenfive as to make them an object of much attention. The kind of rabbits here are moftly the common grey, with the exception of the ftock on a warren at Nappa, in Wenfley-dale, of about one hundred and fifty or two hundred acres, which confifts of filver-greys, and is the only warren which is known, in this diftrict, to be entirely ftocked with this fort: they are ftated to have been brought fome years fince from a warren in the above noticed diftrict of Lincolnfhire, to which they had been originally introduced from Ireland. The fkins of this kind of rabbits are fuppofed to be worth double thofe of the grey; they are not ufed for felts, as the laft, but dreffed as furs, and ultimately exported in that ftate for the China market, where they are worn by the principal people; an ufe which has been already noticed and confidered in regard to the demand which it creates.

But in the northern parts of Lancafhire, warrens of this kind are more frequent. At Roffall-hall, in the tract called the Fild, one of great extent has exifted for a very great length of time; but the prefent proprietor, B. F. Hifketh, efq. has, with great propriety, lately reduced it very confiderably, by taking two large fine farms from it, fo that it now confifts only of about a hundred acres of the moft fandy barren part.

This warren formerly fupplied a great number of rabbits for fale in the markets and hat manufactories of the neighbourhood, and of courfe became a fource of profit to the owner, though the management was very imperfect. The farms taken from it will, however, become far more advantageous to him.

The ftock here was formerly of the grey rabbit kind, and it is ftill the fame on the warren which remains, which is however far from being fufficiently ftocked.

There was formerly no fort of green food ever cultivated for this fort of ftock; nor has it been yet attempted on the prefent warren, but the proprietor intends to have it done in an effectual manner. Nor have the rabbits ever been fed in the winter feafon with either hay, bark, or any other fort of of food; their being ſo near to the ſea-coaſt perhaps renders it unneceſſary.

The only mode of taking the rabbits here has hitherto been in nets, by what is termed *running* them by means of dogs.

At Heyſham the Rev. Mr. Clarkſon has a tract of coarſe ſtony land above his houſe, of about twenty acres, which has a great number of grey rabbits in it, and is well ſuited for a rabbit-warren, as it is incapable of being converted to any better purpoſe on account of the ſeverity of the weſt winds, and the effects of the ſea-ſpray thrown up by them, as well as its rocky, whiny nature.

The principal rabbit-warrens in this county are, however, thoſe in the ſandy tracts in the ſouth and north ends of the iſle of Walney, and in the neck of land from which it ſeems to have been ſeparated. The rabbit-warren at the north end of this little iſland occupies a conſiderable ſpace of ground of this barren ſandy quality, as well as that at the ſouthern point. The former is ſtocked wholly with rabbits of the grey kind, this ſort being in moſt demand. There is much expence attending theſe warrens in many caſes.

The expence of ſtocking in order to keep them up is ſometimes very conſiderable. In this inſtance the farmer has upwards of two miles of dike fence compoſed of ſod and ſtone to keep up and in repair, which coſts from five to ſix ſhillings the rod of ſeven yards. The expence of a man conſtantly to look after the rabbits, and keep the dike fences in proper order and repair. That of the purchaſe of the traps or types, which coſt 3*l.* a-piece, and eighteen are required; but they laſt long, and coſt little in repairs.

The providing net and dogs, which is annually about 10*l.*

The charge of taking the rabbits to Ulverſton, twice in the week, during ten weeks, which is 5*s.* each time.

The ſale of rabbits is annually from one hundred and fifty couple upwards, at the rate of 2*s.* 6*d.* each couple. They are uſually ſold to Lyons of Preſton, who takes the charge of them after they have been delivered at the above-named place.

Not any ſort of dry or green food is ever given to the rabbits in this warren during the winter ſeaſon; but there is not any ſnow, and very little froſt taking place; in conſequence of the ſituation being ſo ſurrounded by the ſea.

The warren at the ſouth end of the ſame little iſland is of ſimilar extent, and exactly under the ſame ſort of management; but it is ſaid to be earlier, by a month at leaſt, in the breeding of the rabbits, and the quality of their fur; which is ſuppoſed to ariſe from its being more fully expoſed to the influence of the morning ſun, in which the rabbit delights, and by which it is greatly benefited.

The rabbits are here likewiſe aſſerted to ſell for a higher price, as 3*s.* the couple, than in the warren at the north end of it.

The rabbit-warren at Sand Scale is another farm of this ſort in this neighbourhood, under ſimilar regulations, but ſomewhat ſmaller than thoſe in the iſle of Walney; and there is a ſtill ſmaller one attached to a farm at Roanhead, the property of Miles Sandyes, eſq. of Graythwate, which is conducted in much the ſame manner, and with the ſame reſults as in the above caſe.

It may be noticed that this ſort of ſtock is moſtly taken by nets or traps, ſet in the form of a fold between the places where they run, and thoſe where they feed, the rabbits being hunted into them as they return from feeding. But the wold warreners, Mr. Marſhall ſays, have three ways of catching their rabbits: with fold-nets, with ſpring-nets, and with "types;" a ſpecies of trap. The fold-nets are ſet about midnight, between the burrows and the feeding-grounds; the rabbits being driven in with dogs, and kept incloſed in the fold until morning. But the ſpring-net, when uſed, is, he believes, generally laid round a hay-ſtack, or other place, where rabbits collect in numbers. It is added that the trap is a more modern invention. It conſiſts of a large pit or ciſtern, formed within the ground, and covered in with a floor: or with one large falling door, having a ſmall trap-door towards its centre, into which the rabbits are led by a narrow muce. And this trap, on its firſt introduction, was ſet moſtly by a hay-ſtack; hay being, at that time, the chief winter food of rabbits; or on the outſide of the warren wall, where rabbits were obſerved to ſcratch much, in order to make their eſcape. Since the cultivation of turnips, as a winter food for this ſpecies of ſtock, has become a practice, the ſituation of the trap has been changed. Turnips being cultivated in an incloſure within the warren, a trap is placed within the wall of this incloſure. For a night or two, the muce is left open, and the trap kept covered (with a board or triangular rail), in order to give the rabbits the requiſite haunt of the turnips: which having got, the trap is barred, and the required number taken. He adds, that in emptying the ciſtern, the rabbits are ſorted; thoſe which are fat, and in ſeaſon, are ſlaughtered; thoſe which are lean, or out of condition, are turned upon the turnips to improve. And that, at the cloſe of the ſeaſon, the bucks and the does are ſorted, in a ſimilar way; the bucks are ſlaughtered, the does turned looſe to breed. Mr. Marſhall alſo remarks, that great caution is requiſite in the uſe of theſe traps. If too many rabbits be admitted at once, and the ciſtern be kept cloſe covered only for a few hours, ſuffocating and inordinate heat takes place, and the carcaſes, at leaſt, are ſpoiled. Many thouſand carcaſes have been waſted through this means. The traps are therefore watched; and when the required number is caught, the muce is ſtopped, or the trap covered in a proper manner.

And it is obſerved, that ſome notion may be formed of the produce of the wold warrens, from the great numbers which are frequently ſlaughtered at once; five or ſix hundred couple having not unfrequently been ſlaughtered in one night: and, it is ſaid, that when the two Driffield warrens lay together, there was once an inſtance of fifteen hundred couple being killed at one time.

There is often much inconvenience in this ſort of ſtock, from their getting out of their incloſures, and deſtroying the young corn-crops, new ſown graſſes, young turnips, and the quick hedges as well as young plantations of apple-trees that may be in the neighbourhood. This forms a material objection to this ſort of ſtock by the farmer.

Tame Rabbits.—In reſpect to breeding and rearing tame rabbits with the view of profit, thoſe who are engaged in the buſineſs perform it in hutches, which muſt be kept very neat and clean, otherwiſe the rabbits will be ſubject to diſeaſe. Care muſt be taken alſo to keep the buck and does apart, till the latter have juſt kindled, then they are to be turned to the bucks again, and to remain with them till they ſhun and run from them.

And the general direction for the chooſing of tame rabbits, is to pick the largeſt and ſleekeſt: but the breeder ſhould remember, that the ſkins of the ſilver-haired and white ſorts ſell better than any other. The food of the tame rabbits may be colewort and cabbage-leaves, carrots, parſnips, green corn, and vetches in the time of year; alſo parſley, graſs, green leaves, milk, and ſow-thiſtles, and other ſimilar plants, but with theſe moiſt foods they muſt conſtantly have a proportionable quantity of dry food, as hay, bread, oats, bran, and other ſimilar matters, otherwiſe they grow pot-bellied, and die. Bran and grain mixed together have been found

to

to be very good food. In winter they eat hay, oats, and chaff, and thefe may be given them three times a day; but when they eat green things, it muft be obferved that they are not to drink at all, as it throws them into a dropfy. At all other times a very little drink ferves, but it fhould always be frefh. When any green herbs or grafs are cut for their food, care muft be taken that there is no hemlock among it, for, though they will eat this greedily among other things, when offered to them, it is a fudden poifon to them. In this mode of breeding, one male to eight or ten females is fufficient.

It is remarked, that the author of the Treatife on Agriculture and Gardening, has bred thefe animals with much fuccefs and ornamental effect in a fmall artificial warren, in a lawn in the garden, made in the following manner. "Pare off the turf of a circle, about forty feet diameter, and lay it on the outfide; then dig a ditch within this circle, the outfide perpendicular, the inner floping, and throw earth fufficient into the middle to form a little hill, two or three feet higher than the level of the lawn; the reft muft be carried away. Then lay down the turf on the hill, and beat it well to fettle. The ditch at bottom fhould be about three feet wide, and three and a half deep, with two or three drains at the bottom, covered with an iron grate, or a ftone with holes, to carry off the hafty rains, in order to keep the rabbits dry. In the outfide bank fhould be fix alcoves, the fides and top fupported, either by boards or brick-work, to give the rabbits their dry food in; by their different fituations, fome will always be dry; fix boxes, or old tea-chefts, let into the bank, will do very well. If the ground be very light, the outfide circle fhould have a wall built round it, or fome ftakes driven into the ground, and boards or hurdles nailed to them, within a foot of the bottom, to prevent the bank from falling in. The entrance muft be either by a board to turn occafionally acrofs the ditch, or by a ladder. The turf being fettled, and the grafs beginning to grow, turn in the rabbits, and they will immediately go to work to make themfelves burrows in the fides, and in the hill. By way of inducing them rather to build in the fides, to keep the turf the neater, make a fcore of holes about a foot deep, and they will finifh them to their own mind; and if there be a brick-wall round it, it fhould be built on pillars, with an arch from each, to leave a vacancy for a burrow." But there is, he fays, another way that may be practifed, which is, "to dig the ditch only about two feet deep, which will yield about earth enough to make the hill; put fome pales, about a foot high, on the outfide, for that will be a fufficient height to keep the rabbits in. Feed them as other tame rabbits are fed; and in wet weather fprinkle faw-duft at the bottom, by which means the quantity of manure will be increafed; once a week is often enough to take it away: the quantity will be furprifing, nor will the fmell be in the leaft offenfive, even though it be quite clofe to the houfe. In a very large lawn, two or three of thefe hills, with the rabbits feeding on the tops, will not be unpleafing objects. If the bucks happen to be mifchievous in killing the young ones, they muft be chained in an alcove; or elfe have their liberty as in a warren. After a great fnow they will want fome affiftance early next morning; becaufe the ditch will be nearly filled, and perhaps the alcove, where the hay is, will be blocked up."

He adds, that "it is a great improvement to caftrate the young bucks, and keep them till they are full grown, before you kill them; the flefh will be amazingly finer, whiter, and tenderer. But then it will be beft to take them away, and keep them in another warren, left they fhould be too numerous, and difturb the breeding does; or elfe have a few hutches in the alcove to fatten them in."

It is fuggefted, that "as oil-cakes are found of great ufe in fattening cattle, it is probable they would be ufeful in fattening rabbits: and it is afferted, that fome of the oil mixed with the pollard or buck-wheat, is cheaper than the cakes; but having never made the experiment, he cannot afcertain its fuperior advantages."

In this mode, attention fhould be had to the breeding thofe forts of rabbits whofe fkins are in the greateft efteem with the furriers and hatters. Thefe fkins are generally of more value than the flefh, efpecially in the winter, againft which time contrive to have the greateft quantity of thefe fattened bucks.

Profit.—It is remarked, in refpect to profit in this way, that where does are kept in hutches, they are fuppofed to breed fix times a-year, and only five young ones are left to each, which is thirty from each doe: but as thefe are in a more natural way, and the young ones difficult to be gotten at, let us fuppofe about thirty-fix to be produced from each doe, reckoning only feven-pence for each; there is a guinea profit from each doe; as the additional value of the fkins in winter, and the dung, will more than pay the expence of food and attendance on them. And it is quite neceffary that thofe who keep many rabbits in this way, fhould cultivate fome lucern, parfley, and carrots, as no other vegetables are fuch proper food for them as thefe; they fhould alfo be fed upon fome of the beft upland pafture-hay; for if it be coarfe, fo far from eating, they will wafte it. Lucern hay is very proper for them in thefe cafes.

In fome diftricts very confiderable profits and advantages are derived from the breeding and keeping of white tame rabbits. The fkins of this fort having lately been much employed in trimmings, have fold at a much higher price than thofe of the common kinds. Their dung is alfo found of very great utility in the cultivation of large farms.

Difeafes.—When kept in this way, rabbits are fubject to feveral difeafes, as the *rot*, which is caufed by the giving them too large a quantity of green food, or the giving it frefh gathered, with the dew or rain hanging in drops upon it, as it is over-moifture that always caufes the difeafe; the green food fhould, therefore, always be given dry, and a fufficient quantity of hay, or other dry food, intermixed with it, to counteract the bad effects of it. And a fort of *madnefs* often feizes them: this may be known by their tumbling about; their heels upwards, and hopping in an odd manner into the boxes. This diftemper is fuppofed to be owing to the ranknefs of their feeding: and the general cure is the keeping them low, and giving them the prickly herb called tare-thiftle to eat as much as poffible. They are alfo fubject to a fort of fcabby eruption, which is feldom removed. Thefe fhould, however, be directly feparated from the reft of the flock.

It is noticed that the profit in this mode of management cannot, however, be well afcertained, as much will depend on the care which is taken in the feeding, and other management.

Rabbit-*Warren*, the place where thefe animals breed and rear their young. The land for this purpofe fhould be of a light fandy quality, and it is beft to have a hilly fituation, with a funny expofure, being well inclofed by means of fod-walls, or paling-fences: any fort of wafte, craggy, or rocky land, on which nothing elfe can be cultivated, anfwers very well for this purpofe. See Rabbit.

Rabbit-*Warren Farm*, that fort which is chiefly managed under the rabbit fyftem. Thefe forts of farms are now much lefs common than formerly, but in fome inftances, as has been feen, they afford the beft and moft advantageous means by which lands can be turned to any account in the way of cultivation. They, however, in moft cafes require no little capital, exertion, and attention, to manage them in the beft and moft profitable methods. See Rabbit.

Rabbit *Manure*, that which is collected from the dung of thofe animals, and which is faid to be very valuable. See Manure.

It is found beneficial in different modes of application, as by being intimately mixed and blended with the main particles of the foil or mould in arable lands, and by being fown by the hand, only over the furface of it, in the way of a top-dreffing, when they are in a ftate of crop. When ufed in this laft manner, it is likewife highly advantageous on moft forts of grafs land; and in both thefe cafes of top-dreffing with it, there is a very quick and powerful ftate of vegetation produced in the crops, which can hardly be gained in any other way. See Quick *Manure*, and Top-*Dreffing*.

In Oxfordfhire, Mr. Fane has raifed a fmall building for keeping rabbits in hutches, for the fake of the manure; he is faid to have fome hundreds, and to meditate the erection of a fecond building for keeping double the number; the prefent quantity make a load of manure in the courfe of the week; and as two loads manure an acre, they are the means of fully dreffing twenty-fix acres annually: it is not conceived by him that they produce any other profit, nor is it neceffary; for to be able to fell fo much food at home, and pay attendance, the profit of manuring fuch a breadth of land, it is fuppofed, muft be confiderable. Three dozen of rabbits in the week are moftly fent to the London market during the feafon in which they can be ufed.

This is a fort of dung or manure, which has yet been but little fubjected to chemical examination, confequently its real properties, or conftituent principles, are very imperfectly known or underftood; it would appear, however, from the effects which it produces, that it may be employed with the moft advantage, when laid upon the land, in its more raw, crude, or frefh ftate, before it has undergone much decompofition by the procefs of fermentation or putrefaction. It has, perhaps, never yet been kept dry and reduced into a powdery condition, fo as to be put in along with the feed, in the manner of rape-duft, though it feems probable that it would go farther, and be more beneficial, in fome cafes, if ufed in this way. See Dung.

RABCHORCADO, in *Ornithology*, the name of an American bird, defcribed by Nieremberg with many fabulous circumftances. All that feems certainly known is, that its tail is very remarkably forked.

RABDA, in *Geography*, a town of Arabia, in the province of Yemen; 30 miles N.W. of Sana.

RABDIUM, in *Ancient Geography*, *Tur-Rabdin*, a town of Afia, upon a mountain, at fome diftance from the Tigris, fouth of Tigranocerta, and eaft of Nifibis.

RABDOIDES. See Rhabdoides.

RABDOLOGY. See Rhabdology.

RABDOMANCY. See Rhabdomancy.

RABEBOIA, a name given by fome to the roots of the flammula major.

RABELAIS, Francis, in *Biography*, was born about the end of the fifteenth century at Chinon, in Touraine. At an early period he entered himfelf among the Cordeliers, and became well fkilled in the learned languages, and the literature of the age. He acquired a good fhare of popularity as a preacher; and what he gained by his fermons, he expended in the purchafe of a fmall library. His private life was not fo exemplary as his public difcourfes were edifying; and for fome mifconduct, which caufed fcandal in the monaftery, he was imprifoned in his cloifter. By his wit and facetioufnefs he obtained his liberation, with the pope's permiffion to quit his order, and remove to that of St. Benedict. Not being able, however, to bear any kind of reftraint, he laid afide his religious habit, and, in 1530, went to Montpelier to ftudy medicine. After fome time he repaired to Lyons, where he printed a collection of pieces of Hippocrates and Galen. Here he likewife publifhed feveral other works, among which were fome of the books of his Hiftory of Pantagruel, which gave him fo diftinguifhed a place among burlefque writers. In 1535 he went to Paris, and waited on cardinal John du Bellay, to whom he had been known when they refided in the fame convent; and he now made himfelf fo agreeable to his old friend, that he was taken into his houfe in the feveral capacities of phyfician, reader, librarian, and fteward. Du Bellay, in the following year, going out as ambaffador to the court of Rome, took Rabelais with him, where his wit fo much interefted the pope and cardinals, that he very readily obtained a full abfolution for the crime of apoftacy. In 1537 he took his doctor's degree in phyfic at Montpelier; and returning to Paris foon after, his friend the cardinal prefented him with a prebend in the chapter of St. Maur. He was afterwards made the curè of Meudon, which office he held from 1545 to his death, in 1553, being, according to one of his biographers, in the 63d, and according to another, in the 70th year of his age. His Pantagruel, which was finifhed about the time that he accepted the curè of Meudon, brought upon him the hoftility of the monks, whom he had feverely fatirized, and who procured its condemnation by the Sorbonne and the parliament; but it caufed his company to be much fought after, as the wittieft writer of his time. The want of decency was eafily pardoned at that period, and Rabelais had fome eftimable qualities, and poffeffed extenfive and various erudition, with a ready elocution, and an inexhauftible ftore of ludicrous ideas. "The *Pantagruel* and *Gargantua* of Rabelais," fays a critic, "are to be regarded as comic fatires, often concealing, under a whimfical extravagance, attacks upon follies which it would not have been fafe ferioufly to expofe. It is in vain, however, that commentators have attempted to find out the meaning in much that is mere ribaldry and nonfenfe, and even to difcover real hiftory veiled in the allegory of burlefque, where the author meant nothing more than to make his reader laugh or wonder. His fatire, where it is intelligible, is often juft and ingenious; but the obfcurity of his language, and eccentricity of his conceptions, render the perufal of his works, to a modern at leaft, rather a tafk than an amufement." The moft complete editions of his works is that publifhed in Holland, in 5 vols. 8vo., 1715, with notes by Duchat; and that at Amfterdam, in 3 vols. 4to., 1741, with plates by Picart. The letters of Rabelais were publifhed in an octavo volume, with notes by St. Marthe. The memory of Rabelais is perpetuated in the medical fchool of Montpelier, where bachelors are invefted with a fcarlet robe, faid to have been the very robe which that wit himfelf wore.

RABELHORST, in *Geography*, a town of the duchy of Holftein; 5 miles W.N.W. of Cifmar.

RABENAU, a town of Saxony, in the margraviate of Meiffen;

Meiſſen; 8 miles S.S.W. of Dreſden. N. lat. 50° 52′. E. long. 13° 36′.

RABENECK, a town of Bavaria, in the biſhopric of Bamberg; 3 miles S.W. of Weiſchenfeld.

RABENER, Theophilus William, in *Biography*, a celebrated German writer, was the ſon of an advocate at Leipſic, and born at Wachau in 1714. He was educated at home, by tutors employed for the purpoſe; but when he was 14 years of age, he was ſent to the college of Meiſſen, where he had for fellow-ſtudents Grabener, Gærtner, and Gellert, with whom, and particularly with the laſt, he formed a friendſhip which continued through life. In 1735 he went to the univerſity of Leipſic, where he applied himſelf chiefly to the ſtudy of juriſprudence, without entirely neglecting the Muſes. In 1741, profeſſor Schwabe having begun a journal in the German language, entitled "Amuſements of Reaſon and Wit," Rabener became one of his principal coadjutors, and continued to aſſiſt him by his contributions till the year 1744. He is chiefly known as a writer in the firſt volume, by a humorous piece entitled "Proofs of the Neceſſity of employing Rhyme in German Poetry." This periodical work was, for ſome time, carried on with ſpirit and ſucceſs; but at length it became degraded by literary diſputes, which finally put an end to it; and another was eſtabliſhed, under the title of "Contributions of Bremen." The writers engaged in this were all the moſt celebrated perſons who flouriſhed at that period, among whom were Gærtner, Schmidt, and Rabener, to whom were united Gellert, Klopſtock, and others. The Journal of Bremen forms an epoch in the hiſtory of the German literature, as it introduced into the country a better taſte, and tended greatly to improve the language, which, previouſly to this, had been much neglected. Rabener had before this been appointed controller of the taxes in the circle of Leipſic, a place of great labour, and which required an exact knowledge of the laws of the country, and the moſt inflexible integrity. Notwithſtanding, however, the attention which the duties of this office required, he found leiſure to continue his literary purſuits; and towards the end of 1751, compoſed his ſatirical letters, in which he introduces perſons of every ſtate and character, all of whom ſpeak in the language ſuited to their condition. In 1753 he was appointed chief ſecretary to the directors of the taxes at Dreſden; and two years afterwards he publiſhed the fourth and laſt volume of his ſatires, which contains "A burleſque Explanation of the Proverbs of Sancho Panza," the "Firſt of April," and "The Excuſe and Reparation." After this he began to write for the ſtage, and compoſed a comedy in four acts, entitled "The Freethinker," which, with many other papers and letters, were burnt, together with his houſe, during the ſiege of Dreſden, in 1760. He now abandoned his literary labours, but his friends obtained from him a collection of letters, which were afterwards publiſhed by Weiſs. Theſe were never intended for the public, but they are written with ſo much truth and ſincerity, and exhibit a more correct picture of the author than any pen could have drawn. His health began to decline ſoon after his loſs in 1760, and in 1767 he experienced a paralytic ſtroke, which was repeated in 1769; but he lingered out till March 1771, when he died. "He was," ſays his biographer, "among the ſmall number of thoſe privileged men, whom nature has endowed with every quality neceſſary to their ſtate. He thought and ſpoke in a manner peculiar to himſelf: his pleaſantries flowed as from an abundant ſource; he never ſought for them; and they appeared ſo natural, pleaſant, and lively, that it was impoſſible not to be ſtruck by them. But he diſplayed his wit only among his friends: he never laviſhed it on the rich and great; on the contrary, he concealed it, when invited merely for the purpoſe of being heard. He always ſpoke the truth, without regard to perſons or rank." Rabener, ſays he, was the favourite author of Germany, who wrote poetically in proſe, whoſe ſatirical, ſportive genius poſſeſſed ſalt without gall. Rabener's works are generally known throughout Europe, having been tranſlated into the French, Engliſh, Dutch, and Swediſh languages. Gen. Biog.

RABENSPURG, in *Geography*, a town of Auſtria; 8 miles N.E. of Liſterdorff.

RABENSTAIN, a town of Auſtria, on the river Bielach; 8 miles S. of St. Polten.

RABENSTEIN, a town of Bohemia, in the circle of Leitmeritz; 40 miles E. of Prague. N. lat. 50°. E. long. 13° 26′.—Alſo, a town of the duchy of Stiria; 11 miles N.N.W. of Gratz.—Alſo, a town of Bavaria, in the biſhopric of Bamberg; 2 miles S. of Weiſchenfeld.

RABIA Prior, in *Chronology*, is the name of the third month of the Arabic year, conſiſting of thirty days; and *Rabia poſterior* is the name of the fourth month, conſiſting of twenty-nine days.

RABICH, a name given by Leo Africanus to a tree or ſhrub growing very plentifully in many parts of Africa, the fruit of which is much eſteemed by the natives. He ſays that the tree rabich is prickly, and that the fruit is round, and like a cherry, but ſmaller, and of the taſte of the jujube.

RABIEL, a name given by ſome authors to dragon's blood.

RABIES, in *Medicine*, that peculiar ſtate of the nervous ſyſtem, which is produced by the bite of a rabid animal, and which is commonly, but improperly, called *madneſs*. As the dog is the principal ſource of this diſeaſe, the word rabies is commonly united with the epithet *canina*. See Hydrophobia.

RABINAL, in *Geography*, a town of Mexico, in the province of Vera Paz; 40 miles S.S.W. of Vera Paz.

RABINET, a name formerly given to a ſmall piece of ordnance, between a falconet and a baſe. Its dimenſions, &c. ſee under Cannon.

RABIRA, a word uſed by ſome of the chemical writers to expreſs tin.

RABISHI, in *Geography*, a river of the iſland of St. Vincent, forming a bay on the eaſtern coaſt, near the ſouthern extremity, where it runs into the ſea. N. lat. 13° 5′. W. long. 61° 11′.

RABLAY, a town of France, in the department of the Mayne and Loire; 9 miles N. of Villiers.

RABLES, *Iſles aux*, a cluſter of ſmall iſlands at the entrance of lake Superior, in Upper Canada, and at the eaſt end of it, eaſt of White Fiſh iſland, and pretty cloſe to the main land.

RABNABAD, a town of Hindooſtan, in Bengal, at the mouth of the Ganges; 90 miles S.S.E. of Mahmudpour.—Alſo, a ſmall iſland on the coaſt of Bengal, at the mouth of the Ganges. N. lat. 22°. E. long. 90° 30′.—Alſo, one of the mouths of the Ganges, which opens into the bay of Bengal. N. lat. 22°. E. long. 90° 26′.

RABNITZ, a river of Hungary, which runs into the Danube, a little below Raab.

RABOGH, a town of Arabia, in the province of Yemen, near the coaſt of the Red ſea, where the Arabs live in huts; 105 miles S.W. of Medina.

RABOLANE, in *Ornithology*, a name given by many to the lagopus, a bird found on the ſnowy mountains, and called by ſome the white partridge.

RABRI, a name given by some authors to bole armenic.

RABUEL, Claude, in *Biography*, a French Jesuit and able mathematician, was born at Pont-de-Vele, in the county of Bresse, in the year 1668. About the age of 18 he was entered into the society of Jesus, and principally distinguished himself by his proficiency in mathematical learning, of which he became the professor in Trinity college at Lyons, performing its duties with great reputation and success. He died in 1728, in the 60th year of his age. His chief work was "A Commentary on the Geometry of Descartes," which was published after his death in 1730, under the care of father l'Espinasse. This was the first illustration of the whole of that work, which had been given to the public. The labours of Fermat, De Witt, and others, extended only to particular parts of it. Rabuel left behind him other works on algebra, the conic sections, and the geometrical loci of the differential calculus, and of the integral calculus; and he was one of the few instances of persons who, with a passion for the mathematics, had a fine taste for polite literature.

RABUTAH, in *Geography*, a town of Africa, in the kingdom of Sennaar; 35 miles S.S.W. of Sennaar.

RABUTIN, Francis de, in *Biography*, who flourished in the sixteenth century, was of an ancient and noble family in Burgundy, and served in the army with the duke de Nevers, under Henry II. and Charles IX., with a high reputation for valour and fidelity. He was living in 1581, but nothing is known of him beyond that period. He was author of "Commentaires de dernières Guerres du Roi Henri II. et de l'Empereur Charles Quint," first printed in 1555; a continuation was printed afterwards, in 1558; and the whole work together in 11 books, in 1574. It contains a history of the wars in the Low Countries, from 1550 to 1558, and is said to be written in a simple style, with a great appearance of vivacity.

Rabutin, Roger de, count of Bussi, a very distinguished character in the reign of Lewis XIV., was born at Epiry, in the Nivernois, in 1618. He entered very young into the army, in his father's (Leonor Baron of Bussi) regiment, of which he became colonel. After serving in a number of battles and sieges, he rose to the rank of mestre-de-camp of the light horse, and lieutenant-general of the Nevernois. He looked for still higher honours, and being disappointed, engaged in lampoons upon persons about the court, which drew upon him the king's displeasure; and in 1665, in which year he was admitted a member of the French academy, a manuscript history of the amours of two court ladies, of which he was the writer, being handed about, under the title of "Histoire Amoureuse des Gaules," a complaint was laid before his majesty, in consequence of which he was sent to the Bastille. Imprisonment had nearly proved fatal to him, and he was liberated, but was obliged to resign the office which he held under government. After this he was exiled to his country-seat, where he remained 17 years, during which he did not cease to importune the king to be allowed to return, by letters conceived in terms of abject humility and base adulation. In 1682 he was allowed to return to court, but finding himself generally neglected, he retired of his own accord to his estates. He died at Autun in 1693, at the age of 75. He was author of several works, among which were "Discours a ses Enfans, sur le bon Usage des Adversites;" "Memoires," published first at Paris in two, and afterwards at Amsterdam in three volumes, 4to.; "Lettres," 7 vols. 12mo.; and "Histoire Abregée de Louis le Grand." His son the abbè de Bussi became bishop of Luçon in 1723, and was a learned and ingenious member of the French academy. The sister of the bishop, a nun, published an abridgment of the life of Madame de Chantal, and of the life of St. Francis de Sales.

RABY, in *Geography*, a small township of America, in New Hampshire, in Hillsborough county; about 65 miles W. by. S. of Portsmouth; incorporated in 1790. Its name has been since changed.—Also, a town of Bohemia, in the circle of Prachatitz, containing a citadel, at the siege of which, Zisca, general of the Hussites, lost his only remaining eye; 4 miles S. of Horazdiowitz.—Also, a town of Sweden, in Sudermanland; 7 miles N. of Nykoping.

RACA, or Racha, a Syriac term, found in the Gospel of St. Matthew, chap. v. 22. and preserved in most translations.

Father Simon observes, that the Greek translator of St. Matthew's Gospel retained the Syriac raca, which he found in the original, because it was very common among the Jews. And St. Jerom, Luther, the English translators, those of Geneva, Louvain, Port royal, &c. still preserve it in their respective languages.

F. Bouhours chooses rather to express the sense of it in a sort of paraphrase, thus: he that says to his brother, *homme de peu de sens*, *man of little understanding*, shall deserve to be condemned by the tribunal of the council, &c.

Most translators, except the English, and F. Simon, for raca write racha; but the former orthography seems the best founded; all the Latin copies having raca, and all the Greek ones ῥακα, or, with Hesychius, ῥακκα, which is the same; all, we mean, but St. Irenæus, and Beza's copy, now at Cambridge, which have ῥαχα. In effect, the origin of the word shews it should be raca; as coming from the Syriac רקא, *raca*, of the Hebrew *rek*, רק, *empty*, *shallow*.

RACAISBONE, in *Geography*, a town of Hindoostan, in Aurungabad; 30 miles S. of Aurungabad.

RACAM, a town of New Mexico, in the province of Hiaqui; 60 miles S.W. of Riochico.

RACAN, Honorat de Bueil, *Marquis of*, in *Biography*, a French poet, was born in 1589, of a noble family, in Touraine. When very young, he had a place in the king's bed-chamber, under the duke of Bellegarde. From Malherbe, who was at that time domesticated with the duke, he acquired a fondness for poetry, and obtained instructions in the art of versifying. He at first bore arms, as a profession; but after a time he devoted himself to a life of leisure. He was one of the earliest members of the French academy, and though almost wholly without the advantages of education, he obtained reputation as a writer. His most popular work was entitled "Bergeries." He composed in various styles, and wrote translations of Psalms, and many sacred odes taken from the Psalms, and other scriptural poems. In prose he published "The Life of Malherbe;" "A Discourse pronounced before the Academy;" and some "Letters." He died in 1670, at the age of 81. Of his works a new edition was given at Paris, in 1724, in 2 vols. 12mo.

RACCA, Racah, *Rika*, or *Racka-Rica*, in *Geography*, a town of the Persian empire, in the province of Diarbekir, and pashalic of Orfa, the capital of the district named Diar Modzar. It is situated on the eastern bank of the river Euphrates, at the mouth of a small river named Beles, (the ancient Billicha,) and was founded, according to Pliny, by Alexander the Great. It was first called Nicephorium, and afterwards Callinicum and Leontopolis, from Seleucus Callinicus and the Greek emperor Leo. It was the favourite residence of Haroun al Rashid, the ruins

ruins of whofe palace, it is faid, are ftill vifible. The pofition of Racca, in the parallel of 36° N., was afcertained by the celebrated oriental aftronomer Mahomed Ben Jaber, furnamed Al Batani, who paffed many years of his life at this place. The town and adjoining country are inhabited by different tribes of wandering Arabs. N. lat. 36° 1′. E. long. 38° 50′.

RACCAN, a river on the north coaft of Sumatra, which runs into the fea, N. lat. 2° 30′. E. long. 100° 15′.

RACCANATTO, a river of Naples, which runs into the gulf of Tarento, N. lat. 39° 47′. E. long. 16° 42′.

RACCOON, in *Zoology*. See RACKOON.

RACCOON, in *Geography*, an ifland in the Atlantic, near the coaft of South Carolina, nine miles long and one wide. N. lat. 33° 3′. W. long. 79° 22′.

RACCOON *Creek*, a river of Pennfylvania, which runs into the Ohio, N. lat. 40° 38′. W. long. 80° 25′.

RACCOON *Ifland*, a fmall ifland in Offabaw found, belonging to the ftate of Georgia. N. lat. 31° 47′. W. long. 81° 12′.

RACCOON *Key*, a fmall ifland or rock in the gulf of Mexico, near the fouth coaft of Weft Florida. N. lat. 29° 46′. W. long. 89° 21′.

RACCOON *Keys*, a clufter of fmall iflands near the coaft of South Carolina. N. lat. 24° 8′. W. long. 79° 15′.

RACCOURCY, in *Heraldry*, fignifies the fame as *coupé*, that is, *cut off*, or *fhortened;* and denotes a crofs, or other ordinary, when it does not extend to the edges of the efcutcheon, as they always do when abfolutely named, without fuch diftinction.

RACE, in general, fignifies running with others, in order to obtain a prize, either on foot, or by riding on horfeback, in chariots, &c.

Racing was one of the exercifes among the ancient Grecian games, which was performed in a courfe, containing one hundred and twenty-five paces; and thofe who contended in thefe foot-races were frequently clothed in armour. For a particular account of thefe races, fee STADIUM.

There were properly but two kinds of horfe-races at Olympia, namely, the *chariot-race*, introduced into thofe games in the 25th olympiad (for an account of which fee CHARIOT), and the race of riding-horfes, which was not admitted till the 33d. Although chariots were in ufe before riding-horfes, as we may conclude from the teftimony of Homer, among all whofe heroes, Greek and Trojan, no one makes his appearance on horfeback, except Diomedes and Ulyffes mounted upon the horfes of Rhefus (Il. x.), it is neverthelefs plain, from this inftance, that neither the heroes nor the horfes were utter ftrangers to the art of riding; and it is alfo evident, from another paffage in the 15th Iliad, that horfemanfhip was carried even to fome degree of perfection, at leaft in the time of that poet, who lived but in the next generation after the fiege of Troy, according to fir Ifaac Newton. This paffage, extracted from Pope's Homer (Il. xv. v. 822.) is as follows:

> " So when a horfeman from the wat'ry mead
> (Skill'd in the manage of the bounding fteed)
> Drives four fair courfers, practis'd to obey,
> To fome great city, thro' the public way:
> Safe in his art, as fide by fide they run,
> He fhifts his feat, and vaults from one to one:
> And now to this, and now to that he flies:
> Admiring numbers follow with their eyes."

Some authors (fee Rollin's Anc. Hift. tom. v. p. 72. ed. Amft.) have introduced an exercife like this into the Olympic games, though Mr. Weft profeffes himfelf diffatisfied with the authority upon which they depend: and fays that in the books which he has confulted, he can find no mention of any other race of riding-horfes, befides thofe of the *Celes* and the *Calpé*. As to that particular branch of horfemanfhip, above defcribed, Euftathius, in his comment upon Homer, tells us, that in the old fcholia it is written, that Demetrius fays he had feen a man, vaulting in the manner defcribed by the poet, from the back of one horfe to another, holding the bridles at the fame time, and keeping the horfes to their fpeed, without any interruption or incumbrance. This affertion implies that fuch a fight was very uncommon, and confequently that no fuch exercife could ever have been admitted into any of the games of Greece. The word Κελητίζειν, ufed by the poet in the beginning of this fimile, fays Mr. Weft, may poffibly have induced fome people to imagine, that the riders of the horfes called Κέλητες, *celetes*, were accuftomed to leap from one horfe to another, as if that word was a term of the manege, of which the verfes that follow were merely an explanation. It is certain, however, from a paffage in the Odyffey (E. v. 371.) that by ἵππος Κέλης, Homer meant to fignify no more than a riding-horfe, and confequently that by the word Κελητίζειν, which is derived from Κέλης, no more is to be underftood in this place than fimply to ride. This interpretation of Κέλης, *celes*; may be farther confirmed by the authorities of Pindar and Paufanias, and particularly by a ftory related by the laft mentioned author (lib. vi. c. 13.) of a mare, named Aura, belonging to one Phidolas, a Corinthian. This mare, fays the hiftorian, having accidentally thrown her rider foon after fhe had ftarted from the barrier, continued the race of her own accord, and turned round the pillar as if the rider had been ftill upon her back; upon hearing the trumpet, fhe mended her pace, till coming in before her antagonifts, fhe ftopped fhort over-againft the judges of the games, as confcious of having gained the victory. The victory was accordingly adjudged to her mafter Phidolas, who, by erecting in return a ftatue to her honour, intimated to whom the merit of that victory was due. In this ftory, there is no mention of any other horfe or mare, that fhared the victory with Aura, and confequently that, in the race called *Celes*, each competitor made ufe of but one fingle horfe. Moreover, the victorious Aura was of the feminine gender, and hence we may infer, that in all the races, as well of riding horfes as of chariots, mares or horfes were indifferently ufed; excepting in the race named *Calpé*, in which mares only were employed. And further it appears, that though the rider was thrown off in the very beginning of the race, yet the crown was awarded to Phidolas, the mafter of Aura; to whom certainly no lefs was due, than if his mare had conquered under the conduct and difcretion of her rider. It appears alfo, by the circumftance of Aura's mending her pace upon hearing the trumpet, that the trumpet either did not found during the whole race, but at the laft round only, or that it founded differently in different periods of the courfe. There was, however, a meaning in the found of the trumpet, which Aura, probably an old ftager, underftood.

The race of full-aged riding-horfes was inftituted in the 33d olympiad, and that of the Πωλος Κέλης, or under-aged riding-horfes, in the 131ft. It is a well-known fact that chariots were ufed in war above 1000 years before cavalry was introduced among the ancients. They feem to have had a terrible notion of being mounted upon the back of a horfe, and have accordingly made monfters of thofe whom they firft beheld in that attitude, to which they were not very fpeedily reconciled. Their amazement gradually diminifhed: and their intercourfe with other nations not only

 rendered

rendered riding-horfes familiar to them, but convinced them likewife of the advantages accruing from the ufe of cavalry. Hence it came to pafs, that an order of equites, or horfemen, was inftituted in moft of their commonwealths; to whom, as in Athens, was allotted the fecond rank in the ftate. Upon the fame principle, perhaps, the ἵππος Κελης, or riding-horfe, was admitted into the Olympic hippodrome, and held in fuch eftimation, that although the race of riding-horfes was neither fo magnificent nor fo expenfive, and confequently not fo royal, as the chariot-race, yet we find, among the competitors in this exercife, the names of Philip, king of Macedon, and Hiero, king of Syracufe. To the latter is infcribed the firft Olympic ode of Pindar, in which honourable mention is made of the horfe Pherenicus, whofe fleetnefs gained for his mafter the Olympic crown. The race of the Calpé was performed by mares. (See Calpé.) The length of this race, and alfo that of the Celes, are not afcertained; but it is reafonable to fuppofe, that the latter, diftinguifhed, as we have already obferved, into two claffes, one of full-aged, and the other of under-aged horfes, confifted of the fame number of rounds as thofe of the chariots, diftinguifhed in like manner into two claffes. Mr. Weft has not been able to determine the different ages that ranked the horfes in one or the other clafs; nor whether the weight of the riders, or the fizes of the horfes, were taken into confideration. Thefe points feem to have been left to the difcretion of the Hellanodicks, who were appointed to examine the young horfes that were entered to run for any of the equeftrian crowns (Pauf. l. iv. c. 24.), and who were fworn before the ftatue of Jupiter Horcius, to give a true and impartial judgment upon the matters left to their examination, without taking any reward; and not to difcover the reafons which difpofed them to reject fome, and admit others. Weft's Differtation on the Olympic Games. Sect. 14. See Hippodrome.

Race, in *Genealogy*, a lineage, or extraction, continued from father to fon.

The word is French, formed from the Latin *radix*, *root*; as intimating the root of the genealogical tree.

In feveral orders of knighthood, as in that of Malta, &c. the candidates muft prove a nobility of four races or defcents.

In fome republics the magiftrates are to prove themfelves of plebeian race, to be qualified.

The French reckon their kings by races; as, the firft race, the fecond race, the third race. We alfo fay the race of the Ottomans, the Arfacidæ, the Ptolemies, &c.

Race, in *Natural Hiftory*. See Cibdeloplacia.

Race, the mark made on timber, &c. by a tool called a racing-knife.

Race, *Cape*, in *Geography*, a cape on the S.E. coaft of Newfoundland. N. lat. 46° 40'. W. long. 53° 3' 30".

Race *Point*, a cape on the coaft of America, W. of cape Cod. N. lat. 42° 4'. W. long. 78° 12'.

RACEME, in *Gardening*, the long mode of clufter-flowering and fruiting which takes place in fome forts of plants and fruit-trees, as in the grape vine, and the different kinds of currants. See Racemus.

RACEMIFEROUS, in *Botany*, denotes bearing in clufters.

RACEMUS, in *Botany* and *Vegetable Phyfiology*, a clufter, is a mode of inflorefcence, in which feveral flowers, each fupported on its own proper ftalk, are connected by one common ftalk, either fimple or compound. A bunch of Currants is a fimple *racemus*; the inflorefcence of the Woody Nightfhade, *Solanum Dulcamara*, is a compound one. In the American plant called *Actæa racemofa*, the clufters are fimple, but aggregate. A *racemus* differs from a *fpica*, or fpike, in having a partial ftalk, as above defcribed, to each flower; it is moreover generally underftood to be drooping or pendulous, and to have the flowers expand all nearly at one time. On the contrary, a fpike is moft frequently erect; the flowers open in very gradual fucceffion, infomuch that the lowermoft may have partly perfected their feeds, before the uppermoft expand; and efpecially, they are individually feffile, at leaft at the time of their expanfion. To thefe characters may be added, that a fpike is crowded or denfe; a clufter lax or fcattered. It muft be allowed that botanifts, even of the firft rank, are incorrect in the application of thefe terms. The male inflorefcence of *Quercus*, the Oak genus, becaufe drooping and loofely difpofed, with all the flowers in perfection nearly at the fame time, is termed a *racemus*; though it poffeffes the moft effential character of a *fpica*, feffile flowers. On the other hand, *Veronica fpicata*, having a denfe upright feries of flowers, expanding gradually, is faid to be fpiked, though each feparate flower has a partial ftalk. A little latitude muft neceffarily be allowed, though it is very defirable that botanifts fhould be more exact in the ufe of thefe and other terms, than they fometimes are. See Spica and Inflorescence.

RACER, in *Gardening*, a name applied to a fort of fward-cutter, or cutting implement, ufed in racing out or cutting through the furface of grafs fward, and dividing it into proper widths, lengths, and thicknefs, for turf intended to be cut up for laying in pleafure-grounds, or other places, and always neceffary preparatory to the work of flaying or cutting up the turf with the turfing-iron. It is alfo ufeful for cutting and ftraightening the edges of grafs verges in fuch grounds, as well as for many other purpofes.

It is a tool which is very fimple in its conftruction, merely confifting of a ftrong wooden handle, about four feet long, having the cutter fixed at the lower end, in the form of a half moon, with the edge downward, to cut into the fward; the handle fhould be about an inch and a half thick, growing gradually thicker towards the lower end.

In ufing the tool, it is pufhed forward fo as to cut or race out the fward in an expeditious manner. And in cutting turfs with it, it is neceffary firft to mark out on the fward the width of the turf intended, which fhould generally be a foot wide, and a yard long, and about an inch or inch and a half deep; then ftrain a line tight, firft lengthways, ftriking the racer into the fward clofe to the line, running it along expeditioufly, fo as to cut its way, and divide the fward to a proper depth, afterwards placing a line a foot farther, and racing it out as before, and fo on, to as many widths as may be wanted; and then, with the line placed crofs-ways, to race out the fward accordingly in yard lengths. The fward being thus raced out, the turf-cutter with the turfing-iron fhould proceed to cut them up and flay them off from the ground. This fmall implement is likewife very convenient for many other little purpofes about pleafure grounds and gardens, as thofe of cutting the edges of the verges which are laid with turf, and ftraightening the edges of the borders in different parts. See Turf.

RACHA. See Raca.

Racha, in *Geography*, a town of Bohemia, in the circle of Leitmeritz; 8 miles E. of Leitmeritz.

RACHELSDORF, a town of Bavaria, in the bifhopric of Bamberg; 15 miles N. of Bamberg.

RACHETUM, from the Fr. *racheter*, *redimere*, the compenfation or redemption of a thief.

RACHIA,

RACHIA, in *Geography*, a town of Iftria; 7 miles N.E. of Pedena.

RACHIALGIA, in *Medicine*, a term given by Aftruc, and adopted by the nofologifts, to denote certain colicky pains in the bowels, which were fuppofed to originate from the nerves of the fpine, and efpecially the colic from the poifon of lead, or COLICA *Pictonum*; which fee. The word is from ῥαχις, *the fpine*, and αλγν, *pain*. See Sauvages Nofol. Meth. clafs vii. gen. 29.

RACHIS, or rather *Rhachis*, in *Botany*, from ῥαχις, *the back-bone*, is the common ftalk, or receptacle, of the florets, in the fpikelets of graffes; or of the fpikelets themfelves in *Lolium*, *Triticum*, *Secale*, *Hordeum*, *Rottböllia*, &c. The fame term is applied to the rib, or leaf-ftalk, of ferns, which is often winged or bordered. The *Rachis* in both thefe inftances is frequently jointed; by which in the former, the ripe feeds of fuch graffes, wrapped up in their hufks, are the more readily difperfed. The part in queftion being in fome cafes fmooth, in others varioufly hairy or bearded, affords excellent fpecific diftinctions; witnefs the genus *Avena*.

RACHISAGRA, a term ufed by fome phyficians for the gout in the fpine of the back.

RACHITIS, in *Medicine*, from ῥαχις, *the fpine*, (becaufe the fpinal marrow was fuppofed to be the feat of the difeafe,) a malady corruptly termed in Englifh the *Rickets*: which fee.

RACH-KOKE, in *Geography*, one of the Kurilfkoi or Kurilly iflands in the Eaftern or Pacific ocean: diftant from Muffyr, another of the faid iflands, about 120 verfts. Its length is about 20 verfts, and its breadth the fame, and it prefents the appearance of a folitary mountain rifing upwards from the fea. It was formerly covered with verdure, with fhelves of rocks, where fea-fowl in great number made their nefts: but thefe rocky fhelves have been demolifhed by the eruption of fubterraneous fires, which fplit the fummit of the mountain, throwing up vaft quantities of ftones and afhes; and fince that time, the ifland has always continued burning. At this eruption thofe places on the fhore where formerly they had thirteen fathom water, were filled up with rubbifh and afhes into fhoals and banks.

RACHLIN, in *Ancient Geography*, the *Ricina* of Ptolemy, near the N.E. coaft of Ireland, memorable as the retreat of Robert I. of Scotland.

RACHOL, in *Geography*, a town of Hindooftan, in Soonda; 16 miles S.S.E. of Goa.

RACHORE, a diftrict or province of Hindooftan, in Golconda, bounded on the N. by the Kiftnah, on the E. by Canoul, on the S. by Adoni, and on the W. by Sanore.—Alfo, a town of Hindooftan, and capital of the above-mentioned province, on the S. fide of the Kiftnah, and not far above the conflux of the Toombuddra with it, and below that of the Beemah; belonging to the Nizam. It is four days' journey from Adoni, reckoning a day's journey at 22 Britifh miles in road diftance, and 17 or 18 geographical miles; 91 miles S.W. of Hydrabad. N. lat. 16° 24'. E. long. 78° 2'.

RACHOSIS, from ῥακοω, *lacero*, a difeafe, in which the fcrotum is relaxed and excoriated.

RACHOUR, in *Geography*, a town of Hindooftan, in the circar of Gurry Mundella; 20 miles S.S.W. of Gurrah.

RACHOURE, a town of Hindooftan, in Myfore; 20 miles S. of Gurramconda.

RACHOW, a town of Poland; 36 miles S.S.W. of Lublin.

RACINE, JOHN, in *Biography*, an eminent French poet, was born in 1639. He was educated at the convent of Port-Royal, near Paris; after this he went through a courfe of philofophy at the college of Harcourt, and then made his appearance before the public in an ode on the king's marriage. This effort was, through the intereft of Colbert, rewarded with a prefent and a fmall penfion. Elated with the fuccefs that crowned his firft effort, he determined to follow poetry as a profeffion; and, rejecting the offer of an uncle, a prior, who offered to refign his benefice to him, provided he would enter into holy orders, he fixed his refidence at Paris. In 1664 he brought upon the ftage his firft tragedy, entitled "La Thebaide ou les Freres ennemis." It was written in the manner of Corneille, which he foon after quitted for one of his own; a judicious change, fays a critic, fince the characteriftics of thefe two mafters of the French drama were extremely different. He next publifhed his "Alexandre," which was followed by his "Andromaque." About this time he was prefented to the priory of Epinay, but not being in orders, he was, after a law-fuit, obliged to quit. His "Andromaque," which eftablifhed his character as a tragedian, was foon followed by the comedy "Les Plaideurs," which, though it obtained for him the praife of Moliere, and was well received at court, was his only attempt in that walk. Between the years 1670 and 1678, he publifhed his "Britannicus," "Berenice," "Bajazet," "Mithridate," "Ephigene," and "Phædre." His popularity and well-earned reputation excited a ftrong party againft him: the chagrin which he underwent from the artifices of his enemies, and the over-fenfibility to criticifm, which led him to confefs, in the confidence of friendfhip, that the worft critique made upon his works caufed him more uneafinefs than the greateft plaudits had given him pleafure, infpired him with the refolution of renouncing poetry and turning Carthufian. He was, however, perfuaded to change his plan, and to marry: he accordingly formed an alliance with the daughter of a gentleman in the treafury of Amiens, by whom he had feveral children. At the fame time he ceafed to write for the ftage, and thereby reconciled himfelf with his old friends of the Port-Royal. Racine now became a courtier, and obtained the fituation of gentleman in ordinary to the king, to whom he made himfelf very ufeful. He was alfo appointed to the office of hiftoriographer-royal, in conjunction with his friend Boileau, which they made a complete finecure. He was prevailed upon by madame Maintenon to write a dramatic piece on a fcriptural fubject, for the ladies of her foundation of St. Cyr, and his "Efther" was performed by them in 1689, with great applaufe, in the prefence of the whole court. He followed it with "Athalie," acted by the fame ladies in 1691. Madame Maintenon, deeply affected with the miferies of the people in the latter years of Lewis's reign, engaged Racine to draw up a memoir on the fubject. This he did in fo free a manner, as to give great offence to the king, who happened to obtain a fight of it from a lady to whom it had been lent. Racine was excluded from the court, a circumftance that fo preyed upon his mind, that he fell into a ftate of melancholy, of which he died in 1699, at the age of 60. For a character of this writer we fhall be indebted chiefly to the General Biography. He was polite in his manners, with the affected foftnefs of a courtier, which was, however, a mafk to his actual difpofition, for, in reality, he had much gall and fpleen in his character. Religion, however, corrected, in a good meafure, thefe defects, and in all the relations of domeftic life he was exemplary. As a dramatic writer he is fuppofed to have ranked with Corneille, though in many points he even furpaffed him. His characteriftics are tendernefs,

nefs, elegance, correctnefs, good tafte, refined fentiments, and the art of verfifying in a fupreme degree, fo that his countrymen find a charm in his lines, which diftinguifhes them from other French poetry. The criticifms of Boileau contributed much to his excellence in this particular, and he is faid to have taught him, as a great fecret, to write the fecond line of a couplet firft. With refpect to the proper dramatic merit, Racine muft be judged by thofe who are formed to the French fchool, and are not readily wearied with long fpeeches, rather defcriptive of feeling than expreffing it, and all refinements of the tender paffion, often applied to characters, to which it is hiftorically unfuitable. Many parts of his beft pieces, however, prove that his mind was well furnifhed with elevated and dignified fentiments, which he probably derived from an affiduous ftudy of the ancients. Befides his dramatic works, Racine was author of "Cantiques," replete with the unction of tender devotion; "L'Hiftoire de Port-Royal;" "Idylle fur la Paix;" "Epigrams;" Letters;" and fome "Opufcules." He was member of the French academy from 1673, and as director of that inftitution he pronounced the eulogy of Corneille. The beft edition of his works is in feven vols. 8vo. 1768.

Racine, Louis, fon of the preceding, alfo a diftinguifhed poet, was born at Paris in 1692. He was, however, not more diftinguifhed for his poetry than for his piety, and adopted the ecclefiaftical habit. In a ftate of retirement, in 1720, he publifhed his poem "On Grace." The chancellor d'Augeffeau, during his own exile at Frefnes, brought Racine again into the world, and cardinal Fleury afterwards gave him a place in the finances. He married, and lived very happily in his family, till the lofs of an only fon threw him into a deep melancholy. His religious fentiments took full poffeffion of his foul, the fervour of which may be eftimated by the line from Tibullus which he infcribed on the crucifix which ever accompanied him:

"Te fpectem fuprema mihi cum venerit hora,
Te teneam moriens deficiente manu."

He died in 1763, at the age of 71. His poetical writings are "Poems on Religion and Grace;" "Odes," of which the diction is fplendid, and the fentiments elevated; "Epiftles," and a "Tranflation of Milton's Paradife Loft." In profe he wrote "Reflexions fur la Poefie;" "Memoires fur la Vie de Jean Racine;" "Remarques fur les Tragedies de J. Racine:" befides thefe he contributed feveral differtations to the Memoires of the Academy of Infcriptions, of which he was a member. His works were collected and publifhed in 6 vols. 12mo.

Racine, Bonaventure, a learned French prieft and ecclefiaftical hiftorian, was born at Chauny, in the diocefe of Noyon, in the year 1708. He received an excellent education at the Mazarin college at Paris, where he not only ftudied the ancient languages, but entered pretty fully into the different branches of philofophy, divinity, and the ftudies connected with ecclefiaftical hiftory. At the age of twenty-one he was entrufted by the archbifhop of Alby, as a fit perfon, to re-eftablifh the college of Rabaftens, a town in his diocefe. To this defign he devoted his talents with unwearied zeal and affiduity, and was abundantly compenfated by the fuccefs which attended his labours. The inftitution was, in a fhort time, crowded with ftudents, who imbibed from his lectures a tafte for fcience and literature. Thus ufefully engaged, he became an object of the jealoufy of the witty Jefuits, who caufed him to be banifhed from Rabaftens. He retired to Montpelier, where M. Colbert engaged him to undertake the direction of the college of Lunel: from this place he was alfo driven by the fame perfecutors, and he found it neceffary to withdraw fecretly to Paris, where he was invited to undertake the education of certain young perfons at the college of Harcourt, in connection with fome other ecclefiaftics. Here his old enemies the Jefuits purfued him, and an order was obtained from cardinal Fleury, in 1734, to deprive him of his office of tutor. In the following year M. de Caylus, bifhop of Auxerre, nominated him to a canonry in his cathedral, and ordained him prieft; but his new dignity produced no alteration in his manner of living, nor in the diftribution of his time, which was almoft wholly fpent in devotion and ftudy. From this time he fet about preparing to publifh the collections that he had made in ecclefiaftical hiftory, and in 1748 he fent into the world the firft volumes of an "Abridgment of Univerfal Hiftory, containing the principal Events in every Century, with Reflections," in 12mo. Thefe were followed by others, to the number of thirteen, the laft making its appearance in the year 1754. This work, written in a neat, perfpicuous, and fimple ftyle, was well received, and became extremely popular. The labour which it coft him his weak conftitution was unable to fuftain; he funk under his exertions in the 47th year of his age. He was characterifed by the excellence of his manners and the amiablenefs of his temper, and he had an ardent zeal for what he regarded as truth, which approached to enthufiafm. Two other volumes have been added fince his death to the Hiftory, but they are the work of an inferior hand, and unworthy of being placed in conjunction with thofe of Racine. Moreri.

RACING, the riding of heats for a plate or other premium. Horfes for this ufe fhould be as light as poffible, large, long, and well-fhaped, nervous, of great mettle, and good wind, with fmall legs, and neat fmall-fhaped feet.

The firft thing to be confidered in this fort of gaming is the choice of a rider; for it is not only neceffary that he fhould be very expert and able, but he muft alfo be very honeft.

He muft have a very clofe feat, his knees being turned clofe to the faddle fkirts, and held firmly there, and the toes turned inwards, fo that the fpurs may be turned outward to the horfe's belly; his left hand governing the horfe's mouth, and his right the whip. During the whole time of the race, he muft take care to fit firm in the faddle, without waving or ftanding up in the ftirrups. Some jockies fancy this is a becoming feat, but it is certain, that all motions of this kind do really incommode the horfe. In fpurring the horfe, it is not to be done by fticking the calves of the legs clofe to the horfe's fides, as if it were intended to prefs the wind out of his body; but, on the contrary, the toes are to be turned a little outwards, that the heels being brought in, the fpurs may juft be brought to touch the fides. A fharp touch of this kind will be of more fervice toward the quickening of a horfe's pace, and will fooner draw blood than one of the common coarfe kicks. The expert jockey will never fpur his horfe until there is great occafion, and then he will avoid ftriking him under the fore-bowels between the fhoulders and the girt; this is the tendereft part of a horfe, and a touch there is to be referved for the greateft extremity.

As to whipping the horfe, it ought always to be done over the fhoulder, on the near fide, except in very hard running, and on the point of victory; then the horfe is to be ftruck on the flank with a ftrong jerk; for the fkin is the moft tender of all there, and moft fenfible of the lafh.

When a horfe is whipped and fpurred, and is at the top of his fpeed; if he claps his ears in his pole, or whifks his tail, it is a proof that the jockey heats him hard, and then he ought to give him as much comfort as he can, by faw-

ing

ing the fnaffle backwards and forwards in his mouth, and by that means forcing him to open his mouth, which will give him wind, and be of great fervice. If there be any high wind ftirring in the time of riding, the artful jockey will let his adverfary lead, holding hard behind him, till he fees an opportunity of giving a loofe; yet in this cafe, he muft keep fo clofe behind, that the other horfe may keep the wind from him; and that he, fitting low, may at once fhelter himfelf under him, and affift the ftrength of the horfe. If the wind happen to be in their back, a juft contrary method is to be taken with it; the expert jockey is to keep directly behind the adverfary that he may have all the advantage of the wind to blow his horfe along, as it were, and at the fame time intercept it in regard to his adverfary.

When running on level carpet-ground, the jockey is to bear his horfe as much as the adverfary will give him leave, becaufe the horfe is naturally more inclined to fpend himfelf on this ground: on the contrary, on deep earths he may have more liberty, as he will there fpare himfelf.

In riding up hill the horfe is always to be favoured, by bearing him hard, for fear of running him out of wind; but in running down hill, if the horfe's feet and fhoulders will bear it, and the rider dares venture his neck, he may have a full loofe. If the horfe have the heels of the reft, the jockey muft always fpare him a little, that he may have a referve of ftrength, to make a pufh at the laft poft.

A great deal depends on the jockey's knowing the nature of the horfe that is to run againft him; for by managing accordingly, great advantages are to be obtained: thus, if the oppofite horfe is of a hot and fiery difpofition, the jockey is either to run juft behind him, or cheek by joul with him, making a noife with the whip, and by that means forcing him on fafter than his rider would have him, and confequently fpending him fo much the fooner; or elfe keep juft before him, in fuch a flow gallop, that he may either over-reach, or by treading on the heels of the fore horfe, endanger tumbling over.

Whatever be the ground that the adverfary's horfe runs worft on, the cunning jockey is to ride the moft violently over; that by this means it will often happen, that in following he either ftumbles or claps on the back finews. The feveral corrections of the hand, the whip, and the fpur, are alfo to be obferved in the adverfary, and in what manner he makes ufe of them: and when it is perceived, by any of the fymptoms, of holding down the ears, or whifking the tail, or ftretching out the nofe like a pig, that the horfe is almoft blown, the bufinefs is to keep him on to this fpeed, and he will be foon thrown out, or diftanced. If the horfe of the opponent looks dull, it is a fign his ftrength fails him; and if his flanks beat much, it is a fign that his wind begins to fail him, and his ftrength will foon do fo too.

After every heat for a plate, there muft be dry ftraw, and dry cloths, both linen and woollen, ready to rub him down all over, after taking off the fweat with what is called a fweat-knife; that is, a piece of an old fword-blade, or fome fuch thing. Some advife the fteeping of the cloths in urine and faltpetre the day before, and letting them be dried in the fun for this occafion. After the horfe has been well rubbed with thefe, he fhould be chafed all over, with cloths wetted in common water, till the time of ftarting again. When it is certainly known that the horfe is good at the bottom, and will ftick at the mark, he fhould be rid every heat to the beft of his performance; and the jockey is, as much as poffible, to avoid riding at any particular horfe, or ftaying for any, but to ride out the whole heat with the beft fpeed he can. If, on the contrary, he has a fiery horfe to ride, and one that is hard to manage, hard-mouthed, and difficult to be held, he is to be ftarted behind the reft of the horfes with all imaginable coolnefs and gentlenefs; and when he begins to ride at fome command, then the jockey is to put up to the other horfes; and if they ride at their eafe, and are hard held, they are to be drawn on fafter; and if it be perceived that their wind begins to rake hot, and they want a fob, the bufinefs is to keep them up to that fpeed; and when they are all come within three quarters of a mile of the poft, then is the time to pufh for it, and ufe the utmoft fpeed in the creature's power.

When the race is over, the horfe is immediately to be clothed up, and rode home; and immediately on his coming into the ftable, the following drink is to be given him. Beat up the yolks of three eggs, and put them into a pint and a half of new milk made warm; let there be added to this three pennyworth of faffron, and three fpoonfuls of fallad-oil, and let the whole be given with a horn. After this he is to be rubbed well down, and the faddle-place rubbed over with warm fack, and the places where the fpurs have touched, with a mixture of urine and falt, and afterwards with a mixture of powder of jet and Venice turpentine; after this he fhould have a feed of rye-bread, then a good mafh, and at fome time after thefe as much hay and oats as he will eat. His legs, after this, fhould be bathed fome time with a mixture of urine and faltpetre.

For the preparation of the horfe before running, &c. fee Plate.

We fhall here obferve, that horfe-races were a fpecies of amufement known in England in very early times. Fitz-Stephen, who wrote in the days of Henry II. records the great delight which the citizens of London took in the diverfion. Races appear likewife to have been in vogue in the reign of queen Elizabeth, and to have been carried to fuch excefs as to have injured the fortunes of the nobility. Lord Herbert of Cherbury (fee his Life by Mr. Walpole, p. 51.) enumerates thefe among the fports which he thought unworthy of a man of honour. "The exercife," fays he, "I do not approve of is running of horfes, there being much cheating in that kind; neither do I fee why a brave man fhould delight in a creature whofe chief ufe is to help him to run away." Jarvis Markham, who wrote on the management of horfes in 1599, mentions running horfes; but at this time there were only private matches made between gentlemen, who were their own jockies, and rode their own horfes. However, in the following reign of James I., public races were eftablifhed; and Garterly, in Yorkfhire, Croydon, near London, and fometimes Theobald's, near Enfield-chace, where the king refided, were the courfes in which they were performed. The horfes at this time were prepared for running by the difcipline of food, phyfic, airing, and fweats and clothing, which compofe the prefent fyftem. The weight alfo which each horfe was to carry was rigidly adjufted; the ufual weight of the riders being ftated at ten ftones, who were put into fcales, and weighed before they ftarted. Moft of the celebrated races in the kingdom were called bell-courfes, the prize and reward of the conquering horfes being a bell. To this purpofe, Camden fays, that in 1607 there were races near York, and the prize was a little golden bell. Upon this Berenger offers a conjecture, whether the phrafe of *bearing the bell*, which implies being comparatively the beft or moft excellent, and correfponds with the expreffion of bearing the palm among the ancients, as a reward decreed to the fwifteft horfe in a race, is not more aptly deduced from this cuftom,

cuftom, than from the method of tying a bell round the neck of the fheep, which leads the flock, and is, therefore, counted the beft.

About the latter end of the reign of Charles I. it was cuftomary to have races performed in Hyde Park. See the Comedy of the Merry Beggars, or Jovial Crew, written in 1641, in Dodfley's Collection of Old Plays.

Racing was much encouraged by Charles II. after his reftoration: he gave public rewards and prizes, and appointed races for his own amufement at Datchet Mead, when he refided at Windfor. But the moft diftinguifhed fpot for thefe exercifes was Newmarket, which was at firft frequented for the purpofe of hunting, and feems not to have been deftined to be a horfe-courfe till fome time before the troubles of the reign of Charles I., when races were difcontinued; but they were revived foon after the Reftoration. The king attended in perfon, and eftablifhed a houfe for his accommodation, and kept and entered horfes in his own name. Inftead of bells, a filver bowl or cup, of the value of a hundred guineas, was allotted for a prize; and upon this royal gift the exploits of the fuccefsful horfe, and his pedigree, were generally engraved. The fum of a hundred guineas is now given in lieu of the filver bowl.

When William III. was advanced to the throne, he not only added to the plates given to different places in the kingdom, but founded an academy for riding. Queen Anne continued the bounty of her predeceffors, with the addition of feveral plates. George I., towards the end of his reign, difcontinued the plates, and gave the fum of a hundred guineas in their room.

In the thirteenth year of George II. an act was paffed for the fuppreffion of races by poneys, and other fmall and weak horfes, by which all matches for any prize under the value of 50*l.* are prohibited, under a penalty of 200*l.*, to be paid by the owner of each horfe running, and 100*l.* by fuch as advertife the plate; and by which each horfe entered to run, if five years old, is obliged to carry ten ftone; if fix, eleven; and if feven, twelve. It is alfo ordained, that no perfon fhall run any horfe at a courfe, unlefs it be his own, nor enter more than one horfe for the fame plate, upon pain of forfeiting the horfes: and alfo every horfe-race muft be begun and ended in the fame day. Horfes may run for the value of 50*l.* with any weight, and at any place. 13 Geo. II. cap. 19. 18 Geo. II. cap. 34. Pennant's Brit. Zool. vol. i. p. 6, &c. Berenger's Hift. and Art of Horfemanfhip, vol. i. p. 185, &c.

We fhall here add, that at Newmarket there are two courfes, the long and the round: the firft is exactly four miles, and about three hundred and eighty yards, *i. e.* feven thoufand four hundred and twenty yards. The fecond is fix thoufand fix hundred and forty yards. Childers, the fwifteft horfe ever known, has run the firft courfe in feven minutes and a half, and the fecond in fix minutes forty feconds; which is at the rate of more than forty-nine feet in a fecond. But all other horfes take up at leaft feven minutes and fifty feconds in completing the firft and longeft courfe, and feven minutes only in the fhorteft, which is at the rate of more than forty-feven feet in a fecond, and it is commonly fuppofed that thefe courfers cover, at every bound, a fpace of ground in length about twenty-four Englifh feet.

RACITZA, in *Geography*, a town of Bukovina; 7 miles N. of Czernaucii.

RACK, a fmall ifland near the coaft of Virginia. N. lat. 37° 19′. W. long. 75° 51′.

Rack, *Lower* and *Upper*, two fmall iflands near the coaft of Virginia; the former in N. lat. 37° 20′. W. long. 75° 50′, and the latter in N. lat. 37° 26′. W. long. 75° 45′.

Rack, an engine of torture furnifhed with cords, &c. for extorting confeffion from criminals.

The duke of Exeter, conftable of the Tower under Henry VI., with the duke of Suffolk, and others, having a defign to introduce the civil law into England; for a beginning, the *rack*, or *brake*, allowed in many cafes by the civil law, was firft brought to the Tower, where it is ftill preferved; in thofe days the rack was called the duke of Exeter's daughter. 3 Inft. 35.

It was occafionally ufed as an engine of ftate, not of law, more than once in the reign of queen Elizabeth. (Barr. 92. 496.) But when, upon the affaffination of Villiers, duke of Buckingham, by Felton, it was propofed in the privy-council to put the affaffin to the rack, in order to difcover his accomplices; the judges being confulted, declared unanimoufly, to their own honour, and the honour of the Englifh law, that no fuch proceeding was allowable by the laws of England. The uncertainty of this punifhment, as a teft and criterion of truth, was long ago very elegantly pointed out by Tully (pro Sulla, 28.); though he lived in a ftate in which it was ufual to torture flaves, in order to furnifh evidence. "Tamen," fays he, "illa tormenta gubernat dolor, moderatur natura cujufque tum animi tum corporis, regit quæfitor, flectit libido, corrumpit fpes, infirmat metus; ut in tot rerum anguftiis nihil veritati loci relinquatur."

The marquis Beccaria (ch. 16.), in an exquifite piece of raillery, has propofed this problem, with a gravity and precifion that are truly mathematical: "the force of the mufcles, and the fenfibility of the nerves of an innocent perfon being given, it is required to find the degree of pain neceffary to make him confefs himfelf guilty of a given crime."

Rack, in the *Manege*, a pace in which a horfe neither trots nor ambles, but fhuffles, as it were, between both.

The racking pace is much the fame as the *amble* (which fee); only that it is a fwifter time, and a fhorter tread.

Rack is alfo a wooden frame, made to hold hay or fodder for cattle. There has lately been much improvement made in the forming of all forts of racks, both for the ftable, cattle-fheds, and field. See Cattle-*fheds*, Stable, and Sheep-*houfe*.

Rack, in *Rigging*, a fhort thin plank, with holes made through it, containing a number of belaying-pins, ufed inftead of cleats; it is feized to the fhrouds, and nailed over the bowfprit or windlafs.—Alfo, a long fhell, containing a number of fheaves, formerly fixed over the bowfprit to lead in the running rigging. At prefent, wooden faddles, with holes in them, are nailed on the bowfprit for this purpofe. being more out of the way, and lefs liable to be out of order, See Shot-*rack*, and Shroud-*rack*.

To Rack *Wines*, &c. is to draw them from off their lees, after their having ftood long enough to clear and fettle. Hence,

Rack-*Vintage*, is frequently ufed for the fecond voyage our wine-merchants ufed to make into France for racked wines; whence they ufed to return about the end of December.

Rack-*Holders*, fuch tenants as hold their lands under fuch leafes.

Rack-*Leafes*, are fuch forts of leafes as are granted for one or more lives, at the full rack rents, as in Cornwall, and fome other counties. See Leases *of Land*.

Rack-*Rent*, is the full yearly value of land let by leafe, payable by tenant for life or years, &c. See Rent.

Rack-

Rack, *Sheep*, a fort of long narrow crib, fixed upon wheels, for containing hay for fheep, having a lid or covering on the top. It is very ufeful in bad weather, in the winter feafon, as preventing the hay from being wafted, and admitting the fheep to feed conveniently.

RACKAMA, in *Geography*, a lake of Syria, fouth of Hella and the ancient Babylon, is about 30 miles long, and flows into the Euphrates.

RACKEBY, a town of Sweden, in Weft Gothland; 40 miles N.E. of Uddevalla.

RACKET, a kind of bat for ftriking the ball at tennis; confifting ufually of a lattice, or net-work, of cat-gut, ftrained very tight over a circle of wood, with a handle or fhaft of a moderate length.

The word is formed from the French *raquette*, which Menage derives from the Latin *retetta*, a diminutive of *rete*, *net*; whence alfo *reticum*, and *reticulum*.

Pafquier obferves, that anciently they ufed no rackets at tennis, but played with the palm of the hand: and hence he conjectures it is that the French call tennis play, *jeu de paume*. He adds, that rackets were not introduced till a little before his time.

Racket is alfo a machine which the favages of Canada bind to their feet, to enable them to walk more commodioufly over the fnow; made much in the manner of a tennis-racket.

Its figure is a lozenge, of which the two obtufe angles are rounded off. It is bound about with very fine thongs of leather, and the mefhes of it are much fmaller and clofer than thofe of our rackets.

In the middle is fitted a kind of fhoe, lined with wool, or hair; to be tied on to the ankle: by which means the feet are prevented from finking in the fnow. Rackets oblige the perfon to take very long fteps, and, as we fay, to walk a great pace, to keep them from knocking againft each other.

Racket, in *Geography*, a river of New York, which runs into the St. Lawrence, N. lat. 45° 13′. W. long. 74° 42′.

RACKIBIRN, the name of a fmall ifland on the N.W. coaft of Ireland, fituated near Tiellen head, in the county of Donegal. N. lat. 54° 39′. W. long. 8° 44′.

RACKING, in *Sea Language*, denotes the faftening of two oppofite parts of a tackle together, fo as that any weighty body fufpended by it fhall not fall down, although the rope, which forms the tackle, fhould be loofened by accident or neglect. This expedient is chiefly practifed when the boats are hung up to the fhip's fide in the night, in an open road or bay, left the rope of the tackle fhould be untied by the inattention of fome of the crew, by which accident the boat might be confiderably damaged, and probably loft or dafhed to pieces. Falconer.

Racking *Fruit Liquor*, the operations of fining and drawing it off. See Cyder.

RACKLIA, in *Geography*, a fmall rocky ifland in the Grecian Archipelago, inhabited by two or three poor monks, who take care of a few fheep and goats. N. lat. 36° 53′. E. long. 25° 38′.

RACKNITZ, a town of the duchy of Carinthia; 3 miles S. of Saxenburg.

RACKOON, or Raccoon, the *urfus lotor* of Linnæus, in *Zoology*, the name by which we commonly know an American animal, called *coati* by the Brafilians. It is fomething fmaller than the beaver, and is of the fhape of the beaver in the body, and its legs are as fhort as in that creature. The face, cheeks, and chin are white; the upper part of the body is covered with hair, long, foft, and thick; black at the ends, whitifh in the middle, and afh-coloured at the root. Sometimes from this mixture of colour the back appears plainly grey; and Maregrave mentions another fpecies, which is of a deep yellow or ochre colour.

The head is very like that of the fox in fhape; but that the ears are fhorter, roundifh, and naked, and it has from the forehead to the nofe a dufky line. The eyes are large, and furrounded with two broad patches of black; the nofe is black and fharp-pointed; its tail is very bufhy, and annulated with black. Its feet are each divided into five flender toes; by the help of which it climbs trees as expertly as a monkey, and ufes the fore-feet as hands, to reach up its food to its mouth. It is a very cleanly animal; and if there be water near, it always wafhes its food, be it what it will, before it eats it. It feeds on vegetables, but is alfo very fond of eggs, and will even feize birds if it can catch them. It is alfo very fond of fweet things and ftrong liquors, and will get exceffively drunk: at low-water it feeds much on oyfters, watching their opening, and with its paw fnatching out the fifh, and is fometimes caught in the fhell. It is very common in the warm and temperate parts of America, in the mountains of Jamaica, and in the ifles of Maria in the South fea, and is a creature eafily tamed. It is hunted for its fkin; the fur, next to that of the beaver, being excellent for making hats. Ray and Pennant.

RACLER, Fr., to fcrape, to rafp, or file a hard body. It is faid, in derifion of a bad performer on the violin, or any other inftrument played with a bow, that he fcrapes or rafps the ftrings; becaufe, in fact, he draws a harfh and difagreeable tone from his inftrument, which refembles that produced by fcraping or filing a hard body. Even good players on the violin fometimes fcrape a little in the *forte* parts of their performance. Suppl. to Encycl., 1ft edit.

RACLERGUNGE, in *Geography*, a town of Bengal; 50 miles N.W. of Burdwan.

RACONIGI, a town of France, in the department of the Stura, containing four gates, with as many fauxbourgs, well peopled. The king of Sardinia had a palace here. The police is conducted by fifteen counfellors, from whom two fyndics are chofen every four months, who act as bailiffs or mayors of the town. It has two parifhes, and feveral religious houfes. The inhabitants are induftrious, and much employed in making gauzes and filk ftuffs; 6 miles N. of Savigliano.

RACOPILUM, in *Botany*, from ῥακος, *a rent in a garment*, or *a wrinkle*, and πιλος, *a hat* or *cap*, the name of one of Paliffot de Beauvois's genera of moffes, whofe veil is torn at the fide. It ought to be written *Rhacopilum*.

RACOUBEA, a name of Aublet's, of which we find no explanation. See Homalium.

RACOW, *Catechifm of*, in *Ecclefiaftical Hiftory*, a fyftem of theology compiled by the moft eminent Socinian doctors, and firft publifhed at Racow, or Rakow, in Poland, in the year 1609, with a dedication to our king James I. This catechifm, or a tranflation of it, was committed to the flames in England, in the year 1653, by order of parliament. A new edition of it, corrected and enlarged, was publifhed at Stauropolis, in 1684. The Socinians confider this catechifm as the great ftandard of Socinianifm, and an accurate fummary of the doctrine of that fect. However, Mofheim obferves, that it is, in reality, no more than a collection of the popular tenets of the Socinians, and by no means a juft reprefentation of the fecret opinions and fentiments of their doctors. Hence he fays it never obtained among them the authority of a public confeffion or rule of faith; and hence the doctors of that fect were authorifed to correct and contradict

tradict it, and to substitute another form of doctrine in its place. But to this account it has been replied, that it would have been inconsistent with the liberty, for which they argue in the preface to this catechism, to have limited their religious inquiries to this standard; and by treating it as a rule of faith, they would have violated their express declarations, that they dictated to no one, and assumed no authority. Mosh. Eccl. Hist. See RAKOW.

RACSON-COMPON, in *Geography*, a mountain of Thibet. N. lat. 31° 50'. E. long. 86° 14'.

RADA, a town of Sweden, in Warmeland; 33 miles N. of Carlstadt.—Also, a town of Sweden, in Warmeland; 35 miles S.E. of Carlstadt.—Also, a town of Sweden, in West Gothland; 5 miles W. of Gothenburg.—Also, a river of Westphalia, which runs into the Ocker, 5 miles N.E. of Goslar.

RADANAGUR, a town of Hindoostan, in Bahar; 32 miles E. of Ramgur.

RADANI, a town of Sweden, in West Gothland; 16 miles N. of Uddevalla.

RADAR, a town of Persia, in the province of Chorasan; 48 miles N. of Meschid.

RADASALMI, a town of Sweden, in the province of Savolax; 20 miles N.N.W. of Nyslot.

RADAVITZA, a town of Prussia, in the palatinate of Culm; 22 miles E.S.E. of Culm.

RADAUN, a town of Austria; 6 miles W.S.W. of Vienna.

RADAUTZ, or RADENTZ, a town of Bukovina; 22 miles W.S.W. of Saczava.

RADAWAIR, a town of Hindoostan, in Candeish; 14 miles S.W. of Burhanpour.

RADBUZA, a river of Bohemia, that rises in the S.W. part of the circle of Pilsen, and runs into the Miza, near the town of Pilsen.

RADCLIFFE, JOHN, in *Biography*, an eminent and eccentric physician, was born at Wakefield, in Yorkshire, where his father possessed a moderate estate, in the year 1650. He received the rudiments of his classical education at a school in that town; and at the age of 15, was sent to complete his studies at University college, in Oxford. He took his bachelor's degree in arts in 1669, and removed to Lincoln college, where he was elected to a fellowship. Having determined upon the profession of physic, he went through the courses of botany, chemistry, and anatomy, and was distinguished by the rapidity of his attainments in all these pursuits. Nevertheless he did not apply with zeal or industry to the studies of the closet, and recommended himself rather by his vivacity, acuteness, and wit, than by any extraordinary acquisitions in any department of knowledge. In the prosecution of his medical inquiries, he contented himself with looking into the works of Dr. Willis, who was at that time practising in London with much reputation. He was possessed, indeed, of very few books; insomuch that when Dr. Bathurst, head of Trinity college, asked him once with surprise where his study was? he pointed to a few vials, a skeleton, and a herbal, and said, "Sir, this is Radcliffe's library." He took the degree of master of arts in 1672, and in 1675 he proceeded bachelor of medicine, and immediately began to practise in Oxford. He professed to pay very little regard to the rules which were generally followed, but censured them on many occasions with great freedom and acrimony; a conduct which did not fail to draw upon him the enmity of all the old practitioners. Nevertheless his reputation and his practice rapidly increased; and before he had been two years in the world, he was very generally consulted, even by those of the highest rank. About this time, in consequence of some witticisms, which he had launched with his accustomed freedom against Dr. Marshall, rector of Lincoln college, the latter unkindly opposed his application for a dispensation for taking holy orders, which the statutes required, if he retained his fellowship, and shewed other tokens of incivility; which induced Radcliffe to resign his fellowship, quit the college, and take lodgings in the town. He continued to practise at Oxford, increasing alike in wealth and reputation, until 1684, having taken the degree of doctor in 1682; and he then determined to remove to London, and settled himself in Bow-street, Covent Garden.

His success in the metropolis was unusually rapid; and doubtless his wit and pleasantry, which rendered him a most entertaining companion, contributed scarcely less than his reputed skill in his profession to forward his progress. In less than a year he was in full practice; and in the second year, he was appointed physician to the princess Anne of Denmark. In 1688, when prince George of Denmark joined the prince of Orange, and the princess retired to Nottingham, in a state of pregnancy, he was pressed by bishop Compton to attend her, in quality of his office; but he excused himself on account of the multiplicity of his patients. After the revolution, he was consulted by king William and the nobility about his court; an honour which he must have owed entirely to his high reputation, for he never shewed any inclination to be a courtier. By his rough independence of spirit and freedom of language, indeed, he ultimately lost all favour at court. In 1699, when king William returned from Holland in a state of severe indisposition, he sent for Radcliffe, and shewing him his swollen ankles, while the rest of his body was emaciated, said, "What think you of these?"—"Why truly," replied the physician, "I would not have your majesty's two legs for your three kingdoms." This freedom was never forgiven by the king, and no intercessions could ever recover his favour towards Radcliffe. In 1694, when queen Mary caught the small-pox, and died, Radcliffe was accused, bishop Burnet says, of negligence and unskilfulness. He soon afterwards lost the favour of princess Anne, by neglecting to obey her call from his too great attachment to the bottle, and another physician was appointed in his place. When queen Anne came to the throne, the earl of Godolphin exerted all his endeavours to reinstate him in his former post of chief physician; but she refused, alleging that Radcliffe would send her word again, "that her ailments were nothing but the vapours." Nevertheless he is said to have been consulted in all cases of emergency, in a private way. In 1703 Dr. Radcliffe had an alarming and dangerous attack of pleurisy, which he neglected, and increased in the outset by drinking a bottle of wine: he had, however, 100 ounces of blood taken from him by Mr. Bernard, the serjeant surgeon; and the next day, in spite of all intreaties, was carried to Kensington. His escape was almost miraculous. The queen asked Mr. Bernard how he did? and when he told her that he was ungovernable, and would observe no rules, she answered, that then nobody had reason to take any thing ill from him, since it was plain he used other people no worse than he used himself. During this illness he made a will, by which he disposed of the greater part of his property for charitable purposes, appropriating particularly several thousand pounds for the relief of sick seamen set on shore. He recovered, however, and continued in full occupation in his profession, increasing in wealth and insolence to the end of his days, and waging a perpetual war with his brethren; who, in their turn, represented him as an active, ingenious, adventuring empiric, whom constant practice

practice had brought at length to fome fkill in his profeffion. His caprice in the performance of his profeffional duties appears to have been unbounded; and many anecdotes are related of his refufal to attend on perfons of diftinction, if he happened to be engaged in pleafant company, or had any perfonal pique againft the individuals, or if he conceived himfelf in any way affronted. Thus he fet off fuddenly for Bath in 1704, while attending the lady of fir John Trevor, becaufe that gentleman fent to Oxford for Dr. Breach to confult with him; which he had done as a compliment to Radcliffe, rather than join any of the London phyficians with him. When Mr. Harley was ftabbed by Guifcard, Swift complains, that by the caprice of Radcliffe, who would allow none but his own furgeon to be admitted, "he had not been well looked after;" and adds in another place, "Mr. Harley has had an ill furgeon, by the caprice of that puppy Dr. Radcliffe, which kept him back fo long." On the other hand, he attended the lady of fir John Holt in a bad illnefs, with unufual diligence, out of pique to the hufband, who was not fuppofed to be over fond of her. In the laft illnefs of queen Anne, he was fent for to his country-houfe at Carfhalton about noon, by order, as one account affirms, of the privy council; but he returned an anfwer, that "he had taken phyfic, and could not come." It has been ftated, however, on the other hand, that he was only fent for on this occafion by lady Marfham, without any order from the queen or the council; which is countenanced by the following circumftances. On the 5th of Auguft, four days after the queen's death, a friend of the doctor's moved in the houfe of commons, that he might be fummoned to attend in his place, (Dr. Radcliffe had been elected a member for Buckingham in 1713,) in order to be cenfured for not attending on her majefty. A letter is preferved, faid to have been written by the doctor to one of his friends, on this occafion, in which he fays, "I know the nature of attending crowned heads in their laft moments too well, to be fond of waiting upon them, without being fent for by a proper authority. You have heard of pardons being figned for phyficians before a fovereign's demife; however, ill as I was, I would have went to the queen in a horfe-litter, had either her majefty, or thofe in the commiffion next to her, commanded me to do fo." Whatever was the true ftate of the cafe, it is certain that Dr. Radcliffe became fo much the object of popular refentment, that he was apprehenfive of being affaffinated, as appears from a letter addreffed by him to Dr. Mead, which is extant. "Nor fhall I be at any time from home," he fays, "becaufe I have received feveral letters, which threaten me with being pulled to pieces, if ever I come to London." He furvived the queen but three months, and died at Carfhalton, on the 1ft of November 1714, at the age of 64. It was believed, that the dread which he had of the populace, and the want of company in his retirement, which he did not dare to leave, contributed to accelerate his death. He was carried to Oxford, and buried in St. Mary's church in that city.

It does not appear that Dr. Radcliffe ever attempted to write, and probably he would not have fucceeded as an author. He was believed, indeed, to have been very little converfant with books; which made Dr. Garth humoroufly fay, that "for Radcliffe to inftitute a library, was as if an eunuch fhould found a feraglio." He was often the fubject of the attacks of ridicule from poets and wits, and even was not fpared on the ftage; having been feverely fatirized in a piece acted in 1704, foon after a legal difpute with an apothecary, which was attended by the ladies of the court, and in which the paffages affronting the doctor were much applauded. Swift, in Martinus Scriblerus, and Steele in the Tatler, levelled their ridicule at the doctor; and the following fevere portrait of him was drawn by Dr. Mandeville, in his Effay on Charity Schools. "That a man with fmall fkill in phyfic, and hardly any learning, fhould by vile arts get into practice, and lay up great wealth, is no mighty wonder; but that he fhould fo deeply work himfelf into the good opinion of the world as to gain the general efteem of a nation, and eftablifh a reputation beyond all his contemporaries, with no other qualities but a perfect knowledge of mankind, and a capacity of making the moft of it, is fomething extraordinary. If a man arrived to fuch a height of glory, fhould be almoft diftracted with pride, fometimes give his attendance on a fervant, or any mean perfon, for nothing, and at the fame time neglect a nobleman that gives exorbitant fees; at other times, refufe to leave his bottle for his bufinefs, without any regard to the quality of the perfons that fent for him, or the danger they are in:—if he fhould be furly and morofe, affect to be a humourift, treat his patients like dogs, though people of diftinction, and value no man but what would deify him, and never call in queftion the certainty of his oracles:—if he fhould infult all the world, affront the firft nobility, and extend his infolence even to the royal family:—if, to maintain as well as to increafe the fame of his fufficiency, he fhould fcorn to confult with his betters on what emergency foever, look down with contempt on the moft deferving of his profeffion, and never confer with any other phyfician but what will pay homage to his fuperior genius, creep to his humour, and never approach him but with all the flavifh obfequioufnefs a court flatterer can treat a prince with:—if a man in his life-time fhould difcover, on the one hand, fuch manifeft fymptoms of fuperlative pride, and an infatiable greedinefs after wealth at the fame time; and on the other, no regard to religion, or affection to his kindred, no compaffion to the poor, and hardly any humanity to his fellow-creatures:—if he gave no proofs that he loved his country, had a public fpirit, or was a lover of arts, of books, or of literature:—what muft we judge of his motive, the principle he acted from, when after his death we find that he has left a trifle among his relations, who ftood in need of it, and an immenfe treafure to an univerfity that did not want it."

Whatever may be the motives of the endowers of fplendid inftitutions for the public ufe, the nation is at all events benefited for ages, by fuch noble eftablifhments as the library and infirmary which he founded at Oxford, and which bear his name. He alfo endowed two travelling fellowfhips, with an annual income of 300*l.* attached to each. He had previoufly caufed the beautiful eaft window, over the altar, in Univerfity college, to be put up at his own expence; and likewife given the money, which was paid for the erection of the mafter's lodge there, making one fide of the eaftern quadrangle. He was certainly avaricious to the extent almoft of fpunging, and never could be induced to pay bills without much following and importunity. A piece of waggery would fometimes conquer this difpofition. A pavior, after long and fruitlefs attempts, once caught him juft getting out of his chariot, at his own door, in Bloomfbury fquare, and fet upon him. "Why, you rafcal," faid the doctor, "do you pretend to be paid for fuch a piece of work? Why, you have fpoiled my pavement, and then covered it over with earth to hide your bad work."—"Doctor," faid the pavior, "mine is not the only bad work the earth hides."—"You dog you," faid the doctor, "are you a wit? You muft be poor; come in:" and he paid him. He told Dr. Mead, that the great fecret by which he might make his fortune was to "ufe all mankind ill." Dr. Mead, however, adopted the contrary axiom, and fucceeded even beyond his advifer. Notwithftanding that Radcliffe feems to have literally practifed this principle, in his dealings both with his patients and his brethren; and notwithftanding the fevere accufations of ignorance and empiricifm, which were every where levelled againft him; the univerfal reputation, which he acquired and maintained, feems to fanction the teftimony of Dr. Mead, that "he was defervedly at the head of his profeffion, on account of his great medical penetration and experience." See Atterbury's Epiftolary Correfpondence. The Richardfoniana. Pope's Works, vol. vii. Swift's Works, vol. xix. Hutchinfon's Biographia Medica.

RADDELE, in *Geography*, a town of Ceylon, on the eaft coaft; 5 miles N.E. of Trincoli.

RADDINSDORP, a town of the duchy of Holftein; 6 miles E.S.E. of Eutyn.

RADDLE, in *Agriculture*, a red ochre of iron, which, according to Dr. Darwin, has been found ufeful as a manure in the northern parts of Staffordfhire. Its properties have not, however, been yet chemically examined as they relate to manure. See REDDLE.

RADEBURG, in *Geography*, a town of Saxony, in the margraviate of Meiffen; 10 miles N.E. of Drefden. N. lat. 51° 8'. E. long. 13° 53'.

RADECHAU, a town of Bohemia, in the circle of Konigingratz; 9 miles S.E. of Trautenau.

RADEGATZ, a town of Germany, in the principality of Anhalt-Deffau; 13 miles S.S.W. of Deffau.

RADEGURRY, a town of Hindooftan, in Canara; 24 miles S.S.E. of Mangalore.

RADENTHAL, a town of the duchy of Carinthia; 13 miles E. of Saxenburg.

RADERAN, a town of Bohemia, in the circle of Kaurzim; 3 miles N.E. of Kaurzim.

RADERMACHIA, in *Botany*, a name originally given to the Bread-fruit, (fee ARTOCARPUS,) by Thunberg, in honour of one of his great patrons, Joachim Cornelius Matthew Radermacher, a member of the Dutch council, and Prefident of the Society of Sciences, at Batavia. The author, in his Nova Genera, p. 25, reprefents this gentleman as a moft diftinguifhed Mæcenas, and encourager of Natural Hiftory. Neverthelefs, the above name has, by common confent, given way to the expreffive one of Forfter, *Artocarpus*, which is precifely fynonimous with Bread-fruit.

RADERSBERG, in *Geography*, a town of Germany, in the principality of Culmbach; 7 miles E. of Bayreuth.

RADES, a town of Tunis, on the N.E. coaft; 5 miles S.E. of Tunis.

RADESCHE, or RATSCHACH, a town of Lower Carniola, on the Save; 10 miles N.W. of Gurckfeld.

RADHA, in *Mythology*, is the name of the confort of the Hindoo deity Krifhna. As Krifhna was an avatara, or incarnation of Vifhnu, fo Radha is underftood to be fimilarly an avatara of Vifhnu's confort Lakfhmi; thus incarnated to accompany her lord in this, his moft fplendid terreftrial manifeftation. Under the articles KRISHNA and LAKSHMI fome notice will be found on the fubject of this. Radha is feen very frequently pourtrayed and alluded to in the paintings and writings of India: Krifhna is, indeed, feldom feen without her. She is reprefented of perfect beauty, and is warmly celebrated in the amatory poetics of Hindooftan. In the elegant work of Jayadeva, entitled Gita Govinda, a paftoral drama exhibiting the loves of Krifhna and Radha, the lovely nymph is thus defcribed after a quarrel with her frolickfome and fickle lord, in the morning after the night of reconciliation, when affiction ceafed, and ecftacy crowned the recollection of paft forrows. "In the morning fhe arofe, difarrayed, and her eyes betrayed a night without flumber, when the yellow-robed god, who gazed on her with tranfport, thus, in his heavenly mind, meditated on her charms: 'Though her locks be diffufed at random; though the luftre of her lips be faded; though her garland and zone be fallen from their enchanting ftations; and though fhe hides their places with her hands, looking towards me with bafhful filence; yet, even thus difarrayed, fhe fills me with ecftatic delight.' But Radha, preparing to array herfelf before the company of nymphs could fee her confufion, fpake thus with exultation to her obfequious lover.

'Place, O fon of Yadu! with fingers cooler than fandal wood, place a circlet of mufk on this breaft, which refembles a vafe of confecrated water, crowned with frefh leaves, and fixed near a vernal bower to propitiate the god of love. Place, my darling! the gloffy powder, which would make the blackeft bee envious, on this eye, whofe glances are keener than arrows darted by the hufband of Reti. (See RETI.) Fix, O accomplifhed youth! the two gems, which form part of love's chain, in thefe ears, whence the antelopes of thine eyes may run downwards and fport at pleafure. Place now a frefh circlet of mufk, black as the lunar fpots, on the moon of my forehead; and mix gay flowers on my treffes with peacock's feathers, in graceful order, that they may wave like the banners of Kama. Now replace, O tender hearted! the loofe ornaments of my vefture; and refix the golden bells of my girdle on their deftined ftation, which refembles thofe hills where the god with five fhafts, who deftroyed Sambara, keeps his elephant ready for battle.' While fhe fpake, the heart of Yadava triumphed; and obeying her fportive behefts, he placed mufky fpots on her bofom and forehead; dyed her temples with radiant hues: embellifhed her eyes with additional blacknefs; decked her braided hair, and her neck, with frefh garlands; and tied on her wrifts the loofened bracelets, on her ankles the beamy rings, and round her waift the zone of bells, that founded with ravifhing melody."

But we muft recollect, fays the author of the Hindu Pantheon, whence this article is chiefly taken, that the feemingly amorous conflicts of thefe ardent lovers are mere myftical defcriptions of "the reciprocal attraction between the divine goodnefs and the human foul." This is the emblematical theology that Pythagoras admired and adopted; that the Sufi poets, Hafez, Sadi, and many others among the Perfians, and Solomon alfo, in his fine Song, fo beautifully inculcates. Like the enthufiafts of other days, and in a manner not eafily comprehended by the unenlightened, nor believed by them to be permanently chafte, however innocent its commencement, "they profefs eager defire, but without carnal affection; and circulate the cup, but no material goblet: in their fect, all things are fpiritual, all is myftery within myftery." See fir W. Jones's admirable Effay on the Myftical Poetry of the Perfians and Hindoos, in the third volume of the Afiatic Refearches, in which a tranflation of the Gita Govinda of Jayadeva is introduced. Under the article JAYADEVA of this work is a brief notice of his poem; and under MAHESA is an extract from it, defcriptive of the perfons and loves of this interefting couple. (See alfo PRABHA.) The reader defirous of feeing what has been faid and believed on the curious fubject of myftical or emblematical theology, may confult our articles under MYSTERY, MYSTICS, and thofe thence referred to.

Returning to Radha, we have to obferve that among the fect of Gokalaftha (fee SECTS *of Hindoos*) fhe is deemed a perfonification of religion, and fometimes called *Rukmeni*. (See

(See that article.) There is a fect faid to worfhip her exclufively, and called Radha-ballabhi: they confider her as the Sakti, or active power of Vifhnu or Krifhna. (See SAKTI.) The followers of this fect have afcribed to them the fingular practice of making their own wives perfonate Radha, and of prefenting to or through them the oblations propitiating the goddefs, or Lakfhmi, of whom, as before faid, fhe is an incarnation. There is no end to the whimficalities in the modes of human worfhip, to give them no harfher name, wherever, to ufe an oriental expreffion, we fuffer our necks to flip out of the collar of reafon. Thus in India, as hath been the cafe in other countries, there is, with feveral fects, a *right-handed* and a *left-handed* mode of worfhip; one meaning a decent, the other an indecent mode. Thofe among the fect in queftion, who follow the left-handed path, require their wives to be naked, when attending them at their devotional abominations. She is fometimes called Radhika, and Krifhna, Radhikefwara, or lord of Radhika; and fometimes the name of Kantamati is given both to her and Rukmeni. See RUKMENI and YONI.

In Radha may be recognized the Grecian Juno, and of courfe in her hufband Krifhna, or Vifhnu, the amorous Jove of that imitative race. On this point we fhall quote a paragraph from the Edinburgh Review, N° xxxiv.

"We tranflate a paffage from the Purana, entitled Brahma Vaivartica, to demonftrate the identity of character afcribed to Jupiter and Vifhnu; only premifing, that in conformity to the peculiar tenets of its author, Vifhnu is here ftiled Krifhna, and his goddefs, Rādhā. Gangā (the Ganges) was originally a nymph of wonderful beauty, who inhabited Paradife. She became enamoured of Krifhna, and, concealing her face with her robe, ftood immoveable in his prefence, her eyes fixed on his radiant countenance. The jealoufy of Rādhā (Juno) was excited. Followed by her innumerable attendants, fhe repaired to the prefence of the god, and feated herfelf on her throne of gems. The timid Gangā trembled at her afpect, and diffolved with terror. The goddefs fpeaks: "Who is this nymph, lord of the univerfe, who, with half concealed vifage, and eyes fparkling defire, thus gazes on thy facred perfon? This is not the firft time the fkies have witneffed the infidelity of their lord. When I detected thee dallying in a grove of fandal with Viraja, the figure of a quadruped concealed thy fhame, and fhe was changed into a river. Still purfued by thee fhe became the mother of the mighty ocean. The fame foreft was the fcene of thy amours with the nymph Sobhā, (beauty). Again thou affumedft the form of an animal; whilft her fpirit fled to the moon, and thou divideft her body amongft gems, flowers, and black-eyed damfels. The woods of Vrindavan afforded thee a retreat with the fhepherdefs Prabha (luftre.) On my arrival, her fpirit tranfmigrated to the folar orb; of her body thou madeft a diftribution: the god of fire obtained a part; and fome, as gold, give brightnefs to the crowns of the kings of the earth. When I found thee, unexpectedly, on a bed of vernal buds, reclined in company with the fair Xamā (patience), alarmed at my voice, thou gatheredft as they lay difperfed, thy yellow robes, thy lyre, thy necklace of flowers, and thy creft of gems. Thee I forgave when thou beftowedft a portion of her body on the pious anchoret, a portion on the fick, and a portion on the ftudious."

Such of our readers as have obtained a fhare in the latter portion, may, in the endeavour to expound this folar allegory, be repaid perhaps for ther pains; in perufing the Gita Govinda and the article in which it is comprifed, above referred to, they affuredly will.

RADHIKA, a name of *Radha*, confort of the Hindoo deity *Krifhna*, as fufficiently noticed under thofe articles.

RADHOST, in *Geography*, a mountain of Moravia, in the circle of Prerau; 12 miles E. of Meferitch.

RADHUA, a mountain of Arabia; 30 miles W. of Medina.

RADIÆUS, in *Anatomy*, an epithet applied to parts about the radius, and equivalent to *radialis;* which fee.

RADIAL CURVES. See CURVES.

RADIALIS, in *Anatomy*, a name given to parts in the fore-arm, fituated near the radius. The adjective *radial* is alfo employed to denote the edge, furface, or afpect of any part, which is towards the radius; and in this way, with the term *ulnar*, affords the means of defcribing the organs much more accurately and intelligibly, than the indefinite expreffions of *outer* and *inner*, which vary conftantly in the changing attitudes of the limb.

RADIALIS *Arteria*, is the artery of the wrift, in which the pulfe is commonly felt. See ARTERY.

RADIALIS *Carpi Extenfor*, *Longior & Brevior*. See CARPI.

RADIALIS *Carpi Flexor*. See CARPI.

RADIALIS *Externus*, *Longior & Brevior*, fynonyms of the extenfores carpi radiales, longior & brevior. See CARPI.

RADIALIS *Internus*, a fynonym of the flexor carpi radialis. See CARPI.

RADIALIS *Nervus*. The large nerve which goes behind the humerus, between two heads of the triceps, is called radial by fome anatomifts: others give this name to the nerve which lies parallel to and over the brachial artery. The firft of thefe is called alfo the mufcular fpiral nerve, the fecond the median. See NERVE.

RADIALIS *Vena*, the vein correfponding to the radial artery. See VEIN.

RADIANT HEAT. See HEAT.

RADIANT *Point*, or *Radiating Point*, is any point of a vifible object, whence rays proceed.

Every radiant point diffufes innumerable rays all round; but only thofe radiants are vifible, from which right lines may be drawn to the pupil; becaufe the rays are all right lines.

All the rays proceeding from the fame radiant continually diverge; the cryftalline collects or reunites them again.

RADIATED, in *Botany*, an epithet applied to round flat flowers, confifting of a difk, and a fingle row of longifh pointed leaves, ranged all around it in manner of rays, or fpokes.

Radiated flowers are properly fuch as have feveral femi-florets fet round a difk, fo as to refemble a radiant ftar: fuch are daifies, chamomile-flowers, fun-flowers, &c. Thefe are fometimes alfo called *radiated difcous flowers*.

A radiated flower has two parts; its middle part, which is called the difk, and which is wholly made up of flofcules; and the other part, which is called the circle or border, which is wholly made up of femi-flofcules, or elfe of plain flat leaves; but that is lefs common. The flofcules and femi-flofcules both ufually adhere to the embryos, and to the thalamus of the flower, being contained in one general cup. Thefe embryos finally ripen into feeds; fometimes furnifhed with down, fometimes with foliaceous heads, and fometimes without either, and fometimes marginated. Of thefe feeds fome are wrapped round with a kind of cafe or capfule, others are feparated from one another by fmall perpendicular leaves.

RADIATED *Leaf*. See LEAF.

The word is alfo ufed in fpeaking of medals, and in heraldry,

heraldry, where the ancient crowns are called radiated crowns, coronæ radiatæ. See CROWN.

RADIATION, in *Physics*, the action of a body diffusing rays of light as from a centre.

Every visible body is a radiating body; it being only by means of its rays that it affects the eye.

The surface of a radiating body may be conceived as consisting of radiant points.

RADIATION, *Place of*. See PLACE.

RADIATION, or *Irradiation*, is also used by some authors to express the manner of the motion of the animal spirits; on a supposition that they are diffused from the brain towards all parts of the body, through the little canals of the nerves, as light is from a lucid body. But in lieu of a radiation, the moderns rather incline to the opinion of the circulation of the spirits.

RADICAL, RADICALIS, in *Physic*, &c. something serving as a basis or foundation; or which, like a *root*, is the source or principle whence any thing arises.

The schools talk much of a radical moisture inherent in the seeds of all animals, which nourishes and preserves the vital heat or flame, as oil does a lamp; and which, when exhausted, life is extinguished.

Dr. Quincy observes, that this radical moisture is a mere chimera; unless we thereby mean the mass of blood, which is the promptuary whence all the other juices and humours are derived; and which, while it circulates, sustains life, &c.

In grammar, we use the term, radical words, for roots and primitives; in opposition to compounds and derivatives. In the Hebrew language, the letters of the alphabet are divided into *radical* and *servile*. The first constitute primitive or original words, which, by a significant metaphor, are called roots, שרשים. All the 22 letters of the alphabet may be radicals; *i. e.* primitive words may consist of any of these letters; but the following 11 letters properly claim this title, because they can never be *serviles*; *viz.* ג, ד, ז, ח, ט, ס, ע, פ, צ, ק, ר. Of whatever letters any word consists, it must at least contain one of a radical character. (See ROOT.) For an account of the servile letters, see SERVILE.

RADICAL *Numbers*, *Numeri Radicales*, in the Italian music, are 2, 3, 4, 5, 6, 7, 8, 9, and sometimes 10, which are often met with in musical compositions, to denote the accords of the thorough basses: 2 stands for the second and its duplicates; 3 for the third; 4 for the fourth, &c.

RADICAL *Leaf*, among *Botanists*. See LEAF.

RADICAL *Sign*, in *Algebra*, the sign or character of the root of a quantity.

$\sqrt{}$ is the character of radicality, and expresses the square root;

$\sqrt[3]{}$ the cube root, &c.

RADICANS, in *Botany*, rooting, a term applied to a stem which throws out fibres as it extends itself, whether those fibres be true radicles, by which the plant imbibes nourishment, and is generally increased; or whether they serve only for the support of the stem against walls, rocks, or neighbouring trees. Of the first kind, the Strawberry affords a familiar example; of the latter, the Ivy, the Virginian Creeper (*Hedera*, or rather *Vitis, quinquefolia*), and the *Bignonia radicans*, are instances.

RADICATION, the action by which plants take root, or shoot out roots.

The French Royal Academy of Sciences have made a great number of curious observations on the germination and radication of plants.

RADICLE, in *Agriculture*, that part of the seeds of plants which, upon vegetating, becomes their nascent roots. It is, in fact, the main organ or medium of nutrition, and the means by which food is imbibed or drank up from the surrounding soil or earth. The radicles, together with the leaves, therefore, constitute the *absorbent* organ of plants. See RADICULA, and ROOT.

RADICOFANI, in *Geography*, a town of Etruria, near which are two castles, one built by Didier, last king of the Lombards, and the other by Cosmo I.; 55 miles S. of Florence.

RADICONDOLI, a town of Etruria; 24 miles N.E. of Florence.

RADICULA, in *Botany* and *Vegetable Physiology*, the radicle, or fibre of the root. (See ROOT.) This term is used by Dillenius, in his Nova Genera, 121. t. 6, as a generic name, for a set of plants referred by Linnæus to SISYMBRIUM. See that article.

RADII *Pronator Quadratus*, in *Anatomy*, a muscle of the fore-arm. See PRONATOR.

RADII *Pronator Teres*. See PRONATOR.

RADII *Supinator Brevis*, } muscles of the fore-arm. See
RADII *Supinator Longus*, } SUPINATOR.

RADII *Pinnarum*, in *Ichthyology*, the little slender bones supporting the membrane, forming the fins in fishes, and called by Artedi ossicula radiata pinnarum, from their running from the base to the summit in the form of rays. See FIN, and *Anatomy of* FISH.

RADIMPOUR, in *Geography*. See RADUNPOUR.

RADIOLA, in *Botany*, so called by Dillenius, because the cells of the ripe capsule spread like the rays of a little wheel. The plant having been referred by Linnæus to the genus *Linum*, the above became its specific name; but it is now restored to the rank of a genus by the late professor Gmelin of Gottingen, as well as by the author of Flora Britannica.—Dill. Nov. Gen. 126. t. 7. Gmel. Syst. Nat. Linn. v. 2. 289. Sm. Fl. Brit. 201. Prod. Fl. Græc. Sibth. v. 1. 110. Ait. Hort. Kew. v. 1. 282.—Class and order, *Tetrandria Tetragynia*. Nat. Ord. *Gruinales*, Linn. *Caryophyllaceæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, cut about half down into four equal, permanent, wedge-shaped segments, each of which is three-cleft. *Cor.* Petals four, obovate, about the length of the calyx, alternate, with its principal segments. *Stam.* Filaments four, awl-shaped, erect, the length of the calyx; anthers roundish, of two lobes. *Pist.* Germen superior, roundish, with four grooves; styles four, terminal, very short; stigmas capitate. *Peric.* Capsule roundish, bluntly five-sided, of eight cells and eight valves. *Seeds* solitary, elliptical, compressed, very smooth.

Eff. Ch. Calyx in many segments. Petals four. Capsule superior, with eight valves and eight cells. Seeds solitary.

1. R. *millegrana*. Thyme-leaved Flax-seed. Engl. Bot. t. 893. (R. vulgaris serpyllifolia; Dill. in Raii Syn. 345. t. 15. f. 3. Jacob. Faversh. 92. Linum Radiola; Linn. Sp. Pl. 402. Fl. Dan. t. 178. Linocarpum Serpylli folio, multicaule et multiflorum; Mich. Gen. 23. t. 21. Millegrana minima; Raii Syn. ed. 2. 207. Ger. Em. 569. Chamælinum vulgare; Vaill. Parif. t. 4. f. 6.) — Native of sandy ground, overflowed by clean fresh water, throughout Europe, flowering in July and August; but not a very general English plant. The *root* is annual, small, and fibrous. *Stem* an inch or two high, repeatedly forked, corymbose, spreading, leafy, round, nearly smooth, many-flowered, often reddish. *Leaves* opposite, sessile, ovate, entire, smooth, scarcely a quarter of an inch long. *Flowers* small, white, on short, simple, solitary stalks from the forks of the stem.—Gmelin has erred considerably in

 the

the generic character and name, as well as in his reference to Linnæus. The *calyx* is many-cleft, not composed of four distinct leaves; the plant has hardly any thing of the aspect of a *Linum*, and therefore cannot properly be called *linoides;* neither has it been published as a genus, under the name of *Radiola*, by Linnæus, as Gmelin's reference to the 12th edition of Syst. Nat. indicates.

RADIOMETER, a name which some writers give to the *radius astronomicus*, or Jacob's staff. See FORE-STAFF.

RADISH, in *Botany*. (See RAPHANUS.) The radish is much grown, according to the author of the Agricultural Survey of the County of Kent, on the best rich loamy soils of the Isle of Thanet, and in East Kent, for the supply of the London seedsmen. The sorts usually cultivated for this use are, the early short top, the salmon, and the turnip-rooted radish.

The land for the growth of this sort of crop should be in a fine state of preparation, by being ploughed to a great depth in the early part of the winter, and broken well down by harrowing, so as to render it perfectly clean from weeds, being previously filled with well reduced manure. The ground being brought into this fine condition, the seed is sown on furrows about ten inches apart, in a dry time in the month of March, about two or three gallons *per* acre. And as soon as the plants appear, every other row is cut up with a horse-hoe, leaving the rows twenty inches apart. When the plants get two or three rough leaves, they are hoed out in rows, and are then kept clean by repeated horse and hand-hoeing, when necessary, leaving the plants at about eighteen inches distance. It is added, in the above Report, that the crop is seldom fit to reap till October, and sometimes is out in the fields till Christmas, without receiving injury from wet weather; it being necessary that it should have much rain to rot the pods, that it may thrash well. In respect to the produce, it is from eight to twenty-four bushels *per* acre: and it is sold to the London seedsmen, who send it to all parts of the kingdom for retailing to the gardeners.

It is probable that this sort of crop might be grown in many other districts near the metropolis, or other large towns, with equal success, where the soil is of a rich loamy nature, as it is very easy in its culture, and requires but little labour or trouble. As it is necessary for it to remain out such a length of time, however, it will be proper, especially in wet seasons, to keep the stems from falling too much upon the ground, as they and the seed may be injured by being too much in contact with it. If kept up in this way, the stalks, seed-husks, and other offal parts, may also form a good cut food for some sorts of live-stock, as is the case with some other similar sorts of crops.

RADISH, *Horse*. See COCHLEARIA *Armoracia*.

RADIUS, in *Anatomy*, that bone of the fore-arm which extends from the humerus to the wrist, in the line carried from the external condyle of the former bone to the thumb. See EXTREMITIES.

RADIUS, *Dislocations and Fractures of*. See FRACTURE and LUXATION.

RADIUS, in *Botany* and *Vegetable Physiology*, means the aggregate marginal florets, of compound flowers, each generally of an oblong form, and all spreading from the centre, or disk, like rays. Such are the white florets of the Daisy, and blue, purple or red ones, for the most part, of the *Aster*. The usual shape of the limb or border of such florets is ligulate; either linear, or elliptical; rarely, as in *Achillea*, short and roundish; the extremity having three or five teeth. In some compound flowers the *radius* consists of tubular florets, as in *Centaurea;* and those are neuter, destitute of organs of fructification. The ligulate radiant florets above-mentioned are either female, producing perfect seed; or they are abortive, with more or less imperfect traces of a pistil. Many of them have no signs of a style or stigma, but none is without so much of a germen, as serves for the basis, that supports the petal itself.

A radius is occasionally assumed by some flowers, naturally destitute of one, as in the genus *Bidens*, each species of which, by such an acquisition, becomes a *Coreopsis*, and changes its order in the *Syngenesia*, from *Polygamia æqualis*, to *P. superflua*. This change is an approach towards a double flower, in that class; being a transformation of a certain number of the perfect, or united, florets into female ones. If such a transformation be total, and all the tubular florets become ligulate, the whole flower is double, and unproductive of seed, like the double Chamomile.

RADIUS, *Ray*, in *Geometry*, the semidiameter of a circle; or a right line drawn from the centre to the circumference.

The word is derived from the Greek ῥαβδος, *rod*. Fleta uses the word radius, for a furrow.

The radius is also called, especially in trigonometry, *sinus totus;* the whole sine.

It is implied in the definition of a circle, and it is apparent from its construction, that all the radii of the same circle are equal.

RADIUS, in the *Higher Geometry*, *Radius of the evolute*, *Radius curvedinis*, or *Radius osculi*, called also the radius of concavity and the radius of curvature, is a right line representing a thread, by whose evolution from off the curve on which it was wound, the curve is formed: or it is the radius of a circle that has the same curvature in a given point of a curve with that of the curve in that point. See CURVATURE and EVOLUTE, under which articles the method of finding this radius may be seen.

RADIUS *Astronomicus*, an instrument usually called Jacob's staff, the cross-staff, or fore-staff.

RADIUS, in *Optics*. See RAY.

RADIUS, in *Mechanics*, is applied to the spokes of a wheel; because issuing like rays from its centre.

RADIUS *Vector*, is also used for a right line drawn from the centre of force in any curve in which a body is supposed to move by a centripetal force, to that point of the curve where the body is supposed to be. See CENTRAL *Force*.

RADIUS, among the Romans, a name given to the iron rod with which the boys rolled the trochus.

RADIUS *Articulatus*, in *Natural History*, a name given by Mellius, Gmelin, and some other authors, to a kind of figured fossils, of which there are a great many very different species, some of which have been described by authors among the belemnitæ, under the names of alveoli belemnitarum. Mr. Gmelin, who has taken great pains to inform himself, as well of the nature and figure of these stones, from the subjects themselves, as of their history, and the various accounts of them from other authors, observes, that the place where they are most frequent is Sweden, and that there they are no where so common as in the isle of Oeland. Volkman figures some also which he found in Silesia, and Helwing others which he collected in Prussia: he also found great numbers of them himself in Russia.

They are usually immersed in lime-stone, and though at first sight they may all appear alike, yet, on a careful examination, they will be found to differ very greatly. The most obvious general distinction, established by Gmelin, is that some of them are straight, and others crooked. The straight ones may be divided into two genera. The first of these comprehend, according to this gentleman, two species; the first smooth, and with a converging alveolus.

The

The regular and nice configuration of theſe bodies ſhews very plainly that they cannot be of mineral origin; but the ſeveral patellæ of which each is compoſed, the ſiphunculus of communication, obvious in ſeveral, and the ſhelly matter yet found remaining on many, prove them to have been once ſhell-fiſh of the univalve or tubular concamerated kind; the deſcription of which, ſo far as it can be gathered from theſe remains, muſt have been this. The ſhell muſt have been either cylindric or conic in figure, of a ſmooth ſurface, and divided into ſeveral chambers or cells; but this ſo that the ſepta which form the concamerations are not continued and whole, but in ſome part of the periphery are cut in, in the ſhape of a creſcent. Through theſe creſcents, which, ſtanding all together, make a continued canal, there has paſſed another ſhelly body of a cylindric or conic figure, alſo divided into concamerations, and that in ſuch a manner, that the ſepta which form the cells are pierced with a ſmall aperture on one ſide, which grows gradually ſmaller as the ſhell extends in length; and finally, through theſe apertures, in the concamerations, there paſſes another ſhell pointed at the end, and, like the reſt, divided into its concamerations, and pierces along its middle with a ſiphunculus. Mem. Acad. Petrop. vol. iii. p. 263.

This ſhell is, therefore, a compages of three ſhelly bodies, encloſed one within another; and, it muſt be ſuppoſed, in order to carry an analogy with other ſhell-fiſh, theſe three ſhelly bodies have communication with one another, by means of certain ſtips or perforations. The communication of theſe, one with another, ſeems all evident, from their being all found in their foſſile ſtate, filled with the ſame ſtony matter; this has, doubtleſs, been all received in at the ſiphunculus of the inner ſhell, and thence has been thrown into the ſecond, and from this into the third ſhell, ſo as to fill up all the concamerations of the outer, as well as of the inner parts. This muſt have been the caſe with theſe; and the ſeveral various ſpecies that are at this day found foſſile, muſt have owed their origin to as many different ſpecies of the ſhells. The crooked and twiſted, or wreathed kinds, which have the ſiphunculus uſually placed near the ſide, greatly approach in their ſtructure to ſome of the cornu ammonis.

RADIX, in *Botany* and *Vegetable Phyſiology*. See Root.

Radix is uſed among ſome anatomiſts for the ſole of the foot.

Radix *Carlo Sancto*; this root is found in temperate ſoils, in Mechoacan, a province of America. Its bark is eaſily ſeparated from it, is of an aromatic ſmell, and of a bitter and ſomewhat acrid taſte. The root itſelf conſiſts of very ſlender fibrils, which are eaſily ſeparated from each other. The bark is accounted ſudorific, and corroborates the ſtomach and gums: if chewed, it procures an agreeable breath. It is good for ſcurvies, catarrhs, epilepſies, haſtening deliveries, and removing hernias, and the ſmall-pox, if taken either in powder or in the form of a decoction. The Spaniards have called it by the name of St. Charles, on account of its uncommon virtues.

Radix *Entrochorum*, the root of the entrochi, a name given by ſome authors to a foſſile ſubſtance, uſually found among the entrochi, and ſeeming to have been the baſis from which they have grown. It is plainly a part of the ſtella marina arboreſcens petrified, as thoſe ſtones alſo are. This foſſile is rarely found whole, but the fragments of it are very common. When entire, it is about the ſize of a walnut; the top of it being flat, and in ſome degree reſembling the end of an entrochus, with a central hollow, but not having the leaſt appearance of the rays of thoſe ſtones. Theſe foſſils, though not properly judged of as to their origin, have yet been deſcribed by a great number of authors. Agricola, in particular, compares the form of them to a wheel. The body of this kind well reſembles indeed the nave of a wheel, the ſhape of it being conical toward one end, till you come to the top, and then a little flattened, with a hole in it. There is alſo a like hole in the oppoſite broad end of the ſame foſſil, ſeeming fit for an axle to paſs through; and there are five hollow ſtilts, or feet, iſſuing ſideways, at equal diſtances from the broad bottom, and equally carried on in the ſame direction, ſo as not amiſs to repreſent the ſpokes. At the end of each of theſe rays or ſpokes, there is a hollow, of the ſame nature with thoſe in the middle of the common entrochi, but this is cut acroſs, by a ſeam, or ſtreak of the ſame ſtone, which paſſes directly over its centre, and covers about a third part of it; this goes no farther than the mouth of the hole, but it cuts it into two, and ſhews it in the form of two eyes. Theſe radii or ſpokes are very ſeldom found ſo perfect as here deſcribed. Liſter mentions them as being formed like creſcents at the end, which may very eaſily happen from the breaking off a part of the terminating portion. Phil. Tranſ. N° 129.

Radix *Alba*, a word uſed by Dioſcordes, to expreſs the root of the dracunculus.

Radix, among *Grammarians*. See Radical, and Root.

Radix, in *Mathematics*, the ſame as root; but uſed in a different ſenſe by different authors: we ſay the *root* of an equation, but the *radix* of a ſyſtem of logarithms, the *radix* of a ſeries, the *radix* of notation, &c. meaning in all theſe caſes the fundamental quantity on which the ſyſtem is conſtructed, or that whence it has been derived, or that by means of which all other things of a like kind are compared.

Radix *of a Syſtem of Logarithms*, is that number which involved to the power denoted by the logarithm, is equal to that number. Thus, under the article Logarithms it is ſhewn, that if $r^x = a$, then x is the logarithm of a, and r is called the radix of the ſyſtem. This radix in the common or Briggs's logarithms, is 10, and in the Neperian or hyperbolic logarithms, it is 2.71828128, &c. and generally the radix of any ſyſtem of logarithms, is that number whoſe logarithm in that ſyſtem is unity.

Radix *of a Syſtem of Notation*, is that number which indicates the local value of the figures, and is in all ſyſtems repreſented by a unit and cipher (10), which is *ten* in the common ſyſtem, *two* in the binary ſyſtem, *three* in the ternary, *twelve* in the duodenary, and ſo on. See Notation.

Radix *of a Series* is uſed, by ſome authors, as a term of compariſon between any finite function, and its expanſion or developement: thus, the radix

$$\text{of } 1 - r + r^2 - r^3 + r^4 \text{ \&c. is } \frac{1}{1+r}$$

$$\text{of } 1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \frac{1}{16} \text{ \&c. is } \frac{1}{1+\frac{1}{2}}$$

$$\text{of } 1 - 1 + 1 - 1 + 1 \text{ \&c. is } \frac{1}{1+1}$$

$$\text{of } 1 - 2 + 4 - 8 + 16 \text{ \&c. is } \frac{1}{1+2}$$

$$\text{of } \frac{1}{2} - \frac{1}{4} + \frac{1}{8} - \frac{1}{16} + \frac{1}{32} \text{ \&c. is } \frac{1}{2+1}$$

$$\text{of } 1 + x + x^2 + x^3 + x^4 \text{ \&c. is } \frac{1}{1+x}$$

of

of $1 + 2x + 3x^2 + 4x^3 + 5x^4$ &c. is $\frac{1}{(1-x)^2}$

of $1 + \frac{x^2}{2} + \frac{3x^4}{8} + \frac{5x^6}{16} +$ &c. $\sqrt{\frac{1}{1-x}}$

See Dr. Hutton's Tracts, vol. i. p. 9. See alfo our article SERIES.

RAD-KNIGHTS. See REDMANS.

RADL, in *Geography*, a mountain of Stiria; eight miles S.S.W. of Landfperg.

RADLER SEE, a lake of Carinthia; fix miles N. of Saxenburg.

RADLSTEIN, a town of the duchy of Carnolia; fix miles W. of Landftrafs.

RADLSTHAL, a town of Auftria; nine miles E. of Krottau.

RADMANS. See REDMANS.

RADMANSO, in *Geography*, a fmall ifland in the Baltic, near the coaft of Sweden. N. lat. 59° 45'. E. long. 18° 44'.

RADNAGUR, a town of Bengal; 32 miles S. of Burdwan.

RADNITZ, a town of Bohemia, in the circle of Pilfen; 10 miles N.E. of Pilfen.

RADNOR, NEW, or *Maes-Yfed*, a borough and market-town in the cwmwd of Swydd Wynogion, Cantref y Clawdd, (now called the liberties of the town of New Radnor,) county of Radnor, South Wales, is fituated near the river Somergill, at the diftance of feven miles N.W. from Kington, and 156 miles W.N.W. from London. In remote times, this town was a place of great importance, as appears from its having given name to the county, but it has now dwindled into comparative poverty and infignificance. Caradog informs us, that about the year 990, Meredydd ab Owain deftroyed Radnor, in a ferocious conteft with his nephew, who had been affifting the Englifh to ravage South Wales. It recovered, however, from this difafter, and continued to flourifh till the union of Wales with England, when it began to decline, in confequence of its ceafing to be fortified and garrifoned as a frontier town. Before that period, it was furrounded by a lofty wall, and a deep moat, fome remains of which are diftinctly vifible on the weft and fouth fides. The walls, when ftanding, are traditionally faid to have been of great height. The area inclofed by them was an oblong fquare, containing about twenty-fix acres of ground, laid out into three longitudinal ftreets, which were interfected by five tranfverfe ones. Of thefe at prefent feveral have no buildings; and others are only foot paths. But though thus decayed, Radnor ftill preferves its privileges as a borough. The corporation confifts of a bailiff, twenty-five capital burgeffes, two aldermen, a recorder, a coroner, a town-clerk, and other inferior officers. The bailiff and aldermen are chofen annually from among the capital burgeffes, and are juftices of the peace. The bailiff of the preceding year is alfo a juftice of the peace; and there are befides three additional perfons nominated out of the capital burgeffes, who are invefted with fimilar authority. The diftrict over which they prefide, and fuperfede the jurifdiction of the county magiftrates, is confiderable; comprehending a circle round the town nearly ten miles in diameter. The bailiff's courts and the petty feffions are regularly held every Monday, when the bailiff, aldermen, and town-clerk attend to tranfact bufinefs relating to the borough, and have power to determine all fuits for fums under forty fhillings. The quarter-feffions for the borough are held on the Mondays after the county quarter-feffions at Prefteigne; and the fheriff's county courts for the recovery of fmall debts, are holden every alternate month here, and at the town laft mentioned. The reprefentative for the borough is chofen by the burgeffes of New Radnor, in conjunction with thofe of the boroughs of Knighton, Rhaiadar, Cefn Llys, and Cnwclas; the bailiff being the returning officer. As nothing but the circumftance of receiving parochial relief difqualifies any perfon from becoming a burgefs, the number of voters is confiderable; thofe of New Radnor are fuppofed to exceed 300, and the whole number, including thofe of the contributary boroughs, is eftimated to be about 1300. To be a capital burgefs of New Radnor, however, actual refidence within the jurifdiction is effential, which is not the cafe as to the contributary boroughs: and if a capital burgefs becomes non-refident he lofes his privileges as fuch. A benefit fociety, eftablifhed here in 1778, at prefent confifts of above 100 members, who hold their annual meetings on the 6th of January.

Weekly markets were formerly held here on Tuefdays, but thefe are, at prefent, only nominal, notwithftanding fome late attempts to reftore them. There are ftill, however, five annual fairs, and there is alfo an annual wake on the third Sunday in the month of Auguft. The parifh of Radnor is divided into three portions, of which the town of New Radnor is the principal, containing, according to the parliamentary returns of 1811, 75 houfes, and 380 inhabitants. The public buildings here are the town-hall, the prifon, and the church. The laft confifts of a nave, fouth aifle, and chancel, with a tower at the weft end.

Radnor caftle ftood on an eminence commanding the town. Of this once majeftic pile, a few fragments of walls only remain, but the entrenchments are ftill entire; the outer ward, called Baili-Glas, or the Green Court-Yard, is yet diftinct from the inner one, or keep, and is nearly in its original form. In 1773, on digging within the area of this caftle, fix or feven fmall "Gothic arches of good mafonry were difcovered," befides a variety of ancient inftruments. The foreft of Radnor extends feveral miles to the north of the town, covering the flope of a lofty eminence, from the fummit of which are very extenfive profpects. The principal feats in the vicinity are Downton-hall, the feat of Percival Lewis, efq. and Harpton-court, a feat belonging to Thomas Frankland Lewis, efq. Both thefe manfions are furrounded by beautiful fcenery, and are highly ornamental to this diftrict. About two miles weftward from the town is a celebrated water-fall, called Water-break-its-neck, feventy feet in perpendicular height; but it is extremely defective in water, except during the time of floods, when the effect produced is truly grand. At the weftern extremity of the parifh is an intrenched dyke, which formerly extended acrofs the whole vale of Radnor. War-clofe, a field to the eaftward of the town, is traditionally faid to have been the fcene of fome military conteft, but no particulars refpecting it are preferved.

Old Radnor, or *Pen-y-Craig*, is a fmall village, fituated about three miles to the fouth of New Radnor. Camden fuppofes it to have been the Magnos of Antoninus, which was garrifoned by the Phacienfian regiment in the reign of Theodofius the younger; and there feems every reafon to believe that it was a place of note in the Romo-Britifh period. The Roman road paffed clofe to the bafe of the hill upon which the village ftands. The church here is a venerable old edifice of ftone, with a maffive fquare tower at one end. A curious fcreen, richly carved in wood, extends acrofs the nave and fide aifles. Here are various monuments to the memory of members of the Lewis family of Harpton. Carlifle's Topographical Dictionary of Wales, 4to. 1813. Lipfcomb's Tour through Wales.

Radnor, a small pleasant town of America, in Delaware county, Pennsylvania. The place was originally called "Amstel" by the Dutch, who began to build here. The number of inhabitants is 925.

Radnor, a town of South Carolina; 10 miles S.W. of Edmondsbury.

RADNORSHIRE, an inland county of South Wales, is bounded on the north by the counties of Montgomery and Salop, on the east by the county of Hereford, and on the south and west by the counties of Brecknock and Cardigan. According to Mr. Clark, it contains 510 square miles, or 346,000 acres, and is politically divided into six hundreds, and fifty parishes; some of which are within the diocese of Hereford, and the remainder within that of St. David's. The parliamentary returns of 1811, state the number of its houses at 4194, and of its inhabitants at 20,900. It sends two members to parliament; one for the county, and one for the borough of New Radnor, with its contributary boroughs. The face of the country is extremely mountainous and bleak in every part of it, but it is intersected by several vallies, which are watered by the Wye, the Teme, the Lugg, the Ithan, the Eddow, and their respective subsidiary streams. These vallies afford a considerable extent both of meadow and arable land; especially the Vale of Wye-Side, and the Vale of Radnor, some portions of which are very fertile, and have a good soil and a congenial climature. In the other parts of the county, however, a barren soil, and a chilly atmosphere, are the predominant characteristics. Nearly two-thirds of its whole extent being either in a state of commonage, or lying wholly waste, agriculture has hitherto made little comparative progress here. Cattle and sheep consequently constitute the chief produce of the county. The number of the latter is indeed very great. Hence Radnorshire is famed for its supply of wool; but notwithstanding this circumstance, singular to say, the manufacture of woollen goods is totally disregarded. The raw material is sold to the manufacturers of the north, by whom the inhabitants of this county are in return furnished with cloth.

Radnorshire contains three market-towns; Presteigne, Rhaiadar, and New-Radnor. The market at the last, however, is only nominal. The county courts are held at Presteigne, which is now the most important and flourishing town in the county. (See Presteigne.) The chief remain of antiquity within its limits is Offa's Dyke, which commencing at the river Wye, near Hay, skirts the counties of Radnor and Hereford, and passes into Montgomeryshire at Pwll-y-Pyod, a hamlet on the road between Bishop's-castle and Newtown. The only religious house in the county was the abbey of Cwm Hir, founded in 1143, for monks of the Cistertian order, by Cadwathelan-ap-Madoc, which, at the dissolution, was valued at 28*l.* 17*s.* 4*d.* *per annum*. Of this monastery a considerable part of the buildings is yet standing, though in a very ruinous and dilapidated condition. Leland, in his Itinerary, (vol. v. p. 13.) speaks of its church as the longest in Wales, and informs us, that it was "spoiled and defaced by Owen Glendowr." The principal castles in Radnorshire were those of Colewine, Tynbont, Aberhedow or Aber-Edwy, Ewenlles, Radnor, Rhaiadar, and Pain's-castle. Several antiquaries, among whom are Camden, Gale, and Ward, place the Roman station Magnos, or Magna, at Old Radnor, as is mentioned above; but Baxter contends that it should be fixed at Ledbury, in Herefordshire, and Harris at Gaer, near Brecknock. In this county, particularly on the summit of Gwastedin hill, are several of those collections of stones called in South Wales *karneu*, in North Wales, *karnedheu*, in Scotland, *cairns*, and in Ireland, *duns*.

Radnor was erected into an earldom by Charles II., in the person of John Robarts, lord Robarts of Truro, but that title became extinct in 1757. It was revived, however, in 1765, in the person of William Bouverie, baron Longford, and viscount Folkstone, whose son Jacob, now earl of Radnor, enjoys his privileges. General View of the Agriculture of the County of Radnor, by John Clark, 4to. Skrine's Tours in Wales. Camden's Britannia. Pennant's Tour in Wales, 8vo.

RADNOTH, a town of Transylvania, on the river Maros; 23 miles W. of Scherburg.

RADOE, a small island in the North sea, near the coast of Norway. N. lat. 60° 35′.

RADOFFIN, a town of Moravia, in the circle of Iglau; 21 miles E. of Iglau.

RADOLFZELL, or Ratolfzell, or *Zell*, a town of Germany, in Austrian Swabia; situated on the Untersee, or lake of Lille; 10 miles N.W. of Constance.

RADOM, a town of Poland, in the palatinate of Sandomirz; 50 miles N.N.W. of Sandomirz.

RADOMISCHL, a town of Bohemia, in the circle of Prachatitz; four miles N. of Strakonitz.

RADOMISL, a town of Poland, in the palatinate of Lublin; 45 miles S. of Lublin.—Also, a town of Poland, in the palatinate of Kiev; 56 miles N.W. of Kiev.

RADOMSK, or Radomiski, a town of Poland, in the palatinate of Siradia; 32 miles S.E. of Siradia.

RADONITZ, a town of Bohemia, in the circle of Saatz; 13 miles W.S.W. of Saatz.

RADOSCHITSCH, a town of Poland, in the palatinate of Sandomirz; 20 miles N.E. of Malogocz.

RADOSKU, a town of Prussia, in the palatinate of Culm; 10 miles W. of Lautenburg.

RADSTADT, a town of the archbishopric of Salzburg; 36 miles S.S.E. of Salzburg.

RADT *vor dem Walde*, a town of the duchy of Berg, where Roman Catholics, Lutherans, and Calvinists, have, each of them, a church; 25 miles E. of Dasseldorp.

RADULA. See Raspatory.

RADUNPOUR, or Radimpour, in *Geography*, a town of Hindoostan, in the country of Agimere, on the river Puddar, or Butlass; 171 miles N. of Surat. N. lat. 23° 58′. E. long. 71° 48′.

RADZANOW, a town of the duchy of Warsaw; 30 miles N.E. of Ploczko.

RADZIECZOW, a town of Poland, in the palatinate of Belcz; 24 miles W. of Belcz.

RADZIEJOW, or Rodschowa, a town of Poland, in the palatinate of Brzestye; 25 miles W. of Brzestye.

RADZIVILOW, a town of Lithuania; 50 miles E.N.E. of Minsk.

RADZYMIN, a town of the duchy of Warsaw; 12 miles N. of Warsaw.

RAEMSDONCK, or Ramsdonck, a small but strong place of Brabant; three miles E. of Gertrudenberg.

RAEPOUR, a town of Hindoostan, in the circar of Gohud, on the Jumnah; 38 miles E.N.E. of Lahaar.

RAERDORP, a town of Holland; five miles N.E. of Amsterdam.

RÆTVIK, a calcareous mountain of Sweden, the height of which is estimated by Bergman at 6000 feet above the sea, observing also, as a singularity, that upon this mountain, and that of Rodaberg, are found vast blocks of reddish felspar, mingled with quartz and brown mica.

RAFAEL, Cape, a cape on the E. coast of the island of Hispaniola. N. lat. 19° 2′. E. long. 69° 46′.

Rafael, *St.*, a town of South America, in the province of of Caraccas; 40 miles S. of Caraccas.—Alſo, a town of South America, in the province of Moxes; 210 miles E. of Santa Cruz de la Sierra la Nueva.—Alſo, a town of New Navarre; 105 miles S.W. of Caſa Grande.

RAFAH, a town of Egypt; 57 miles N.E. of Catieh.

RAFALSO, a ſmall iſland in the gulf of Finland. N. lat. 60° 20′. E. long. 26° 12′.

RAFFAELLE DA URBINO, in *Biography*. See RAPHAEL.

RAFFLING, a ſort of game with three dice, in which he who throws the greateſt pair, or pair royal, in three caſts, wins the prize or ſtake.

The word probably comes from the baſe Latin, *rieſlare, to rifle, plunder, take all away*.

The raffle is properly the doublet or triplet: a raffle of aces, or duces, carries it againſt mere points.

RAFFLING is alſo uſed when a company of perſons club to the purchaſe of a commodity, or make ſmall depoſits, amounting in the whole to its full value; and he that throws the higheſt on three dice, or who has the higheſt number by means of balls thrown on a bagatelle or porto-bello table, takes it.

RAFICA, in *Geography*, a town of Aſiatic Turkey, in the government of Diarbekir; three miles S. of Raca.

RAFLUNDA, a town of Sweden, in the province of Skone; 17 miles S. of Chriſtianſtadt.

RAFNIA, in *Botany*, a genus of plants, ſeparated from the Linnæan *Crotalaria* and *Liparia*, augmented with ſeveral new ſpecies from the Cape, and named by its author, profeſſor Thunberg, in the ſecond part of the preface to his Prodromus Plantarum Capenſium. De Theis is completely in the dark as to the perſon commemorated in this name, who can be no other than Mr. C. G. Rafn of Copenhagen, author of a Flora of Denmark and Holſtein, in the Daniſh language, publiſhed in the years 1796 and 1800, in octavo, making two volumes, which include the firſt ten claſſes of the Linnæan ſyſtem. We know not whether any more has appeared. The ſame botaniſt has written a work on the phyſiology of plants; and ſeveral papers for the Academy of Sciences at Copenhagen. See Sims and Konig's Ann. of Bot. v. 1. 6.—Thunb. Prodr. 123. præf. n. 48. Willd. Sp. Pl. v. 3. 949. Ait. Hort. Kew. v. 4. 261.—Claſs and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-ſhaped, five-cleft, ringent; the upper lip in two broadiſh diſtant ſegments; lower divaricated, in three acute ones, the middle one ſmalleſt. *Cor.* Papilionaceous. Standard large, heart-ſhaped, acute, ſpreading, depreſſed at the ſides. Wings ovate, about half as long as the ſtandard. Keel acute, the length of the wings. *Stam.* Filaments ten, all united into a linear tube, ſplit along the baſe; five of them rather the ſhorteſt; anthers ſimple. *Piſt.* Germen ſtalked, linear; ſtyle ſimple, bent upwards at nearly a right angle; ſtigma obtuſe. *Peric.* Legume ſtalked, oblong-lanceolate, compreſſed, of one cell and two valves. *Seeds* ſeveral, ſtalked, roundiſh-kidney-ſhaped.

Eſſ. Ch. Stamens all united. Calyx ringent; upper lip divided; lower divaricated, in three ſegments, the middle one ſmalleſt. Legume ſtalked, lanceolate, compreſſed.

Obſ. The firſt ſpecies in Willdenow, *perfoliata*, *Crotalaria perfoliata* of Linnæus, figured in Smith's Inſects of Georgia, v. 2. t. 67, is *Baptiſia perfoliata* of Brown, in Ait. Hort. Kew. v. 3. 5, a genus adopted from Ventenat, and belonging to the *Decandria Monogynia*.

1. R. *amplexicaulis*. Orbicular Rafnia. Thunb. Prodr. 123. Willd. n. 2. (Crotalaria amplexicaulis; Linn. Sp. Pl. 1003. Geniſta perfoliata, orbiculatis foliis; Seb. Theſaur. v. 1. t. 24. f. 5. *Linn.*)—Leaves reticulated, orbicular, claſping the ſtem, alternate; the floral ones oppoſite, coloured.—Native of the Cape of Good Hope. A ſmooth, handſome, branched *ſhrub*, clothed with entire *leaves*, from one to two inches acroſs, finely reticulated with innumerable veins; the upper ones, which accompany the *flowers*, ſmaller, and pale yellowiſh. *Flowers* ſolitary, nearly ſeſſile, yellow, ſmaller than the floral leaves.

2. R. *elliptica*. Elliptical Rafnia. Thunb. ibid. Willd. n. 3, excluding the reference to Andrews.—Leaves ſlightly veined, elliptic-ovate, acute, alternate; the floral ones oppoſite, not longer than the flowers.—Native of the Cape. Confounded by Linnæus with the foregoing, from which it differs in having much ſmaller *leaves*, ſeſſile, not claſping the ſtem, quite deſtitute of reticulated veins. *Flowers* of a deeper yellow, as long as the floral leaves.

3. R. *cuneifolia*. Wedge-leaved Rafnia. Thunb. ib. Willd. n. 4. (Spartium ovatum; Berg. Cap. 197.)—Leaves obovate, ſomewhat wedge-ſhaped. Branches angular. Flowers racemoſe, terminal.—From the ſame country. *Stem* arboreſcent. *Branches* rather angular, ſtriated, ſmooth. *Leaves* numerous, alternate, ovate, pointed, ſucculent, ſmooth, above an inch long; contracted at the baſe, and tapering down into broad *footſtalks*. *Flowers* purpliſh-yellow, in terminal, corymboſe cluſters. *Bergius.*

4. R. *triflora*. Three-flowered Rafnia. Thunb. ib. Willd. n. 5. Ait. n. 1. Venten. Malmaiſ. t. 48. (Crotalaria triflora; Linn. Sp. Pl. 1004. Curt. Mag. t. 482. Borbonia cordata; Andr. Repoſ. t. 31, excluding the ſynonym.)—Leaves ovate, ſmooth. Branches angular. Stalks ſingle-flowered, three together. Native of the Cape, where it was gathered by Sparrmann and Thunberg, and from whence its ſeeds were ſent to Kew garden, in 1786, by Mr. Francis Maſſon. The plant is biennial, requiring to be ſheltered in winter, and flowering in June and July. *Stem* branched, about a yard high, moſt leafy in the upper part, ſmooth, and of a glaucous green, as well as the *leaves*, which are numerous, alternate, almoſt ſeſſile, more or leſs ovate, but varying in ſize and breadth. *Flowers* abundant at the ſummits of the branches, large, yellow, axillary, ſtalked, three together, the floral leaves ſmaller than the reſt, and often tinged with purple.

5. R. *oppoſita*. Oppoſite-leaved Rafnia. Thunb. ib. Willd. n. 6. (Crotalaria oppoſita; Linn. Suppl. 322. Liparia oppoſita; Linn. Syſt. Veg. ed. 13. 554. Spartium capenſe; Sp. Pl. 995. Cytiſus capenſis; Berg. Cap. 217.)—Leaves elliptic-lanceolate; the upper ones moſtly oppoſite. Flowers lateral, on ſhort ſolitary ſtalks.—Native of the Cape, apparently unknown in our gardens. Linnæus and his ſon confounded many different things under this ſpecies, ſome of which being marked in their herbarium as having been gathered by Thunberg, we preſume to be among thoſe he has defined; yet it is not poſſible to determine them all by his ſhort characters, ſeveral of which unfortunately contradict the ſpecific names. The *ſtem* of the preſent is deſcribed by the younger Linnæus as ſimple, he conſidering as *flower-ſtalks* the copious, alternate, leafy *branches*, three or four inches long, on which one or two pair of the lower *leaves* are oppoſite; the proper floral leaves, like thoſe of the ſtem, being alternate: all the *leaves* are elliptic-lanceolate, or ſomewhat obovate, acute, entire, ſingle-ribbed, an inch or more in length. *Flowers* either lateral or axillary, among the uppermoſt leaves, ſolitary, each on a ſimple *ſtalk* about the length of its *calyx*. *Corolla* yellow, not half ſo large as the laſt ſpecies.

6. R. *axillaris*. Axillary Rafnia. Thunb. ib. Willd. n. 7.

n. 7.—"Leaves lanceolate, alternate or oppofite. Flowers terminal."—This and all the following were gathered by profeffor Thunberg, at the Cape. In the Linnæan herbarium is a fpecimen, by whom gathered does not appear, which feems to anfwer to the above character, (except the *leaves* being linear-lanceolate,) and which may perhaps explain the paradoxical contrariety between the fpecific name and character. In this fpecimen the *flowers* are really *terminal*, being folitary at the ends of copious, fhort, leafy, lateral *branches*, which are *axillary*. The whole *foliage* has a Hyffop-like afpect.

7. R. *angulata*. Angular Rafnia. Thunb. ib. Willd. n. 8.—"Leaves lanceolate, alternate. Flower-ftalks lateral. Stem angular."

8. R. *fpicata*. Spiked Rafnia. Thunb. ib. Willd. n. 9.—"Leaves lanceolate, alternate. Flowers axillary, racemofe."—Of this fpecies alone, it feems, Willdenow had feen a dried fpecimen, and we regret that he did not give us fome account of it.

9. R. *anguftifolia*. Narrow-leaved Rafnia. Thunb. ib. Willd. n. 10.—"Leaves lanceolate, alternate. Flower-ftalks lateral. Stem round."

10. R. *filifolia*. Thread-leaved Rafnia. Thunb. ib. Willd. n. 11.—"Leaves linear-lanceolate, alternate. Flowers axillary."—The Linnæan herbarium contains two fpecimens, fpecifically different, which we prefume belong to this and the laft, but no human fagacity can appropriate them; except that one of them, with large and feemingly purplifh *flowers*, having rather the narroweft *leaves*, may be taken for *filifolia*. This is marked as gathered by Thunberg. The other has much fmaller and yellow *flowers*. The *ftem* is round in both.

11. R. *retroflexa*. Bent Rafnia. Thunb. ib. Willd. n. 12.—"Leaves obovate. Branches reflexed backwards and forwards."—A fpecimen from Thunberg anfwers to the above name and character, except the *leaves* being rather linear-lanceolate than obovate. Their colour is fomewhat glaucous. *Flowers* moftly terminal, folitary, on fhort *ftalks*, with an awl-fhaped *bractea*, or abortive leaf, at the bafe of each ftalk.

12. R. *erecta*. Upright Rafnia. Thunb. ib. Willd. n. 13.—"Leaves oblong. Flowers lateral. Stem erect."

13. R. *diffufa*. Proftrate Rafnia. Thunb. ib. Willd. n. 14.—"Leaves ovate, fmooth. Stem decumbent."

All the fpecies turn more or lefs black in drying. For *Rafnia retufa* of Ventenat, Malmaif. t. 53, fee TEMPLETONIA hereafter, and Ait. Hort. Kew. v. 4. 269.

RAFSO, in *Geography*, a fmall ifland on the E. fide of the gulf of Bothnia. N. lat. 61° 37′. E. long. 21° 12′.

RAFSUND, a town of Sweden, in the province of Jamptland; 28 miles S.E. of Frofon.

RAFT, in *Sea Language*, a fort of float formed by an affemblage of various planks, or pieces of timber, faftened together fide by fide, fo as to be conveyed more commodioufly to any fhort diftance in a harbour or road, than if they were feparate. The timber and planks, with which merchant-fhips are laden in the different parts of the Baltic fea, are attached together in this manner, in order to float them off to the fhipping.

This means of conveying timber to navigable fituations may be advantageoufly practifed in many places. It is found of great utility in many of the northern parts of the ifland as well as others, near canals and waters, where a cheap conveyance for fuch articles is required.

The balfa or catamaran ufed by the Indians and Spaniards in South America, is only a raft made of the trunks of the balfa; for an account of which, fee the article BOAT. They have one maft, on which is hoifted a large fquare fail; and a pair of fheers, whofe heels reft on each fide the raft. When a fore-ftay fail is fet, a pair of fheers is rigged forward. Thefe rafts were the firft conveyance by water, no doubt, long before veffels of a better conftruction were thought of; and what is rather furprifing, they are made to fail with foul winds, and fteer, as well as any other kind of veffel, by means of an invention fimilar to, and perhaps the original of, that which is now called "a fliding-keel." They have for this purpofe planks about ten feet long, and fifteen to eighteen inches wide, which flide vertically in the fpaces between the trunks which form the raft. It is only neceffary to immerge them more or lefs, and put down a greater or lefs number at the fore or after part of the raft, to make it either luff-to, or fall-off from the wind, tack, veer, lie-too, and perform every neceffary manœuvre. The number of thefe planks is five or fix, and if one of thefe planks be drawn up forward, the raft will keep away; and, if one is raifed abaft, it will come to the wind. This fort of raft, from the fimplenefs of its conftruction, might perhaps be well adapted to many cafes of emergency, after fhipwreck upon coafts, deftitute of all other materials for fhipbuilding.

RAFT-*Port*, in a *Ship*, a fquare hole cut through the futtocks of fome fhips, immediately under the counter, to receive the planks or pieces of timber which are brought to lade her for tranfportation; and which, on account of their great length, could not be received aboard otherwife.

RAFTERING, in *Agriculture*, a provincial term ufed for a fort of ploughing in narrow ridges, or fmall ridglets. It is ufeful for expofing a large furface of earth to the influence of the atmofphere.

RAFTERS, in *Building*, are pieces of timber, which, ftanding by pairs on the reafon-piece or raifing-piece, meet in an angle at the top, and form the roof of a building.

It is a rule in architecture, that no rafters fhould ftand farther than twelve inches from one another.

For the fizes or fcantlings of rafters, it is provided by act of parliament, that *principal* rafters from 12 feet 6 inches to 14 feet 6 inches long, be 5 inches broad a-top, and 8 at the bottom, and 6 inches thick. Thofe from 14, 6, to 18, 6 long, to be 9 inches broad at the foot, 7 a-top, and 7 thick. And thofe from 18, 6, to 21, 6, to be 10 inches broad at the foot, 8 a-top, and 8 thick.

Single rafters, 6 feet 6 inches long, to be 4 and 3 inches in their fquare.

RAFTY, a provincial term fignifying damp and mufty, as corn or hay in a wet feafon.

RAG, or RAKE, among *Hunters*, denotes a company or herd of young colts.

RAG, or *Ragg*, *Rowley*, in *Mineralogy*. See FERRILITE.

RAG, a torn piece of cloth of any fort. See the next article.

RAGS, *Woollen*, as well as the clippings of pitch marks upon fheep, are good manure. The rags fhould be chopped fmall, about an inch or two fquare, and fcattered on the earth at the fecond ploughing; for being thereby covered they will begin to rot by feed-time. They imbibe the moifture of dews and rain, retain it long, and, according to Dr. Home, keep loofe dry foils in a moift ftate. They formerly coft about fourpence a bufhel at London, from whence many loads were fent every year to Dunftable, which is thirty-three miles, where they are laid on even ftiff lands, juft after the fowing of the corn, allowing to the acre four facks, of fix bufhels each; they are much higher now, at more than double

double this price, and no quantity of any great account to be procured. See MANURE, and TOP-*dressing*.

The farmers in Oxfordshire make use of rags of this sort, procuring them from London and other places, at the rate of from eight to nine pounds the ton, which, with the carriage, stand them in upon the farms from nine pounds ten shillings to ten pounds. By some they are spread upon the clover lands, lays or layers for wheat, in the proportions of from three or four to six hundred weight to the acre. Tried with dung in this way, in the quantity of seven hundred weight to the acre, the dung is found the better dressing. They are also applied for turnips, for which crop they are ploughed in before the winter, as soon as the wheat-sowing is over: if ploughed in at the time of sowing turnips, they will not work for that crop. Some for this crop give half a coat of rags, and half a coat of sheep-fold. When applied on the clovers they seldom last longer than two years. Others think that half a coat of rags, and half a coat of dung, is the most beneficial method of applying this sort of manure. Some think rags are more durable than any other manure. Rags are occasionally brought from Whitney to this district, at from seven shillings and sixpence to eight shillings and sixpence the hundred weight, and five hundred weight spread upon the acre: they commonly last only one crop, but sometimes for two, and are found superior to any thing for wheat. They are ploughed in; and if the season be very dry, do not answer so well. They are supposed to do best on a summer fallow for that crop.

In Sussex rags are chiefly of service in the hop grounds, for which they are thought an excellent manure. Very great benefit is said to have been derived from the application of these rags, in contributing to preserve this sort of plantation in a state of constant moisture and vegetation in the driest seasons, when grounds which have been manured with dung, have been dried up, and the hop crops have failed. Rags have likewise been found very useful on the mowing grounds in some parts of Lancashire, when laid upon them in a pretty full proportion. When cut or chopped sufficiently small, they readily sink down upon the surface of the land, and do not afford any sort of interruption to the scythe, while they absorb and keep in the moisture, which is of material benefit to such grass lands as are inclined to be dry.

RAG, in a *Ship*. See BOLTS.

RAGAL, in *Geography*, a town of Germany, in the county of Pludentz; 10 miles E. of Pludentz.

RAGALBUTO, a town of Sicily, in the valley of Demona; 23 miles S. of Cefalu.

RAGALMATO, a town of Sicily, in the valley of Mazara; 8 miles N. of Naro.

RAGAMMEE, a town of Ceylon, near the W. coast; 58 miles S. of Columbo.

RAGANELLO, a river of Naples, which runs into the gulf of Tarento, near Civita Mandonia.

RAGAPILLY, a town of Hindoostan, in Golconda, near the left bank of the Godavery; 5 miles S.E. of Badrachillum.

RAGATZ, a town of Switzerland, in the county of Sargans; 5 miles S.S.E of Sargans.

RAGAY, a town on the S. coast of the island of Luçon. N. lat. 13° 50′. E. long. 122° 40′.

RAGGED, in *Heraldry*. See RAGULED.

RAGGED *Hawk*, in *Falconry*, is a hawk that hath its feathers broken.

RAGGED *Robin*, in *Botany*. See LYCHNIS.

RAGGED *Harbour*, in *Geography*, a bay on the E. coast of Newfoundland, being a part of Catalina bay; 2 leagues N. of Catalina harbour. N. lat. 49° 45′. W. long. 53° 40′.

RAGGED *Helmet*, a small island in the Mergui Archipelago. N. lat. 10° 9′.

RAGGED *Island*, a small island in the East Indian sea, near the island of Paraguay. N. lat. 11° 24′. E. long. 119° 30′. —Also, a small island among the Bahamas. N. lat. 22° 27′. W. long. 77° 16′.

RAGGED *Point*, a cape on the E. coast of the island of Borneo. S. lat. 2° 13′. E. long. 116° 40′.—Also, a cape on the N. coast of the island of St. Christopher. N. lat. 17° 30′. W. long. 62° 42′.

RAGGIVOLO, a town of Italy, in the department of the Mincio; 19 miles S. of Mantua.

RAGHU, in *Hindoo Mythology*, is the name of the ancestor of Rama, one of their deified heroes, who is hence sometimes called Raghuva, or son of Raghu. Budha, or Boodha, another of the Indian deities, is said to have had a son also of this name.

RAGHUVA, a name of the Hindoo deified hero Rama, signifying a descendant of Raghu, a warlike character. All these names are still very common among Hindoos: whether confined to the sect who, as chiefly worshipping Rama, are called Ramanuj, or more extensively given, we are not informed. See RAMA.

RAGIAN, in *Geography*, a town of Persia, in the province of Farsistan; 130 miles N.W. of Schiras. N. lat. 30° 40′. E. long. 50° 8′.

RAGLAND, a small village of Monmouthshire, here mentioned on account of its castle, the ruins of which evincing its grandeur and magnificence, command the attention of travellers. During the rebellion it was held for the king, and defended to the last extremity by the marquis of Worcester; 8 miles W. of Monmouth.

RAGMAN'S ROLL, or *Ragimund's Roll*. See ROLL.

RAGNIT, in *Geography*, a town of Prussian Lithuania, on the river Memel, endowed with the privileges of a town in the year 1722. Its ancient castle was famous even in the times of Paganism. The knights of the Teutonic order rebuilt it, with additional works, in 1255; but being destroyed in 1355, it was rebuilt a second time, and called Landshuth; but afterwards it obtained the name of Ragnit from the river which passes by it; 56 miles E.N.E. of Konisberg. N. lat. 55° 5′. E. long. 22° 18′.

RAGOGNA, a town of Italy, in Friuli; 16 miles N.W. of Udina.

RAGOOGUR, a town of Hindoostan, in the Malwa country, and circar of Kitchwana; 116 miles N.E. of Ougein. N. lat. 24° 23′. E. long. 77° 30′.

RAGOTSKI, FRANCIS, in *Biography*, the second of the name, prince of Transylvania, distinguished by his courage and patriotism, was born in 1676, at the castle of Borshi, in Hungary. When he was only a year old he lost his father, prince Francis, and was left to the care of his mother, Helena Sereni, who afterwards married count Tekeli. During his education he was carefully watched by the house of Austria, and his correspondence with his mother, who had retired to Constantinople, was entirely broken off. He was now suffered to travel to most of the courts of Europe, and to contract a marriage with the princess of Hesse Rhinfelds. Zealously attached to the independence of his country, which was kept in a state of great degradation by the Imperialists, he secretly entered into a negociation with the French king, Lewis XIV., but being betrayed by one of his confidents, he was arrested, and a charge of treason was preferred against him. The sentence of guilty was soon pronounced, and he was committed to the custody of an officer,

officer, who, however, connived at his efcape, and he arrived in a dragoon's habit at the frontiers of Poland. Here he received affurances of affiftance from France, and immediately publifhed an eloquent manifefto, calling upon the nation to free itfelf from the Auftrian yoke. Numbers joined him; being, however, but half armed, he was fearful of trufting his caufe in their hands, and withdrew to the frontiers of Poland, where he was joined by frefh recruits. With thefe he ventured to make fome progrefs; ftormed feveral fortreffes; and took a fevere revenge upon the Imperialifts, who had given no quarter to the Hungarian infurgents.

At this period the crown of Poland was vacant, through the depofition of Auguftus by Charles XII. of Sweden, and the Polifh chiefs were defirous of placing it upon the head of Ragotfki. But he had no fuch ambitious views: his great object was to liberate his country, and he refufed to defert its caufe for any other profpects. He accordingly purfued his fucceffes, and by the reduction of Tokay, obtained the fubmiffion of almoft the whole of Lower Hungary. So high was his reputation, that the diet of Alba Julia, in 1704, proclaimed him prince of Tranfylvania, with which dignity he was afterwards folemnly invefted. He obtained likewife the title of protector of Hungary, and Lewis XIV. fent to him a public embaffy. He foon began to feel the difficulty of fupporting a popular infurrection againft the arms and policy of a powerful fovereign, as well by the abandonment of fome of his allies, as by the defertion of his troops. He had another opportunity of giving a refufal to the crown of Poland, which was offered him by the czar Peter, fhewing thereby his fincere attachment to the caufe of his country, and he employed all the refources of valour and good conduct to fupport a declining caufe. In 1711, a treaty was concluded between the Hungarian ftates and the emperor, into which he refufed to enter, although the firft article fecured his life and property, with the title of prince of Tranfylvania. Mortified by the failure of his patriotic exertions, he withdrew to Turkey, renouncing his great eftates, and preferring an honourable poverty to a fplendid fervitude. He afterwards paffed fome time in France, then returning to Turkey, he fixed his final refidence at the caftle of Rodofto, on the fea of Marmora. "There," fays his biographer, "a Chriftian among Mahometans, and a philofopher among barbarians, he tranquilly clofed his life in 1733, at the age of 61." He left "Memoirs of his Life," which were publifhed in the "Revolutions de Hongrie," printed at the Hague in 1739. In 1751 there appeared a work, entitled "Teftament politique et moral du Prince Ragotfki," the authenticity of which is doubted. Moreri.

RAGOUT, or Ragoo, a fauce or feafoning, intended to increafe or recover the appetite when languifhing, or loft.

The term is French, but naturalized. It is alfo ufed for any high-feafoned difh, prepared of flefh, fifh, greens, or the like, by ftewing them with the addition of bacon, falt, pepper, cloves, and the like high-flavoured ingredients.

We have ragoos of beef, of cray-fifh, of giblets, of afparagus, of endive, of cocks-combs, of gammon, of celery, &c.

The ancients had a ragout, called *garum*.

RAG-PAVING. See Paving.

RAG-STONE, a name given by our artificers to a kind of ftone, which they ufe for fetting an edge upon knives, chiffels, and other tools. It is a greyifh-coloured ftone, containing a large quantity of talcky particles, and fplits eafily into thin flakes. It is a foft ftone, and is ufed only to finifh the fetting an inftrument after the edge has been prepared by grinding or rubbing the tool upon fome other ftone of a coarfer texture. We have this from Newcaftle and many other parts of the north of England, where there are very large rocks of it in the hills. This kind of ftone is in fome diftricts confiderably blended and intermixed with the fubfoil, rendering it of a more barren and unfertile quality.

RAGUENET, l'Abbe, in *Biography*. In 1702 the publication of a pamphlet, entitled "Paralele des Italiens et des François en ce qui regarde la Mufique et les Operas," by this author, a man of tafte and intelligence, who had refided fome time at Rome, gave birth to a long, but ineffectual controverfy, concerning the degrees of perfection, and fuperiority of French and Italian mufic. The book was licenfed by Fontenelle, who faid in his teftimony, that "he thought it would be very agreeable to the public, provided they were capable of equity." This declaration, however, did not prevent Freneufe, the continuator of Bonnet's "Hiftoire de la Mufique," from attacking the author and Italian mufic in a moft furious manner, treating both with equal contempt and obloquy.

The French, after this period, feem to have enjoyed their lyric *fommeils* in great comfort and tranquillity till 1752; when the performance of Pergolefi's "Serva Padrona" at Paris, by a company of burletta fingers from Italy, fet the mufical republic in a flame which has not yet been extinguifhed.

There had, indeed, been a *fenfation* excited, that was rather turbulent, and tending to a civil war, on the firft appearance of Rameau as a dramatic compofer in 1733, who, by new harmonies and accompaniments, had given offence to the true believers in the worfhip of Lulli; but this foon fubfided, and the nation not only heard his compofitions with rapture, but reverenced him as "a theorift, to whom mufic was as much indebted as phyfics and philofophy to Newton."

This little work was publifhed in Englifh in 1709, and has been faid to be tranflated by Galliard. If this worthy profeffor was the tranflator, it was before he [illegible] himfelf fo completely mafter of the Englifh [illegible] appeared to be afterwards, in his tranflation [illegible] Song." The Englifh of [illegible] *para*[illegible]; many of the notes, ho[illegible] a perfon who had been in Italy, and well [illegible] in that country, as well as in England, at the [illegible] of the laft century, during our firft attempts at operas, before the arrival of Handel.

RAGUIER, Le, the name given by the French failors to a wind peculiar to the gulf of Alexandretta or Scanderoon, which, rufhing from the fnowy fummits of the mountains, frequently forces fhips to drag their anchors feveral leagues.

RAGULED, or Ragged, in *Heraldry*, is applied to an ordinary, *e. gr.* a crofs, whofe outlines are jagged or knotted.

He beareth fable, a crofs raguled, or, by the name of *Sloway*.

Ragged differs from indented, as the latter is regular, and the former not.

The bearing is very ancient: Julius Cæfar gave for his badge, a boar's head, on a ragged ftaff.

Raguled is fometimes alfo ufed in the fenfe of truncated, or couped, and applied to a branch that is fawed from the tree; or a ftock fawed from its root.

RAGUN, in *Geography*, a town of Germany, in the principality of Anhalt-Deffau, on the Mulda; 9 miles S. of Deffau.

RAGUNDA, a river of Sweden, which rifes in the lake

lake Storfio, and in the province of Medelpadia, changes its name to Indal.

RAGUSA, a fmall republic, fituated on the eaftern fhore of the Adriatic, and neverthelefs regarded as an Italian ftate. It has a population of about 56,000 perfons, on an extent of 352 fquare miles. As this ftate is adjacent to the territory formerly belonging to the Venetians in Dalmatia, its government was formed on the model of the Venetian ariftocracy. Its religion is the Catholic, and its language the Slavonic, though moft of the inhabitants fpeak Italian. The fee is archiepifcopal, with fix fuffragans, and its commerce is confiderable. The chief magiftrate of the ariftocracy in this ifland, called the "rector," is changed every month. Here is alfo a council of ten, and a great council compofed of all the nobles above twenty years of age, and thefe nominate the "Pregadi," a fenate of fixty, which fuperintends all ftate affairs, receives and deputes ambaffadors, and confers offices. The revenue of Ragufa was formerly eftimated at a ton of gold, or about 10,000*l.* fterling. This fmall republic has found it neceffary to engage the protection of the Turks, for which it pays a tribute of about 20,000 fequins; though the commerce is beneficial to the Ottomans, in fupplying them with ammunition. Jealoufy of their neighbours induces the Ragufans to fhut the gates of their city, except for a few hours in the day. The capital is Ragufa; and it has been lately annexed, together with Dalmatia, to the kingdom of Italy. It now (1814) probably waits for a new allotment. The Ragufans have many country-houfes at Gravofa, another fea-port town. Stagno is another little town, fubject to Ragufa. Of the Ragufan ifles, the chief is Milet, or Melada, fertile in oranges, lemons, and good wine. On the north there is a tolerable haven, with a town of the fame name. Three or four little ifles in that neighbourhood alfo acknowledge the fovereignty of Ragufa.

RAGUSA, the capital of the above-mentioned ifland, is an ancient city, being the Ragufium of the Romans, and in the tenth century it became the metropolis of Dalmatia. In the 13th century it was conquered by the Venetians, and afterwards for a time fubject to the crown of Hungary. It is a well-built city, and its commerce is not inconfiderable. The harbour might be rendered capable of a firm defence; and the circumjacent ifles are beautified by nature and art. Earthquakes, however, have been terrible; and that of 1667 deftroyed 6000 perfons; 248 miles N.W. of Saloniki. N. lat. 42° 58′. E. long. 18° 18′.

Ragufa keeps accounts in ducats of 40 groffetti, each groffetto being divided into 6 foldi; but at the public offices accounts are moftly kept in perperi of 12 groffetti. Formerly the ducat reprefented a real coin ftruck at Ragufa, and had a fixed value; but fince it has become a money of account, it is always equivalent to the Turkifh piaftre, and therefore liable to a change of value. At Ragufa no gold coins are ftruck; its filver are the old tallari or dollars, commonly called Viflini or Ragufine, weighing 1 oz. 7 car. (Ragufa wt.), containing 17 parts of pure filver to 13 of alloy, and reckoned at $1\frac{1}{2}$ ducat, or 60 groffetti; but on account of the depreciation of the ducat, the value of the tallari has been proportionably raifed in weight. The new tallari, called libertine, weighing 1 oz. 10 car. and containing 9 parts of pure filver to 6 of alloy, was valued at 80 groffetti. But fince the year 1796, ducats have been coined of 40 groffetti, weighing $\frac{1}{2}$ an ounce; alfo perperi of 12 groffetti, weighing 20 carats, and half perperi in proportion: thefe three coins contain 9 parts of pure filver, and 11 of alloy. The groffetti, none of which have been lately coined, are ftill in circulation: they weigh the 60th part of an ounce, and bear the fame value with the paras of Conftantinople. The ducat of 1796 is worth $13\frac{1}{4}d.$ fterling, which is nearly the value of the Turkifh piaftre. The tallaro, or Ragufina of 1759, is worfe than the Englifh ftandard 4 oz. 2 dwt.; its weight is 18 dwt. $7\frac{1}{2}$ gr., content in pure filver 256.4 gr., and its value in fterling 2*s.* $11\frac{3}{4}d.$ That of 1794 is worfe 3 oz. 19 dwt., its weight 18 dwt. $17\frac{1}{4}$ gr.; its content in pure filver 267.6 gr., and value in fterling 3*s.* $1\frac{1}{4}d.$ The ducat of 1797 worfe 5 oz. 11 dwt.; its weight 8 dwt. $17\frac{3}{4}$ gr., content in pure filver 97 gr., and value in fterling 1*s.* $1\frac{1}{2}d.$ The tallaro or Ragufina has upon it the head of the chief magiftrate, or rector; legend RECTOR REIP. RHACUSIN: reverfe, arms of the city, legend, DUCAT. ET SEM. REIP. RAC., *i. e.* ducat and half of the republic of Ragufa. Pieces of 1794, &c. bear the head of a woman, with RESPUBL. RHACUS., reverfe, a fhield, with the word LIBERTAS, inclofed by two branches, over which is a crown, legend, DUCE DEO FIDE ET JUST. The ducat bears the whole length of a bifhop, legend, AUSPICIIS TUIS A DEO: reverfe, arms of the city, legend, DUCAT REIP. RHACUSINÆ.

The pound with which gold and filver are weighed at Ragufa confifts of 12 ounces; the ounce is divided into 6 faggi; the faggio into 22 carats, and the carat into 4 grains. But the pound of commercial weight is equal to 5607 Englifh grains, or 12 oz. 13dr. avoirdupois; the former being $5062\frac{2}{3}$ Englifh grains. The ell of Ragufa meafures $227\frac{1}{2}$ French lines, or $20\frac{1}{5}$ Englifh inches. Kelly's Un. Cambift.

RAGWORT, in *Botany*. See OTHONNA, SENECIO, and SOLIDAGO.

RAGWORT, in *Agriculture*, a very pernicious plant of the weed kind, which is fometimes termed feagrim. It has a green ftalk in its early ftate, but, as it advances in age, inclining to violet or purple, efpecially downwards. Its flowers are yellow, and thick-fet, and compofed each of a number of fmall pointed leaves. It runs to feed in the latter end of fummer. The fmell, both of the ftalk and leaves, which are jagged, as well as the flower itfelf, are fo offenfive to animals, as that hardly any will feed upon it, except when almoft ftarved.

It has been propofed to deftroy it by picking out the roots, and feeding the land clofe with fheep. It moftly affects meadows and pafture lands when the foils are good.

RAHA, in *Geography*. See JERICHO.

RAHABAH, or RABBA, town of Arabia Deferta, near the Euphrates, on the road by which caravans travel from Syria to the Arabian Irak; 110 miles S.W. of Moful. N. lat. 35° 5′. E. long. 40° 21′.

RAHABAH *Melik Ben Tauk*, a town of Afiatic Turkey, in the province of Diarbekir, on the Euphrates; 50 miles S. of Kerkifieh.

RAHABY, a town of the defert of Syria, containing about five or fix thoufand inhabitants, fituated on a plain, furrounded with date-trees; 70 miles N. of Mefghid Ali.

RAHANPOUR, a town of Bengal; 42 miles N.W. of Nattore.

RAHAPA, a fmall ifland in the Eaft Indian fea, near the E. coaft of Borneo. N. lat. 4° 58′. E. long. 114° 4′.

RAHAS, in *Ichthyology*, a name given by fome authors to the torpedo, or cramp-fifh.

RAHEINA, in *Geography*, a bay on the W. coaft of Mowhee, one of the Sandwich iflands. N. lat. 20° 50′. E. long. 203° 19′.

RAHEMAT, a large lake in the Arabian Irak, 90 miles in circuit, near Mefghid Ali.

RAHENSTEIN, a town of Bohemia, in the circle of Saatz; 19 miles S.W. of Saatz.

RAHMANIE′, a town, or rather village, of Egypt, built

built on the W. bank, at the entrance of the canal of Damanhour, which is navigable only at the rise of the Nile; 9 miles S. of *Faoué*; which fee.

RAHMETABAD, a town of Perfia, in the province of Irak; 20 miles N.E. of Confar.

RAHNIS, or RANIS, a town of Saxony, in the circle of Neuftadt; 10 miles S.W. of Neuftadt. N. lat. 50° 33'. E. long. 11° 40'.

RAHNY, a town of Bengal; 25 miles N.W. of Dinagepour.

RAHON, a town of France, in the department of the Jura; 6 miles S. of Dôle.

RAHOON, a town of Hindooftan, in the fubah of Lahore; 108 miles S.E. of Lahore. N. lat. 31° 7'. E. long. 75° 42'.

RAHU, in *Aftronomy*, is the Hindoo name of the planet of the afcending node, or dragon's head. Ketu is the name of the other node; and a fable, in the ufual ftyle of mythological allegory, is given under that article, of their origin and mifhap. The malignant Rahu was decapitated, and Ketu was his head. In one painting of the Hindoo zodiac, the headlefs Rahu is reprefented of a black colour, in red clothing, mounted on an owl, and holding a lotos in his hand: in another, he holds a fpear, and ftands on a tortoife. In the fable given under Ketu it is related that Vifhnu was the decapitator of Rahu: other accounts affign that office to Narayana. Among the Hindoos, as we have had occafion to remark in feveral articles, their fciences, as well as their hiftory and religion, are enveloped in a mafs of mythological allegory: a farther inftance of which, connected with the fubject of this article, is feen under ECLIPSE (*Note.* A reference being made from the article KETU to this, we take the opportunity of correcting two typographical errors in that article. In its early part, for *Karyapa*, read *Kafyapa*; and in the fourth line of the fecond column, for *or* read *a*.)

RAHWAY, in *Geography*. See RAWA.

RAI, or RAE, an ancient town of Perfia, in the province of Irak, before Ifpahan the capital of Perfia. This was once a grand and proud city; and its ruins ftill cover a great extent of country. It holds a diftinguifhed place in the annals of Perfia: it is mentioned by Arrian and Diodorus Siculus, as the capital of the province of Rhages, fo called from the calamities brought upon this part of the empire by the earthquakes to which it formerly was, and is ftill fubject. It is frequently mentioned in the wars of the renowned Haroun al Rafhid; it was the capital of this part of Perfia, in the reign of Alp-Arflan, and continued to flourifh until it was facked by the generals of Jenghis Khan. Its ruins are fituated five miles S. of Tehraun, the prefent capital of Perfia; and in the centre of them is a village, called Sheik Abdul Azzeem, from a fon of the feventh Imam, to whofe memory a noble mofque and maufoleum have been erected.

RAJA, denoting *king*, an appellation given in Hindooftan, or the empire of the Mogul, to princes defcended from thofe that ruled there before the conqueft of the Moguls; who exercifed all rights of fovereignty, only paying a tribute to the Great Mogul, and obferving the treaties by which their anceftors recognized his fuperiority.

There are fome rajahs who ftill retain a more independent fovereignty in the mountains: the Indians call them *rai*; the Perfians, plurally, *raian*: our travellers *rajahs*, or *ragias*. Thefe have under their command foldiers, called *rajapoots*, or perfons defcended from rajahs, who are a robuft and brave people, and who enter into the fervice of thofe who will pay them. The Great Mogul has feveral of thefe rajahs in his fervice.

The chief lords of the Moguls, *viz.* the vice-roys, governors of provinces, and chief minifters of ftate, F. Catrow obferves, are called *ombras*; and the idolatrous rajahs, or Indian lords who governed petty ftates before the conqueft of their country, held the fame rank at court with the omhras.

All the difference was, that the children of the rajahs fucceeded their fathers in the fhow of the fovereignty left them; whereas the children of the Mahometan lords lofe all in lofing their fathers.

The Indians account four ages from the beginning of the world: and in the fecond, which lafted 1,296,000 years, they hold the rajas or kchatrys had their rife; a noble caft, though inferior to the Bramins. Vice then, they fay, began to creep into the world; men only lived to 300 years, and their ftature was reduced, &c.

RAIA, the *Ray*, in *Ichthyology*, a genus of fifhes of the order Chondropterygia, of which the generic character is, that it has five oblique fpiracles on each fide, placed beneath the neck; the head is fmall, pointed, and not diftinct from the body; the mouth is beneath tranfverfe, toothed; the body is broad, thin, and flat.

The individuals of this genus are all inhabitants of the fea only: they keep at the bottom, and in winter cover themfelves with fand and mud: they feed on teftaceous animals, fifh, or any animal fubftances which they may happen to meet with. They grow to a large fize, fometimes exceeding 200lbs. in weight. The females are the larger, and produce their young alive, only one at a time, which, like the fhark tribe, are inclofed in a quadrangular, black, horny fhell, the corners of which end in flender incurved points, but not extending into long filaments, like thofe of the fhark: the eyes are half covered with a thin membrane, oblong, placed on the upper part of the head: above thefe, in the place of noftrils, is a broad fulcus or groove, divided by a reticulate membrane, confifting of crefted folds, and clofed with a valve: behind this fulcus are two fmall femilunar orifices: the tongue is very broad, fhort, and fmooth. The ventral fins are covered with a thick fkin, and furrounding the body; the ventral at the bafe are connected with the anal; the flefh is generally eatable; the liver is large, and producing a great quantity of pure oil.

Of this genus there are nineteen fpecies, divided into three fections: *viz.* A, comprifing the electric ray, or torpedo and fkates: thefe have fharp teeth. B, including the fting-ray and thornbacks, having obtufe teeth. And C, which are denominated uncertain, comprifing five fpecies, which inhabit the Red fea, or about the Cape of Good Hope, but which have not yet been fufficiently examined.

Section A.—*With fharp Teeth.*

Species.

* TORPEDO; Electric Ray. The body of this fifh is entirely fmooth and flat. The fpecies inhabits the Mediterranean, and grows to a large fize: fome have been taken that have weighed from 60 to 80lbs. each, but the average weight is lefs than 20lbs. It is of a dirty clayifh colour; the head and body are round, and but indiftinctly feparated. The body is extremely thin; behind the eyes are two wide foramina, which have been fuppofed to be intended by nature for conveying found; they are befet with fix cutaneous fingers on their inner circumference, and communicate with the mouth. The torpedo can live about twenty-four hours out of the fea, and a fhort time longer, if put into frefh water;

water; it inhabits thofe places where the bottom is fandy, and buries itfelf fuperficially by flinging the fand over its back with a fort of vibration, which it gives to its extremities. It is in this fituation that the torpedo aftonifhes and terrifies the unwary paffenger, who inadvertently treads upon it, by the exertion of its electrical or benumbing faculty. This power is ferviceable to the animal in two important refpects; as a means of defence againft voracious fifhes, and as a method by which he is enabled to procure his fubfiftence from among the fmaller tribes; for the former, when electrified, are deprived of all poffibility of feizing their prey; and the latter, after having unwarily approached the torpedo, and received the fhock, are incapable of making their efcape. (See TORPEDO.) The food of the torpedo is furmullets and plaife; the former are fo fwift, that it is impoffible for the torpedo to take them by purfuit, and as this fifh has been found in its ftomach, it is prefumed that it was taken by means of the electrical fhock. The torpedo has been taken off Pembroke, at Torbay, and near Waterford in Ireland. It is caught like other flat fifh, with the trawl, and is commonly found in water forty fathom deep, in company with other fpecies of this genus.

* BATIS; the Skate. This fpecies is varied; the middle of the back is fmooth; the tail is befet with a fingle row of fpines. It inhabits the European ocean, and is thought to be the largeft fifh of the genus: the body above is cinereous, fometimes with a few black lines, beneath white, with waved lines of black dots; round the eyes are numerous fmall, hooked fpines; in the males the fins are full of fpines. Of all the larger fifhes, the fkates are the moft numerous, and their numbers are in a great meafure owing to their fize, and to the protection afforded them by thofe frightful fpines which nature has afforded them. There is not one of the rapacious tribes, excepting, perhaps, the cachalot and white fhark, that has a fwallow fufficiently large to receive them, and even thefe are probably deterred from their purpofes of deftruction by the armour with which their prey is covered. Of fome the fize is fuch as to defy all powers of deftruction which even the fhark himfelf poffeffes. In England fome of the fpecies have been taken, weighing upwards of two hundred weight, but even this is far inferior to their enormous bulk in other parts of the world. Near the ifland Guadaloupe, a ray was killed more than twenty-five feet long, and almoft fourteen broad. After all, the fifhes of this tribe probably attain a much larger fize than that of any individual which has ever yet been examined. It is only the fmalleft of the kind that approach the fhores; the largeft continue for ever prowling at the bottom in the unfathomable caverns of the ocean, where they continue perhaps to grow for a century.

The fifhes generate in March and April, at which time they fwim near the furface of the water, feveral males purfuing one female. The females caft their *purfes*, as they are called, in May, and continue to produce till September: they are very prolific, not lefs than three hundred eggs having been found in the body of a fingle female. The rays generally frequent thofe parts of the fea where the bottom is black and muddy, where they devour every thing indifcriminately, but they are more delicate with regard to a baited hook. They devour any putrid fubftances whatever, but if the bait has been taken up and fuffered to lie for any time in the open air, they will not touch it; they appear to perceive the line, and to dread it; but the impulfe of hunger overcomes their caution, and even though they perceive the danger, if thoroughly hungry, they devour the bait, as if regardlefs of the confequences. See SKATE.

OXYRINCHUS; Sharp-nofed Raia. Varied; middle of the back with ten fpinous tubercles. This is fimilar in fhape to the fkate, but with a longer and fharper fnout: the colour of the whole upper part is cinereous, with feveral pale or whitifh fpots, intermixed with a few flight dufky ftreaks or variegations; beneath it is white, with dufky or blueifh ftreaks; down the back and tail runs a fingle row of fpines, and a few others are placed about the region of the eyes: the fides of the tail are alfo fometimes furnifhed with a row of fmaller or weaker fpines than thofe on the upper part; the eyes are large, as is alfo the mouth. This fpecies, like the fkate, fometimes, but not often, is taken of a very confiderable fize. It is a native of the Mediterranean and Northern feas.

MIRALETUS. This fpecies has a fmooth belly and back: it has fpines near the eyes, and a triple row of them on the tail. It inhabits the Mediterranean; the body above is marked with an occellate fpot.

* FULLONICA; the Fuller Ray. The back is covered with fpines; the eyes with a fingle row; pectoral fins and tail with a triple row. It inhabits the European feas; grows to a large fize; the body above is cinereous, with numerous black fpots; beneath it is white. The fnout of this fifh is fhort and pointed; the nictitant membrane is fringed; the teeth are fmall and fharp; and the tail is flender. It has been thought by fome authors that this is only a variety of the next fpecies.

* RUBUS; Rough Ray. The back of this fpecies has a fingle fpine; and the tail is befet with a triple row of fpines. This is greatly allied to the thornback, but covered with more numerous fpines, every part of the fkin on the upper furface being muricated with fharp curved aculei of different fizes: of thefe, one row of the largeft runs down the middle of the back, and three, or fometimes five, along the tail; others are difperfed about the eyes and the flaps of the pectoral fins: the general colour is a yellowifh or whitifh-grey, fometimes variegated with dufky or brownifh clouds and ftreaks; the under fide is white, and befet with very numerous fcattered fpines, but lefs ftrong than thofe on the upper fide. It is about the fize of a thornback. Mr. Pennant mentions one that meafured nearly three feet from the nofe to the tip of the tail. It is a native of the Mediterranean and other feas.

B.—*Teeth obtufe.*

Species.

SEPHEN. Body nearly round; tail twice as long as the body, winged beneath, and with two long fpines above, ferrate on each fide. It inhabits the Red fea, and is fometimes fo large, as to reach three yards acrofs; body above brown, with three rows of large hemifpherical tubercles down the middle of the back; beneath it is quite flat and fmooth, and it is of a reddifh-white. It is from the fkin of this fpecies that the beautiful fubftance called *Galuchat* is prepared by the French, and which, being coloured with blue, green, or red, according to the fancy of the article, and afterwards polifhed, is fo frequently ufed for various kinds of cafes, telefcope tubes, &c. For this purpofe the fmaller or younger fpecimens are preferred; the tubercles in the more advanced or full-grown animals being too large.

There is a variety of this fpecies: the length of the fpecimen defcribed by Dr. Ruffell was about $9\frac{1}{2}$ inches; the tail is about two feet nine inches long; the colour of the whole animal is a dull leaden above, with a deep blue tail; beneath it is dufky white; on the middle of the back there are only two pearl-formed tubercles inftead of three; the tail is furnifhed with a fharp fpine and a fin beneath. It is a native of the Indian feas.

Aquila. The body is ſmooth ; the tail is pinnate, with a long ſerrate ſpine. This ſpecies is of a rhomboidal ſhape, but with a conſiderable dilatation : the pectoral fins approach to a ſubfalcated form : the colour is cinereous above ; pale or whitiſh beneath : the head is rather large, and the ſnout produced : the eyes are large and prominent, with yellow irides : the tail is long, ſlender, ſharp-pointed, and furniſhed about the middle with a ſpine ſimilar to that of the ſting-ray. This ſpecies grows to a very great ſize, ſometimes meaſuring ten, twelve, or even fifteen feet in length, and weighing upwards of three hundred pounds. It is found in the Mediterranean, Atlantic, and Indian ſeas, and is ſaid to ſwim in a ſlower manner than moſt other rays ; it preys on ſmaller fiſhes, and is ſuppoſed to ſtrike and kill, or at leaſt diſable its prey with the caudal ſpine : when taken, it is obſerved to vibrate the tail with great ſtrength and rapidity in all directions. It is not reckoned among the edible fiſhes ; but the liver, which is very large, is ſaid ſometimes to be eaten, though it is more frequently uſed for the purpoſe of preparing from it a clear oil, which it affords in great plenty.

* Pastinaca ; Sting-ray. The body of this ſpecies is ſmooth ; its tail has a long ſharp ſpine, ſerrate on the fore part, and another on the back : there are two other varieties, of which the one has a ſmooth body ; the back is beſet with two ſpines, ſerrate on the fore part ; the body of the other is covered with ſpots.

This ſpecies is deſcribed as having a body ſomewhat approaching to the ovate, the pectoral fins leſs pointed than in ſome other ſpecies of this diviſion. The ſnout is pointed ; the body more convex than uſual ; the colour of the whole animal above of a yellowiſh-olive, but the back is ſometimes found to approach to a blueiſh-brown ; beneath it is whitiſh ; the tail is of a conſiderable length, and without a fin, very thick at the baſe, and gradually tapering to the extremity, which is very ſlender : near the middle it is armed, on the upper part, with a very long, flattened, and ſharp-pointed bone or ſpine, finely ſerrated in a reverſed direction on both ſides : with this the animal is capable of inflicting very ſevere wounds on ſuch as incautiouſly attempt to handle it ; and it anſwers the purpoſe both of an offenſive and defenſive weapon. This weapon is annually caſt, and as it frequently happens that the new ſpine has arrived at a conſiderable ſize before the old one has been caſt, the animal is occaſionally found with two, in which ſtate it has been ſometimes erroneouſly conſidered as a diſtinct ſpecies. This fiſh is ſaid not to grow to a very large ſize. It is found in the Mediterranean, Atlantic, and Indian ſeas, and is numbered among the edible rays. On account of the danger attending the wounds inflicted by the ſpine, it is uſual with the fiſhermen to cut off the tail as ſoon as the fiſh is taken. In ſome countries it is ſaid to be illegal to ſell the fiſh with the tail adhering to it.

It was formerly thought that the ſpine of the fiſh poſſeſſed a venomous quality, by infuſing into a wound made by it ſome very active poiſon ; this is now proved to be completely erroneous, and the effects ſometimes produced by it ariſe entirely from the deepneſs of the puncture and laceration, which, if taking place in a tendinous part, or among the larger nerves and blood-veſſels, have often proved fatal. It may not be amiſs to obſerve, that ſome ancient writers have deſcanted upon the effects of this animal's powerful weapon in terms of conſiderable luxuriance ; it was ſuppoſed to be not only poiſonous in the living animal, but to preſerve its poiſon when taken from the fiſh, and affixed to the head of an arrow or a ſpear ; it was ſaid even to deſtroy the moſt healthy and flouriſhing plant by its touch, and even to cauſe trees to die by ſtriking the bark with its point. It formed the head of the fatal ſpear preſented by Circe to her ſon Telegonus, by which he was rendered ſuperior to his enemies, and with which he, at length, unconſciouſly, ſlew his father Ulyſſes. The general habits of this ſpecies are ſimilar to thoſe of the reſt of the genus, often lying flat, and in ambuſcade on the ſoft mud at the bottom of the ſhores which it frequents, and ſeizing its prey by ſurprize ; at other times it will purſue it through the depths of the ocean.

* Clavata ; Thornback. The body of this ſpecies is ſpinous ; the teeth tuberculate ; acroſs the belly is a ſtrong ſemilunar cartilage. This ſpecies grows to a very conſiderable ſize, though rarely equal in magnitude to the ſkate already deſcribed ; in its general appearance it reſembles that fiſh, but is ſomewhat broader in proportion, and is readily diſtinguiſhed from the ſkate by the very ſtrong, curved ſpines with which its upper ſurface is covered ; theſe are moſt conſpicuous down the middle and on each ſide of the back, where four or ſix, of much larger ſize than the reſt, are generally ſeen ; the remaining parts being furniſhed with many ſcattered ſpines of a ſmaller ſize, intermixed with ſtill more minute ones, and the whole ſkin is of a rough, or ſhagreen-like ſurface ; the back is marked with an uncertain number of pale or whitiſh round ſpots of different ſizes, and which are commonly ſurrounded with a blackiſh or dark coloured edge ; theſe ſpots are ſaid to be cauſed by the ſhedding of the ſpines at different intervals ; along the middle of the back runs a ſingle row of ſtrong ſpines, continued to the tip of the tail ; the colour of the ſkin is a browniſh-grey, with irregular blackiſh or duſky variegations ; the under part is white, with a light caſt of fleſh-colour, and about the middle of the body, as well as on the fins, are diſpoſed ſeveral ſpines ſimilar to thoſe on the upper ſide, but leſs ſtrong. The thornback is an inhabitant of the Mediterranean and other ſeas, and is held in ſome eſteem as food, though not conſidered equal to the ſkate in goodneſs.

Rhinobatos. Body long, tapering ; ſnout lengthened. This is reckoned a very remarkable ſpecies, and is thought to connect in ſome degree the genera of raia and ſqualus, the body being much longer than in the preceding kinds of ray ; the ſnout is lengthened, but not very ſharp ; and the body, which is moderately convex above, and flat beneath, gradually tapers from the ſhoulder to the tail, which is furniſhed above with two fins, of an oblong ſhape, and ſituated at a conſiderable diſtance from each other : the tip of the tail is alſo dilated into an oblong fin. The colour of the whole fiſh is of a dull earthy brown, paler beneath, and the ſkin is every where roughened by minute tubercles. This fiſh is ſaid to grow to the length of about four feet, and is a native of the European ſeas. It is very frequently ſeen about the coaſts of Naples.

Djiddensis. Tail-fin two-lobed ; ſpines in a triple row at the beginning of the back, and afterwards in a ſingle row ; the firſt dorſal fin is above the ventral. It inhabits the Red ſea, and is about two yards long. The body is a little rough, and of a pale aſh colour ; above it is varied with whitiſh ſpots ; beneath it is whitiſh ; behind the vent are a few brown and white ſtripes.

Lymma. Body oval, ſmooth, teſtaceous, with blue ſpots ; pinnate tail with a ſingle ſpine. It inhabits the Red ſea ; is hardly a foot long ; the ſpots oval, unequal, beneath whitiſh. It is much allied to the eagle-ray, and is of a reddiſh-brown colour above ; the tail is ſomewhat longer than the body, marked above, for half its length, with two longitudinal blue ſtripes, and is furniſhed about the middle with one, and ſometimes with two, large and ſerrated ſpines,

which

which are covered at their base by a blueish-brown skin; the under part of the body is pale or whitish.

Arnak. Body orbicular, silvery; tail round, without a fin, and furnished with two spines. It inhabits the Red sea; the teeth are granulate.

C. *Uncertain.*

Ommesscherit. Tail round and spotted. It inhabits the Red sea, and very much resembles the R. pastinaca.

Tajara. Tail round; body beneath snowy. It inhabits the Red sea. When just taken, it beats violently with its fins.

Schoukir. Body with a few remote spines. It inhabits the Red sea. The Arabians make scabbards for their swords out of its skin.

Mula. Beneath snowy; tail round, variegated. It inhabits the Red sea, and approaches the shores by night. The spine on its tail inflicts a dangerous wound.

Rapensis. Back with a single fin; the tail is short, pinnate at the end; the body is smooth and unarmed; and the snout is a little obtuse. It inhabits near the Cape of Good Hope, is shaped something like the torpedo, except that it has a fin on the back. The body is small and orbicular; above it is convex, beneath flat.

RAJABARRY, in *Geography*, a town of Bengal; 10 miles S. of Dacca. N. lat. 23° 24'. E. long. 90° 36'.

RAJACOTTY, a town of Thibet; 60 miles N.N.W. of Sirinagur.

RAJAGUNGE, a town of Assam; 16 miles S. of Gentiah.

RAJAGUR, a town of Hindoostan, in Bahar; 35 miles W.S.W. of Gayah.—Also, a town of Hindoostan, in Guzerat; 10 miles N.E. of Champaneer.

RAJAHUN, a town of Hindoostan, in the circar of Cicacole; 12 miles W. of Cicacole.

RAJAKERA, a town of Hindoostan, in the province of Agra.

RAJAMUNDRY, a circar of Hindoostan, bounded on the N. by the circar of Cicacole and Golconda, on the E. by the bay of Bengal, on the S. by the circar of Ellore, and on the W. by Golconda. It is crossed by the Bain Gonga from N. to S.—Also, the capital of the above-mentioned circar, situated between Ellore and Cicacole, on the Godavery. Its principal riches consist of forests of teak-wood. N. lat. 17°. E. long. 81° 57'.

RAJANAGUR, a town of Bengal; 25 miles S. of Dacca.—Also, a town of Hindoostan, in the circar of Rajamundry; 7 miles N.E. of Rajamundry.

RAIANIA, in *Botany*, so called in honour of our immortal naturalist, the Rev. John Ray, the most accurate in observation, the most philosophical in contemplation, and the most faithful in description, amongst all the botanists of his own, or perhaps any other, time. His life will be given hereafter, in its proper place. Plumier, who established this genus, finding the name *Raia* preoccupied by zoologists, contrived to call the plant *Jan-Raia;* which Linnæus turned about into *Rajania*, still retaining the idea of the Christian name, combined with the other. But such an idea is ludicrous to English ears, and is happily not, in general, perceived. We presume to alter the orthography in one letter, writing the word as it is always pronounced, and deducing it regularly from the Latin *Raius*, by which name the person commemorated is known all over the literary world.—Plum. Gen. 33. t. 29. Linn. Gen. 525. Schreb. 692. Willd. Sp. Pl. v. 4. 788. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 391. Juss. 43. Lamarck Illustr. t. 818. Gærtn. t. 14.—Class and order, *Dioecia Hexandria.* Nat. Ord. *Sarmentaceæ*, Linn. *Asparagi*, Juss.

Gen. Ch. Male, *Cal.* Perianth bell-shaped, in six deep, oblong, pointed segments, most spreading in their upper part. *Cor.* none. *Stam.* Filaments six, bristle-shaped, shorter than the calyx; anthers simple.

Female, *Cal.* Perianth superior, of one leaf, bell-shaped, in six deep segments, permanent, withering. *Cor.* none. *Pist.* Germen inferior, compressed, with a prominent border at one side, three-celled; styles three, the length of the calyx; stigmas obtuse. *Peric.* Capsule membranous, of three cells, without valves, crowned by the calyx; two of the cells barren, almost obliterated, without wings; the third fertile, compressed, extended into a very large, half-ovate, membranous wing. *Seed* solitary, nearly elliptical, compressed.

Ess. Ch. Male, Calyx in six deep segments. Corolla none. Female, Calyx in six deep segments. Corolla none. Styles three. Capsule membranous, with one wing. Seed solitary.

Section 1. *Leaves simple.*

1. R. *hastata.* Halberd-leaved Raiania. Linn. Sp. Pl. 1461. (Jan-Raia scandens, folio oblongo, angusto et auriculato; Plum. Gen. 33. Bryonia fructu alato, foliis auriculatis; Plum. Amer. 84. t. 98.)—Leaves hastate; somewhat heart-shaped at the base.—Gathered by Plumier, about Port-de-paix in the island of Hispaniola. *Root* perennial, sometimes large and ovate; sometimes four or five inches long, and two thick, round at each end, like a sausage. Its substance resembles that of a radish, without any internal fibres; the bark thin, ash-coloured, a little rugged and warty; the flesh very white, tasting like a bean. This root throws up only one very slender, long, climbing, smooth, knotty *stem*, thickest at the base, where it is accompanied by several fibrous radicles. We presume it to be annual. *Leaves* scattered, spreading, on short stalks, smooth and membranous, about three inches long; heart-shaped, dilated, abrupt, and seven-ribbed at the base; then suddenly elongated into a nearly linear, entire, central, three-ribbed lobe, bluntish, with a small point; the under side paler, and rather downy. *Stipulas* in pairs, awl-shaped, minute. *Flowers* small, whitish, in simple, axillary, drooping clusters. *Bracteas* minute, ovate, acute, solitary at the base of each partial stalk. *Fruit*, as Plumier says, like half that of a maple-tree, of a silvery hue when young, but afterwards tawny.

2. R. *cordata.* Heart-leaved Raiania. Linn. Sp. Pl. 1461. Ait. n. 1. (Jan-Raia scandens, foliis tamni; Plum. Ic. 148. t. 155. f. 1.)—Leaves ovate; somewhat heart-shaped at the base; seven-ribbed.—Native of the West Indies, from whence it was sent to Kew garden, in 1786, by Mr. Alexander Anderson. It flowers in the stove in July, and we cannot but wish some accurate botanist would publish a good figure and description of the plant, out of respect to its name. Plumier represents the habit of the *root*, *stem*, &c. much like the foregoing; but the *leaves* are regularly ovate, pointed, more or less heart-shaped at their base, and furnished with seven ribs continued from that part to the point. These ribs are connected by numerous transverse veins. *Inflorescence*, *flowers*, and *fruit*, much as in *R. hastata*, but having seen no specimen, we can say nothing respecting the *stipulas* or *bracteas*, none of which are noticed in the plate.

3. R. *ovata.* Ovate-leaved Raiania. Swartz Ind. Occ. v. 1. 638. Mart. Mill. Dict. n. 4.—"Leaves ovate, pointed, three-ribbed."—Native of bushy places, on the hills of Hispaniola. *Stem* shrubby, twining, thread-shaped,

 subdivided;

ſubdivided; with ſlender, ſmooth, leafy *branches*. *Leaves* rather diſtant, ſtalked, ſmooth on both ſides, pointed, entire, three-ribbed, veiny; ovate at the baſe. *Footſtalks* round, ſmooth, often as long as the leaves. *Cluſters* axillary, numerous, longer than the leaves, ſlender, many-flowered, rather zigzag. *Flowers* dioecious; the males in compound *cluſters;* females in ſimple ones, all ſtalked, and turned toward one ſide. *Corolla* very minute, yellowiſh-green in the male, reddiſh in the female bloſſoms. *Capſule* compreſſed, with an ovate, falcate, membranous wing. *Swartz.*

4. R. *anguſtifolia.* Narrow-leaved Raiania. Swartz Ind. Occ. v. 1. 639. Mart. n. 3.—"Leaves linear-lanceolate; rounded at the baſe, three-ribbed.—Native of extremely dry buſhy places, in the weſt part of Hiſpaniola, where it climbs upon high trees, flowering in May. *Root* annual. *Stem* thread-ſhaped, round, twining, flaccid, ſubdivided, ſmooth. *Leaves* nearly a ſpan long, entire, three-ribbed, veiny, ſmooth. *Footſtalks* ſmooth, red, twiſted according to the direction of the ſtem. *Cluſters* axillary, in pairs, the length of the leaves, pendulous, ſlender, many-flowered; the *flowers* very minute, nearly ſeſſile, red, polygamous, five or ſix on each of the alternate partial ſtalks, all leaning one way. *Bracteas* very minute, acute, blood-red, under the flowers. On ſome plants the latter are entirely male, with ſix nearly ſeſſile *anthers;* on others all hermaphrodite, with ſix perfect *ſtamens*, a triangular oblique *germen*, no *ſtyle*, but three minute *ſtigmas*. *Capſule* as in the reſt of the ſpecies. *Swartz.*

5. R. *quinquefolia.* Five-leaved Cluſtered Raiania. Linn. Sp. Pl. 1462. (Jan-Raia ſcandens quinquefolia; Plum. Ic. 149. t. 155. f. 2.)—Leaves five together at each joint, elliptic-oblong. Cluſters lateral, between the joints.—Native of the Weſt Indies, but hitherto obſerved by Plumier only. This ſeems to have the habit of all the foregoing, except that the *ſtem* has tumid joints, at each of which ſtand five elliptic-oblong, obtuſe, entire, three-ribbed *leaves*, about three inches long, on ſhort *footſtalks*. The *cluſters* are repreſented not axillary, as in the others, but lateral and alternate, from the ſpaces of the *ſtem* between the joints.

Section 2. *Leaves compound.*

6. R. *quinata.* Five-leaved Umbellate Raiania. Thunb. Jap. 148. Mart. n. 6.—Leaves five on a common ſtalk, emarginate. Umbels axillary.—Obſerved by Thunberg about Nagaſaki and in Koſido, in Japan, flowering in April and May. The Japaneſe call this plant *Fagi Kadſura*, and *Akebi*. *Stem* twining, round, ſmooth, aſh-coloured, branched. *Leaves* ſeveral together, axillary, ſtalked, ſmooth, of five ſeparately ſtalked, umbellate, ovate, entire *leaflets*, each from three-quarters of an inch to an inch and a half long, emarginate with a point. *Common footſtalks* thread-ſhaped, ſmooth, two inches or more in length; *partial* half as long as the finger nail. *Flowers* in umbels, from the ſame buds as the leaves, on ſlender ſtalks as long as the footſtalks; partial ſtalks capillary, the length of the nail. This ſpecies differs from the laſt in having compound *leaves*, and umbellate *flowers*. *Thunberg.*

7. R. *hexaphylla.* Six-leaved Cluſtered Raiania. Thunb. Jap. 149. Mart. n. 7.—Leaves ſix on a common ſtalk, oblong, acute. Flowers racemoſe.—Native of the country of Fakoñia, in Japan, among buſhes, flowering in April. Its vernacular names are *Akebi*, *Mbe Kadſura*, and *Tſu So*. The *ſtem* is round, ſtriated, ſmooth, climbing. *Leaves* alternate, ſmooth, ſix on a ſtalk, umbellate, on ſlender partial ſtalks, oblong, acute, entire, veiny, two inches long; pale at the back. *Common footſtalks* round, bent, three or four inches long, ſwelling at each extremity. *Flowers* in axillary cluſters, ſnow-white. Differs from *R. quinata* in having moſtly ſix leaflets on a ſtalk, which are acute, reticulated with veins at the back, and larger than in that ſpecies. The *flowers* moreover grow in cluſters, not umbels.

RAJAPILLA, in *Geography*, a town of Hindooſtan, in Myſore; 16 miles N.N.E. of Anantpour.

RAJAPORUM, a town of Hindooſtan, in Barramaul; 35 miles S. of Darempoury.

RAJAPOUR, a town of Hindooſtan, in the circar of Hiſſar; 48 miles W. of Hiſſar.—Alſo, a town of Hindooſtan, in the circar of Gohud; 10 miles W. of Janſi.—Alſo, a ſea-port of Hindooſtan, in Concan, where the Engliſh and French had formerly factories. The place has a good harbour, but it is not now frequented; 6 miles N. of Geriah.—Alſo, a town of Bengal; 16 miles S. of Silhet.—Alſo, a town of Bengal; 50 miles N.W. of Burdwan.—Alſo, a town of Hindooſtan, in Bahar; 27 miles W. of Arrah.

RAJARAJESWARI, in *Mythology*, a name of the Hindoo goddeſs Parvati. It means, in Sanſcrit, conſort of the lord of the king of kings. In the maſculine it is Rajrajeſwara, and is then a name of her lord Siva. See that article.

RAJARSHI, is one deſcription of ſaint or ſage, of whom four ſorts are comprehended in the more general term of Riſhi. Rajarſhi means a royal ſage, and is the loweſt of the four; the Devarſhi, or divine ſage, being, as may be ſuppoſed, where Brahmans are the givers of dignity, the firſt. See more hereon under MAHARSHI and RISHI.

RAJASEE, in *Geography*, a town of Hindooſtan, in the circar of Gohud; 10 miles S.W. of Datteah.

RAJASERAI, a town of Hindooſtan, in the circar of Sirhind; 17 miles E.S.E. of Sirhind.

RAIBACH, a town of Bavaria, in the territory of Rothenburg; 7 miles S. of Rothenburg.

RAIBAUG, a town and circar of Hindooſtan, in Viſiapour; 23 miles S. of Maſritch. N. lat. 16° 35′. E. long. 74° 52′.

RAIBOLINI, FRANCESCO, in *Biography*. See FRANCIA, IL.

RAJBULHAUT, in *Geography*, a town of Bengal; 30 miles S. of Burdwan. N. lat. 22° 45′. E. long. 88° 7′.

RAICAN, a town of Perſia, in the province of Irak; 15 miles N.E. of Hamadan.

RAICZ, a town of Hungary; 6 miles S.S.E. of Boleſko.

RAIDURGAM, a town of Hindooſtan, in the Carnatic; 15 miles W. of Tricolore.

RAIDY, a town of Bengal; 25 miles S.W. of Doeſa.

RAIE, a town of Aſiatic Turkey, in the province of Diarbekir; 118 miles S.W. of Diarbekir.

RAJEEATA, a town of Hindooſtan, in Guzerat; 78 miles W. of Gogo.

RAJEE-BEDUROO, a town of Hindooſtan, in Lahore; 27 miles E. of Jummoo.

RAJEGAUT, a town of Bengal; 24 miles S.S.E. of Iſlamabad.

RAJEGUR, a town of Bengal; 26 miles S. of Burdwan.—Alſo, a town of Hindooſtan, in the circar of Gangpour; 23 miles S.W. of Gangpour.—Alſo, a town of Hindooſtan, in Mewat; 20 miles E. of Cotputly.—Alſo, a town of Hindooſtan, in the circar of Gohud; 27 miles S.W. of Narwa.—Alſo, a town of Hindooſtan, in the circar of Bundelcund; 22 miles S.E. of Chatterpour.—Alſo, a town a town of Hindooftan; 20 miles E.S.E. of Allahabad. N. lat. 24° 49′. E. long. 80° 17′.

RAJEGUSDAR, a town of Hindooftan, in Lahore; 35 miles E.N.E. of Behnbur.

RAJEHAUT, a town of Bengal; 16 miles N.W. of Biffunpour. N. lat. 23° 13′. E. long. 86° 40′.

RAJEMAL, a circar of Bengal, bounded on the N. by Purneah, on the E. by Purneah, Mauldah, Dinagepour, and Raujefhy, on the S. by Sultanabad, and on the W. by Hindooa and Boglipour.—Alfo, the capital of the above circar, lying on the W. bank of the Ganges, nearly in the parallel of Mauldah, and about 20 miles from it; at the foot of the chain of hills which projects into the river at Sicly-gully and Terriagully. It is in a ruinous ftate, although not above 1½ century ago the refidence of the viceroy; and has hardly the population of an ordinary market-town at prefent. Its fituation is romantic, but not pleafant; for in Hindooftan, the hills and eminences being always covered with wood, that beautiful fwelling of the ground, which is fo juftly admired in European landfcapes, is loft; and the fancy is prefented at beft with nothing beyond a wild fcene; which can only be relifhed by being contrafted with foft and beautiful ones. It is more than thirty miles above the head of the delta of the Ganges, and therefore M. d'Anville placed it erroneoufly by affigning its fituation at this place. N. lat. 25° 2′. E. long. 87° 56′.

RAJEMATCHY, a town of Hindooftan, in Vifiapour; 37 miles N.W. of Poonah.

RAJEMUNGALUM, a town of Hindooftan; 16 miles S. of Tinevelly.

RAJETEA, one of the South-fea iflands, named alfo *Ulietea;* which fee.

RAJETPOUR, a town of Bengal; 15 miles S. of Rogonatpour.

RAJEWICE, a town of Lithuania; 42 miles S.S.E. of Brzefc.

RAIGIRI, a town of Hindooftan, in Golconda; 10 miles S.E. of Beder.

RAIGUR, a town of Hindooftan, in the circar of Sumbulpour; 15 miles N. of Sumbulpour.

RAJIK, a town of Syria, on the Euphrates; 18 miles S. of Bembig.

RAIL, in *Architecture*, is applied varioufly; particularly to thofe pieces of timber which lie horizontally between the pannels of wainfcot, and over and under them.

The word is alfo applied to thofe pieces of timber which lie over and under ballufters in balconies, ftaircafes, &c.

Alfo, to the pieces of timber that lie horizontally from poft to poft in fences, with pales or without. See FENCE.

RAILS, in a *Ship*, are long narrow pieces of fir, or oak, with mouldings of regular members of architecture ftruck on them, which are faftened, or fometimes wrought from the folid plank, as ornaments to the fhip's fides. The former are now difcontinued in the navy, as they were found to rot the fides very much; the latter, wrought from the folid plank, are ufed in merchant fhips. The rails of the head and ftern are pieces of oak timber handfomely wrought with mouldings. The lower rail along the fide is named the *waift-rail*, and the next above it the *fheer-rail*, which are generally placed parallel to the top timber line, the fheer-rail with the top of the fide amidfhips, and the waift-rail about twenty inches below it; the rails next above and parallel to the fheer-rail are called *drift-rails*, and the rails above the plank-fheer, if any, the *fife-rails*. The rails of the head are diftinguifhed by the *upper* or *main-rail*, the *middle* and the *lower-rail;* and the rails of the ftern take their names from the parts to which they are fixed, as the *tuck-rail*, *lower counter-rail*, *upper counter-rail*, *foot fpace-rail*, *breaft-rail*, *taffarel-rail*, and *taffarel fife-rail*. (See *Plate* I. *Ship-building*.) To thefe may be added the thwartfhip pieces of the framing of the great cabin bulk-heads.

RAILS of the *head* are certain curved pieces of timber, extending from the bows on each fide to the continuation of the fhip's ftem, to fupport the knee of the head, and the ornamental figure fixed upon it.

RAIL, or *Water-Rail*, in *Ornithology*, the name of the *rallus aquaticus* of authors, which is a bird of a long flender body, with fhort concave wings. The bill is flender, flightly incurvated, and one inch three quarters long: the upper mandible black, edged with red, the lower orange-coloured; the irides red; the head, hind-part of the neck, the back and covert of the wings and tail are black, edged with an olive-brown; the bafe of the wing is white; the quill-feathers and fecondaries dufky; the throat, breaft, and upper part of the belly, are afh-coloured; the fides under the wings, as far as the rump, finely varied with black and white bars; the tail is very fhort, confifting of twelve black feathers; the ends of the two middle tipt with ruft colour; the feathers immediately beneath the tail white; the legs are placed far behind, and are of a dufky flefh colour; the toes very long, and divided to their origin: though the feet are not webbed, it takes the water, will fwim on it with much eafe, but is often obferved to run along the furface. It delights lefs in flying than in running, which it does very fwiftly along the edges of brooks covered with rufhes. When it runs, it every now and then flirts up its tail, and in flying hangs down its legs. Pennant.

This bird, fays Mr. Pennant, is properly *fui generis*, agreeing with no other, but forming a feparate tribe; though M. Briffon and Linnæus place it with the land-rail, and Mr. Ray with the water-hens. It is a well-tafted bird.

RAIL, *Land*, the *rallus crex* of Linnæus, is a migrating bird, with a fhort, ftrong, thick bill; always found among corn, grafs, broom, or furze. It leaves this kingdom before winter. They have long legs, and a fingular note, refembling the word *crex*, often repeated. The feathers on the crown of the head, hind part of the neck, and the back, are black edged with bay colour; the coverts of the wings of the fame colour, but not fpotted; the tail is fhort and of a deep bay, the belly white, and the legs afh-coloured. They are in greateft plenty in Anglefea, where they appear about the 20th of April, fuppofed to pafs over from Ireland, where they abound. They are found in moft of the Hebrides, and the Orkneys. Pennant.

RAILING, in *Rural Economy*, a fort of fence conftructed with pofts and rails. It is often made ufe of in protecting young hedge fences, from the cropping of cattle or other animals. Any fort of coarfe timber does very well for this laft purpofe, fuch as outfide planks, and the boughs or loppings of timber plantations. See FENCE.

RAILLERY, as Dr. Johnfon hath defined it, denotes flight fatire, or fatirical merriment; and a beautiful writer compares it to a light which dazzles, and which does not burn. It is fometimes, what it always ought to be, innocent and pleafant, but it is too frequently offenfive. Raillery is of various kinds; ferious, fevere, and good-humoured; there is a kind which perplexes, a kind which offends, and a kind which pleafes.

It has been juftly obferved, that in order to rally well, kindnefs fhould prevail in every thing that is faid, as the character of a friend fhould be maintained to warrant freedom with a perfon who is addreffed, efpecially in this way. Allufions to paft follies, and hints that tend to revive what a perfon wifhes for ever to forget, fhould never be introduced

as

as subjects of raillery. It is below the character of persons of humanity and good breeding, to indulge mirth, while any one in the company is suffering, as the effect of that mirth, pain and mortification.

RAILWAY, *Tram* or *Dram-road*, or *Waggon-way*, in *Rural Economy*, a track constructed of iron, stone, timber, or other material, upon the level surface of an inclined plane, or other situation, for the purpose of diminishing friction, and thus serving for the easy conveyance of heavy loads of any kind of articles. See *Plate* IV. *Canals*, *figs.* 31 to 35. See also CANAL.

It has been remarked, that railways have hitherto been confined, almost exclusively, to coal-works, and other mines; and that inventions, whose only recommendations are simplicity and usefulness, are often suffered to lie long in a state of public neglect; while others, perhaps, of no real utility, but of more imposing aspect, and being pertinaciously blazoned forth by interested or blinded partisans, are readily adopted; and bask, for a while, in the sunshine of public favour. The time has, however, at length arrived, when carriages moving on level surfaces, or on gently inclining planes, with little friction, and *without* obstructions, are fast spreading over the face of the country. It has been observed that there may be many lime-works, as well as other sorts, from which railways may be laid, in different directions, with great benefit to their proprietors and the surrounding neighbourhoods in general.

With the view of diminishing horse labour, it has been suggested by Dr. Anderson, in his Recreations in Agriculture, that where internal canals cannot be established, this may be effected, and intercourse facilitated, by means of railways, which have not yet been introduced into general practice. It is further stated, that they were first solely employed for transporting coals to a moderate distance from the pits, to the places where they could be shipped, being universally made of wood. And long, says he, had they been applied to this use, without any idea having been entertained that they could be employed for more general purposes. By degrees they were, however, carried to a farther extent; the scarcity of wood, and the expence of their repairs, suggested the idea of employing iron for the purpose of improving these roads. At the first, flat rods of bar-iron were nailed upon the original wooden rails, or as they were technically called, *sleepers;* and this, though an expensive process, was found to be a great improvement. But the wood on which these rested being liable to rot and give way, some imperfect attempts were made to make them of cast iron, but these were found to be liable to many objections, until the business was taken in hand by Mr. Outram, engineer, at Butterly Hall, Derbyshire, who contrived at the same time, so far to diminish the expence, and improve the strength of the road, as to bring them to a degree of perfection, that no one who has not seen them can easily conceive could have been done. And it is added, that this having been carried into execution in a few cases, and found to answer, has been improved upon and simplified by practice, till it is now brought to such a state of perfection as to have given proofs, that it admits of being carried much beyond the limits of what was for many years conceived to be possible, and to afford demonstrative evidence, that it may be in future employed to a wider extent still, to which no limits can be at present assigned or foreseen.

There are a great number of railways in Derbyshire, Shropshire, Lancashire, and many other parts of the country.

In the first of the above counties, there are railways of very different lengths; one of five miles in length, leading from the town of Derby to the collieries in the vicinity; another, from the lime-stone rocks on the Cranford canal, called the Crick railway, which is about one mile and a half in length; a third from the Beggarlee colliery to the same canal, denominated Barber and Walker's railway, of similar length; a fourth from the lime-works in the neighbourhood of Boston, to the canal near Whaley bridge, termed the Peak-forest railway, which is about six miles in length; a fifth called the Marple railway, of about one mile and a half long, on the Peak-forest canal; sixthly, railways over Blisworth-hill near Nottingham, on the Grand Junction canal, which are three miles and a half in length, and constructed in a double manner; a seventh, which has the name of the Ashby de la Zouch railway, has four miles of double and eight miles of single rails. Some of these railways are formed in a very complete manner, especially those which have been made since the various improvements of them were introduced. They have been of prodigious utility and advantage to the county, both in regard to its agricultural improvements and its manufacturing interests and concerns.

These sorts of railway roads have likewise been introduced into many parts of the county of Salop, with vast benefit and success to the different interests of the district. They have here had a new application, in being employed for the purpose of conveying heavy weights from different levels on canals.

Speaking of the great utility of canals in the carriage of various articles in this county, it is observed by Mr. Telford, an able engineer, that another mode of conveyance has frequently been adopted to a considerable extent; which is that of forming roads by means of iron rails laid along them, upon which materials are carried in waggons, which contain from six to thirty hundred weight; experience, he thinks, has now convinced us, that in countries the surfaces of which are rugged, or where it is difficult to obtain water for lockage, where the weight of the articles of the produce is great in comparison with their bulk, and where they are mostly to be conveyed from a higher to a lower level, that in those cases, iron railways are in general preferable to canal navigation.

It is supposed, that on a railway well constructed, and laid with a declivity of fifty-five feet in a mile, one horse will readily take down waggons containing from twelve to fifteen tons, and bring back the same waggons with four tons in them. This declivity, therefore, suits well, when the imports are only one-fourth part of what is to be exported. If the empty waggons only are to be brought back, the declivity may be made greater; or an additional horse applied on the returning journey will balance the increase of declivity. If the length of the railway were to be considered, it may, it is supposed, without much inconvenience, be varied from being level to a declivity of one inch in a yard, and by dividing the whole distance into separate stages, and providing the number of horses suitable for each portion of railway, according to the distance and degree of declivity, the whole operation may be carried on with regularity and dispatch.

It is upon the whole believed, that this useful contrivance may be varied so as to suit the surface of many difficult countries, at a comparatively moderate expence. It may be constructed in a much more expeditious manner than navigable canals; it may be introduced into many districts where canals are wholly inapplicable; and in case of any change in the working of mines, pits, or manufactories, the rails may be taken up and laid down again in new situations, at no very great expence or trouble.

It is also further noticed, that some parts of this and the neighbouring counties, in which canals had once been intended

intended to be formed, have ſince been looked over and examined with the view of having iron railways inſtead of navigable cuts; and in many caſes this may be the moſt adviſable and proper, particularly in all ſituations where difficulties ariſe in the conſtructing of navigable canals, or other ſorts of works for water carriage.

The county of Lancaſter, too, has a great many of theſe iron railways for the convenience, accommodation, and advantage of the different collieries, manufactories, and other works, where heavy loads are to be tranſported. The coal work near St. Helens, in the vicinity of Liverpool, has a double railway ſome miles in length; and at the iron-works of lord Belcarras, near Wigan, as well as his cannel coal pits near the ſame place, there are double railways of very conſiderable length. To the ſouth of the town of Preſton, at a ſmall diſtance from Bamber bridge, there is likewiſe one communicating with the Lancaſter and Kendal canal, which is alſo double and of great length; ſerving to convey the coals from the ſouthern parts of the county to that canal, in order to their diſtribution in the northern parts, and the adjoining diſtricts.

On the eaſt ſide of the ſame county they alſo prevail in many places, and are found of the greateſt uſe, being the means of diſpatching much buſineſs in a ready manner and without much expence of labour.

The utility of theſe railways has been found to be extremely great in other coal-works and canals, where they are at preſent very extenſively employed; and it has been ſuggeſted, that they may be applicable in other caſes, as for ſhortening the team labour of a farm ſo as to bring it within one day's journey, where more than one were formerly neceſſary, by which a great ſaving in labour and expence may be made. Alſo, in rendering the buſineſs of lime works more eaſy and expeditious in different inſtances. It has likewiſe been hinted by Mr. Beatſon, in the firſt volume of Communications to the Board of Agriculture, that they might be had recourſe to on roads where there are unavoidable riſes or falls, for taking up or letting down heavy loaded waggons or other carriages. It is obſerved, that near Colebrook Dale there is one at a ſmall diſtance from the iron bridge, upon which loaded boats are drawn up to a canal, two hundred and twenty feet above the level of the river Severn, and let down in a ſimilar manner into it, by which means twenty-two locks are ſaved, and the work executed in an expeditious manner. It is ſuppoſed, that this is the greateſt inclined plane in Europe, or perhaps in the world, for though they are much uſed in China in the place of locks, he has never heard of any of them being equal in height to this. The rails are beſt made of iron. It is added, that they have been found uſeful in improving ſoft, moſſy, boggy lands, on which horſes cannot travel; a rail road of this ſort having been formed through a peat moſs near Mancheſter by Mr. Wakefield, while it was under improvement, at the expence only of about three hundred pounds a mile, on which a ſingle horſe was capable of drawing with the greateſt facility ſeven waggons at once, each being loaded with about ſeven hundred weight of marle, bearing in the whole forty-nine hundred weight, and with the weight of the waggons upwards of three tons. This was performed, it is obſerved, over a place where a few months before a dog could hardly venture without the danger of being *ſwamped.* On the Ketley and other canals in the county of Shropſhire, vaſt advantages have been derived from laying railways upon inclined planes, and letting down and drawing up the different articles by means of machinery, as may be ſeen in the very able Agricultural Report of that diſtrict, where excellent repreſentations of them are given.

Beſides theſe different caſes of railways, another has been ſuggeſted by the writer of the Annals of Agriculture, which is that of having them laid from the ſtack-yards to the thraſhing machines, by which the grain may be conveyed to them at any time with eaſe and convenience, as well as any particular ſtack that may be wanted.

It is further ſtated by the ingenious Dr. Anderſon, that the beſt idea he can give of the benefit that may reſult to the community from the uſe of this kind of railways, will be from ſtating ſome facts reſpecting them, which were lately communicated to the Society of Arts by Mr. Wilkes, of Meaſham, near Loughborough, in Leiceſterſhire; a ſpirited and judicious agriculturiſt. He had a railway of this ſort made, which was about five miles in extent, leading from a coal-mine to a market. He found it ſo fully to anſwer his expectations after it was finiſhed, that he communicated to the above ſociety an account of ſome trials he had made of it, requeſting that ſuch of the members of that reſpectable inſtitution as were deſirous of information on that head, would do him the honour to witneſs ſome experiments that he wiſhed to make upon it, for the information of the public. A committee of the members was accordingly deputed for that purpoſe, and before them he ſhewed that a moderate ſized horſe, of about twenty pounds value, could draw upon it with eaſe down hill (the deſcent being one foot in a hundred) thirty-two tons, and without much difficulty forty-three, and ſeven tons up hill, independent of the carriages. The doctor concludes from theſe facts, that upon a perfect level a horſe could draw with eaſe from ten to twenty tons. It is obſerved, that Mr. Wilkes's railway, on which the experiments were made, was, from local circumſtances, laid upon wooden ſleepers, and is not ſo perfect as thoſe done upon ſtone. But it is added, that twenty tons are the load which ſuch a horſe could draw with eaſe, travelling at the uſual waggon rate, in boats upon a canal; ſo that the number of horſes required in this way will not be much, if at all, greater than on a canal. Certain advantages attach to this mode of conveyance, which do not ſo well apply to a canal, and *vice verſâ*; but it is not his intention to draw a parallel between theſe two modes of conveyance. Nobody can entertain any doubt, he thinks, about the utility of canals where they are eaſily practicable. He only wiſhes to point out this as an eligible mode of conveyance where canals cannot be conveniently adopted.

It is further remarked, that it was cuſtomary at the firſt, to put the whole load to be drawn by one horſe upon railways into one waggon; but now, when the load is ſo much augmented, it has been found eligible to divide it into many parts, ſo that no one waggon ſhall carry more than one or two tons; by this method the weight is ſo divided, that the preſſure is never ſo great upon one point as to be in danger of too much cruſhing the road; the carriages can be made much more limber and light in all their parts, and they are much more eaſily moved, and more manageable in all reſpects than they otherwiſe would have been. And another advantage of this arrangement, which deſerves to be particularly adverted to, is, that it admits of ſhifting the carriages ſo as to leave a load, as it were, in parcels at different places where they may be required, without trouble or expence. This, when it comes to be fully underſtood and carried into practice, will, he thinks, be a convenience of ineſtimable value, a thing that has been always wanted, and never yet has been found though it has been diligently ſought for. The able writer has here endeavoured to illuſtrate its importance and utility in tranſporting goods from the wet docks now forming on the Iſle of Dogs to London, and in carrying roads to different diſtant parts of the country; in which caſes, cafes, and in all where there is much bufinefs to be done, they would require to be double, one for going, and the other for coming upon, to prevent interruption and interference.

And he afterwards offers a few remarks, tending to fhew the practicability of the meafure, and to guard againft fetting out upon a bad plan, which might, he fuppofes, in time to come, fruftrate the good that might have refulted from the undertaking; merely premifing, that he propofes thefe railways folely for the purpofe of conveying weighty loads, leaving the roads, as at prefent, open for coaches and light carriages.

Alfo with a view to difcover how far it may be practicable to introduce thefe iron railways into general ufe, he has made fome inquiries refpecting the expence of making them; and although this muft vary according to the abundance and goodnefs of materials, and other circumftances, the following ftatement may ferve to give fome general notions on that head. In the moft eligible fituation, where materials are abundant and good, and circumftances favourable, the loweft expence at which a *fingle* railway of this fort can be made, will be about one thoufand pounds a mile. But as a fingle railway muft be liable to great inconveniencies, unlefs under very particular circumftances, double railways ought to be confidered as the only ufeful fort. Thefe, for public purpofes, according to the opinion of the inventor, fhould be very fubftantially made. The metal ufed fhould be of the ftouteft fort, and of fubftance enough, not merely to carry the weights propofed, but to be equal to bear almoft any blow or fhock that they may be likely to experience; and, thus made, what they will lofe by ruft or wear, will be long ere it materially weakens them. Made after fuch a manner, in favourable fituations in the country, a double railway may, he thinks, coft about two thoufand pounds a mile, but in the neighbourhood of London, where the charge of every thing is high, and where they fhould be of the ftrongeft fort, we fhould fuppofe they might coft nearly three thoufand pounds a mile. It is bad economy, he thinks, to fave on articles of this fort at the firft; for the little expence thus laid out then will fave much in repairs: how fmall thefe repairs are, may be imagined from this circumftance, that when a road is thus made, the undertaker does not fcruple to fupply all that are broken, free of charge, for the firft three years. Say then that fuch a road coft three thoufand pounds a mile, this would bring a charge upon the turnpike of 150*l.* a-year; fay 50*l.* more for annual repairs; this is, in all, 200*l. per annum.* Compare this with the expence of keeping the prefent roads in repair. It has been fuggefted to him, that there is annually laid out in repairs upon the road from Hyde Park Corner to Hounflow, confiderably above one thoufand pounds a mile; fo that the difference of expence is, even at the beginning, very much in favour of railways: and were the money thus at firft expended to be gradually paid off, the tolls might thus be lowered almoft to nothing. And, he thinks, that a turnpike road cannot be made in almoft any fituation for lefs, as he is told, than 1000*l. per* mile; but where it is of confiderable width, as near great towns, it will run from 1500*l.* to 2000*l. per* mile; and in annual repairs, including the purchafe price of materials, carting them on the road, fpreading, raking off, and carting away again, from 100*l.* to 1000*l.* a mile. Say 1500*l.* prime coft, the intereft is 75*l.* and 150*l.* for repairs, the annual charge of fuch road will be 225*l.* This is an expence of 100*l.* a-year more than the other. But for the prefent, let us fuppofe that they will be equal, the extra charge for purchafing ground for a new waggon-way, &c. being equal to that furplus; let us now fee what would be the difference of charge to the employers of thefe waggons in the two cafes. Suppofing the road to be fo much employed as that 100 waggons (or loaded carriages to the fame amount) pafs each day, carrying fix tons each, drawn by eight horfes; thefe, at one fhilling each waggon for toll (or two-pence a ton), would produce 5*l.* a day, or 1825*l* a-year; which, at the rate of eight miles for each turnpike, would be 228*l. per* mile, the furplus being produced by road horfes and light carriages. The charge then to the employer, for this ftage, muft be 1825*l.* and the keep of 800 horfes, befides fervants, incidental charges, and owner's profits for the tranfporting of 600 tons of goods a day. Say that the fame horfes travel two ftages a day, the turnpike money would be doubled; that is, 3650*l. per annum;* the keep of 800 horfes, at 2*s.* each *per diem*, is 29,200*l.* Thefe fums added make 32,850*l.*; owner's profit and incidental charges, fay 10 *per cent.*, 3285*l.*; in all 36,135*l.*, or, on 219,000 tons (being 600 tons a day), about one-fourth *per* ton. And fuppofing the fame quantity of goods carried on the railway, and the fame turnpike money paid, and that each horfe drew only fifteen tons, this would require only, he thinks, forty horfes; the keep of which, at 2*s.* a day, would be 1460*l.*, add the toll, 1825*l.* is 3285*l. per annum.* Owner's profit, &c. upon this fum 10 *per cent.* as above, 328*l.*; in all 3613*l.*, or about four-pence a ton, juft one-tenth part of the charge in the other cafe. He thinks, that when the object comes to be confidered in this point of view, few meafures that can be propofed will hold forth fuch an important national improvement as this would be. Confidered with regard to the confumption of the produce of the earth (an object at prefent deferving the fulleft attention, as this improvement can be applied to almoft every part of the country), it would, he fuppofes, reduce the number of heavy road horfes to one-eighth part of what they are at prefent, and of courfe augment the number of cattle or other confumeable provifions in a proportionate degree, fo as greatly to lower the price of the neceffaries of life. It would, in the next place, lower the price of the carriage of goods of all kinds to an amazing extent; and laftly, as a confequence of that, it would give fuch encouragement to agriculture, as no other meafure that can be contrived could ever effect, and that without cofting one fhilling expence to any one individual, or to the ftate. On the contrary, by inducing cheapnefs of provifion, and affording fuch efficacious encouragement to manufactures and to agriculture, it would produce a general profperity, which, by augmenting the confumption of taxable commodities, would augment the public revenue; while, at the fame time, every individual would feel himfelf relieved from the preffure of many taxes that prove diftrefsful to him at prefent. After juftly reprobating every fort of gambling fpeculations by monied men in undertakings of this nature, and fhewing the numerous evils that attend them, he advifes it, as highly neceffary to prevent thefe railways from ever becoming private property, on any account, to keep them open and patent alike, to all who fhall choofe to employ them as a king's highway, under fuch regulations as it fhall be found neceffary to fubject them to by law. In fhort, they fhould, he thinks, be put upon the fame footing, in all refpects, as public roads are at prefent, only under the direction of a diftinct fet of commiffioners, who fhould have the fuperintendance of every thing that concerns this fpecies of roads only. Thefe commiffioners fhould be vefted with authority under an act of parliament, to erect turnpikes upon them, to levy certain ftipulated tolls, and to mortgage the produce of thefe tolls for the purpofe of raifing money to be applied in the neceffary purchafes of land, and making the roads. In the act it fhould ſhould be expreſsly ſtipulated, that the produce of theſe tolls ſhould be applied ſolely to keeping the road in repair, paying the intereſt of ſums borrowed, and clearing off the principal as faſt as the collections would admit; and when the whole money borrowed was thus paid off, the tolls ſhould be ſo lowered as only to produce money ſufficient to keep the roads in a ſtate of continually good repair. Thus would the expence of tranſporting goods be annually diminiſhing, and the proſperity of the country be thereby augmenting from day to day. He adds, that he is particularly earneſt in this buſineſs, as he has not been an unconcerned obſerver of the effects that have reſulted from the eſtabliſhment of turnpike roads in Scotland, which were begun within his recollection; and theſe effects have been ſuch as no man who had not ſeen it would have believed could ever have taken place. Diſtance may be ſaid to be thus diminiſhed from place to place; lands that were originally far beyond the influence of the town as a market for any thing elſe than live-ſtock, are thus brought, as it were, cloſe to its gates; and the value of the produce of many articles is thus to them augmented fourfold, while they are at the ſame time diminiſhed to the public. Not only is the value of produce raiſed, but the quantity alſo of that produce is augmented exceedingly by means of manures which become then acceſſible. Foſſile manures, ſuch as chalk, lime, and marle, which were formerly confined to a narrow ſpot, expand themſelves as if it were by a magical power, and by that expanſible influence diffuſe around fertility, riches, and plenty. Coals and other weighty articles that may be uſeful in arts or manufactures of various kinds, which never were, nor ever could have been of any value to the owners of them, ſo long as the expence of tranſportation exceeded a certain ſum, find a ready market to any extent as ſoon as the price falls below that rate, thus contributing not only towards the enriching of the owners, but to the furniſhing of employment to the various perſons who muſt be engaged in preparing or tranſporting them to market, and the univerſal accommodation of the whole. Around every market you may ſuppoſe a number of concentric circles drawn, within each of which certain articles become marketable which were not ſo before, and thus become the ſource of wealth and proſperity to many individuals. Diminiſh the expence of carriage but one farthing, and you widen the circle; you form, as it were, a new creation, not only of ſtones, and earth, and trees, and plants, but of men alſo, and what is more, of induſtry, of happineſs, and joy. It is added, that by making theſe roads the property of the public, and free to every perſon to bring his own waggons upon them wherever he pleaſed, farmers, when near them, would make bye roads of the ſame ſort leading into theſe from their reſpective premiſes; the inhabitants of villages and country diſtricts would join together, and at one common expence make roads of the ſame ſort leading to a greater diſtance inwards, as they now make bye roads for themſelves. Thus would all be accommodated; thoſe who had buſineſs enough to furniſh a ſufficient load for one horſe might go to market with it when they pleaſed: thoſe who had dealings on a ſmaller ſcale could have one, two, or more waggons of their own conjoined with thoſe of others to make up a load for one horſe: and thoſe of ſtill ſmaller means could have one waggon loaded with the joint articles belonging to two, three, or more. A ton weight might then be puſhed before a man to market for many miles, as a wheelbarrow is now. It is ſcarcely poſſible, he ſuppoſes, to contemplate an inſtitution from which would reſult a greater quantum of harmony, peace, and comfort, to perſons living in the country, than would naturally reſult from this arrangement. In fact, he knows, he ſays, no *one* meaſure, that would tend ſo effectually to lower the price of the neceſſaries of life, and reſtore abundance.

In what regards the method of forming and conſtructing theſe railways, it is obſerved by the ſame writer, that the following has been given by the inventor as the moſt improved plan: firſt, that the beſt line the country affords ſhould be traced out, having regard to the direction of the carriage of articles or trade to be expected; and if ſuch trade be both ways in nearly equal quantities, a line as nearly horizontally level as poſſible ſhould be choſen. If the trade is all in one direction, as is generally the caſe between mines and navigation, then the moſt deſirable line is one with a gentle gradual deſcent, ſuch as ſhall make it not greater labour for the horſes employed to draw the loaded waggons down, than the empty ones back; and this will be found to be the caſe on a railway deſcending about one foot vertical in one hundred feet horizontal. Or, if the railway and carriages are of the very beſt conſtruction, the deſcent vertical may be to the length horizontal as 1 to 50, where there is little or no upgate loading. In caſes between mines and navigations the deſcents will often be found greater than could be wiſhed. On a railway on the improved plan, where the deſcent is more than as 1 to 50, ſix or eight waggons, loaded with thirty or forty hundred weight each, will have ſuch a tendency to run downwards, as would require great labour of one horſe to check and regulate, unleſs that tendency was checked by ſledging ſome of the wheels. On ſuch, and ſteeper roads, iron ſlippers are applied, one or more to a gang of waggons, as occaſion may require. Each ſlipper being chained to the ſide of one of the waggons, and, being put under the wheel, forms a ſledge. Where the deſcent is very great, ſteep inclined planes, with machinery, may, it is obſerved, be adopted, ſo as to render the other parts of the railway eaſy. On ſuch inclined planes the deſcending loaded waggons being applied to raiſe the aſcending empty, or partly loaded ones, the neceſſity of ſledging the wheels is avoided; and the labour of the horſe greatly reduced and leſſened.

In order to obtain the deſired levels, gentle deſcents, or ſteep inclined planes, and to avoid ſharp turns, and circuitous tracks, it will often be found prudent to croſs valleys by bridges and embankments; to cut through ridges of land; and in very rugged countries ſhort tunnels may, he thinks, ſometimes be neceſſary. The line of railway being fixed, and the plans and ſections by which the ſame is to be executed and ſettled, the ground for the whole muſt be formed and effectually drained. The breadth of the bed for a ſingle railway, ſhould be, in general, four yards; and for a double one ſix yards, excluſive of the fences, ſide drains, and ramparts.

That the bed of road being ſo formed to the proper inclination, and the embankments and works thereof made firm, the ſurface muſt be covered with a bed of ſtones broken ſmall, or good gravel, ſix inches in thickneſs or depth. On this bed muſt be laid the ſleepers, or blocks to faſten the rails upon. Theſe ſhould be of ſtone in all places where it can be obtained in blocks of ſufficient ſize. They ſhould be not leſs than eight, nor more than twelve inches in thickneſs; and of ſuch breadth (circular, ſquare, or triangular,) as ſhall make them 150lbs. or 200lbs. weight each. Their ſhape is not material, ſo as they have a flat bottom to reſt upon, and a ſmall portion of their upper ſurface level, to form a firm bed for the end of the rails. In the centre of each block ſhould be drilled a hole, an inch and a half diameter, and ſix inches in depth, to receive an octagonal plug of dry oak, five inches in length; for it ſhould not reach the bottom of the hole; nor ſhould it be larger than ſo as to put in eaſily, eafily, and without much driving; for if too tight fitted it might when wet burft the ftone. Thefe plugs are each to receive an iron fpike or large nail, with a flat point and long head, adapted to fit the counter-funk notches in the ends of two rails, and thereby to faften them down in the proper pofition, or fituation in which they are to lie.

With regard to the rails, they fhould be of the ftouteft caft-iron, one yard in length each, formed with a flanch on the inner edge, about two inches and a half high at the ends, and three and a half in the centre; and fhaped in the beft manner to give ftrength to the rails, and keep the wheels in their track. The foles of the rails, for general purpofes, fhould not, he thinks, be lefs than four inches broad; and the thicknefs proportioned to the work they are intended for. On railways for heavy burdens, great ufe, and long duration, the rails fhould be very ftout, weighing 40lbs., or, in fome cafes, nearly half an hundred weight each. For railways of lefs confequence, lefs weight of metal will do; but it will not be prudent to ufe them of lefs than 30lbs. weight each, in any fituation expofed to breakage above ground. But it is obferved that in mines, and other works under ground, where very fmall carriages only can be employed, very light rails are ufed, forming what are called train roads, on a fyftem introduced by Mr. Carr; and thefe kinds of light railways have been much ufed above ground in Shropfhire, and other counties where coals and other minerals are obtained.

It is added, that in fixing the blocks and rails great attention is required to make them firm. No earth or foft materials fhould be ufed between the blocks and the bed of fmall ftones or gravel, on which the rails muft all be fixed by an iron gage, to keep the fides at a regular diftance, or parallel to each other. The beft width of road for general purpofes is four feet two inches between the flanches of the rails; the wheels of the carriages running in tracks about four feet fix inches afunder. Rails of particular forms are neceffary where roads branch out from or interfect each other; and where carriage roads crofs the railways; and, at turnings of the railways, great care is required to make them perfectly eafy. The rails of the fide forming the inner part of the curve fhould be fixed a little lower than the other; and the rails fhould be fet a little under the gage, fo as to bring the fides nearer together than in the ftraight parts: thefe deviations in level and width to be in proportion to the fharpnefs of the curve. The blocks and rails being fixed and fpiked faft, nothing more remains to be done than to fill the horfe-path, or fpace between the blocks, with good gravel, or other proper materials; a little of which muft alfo be put on the outfide of the blocks to keep them in their proper places. This gravel fhould always be kept below the furface of the rails on which the wheels are to run, to keep the tracks of the wheels free from dirt and obftructions. The form of the rails muft be fuch as will free them from dirt if the gravelling is kept below their level.

And in the conftructing of the carriages great attention to avoid friction is neceffary, particularly in the formation of the wheels and axles, which muft be adapted to the fort of railways and kind of loading; but for which general directions cannot be given in a narrow compafs. It is probable that this valuable invention may alfo be applicable to many other purpofes in agriculture or manufactures, as it becomes more fully underftood, and the facilities which it affords are better known. See CANAL.

RAIMALPOUR, in *Geography*, a town of Hindooftan, in Vifiapour; 15 miles E. of Sattara.

RAIMONDI, IGNATIUS, in *Biography*. This worthy mufical profeffor, whofe performance, character, and private virtues, are well known to our country, after a refidence in it of more than thirty years, is honourably mentioned by Ernft Ludwig Gerber, the continuator of Walther's Mufical Lexicon, in 2 vols. 8vo., 1792. He fays, that this expreffive and pleafing performer on the violin, and agreeable compofer for his inftrument, was born in Italy, a fcholar of Barbella, fettled at Amfterdam in 1772, where he remained the principal violin during twelve years, having fucceeded the famous Locatelli. He had publifhed nine different works for violins at Berlin and Amfterdam, before the year 1785. About the year 1773 he arrived in London, fince which time he has publifhed many pleafing compofitions, particularly his "Battaglia," which is the beft imitative inftrumental mufic of that kind that has come to our knowledge.

RAIMPOUR, in *Geography*, a town of Hindooftan, in Rohilcund; 30 miles S. of Bereilly.

RAIN, a town of Hindooftan, in Guzerat, on the gulf of Cutch; 45 miles W. of Noanagur.—Alfo, a town of Bavaria; 16 miles N. of Augfburg. N. lat. 48° 37'. E. long. 10° 52'.

RAIN, or *Old Rain*, a town of Scotland, in Aberdeenfhire, near which are the remains of a palace of the former bifhops of Aberdeen; eight miles S.E. of Inverary.

RAIN, the diftillation of water which defcends from the atmofphere in drops of various fizes. By this circumftance rain is diftinguifhed from dew or fog; in the former of which the drops are fo fmall, that they are quite invifible; and in the latter, though they are of a larger fize, they feem to have little more fpecific gravity than the atmofphere itfelf, and may therefore be reckoned hollow fpherules rather than drops.

Rain is, apparently, a precipitated cloud; as clouds are nothing but vapours raifed from moifture, waters, &c.

And vapours are demonftratively nothing elfe but little bubbles or veficulæ detached from the furface of the terraqueous globe by the power of the folar or fubterraneous heat, or fome other caufe. Thefe veficulæ, being fpecifically lighter than the atmofphere, are buoyed up by it, until they arrive at a region where the air is in a juft balance with them; and here they float, till by fome new agent they are converted into clouds, and thence either into rain, fnow, hail, mift, or the like.

But the agent in this formation of the clouds into rain, and the vapours into clouds, has been much controverted. Some philofophers have fuppofed that the cold, which conftantly occupies the fuperior regions of the air, chills and condenfes the veficulæ, at their arrival from a warmer quarter; congregates them together, and occafions feveral of them to coalefce into little maffes: and by thefe means their quantity of matter increafing in a greater proportion than their furface, they become an overbalance to the thin air, and accordingly defcend in rain.

Dr. Derham accounts for the precipitation thus; that the veficulæ being full of air, when they meet with a colder air than that they contain, this internal air is contracted into a lefs fpace; and confequently the watery fhell, or cafe, is rendered thicker, fo as to become heavier than the air, &c.

It has, however, been objected to this hypothefis, that rain often happens in very warm weather; and though it be allowed, that the condenfation may be owing to the cold of the upper regions, yet the drops acquire a confiderable increafe of fize as they defcend. *E. G.* On the fummit of a hill they are fmall and occafion only a drizzling fhower; but in defcending the hill it becomes more confiderable, and at the bottom of the hill the drops are much larger, and the

the rain is impetuous. Hence it appears that the vapours are condenfed when the atmofphere is warm as well as when it is cold.

Others only allow the cold a part in the action, and afcribe a fhare of it to the winds, alleging, that a wind blowing againft a cloud will drive its veficulæ upon one another, by which means feveral of them, coalefcing as before, will be enabled to defcend; and the effect will be ftill more confiderable, if two oppofite winds blow together toward the fame place. To which they add, that clouds already formed, happening to be augmented by frefh acceffions of vapour, continually afcending, may on this account be enabled to defcend.

Againft the above ftated hypothefis of Derham, it has been objected that the veficulæ of vapour, if they be fuch, are filled, not with air, but fire or heat in a latent ftate, and till they part with this heat, the vapour cannot be condenfed. Cold is not always fufficient to produce this effect, for in the moft fevere frofts the air is ferene, and parts with little or none of its vapours, for a confiderable time. It is alfo alleged, that the winds have no confiderable agency, fince blowing upon vapour is fo far from condenfing it, that it unites more clofely with the air; and wind is known very much to promote evaporation. See VAPOUR.

Yet the grand caufe, according to Rohault, ftill remains: that author conceives it to be the heat of the air, which after continuing for fome time near the earth, is at length carried up on high by a wind, and there thawing the fnowy villi, or flocks of the half-frozen veficulæ, reduces them into drops; which coalefcing, defcend, and have their diffolution perfected in their progrefs through the lower and warmer ftages of the atmofphere Others, as Dr. Clarke, &c. afcribe this defcent of the clouds rather to an alteration of the atmofphere than of the veficulæ; and fuppofe it to arife from a diminution of the fpring, or elaftic force of the air.

This elafticity, which, as they fay, depends chiefly or wholly on the dry terrene exhalations, being weakened, the atmofphere finks under its burden, and the clouds fall, on the common principle of precipitation.

Now, the little veficulæ, by any or all thefe means, being once upon the defcent, will perfift therein. notwithftanding the increafe of refiftance they every moment meet with in their progrefs through ftill denfer and denfer parts of the atmofphere. For, as they all tend toward the fame point, *viz.* the centre of the earth, the farther they fall, the more coalitions will they make; and the more coalitions, the more matter will there be under the fame furface; the furface only increafing as the fquares; but the folidity as the cubes; and the more matter under the fame furface, the lefs friction or refiftance there will be to the fame matter.

Thus if the cold, the wind, &c. happen to act early enough to precipitate the afcending veficulæ, before they are arrived at any confiderable height, the coalitions being few in fo fhort a defcent, the drops will be proportionably fmall: and thus is formed what we call *dew*. See DEW.

If the vapours prove more copious, and rife a little higher, we have a *mift* or *fog*; which fee refpectively.

A little higher ftill, and they produce a fmall rain, &c. If they neither meet with cold, nor wind enough to condenfe or diffipate them, they form a heavy, thick, dark fky; which lafts fometimes feveral weeks. This hypothefis of the diminution of the atmofphere's elafticity, requires a more fatisfactory explication of the caufe of this diminution. By afcribing it to terrene exhalations, we only folve one difficulty by introducing another; for we are totally unacquainted with the nature and operation of thefe exhalations. But let the caufe be what may be fuppofed, if it act equally, and at once, upon all the vapour in the air, all that vapour muft be at once precipitated; and the confequence muft be, that, inftead of gentle fhowers continuing for a confiderable time, we muft have copious water-fpouts, lafting only for a few minutes or feconds, which, inftead of refrefhing the earth, would drown and lay it wafte.

Thofe who admit either of the above hypothefes, account for many of the phenomena of the weather; *e. gr.* why a cold is always a wet fummer, and a warm a dry one; becaufe the principle of precipitation obtains in the one cafe, and is wanting in the other. Why we have ordinarily moft rain about the equinoxes; becaufe the vapours arife more plentifully than ordinary in the fpring, as the earth becomes loofened from the brumal conftipations; and becaufe, as the fun recedes from us in autumn, the cold increafing, the vapours that had lingered above during the fummer heats, are now difpatched down, &c. Why a fettled, thick, clofe fky fcarcely ever rains till it have been firft clear; becaufe the equally diffufed vapours muft firft be condenfed, and congregated into feparate clouds, to lay the foundation of rain; by which means the reft of the face of heaven is left open, and pervious to the rays of the fun, &c.

For other phenomena of rain, as they relate to the weather-glafs, fee BAROMETER, and WEATHER.

It cannot be doubted, that there is a connection between the defcent of the barometer and the fall of rain; but no fatisfactory reafon has yet been affigned for the circumftance; nor is it poffible to foretell with certainty that rain will follow any changes in the height of the barometer that have been obferved. The immediate dependence of rain, or of any other atmofpherical phenomena, on the influence of the moon, appears to be rendered highly improbable, not only by mathematical calculations of the effects of the moon's attraction, but alfo by the irregularity of the obfervations which have been adduced in favour of a fuch a connection. (See *Influence of the* MOON.) But however uncertain the ultimate caufes of rain may be in general, their effects in fome places are fufficiently conftant, to be attributed to permanent local circumftances, and in particular to the periodical recurrence of fimilar winds.

For a more particular account of other theories, for explaining the afcent of vapours, the formation of clouds, and the fall of rain, fee VAPOUR.

Befides the caufes of rain, mentioned above, Defaguliers thinks it owing to the lofs of electricity in the vapours of which they were formed.

Other writers, in the progrefs of this part of philofophical fcience, have confidered rain as an electrical phenomenon: or at leaft they have fuppofed, that the powers of electricity may concur with other caufes in producing it. Signior Beccaria, whofe obfervations on the general ftate of electricity in the atmofphere have been more extenfive and accurate than thofe of any other perfon, reckons rain, hail, and fnow, among the effects of a moderate electricity in the atmofphere. Clouds that bring rain, he thought, were produced in the fame manner as thunder clouds, only by a moderate electricity. He defcribes them at large, and the refemblance which all their phenomena bear to thofe of thunder-clouds is very ftriking. He notes feveral circumftances attending rain without lightning, which render it probable, that it is produced by the fame caufe as when it is accompanied with lightning. Light has been feen among the clouds by night in rainy weather; and even by day rainy clouds are fometimes feen to have a brightnefs evidently independent of the fun. The uniformity with

which

which the clouds are fpread, and with which the rain falls, he thought, were evidences of an uniform caufe like that of electricity. The intenfity alfo of electricity in his apparatus generally correfponded very nearly to the quantity of rain that fell in the fame time. Sometimes all the phenomena of thunder, lightning, hail, rain, fnow, and wind have been obferved at one time; which fhews the connection they all have with fome common caufe. Signior Beccaria, therefore, fuppofes, that, previous to rain, a quantity of electric matter efcapes out of the earth, in fome place where there was a redundancy of it; and in its afcent to the higher regions of the air, collects and conducts into its path a great quantity of vapours. The fame caufe that collects, will condenfe them more and more; till, in the places of the neareft intervals, they come almoft into contact, fo as to form fmall drops; which, uniting with others as they fall, come down in rain. The rain will be heavier in proportion as the elafticity is more vigorous, and the cloud approaches more nearly to a thunder-cloud. He imitated the appearance of clouds that bring rain, by infulating himfelf between the rubber and conductor of his electrical machine; and with one hand dropping colophonia into a fpoon faftened to the conductor, and holding a burning coal, while his other hand communicated with the rubber. In thefe circumftances the fmoke fpread along his arm, and, by degrees, all over his body, till it came to the other hand that communicated with the rubber. The lower furface of this fmoke was every where parallel to his clothes, and the upper furface was fwelled and arched like clouds replete with thunder and rain. In this manner, he fuppofes, the clouds that bring rain diffufe themfelves from over thofe parts of the earth which abound with electric fire, to thofe parts that are exhaufted of it; and by letting fall their rain, reftore the equilibrium between them. Signior Beccaria alfo thought, that the electricity communicated to the air, which both receives and parts with it flowly, would account for the retention of vapours in a clear fky; for fmall disjointed clouds, not difperfed into rain; for the fmaller and lighter clouds in the higher regions of the air, which are but little affected by electricity; and alfo for the darker, heavy, and fluggifh clouds in the lower regions, which retain more of it. He even imagined that fome alteration in the weight of the air might be made by this electricity of it: the phenomena of rain, he thought, favoured the fuppofition, that the electric matter in the air did, in fome meafure, leffen its preffure: for when the electric matter is actually in the air, collecting and condenfing the vapours, the barometer is loweft. When the communication is made between the earth and the clouds by the rain, the quickfilver begins to rife; the electric matter, which fupported part of the preffure, being difcharged. Lettere dell Elettricifmo. Prieftley's Hift. &c. of Electricity, vol. i. p. 427, &c. 8vo.

Dr. James Hutton's theory of rain is ftated and amply illuftrated in the 1ft volume of the Edinburgh Tranfactions, p. 47, &c. It is well known that atmofpheric air is capable, with a certain degree of heat, of diffolving a given quantity of water. (See Vapour.) Dr. Hutton afcertains the ratio of the diffolving power of air, in relation to water, with different degrees of heat; and thus, by mixing a portion of tranfparent humid warm air with a portion of cold air, the mixture becomes opaque, and part of the water will be precipitated; or, in other words, the vapour will be condenfed into rain. Hence he obferves, that fince the capacity of air for moifture increafes fafter than the temperature, there muft be a depofition of moifture when two faturated portions of air at different temperatures are mixed. Dr. Hutton fuppofes that heat and folution do not increafe by equal increments; but that, in reality, if heat be fuppofed to increafe by equal increments along a ftraight line, folution will be expreffed by ordinates to a curve, whofe convex fide is turned towards that line. That the power of folution is not increafed in the fame ratio with heat is, however, hypothetical, except when we rife pretty high in the fcale, when its proportional increafe is fomewhat doubtful; nor has our author fupported it by experiment. The condenfation of the breath in air is not to the purpofe, unlefs we fuppofe the air to be already faturated with vapour. In any view, it can only amount to this, that to render it vifible, the heat muft be diminifhed in a greater proportion than can be compenfated by the power of folution in the body of air, in which the portion expired is at firft immerfed. In order to explain the origin of rain from this caufe, we muft always fuppofe a conftant diminution of heat to take place at the moment of the condenfation of the vapour; but we actually find, that the change from a ftate of vapour to the fluid ftate is attended with heat; fo that rain muft at once oppofe its own caufe, and continued rains would be impoffible without the aid of other caufes. Dr. Hutton endeavours, from his own fyftem, to explain the regular and irregular feafons of rain, with regard either to the generality of its appearance, or the regularity of its return. And to obviate the apparent exceptions of the theory, from the generality of rain, he explains the proportional quantities of rain, and adds a comparative eftimate of climates, in relation to rain with the meteorological obfervations made in our own climate. As our limits will not allow our doing full juftice to our author's reafoning, we muft refer to his own paper on the fubject.

Mr. Dalton, in his "Meteorological Effays," (Eff. vi.) expreffes his approbation of Dr. Hutton's theory in general; to this purpofe, he fays, "the principles of none appear to me to be more plaufible and confiftent with facts." Dr. Hutton, as we have above fhewn, confiders the varieties of heat and cold, affecting the folvent power of the atmofphere, as the fole caufes of rain; and Mr. Dalton obferves, when we confider that evaporation and the precipitation of vapour are diametrically oppofite, it is reafonable to fuppofe that they fhould be promoted by oppofite caufes: and as heat and dry air are favourable to evaporation, fo cold, operating upon air replete with vapour, promotes its precipitation. Dr. Hutton, however, feems to confider water as chemically combined with the atmofphere, and that cold produces precipitation in a manner fimilar to what it does in water faturated with falt, or in other chemical proceffes; whereas Mr. Dalton fuppofes, that a portion of the vapour, confidered as a diftinct and peculiar fluid, is condenfed into water by cold; but the effects refulting from the two theories will be the fame. See Meteorology, and Vapour.

M. de Luc, in the 2d volume of his "Thoughts on Meteorology," has directed particular attention to the various circumftances that attend rain. He has alfo examined the feveral hypothefes of different authors, and concludes, that they are altogether infufficient to account for the formation of it. In this inquiry the grand queftion under difcuffion is, what becomes of the water that rifes in vapour into the atmofphere? or what is the ftate in which it fubfifts there, between the time of its evaporation, and its falling down in rain? If it continues in the ftate of watery vapour, or fuch as is the immediate product of evaporation, it muft poffefs the diftinctive characters effential to that fluid; it muft make

make the hygrometer move towards humidity, in proportion as the vapour is more or lefs abundant in the air: on a diminution of heat, the humidity, as fhewn by the hygrometer, muft increafe; and on an increafe of the heat, the humidity muft diminifh; and the introduction of other hygrofcopic fubftances, drier than the air, muft have the fame effect as an augmentation of heat. Thefe are the properties of vapour, on every hypothefis of evaporation; and, therefore, all the water that exifts in the atmofphere, without poffeffing thefe properties, is no longer vapour, but muft have changed its nature. M. de Luc fhews, that the water which forms rain, though it has ever been confidered and reafoned upon as producing humidity, does not poffefs this property, and muft, therefore, have paffed into another ftate. As he thinks that the vapour paffes into an invifible ftate in the interval between evaporation and its falling again in rain, and that in this ftate it is not fenfible to the hygrometer, he confiders the laws of hydrology as infufficient for explaining the formation of rain; but he does not pretend to have difcovered the immediate caufe of the formation of clouds and rain. If it is not in the immediate product of evaporation that rain has its fource; if the vapours change their nature in the atmofphere, fo as no longer to be fenfible to the hygrometer, or to the eye; if they do not become vapour again till clouds appear; and if, when the clouds are formed, no alteration is perceived in the quality of the air; we muft acknowledge it to be very probable, that the intermediate ftate of vapour is no other than air, and that the clouds do not proceed from any diftinct fluid contained in the atmofphere, but from a decompofition of a part of the air itfelf, perfectly fimilar to the reft. For other obfervations on the afcent and nature of vapour, and the fubfequent formation of rain, we refer to the articles METEOROLOGY, and VAPOUR.

As to the general quantity of rain that falls, and its proportion in feveral places at the fame time, and in the fame place at feveral times, we have many obfervations, journals, &c. in the Memoirs of the French Academy, the Philof. Tranf. and many other publications; from which we fhall make the following extracts.

Upon meafuring the rain falling yearly, its depth, at a medium, is found as in the following table.

Depth of Rain falling yearly, and its Proportion in feveral Places.

	Inches.
At Townley, in Lancafhire, obferved by Mr. Townley	42½
Upminfter, in Effex, by Dr. Derham - - - -	19¼
Zurich, in Swifferland, by Dr. Scheuchzer - - -	32¼
Pifa, in Italy, by Dr. Mich. Ang. Tilli - - -	43¼
Paris, in France, by M. de la Hire - - - - -	19

See Philof. Tranf. abr. vol. iv. pt. ii. p. 81, &c. and alfo Meteorological Journal of the Royal Society, publifhed annually in the Phil. Tranf.

As rain-gages have been fixed of late years in almoft every part of the kingdom, we are enabled to determine, with confiderable exactnefs, the depth of water which the rain yields in any given place. It may be obferved, however, that inland counties have lefs rain than maritime ones, efpecially thofe which border on the weftern feas. But ftill a greater difference feems to take place between a mountainous country, and a champaign or flat country. In the former there often falls double or triple the quantity of rain in a year that there does in the latter, and never lefs than an equal quantity. It is alfo obferved, that thofe winds bring moft rain that blow from the quarter in which is the moft and neareft fea; as are weft and fouth-weft winds. The rain-gage alfo fhews, that more rain is collected in the inftrument, as it is placed nearer the ground; without any appearance of a difference, between two places, on account of their difference of level above the fea, provided that the inftrument is as far from the ground at the one place, as it is at the other. Thefe effects are noticed in the Phil. Tranf. for 1769 and 1771, the former by Dr. Heberden, and the latter by Mr. Daines Barrington. Dr. Heberdeen fays, "A comparifon having been made between the quantity of rain which fell in two places in London, about a mile diftant from one another, it was found that the rain in one of them conftantly exceeded that in the other, not only every month, but almoft every time that it rained. The apparatus ufed in each of them was very exact, and both made by the fame artift; and upon examining every probable caufe, this unexpected variation did not appear to be owing to to any miftake, but to the conftant effect of fome circumftance which, not being fuppofed to be of any moment, had never been attended to. The rain-gage in one of thefe places was fixed fo high, as to rife above all the neighbouring chimnies; the other was confiderably below them; and there appeared reafon to believe, that the difference in the quantity of rain in thefe two places was owing to this difference in the placing of the veffel in which it was received. A funnel was, therefore, placed above the higheft chimnies, and another upon the ground of the garden belonging to the fame houfe, and there was found the fame difference between thefe two, though placed fo near one another, which had been between them, when placed at fimilar heights in different parts of the town. After this fact was fufficiently afcertained, it was thought proper to try whether the difference would be greater at a much greater height; and a rain-gage was therefore placed upon the fquare part of the roof of Weftminfter Abbey. Here the quantity of rain was obferved for a twelvemonth, the rain being meafured at the end of every month, and care being taken that none fhould evaporate by paffing a very long tube of the funnel into a bottle through a cork, to which it was exactly fitted. The tube went down very near to the bottom of the bottle, and therefore the rain which fell into it would foon rife above the end of the tube, fo that the water was no where open to the air except for the fmall fpace of the area of the tube: and by trial it was found that there was no fenfible evaporation through the tube thus fitted up.

The following table fhews the refult of thefe obfervations.

From July the 7th, 1766, to July the 7th, 1767, there fell in a Rain-gage, fixed

1766.	Below the top of a houfe.	Upon the top of a houfe.	Upon Weftminfter Abbey.
	Inches.	Inches.	Inches.
From the 7th to the end of July	3.591	3.210	2.311
Auguft	0.558	0.479	0.508
September	0.421	0.344	
October	2.364	2.061	1.416
November	1.079	0.842	0.632
December	1.612	1.258	0.994
1767, January	2.071	1.455	1.035
February	2.864	2.494	1.335
March	1.807	1.303	0.587
April	1.437	1.213	0.994
May	2.432	1.745	1.142
June	1.997	1.426	1.145
July 7	0.395	0.309	
	22.628	18.139	12.099

By this table it appears, that there fell below the top of a houfe above a fifth part more rain than what fell in the fame fpace above the top of the fame houfe; and that there fell upon Weftminfter Abbey not much above one-half of what was found to fall in the fame fpace below the tops of the houfes. This experiment has been repeated in other cafes with the fame refult. What may be the caufe of this extraordinary difference, has not yet been difcovered; but it may be ufeful to give notice of it, in order to prevent that error, which would frequently be committed in comparing the rain of two places without attending to this circumftance."

Such were the obfervations of Dr. Heberden on firft announcing this circumftance, *viz.* of different quantities of rain falling at different heights above the ground. Two years afterward, Daines Barrington, efq. made the following experiments and obfervations, to fhew that this effect, with refpect to different places, refpected only the feveral heights of the inftruments above the ground at thofe places, without regard to any real difference of level in the ground at thofe places.

Mr. Barrington caufed two other rain-gages, exactly like thofe of Dr. Heberden, to be placed, the one upon mount Rennig, in Wales, and the other on the plane below, at about half a mile's diftance, the perpendicular height of the mountain being 450 yards, or 1350 feet; each gage being at the fame height above the furface of the ground at the two ftations.

The refults of the experiment are as below:

1770.	Bottom of the mountain.	Top of the mountain.
	Inches.	Inches.
From July 6 to 16 - -	0.709	0.648
July 16 to 29 - -	2.185	2.124
July 29 to Aug. 10 -	0.610	0.656
Sept. 9, both bottles had run over.		
Sept. 9 to 30 - -	3.234	2.464
Oct. 17, both bottles had run over.		
Oct. 17 to 22 - -	0.747	0.885
Oct. 22 to 29 - -	1.281	1.388
Nov. 20, both bottles were broken by the froft.	8.766	8.165

"The inference to be drawn from thefe experiments, Mr. Barrington obferves, feems to be, that the increafe of the quantity of rain depends upon its nearer approximation to the earth, and fcarcely at all upon the height of places, provided the rain-gages are fixed at about the fame diftance from the ground.

"Poffibly alfo a much controverted point between the inhabitants of mountains and plains may receive a folution from thefe experiments; as in an adjacent valley, at leaft, very nearly the fame quantity of rain appears to fall within the fame period of time as upon the neighbouring mountains."

Dr. Heberden alfo adds the following note. "It may not be improper to fubjoin to the foregoing account, that, in places where it was firft obferved, a different quantity of rain would be collected, according as the rain-gages were placed above or below the tops of the neighbouring buildings; the rain-gage below the top of the houfe into which the greater quantity of rain had for feveral years been found to fall, was above fifteen feet above the level of the other rain-gage, which, in another part of London, was placed above the top of the houfe, and into which the leffer quantity always fell. This difference, therefore, does not, as Mr. Barrington juftly remarks, depend upon the greater quantity of atmofphere through which the rain defcends: though this has been fuppofed by fome, who have thence concluded that this appearance might readily be folved by the accumulation of more drops, in a defcent through a great depth of atmofphere."

In the examination of the refults from meteorological tables, it fhould be obferved, that feveral years' account of the rain at any place is required, before a medium yearly quantity can be obtained with fufficient accuracy. The following table, formed by Mr. Dalton, and publifhed in the firft part of the fifth volume of Manchefter Memoirs, gives us the largeft collection of accounts of rain fallen in different places in England that has to our knowledge hitherto appeared. They are chiefly taken from the Tranfactions of the Royal Society, and of other focieties.

CUMBERLAND

Counties (Maritime).	Places.	Mean annual Depth in Inches.
Cumberland	Kefwick, 7 years	67.5
	Carlifle, 1 year	20.2

Northamptonshire	Near Oundle, 14 years	23
	General mean	35.2

The general mean of 35.2 inches is, as our author apprehends, a little above the medium for England and Wales, as the greater number of places are thofe where much rain falls. If we take up a mean for each of the above-mentioned counties, (where more than one place in a county is given,) and then a general mean from the counties, the refult is a reduced mean of 31.3. Even then it may be objected, that the greater part of the counties are maritime; but it muft be obferved, that there is no account of rain in Wales: and we may fafely conclude, that the rain in Wales would exceed the laft-mentioned mean as much as the inland counties of England, not in the above lift, would fall fhort; becaufe Wales is both a mountainous country, and expofed to the fea.

We will, therefore, conclude, that the mean annual depth of rain in England and Wales, deduced from thefe twenty counties, is 31 inches: a quantity which fubfequent obfervations, our author is confident, will not diminifh, and probably not increafe much.

The editors of the Encyclopedia, under the article *Weather*, from 16 places of obfervation, make the annual mean for Great Britain 32.53 inches; and M. Cotte, in the Journal de Phyfique for 1791, gives a mean derived from 147 places, in different parts of the world, equal to 34.7 inches.

If we take the dew (fee Dew) at 5 inches annually, we fhall have 36 inches of water at a medium annually, on the furface of the earth, in England and Wales, reckoning 31 for rain and 5 for dew. Admitting the computation of Guthrie, the area of England and Wales is 46,450 fquare miles. This, reduced to fquare feet, gives 1,378,586,880,000; which, multiplied by 3 feet, the annual depth of rain and dew, gives 4,135,760,690,000 cubic feet of water, = 153,176,320,000 cubic yards, or 28 cubic miles = 115 thoufand millions of tons in weight, nearly. This immenfe mafs of water is difpofed of partly by the fupply of rivulets, and the foaking into the earth a fmall way, fo as to break out again in lower ground in the form of fprings, and thence make its way to fome river, by which it is conveyed to the fea; and partly by being raifed into the atmofphere in the procefs of evaporation. The decompofition of water by vegetables is not noticed, becaufe it is prefumed, that in the courfe of nature the principles are combined, and water formed again. See River, Spring, Evaporation, and Vapour.

As to the ufe of rain, we may obferve that it moiftens and foftens the earth, and thus fits it for affording nourifhment to plants: by falling on high mountains, it carries down with it many particles of loofe earth, which ferve to fertilize the furrounding vallies, and purifies the air from noxious exhalations, which tend in their return to the earth to meliorate the foil; it moderates the heat of the air; and is one means of fupplying fountains and rivers. However, vehement rains in many countries are found to be attended with barrennefs and poornefs of the lands, and mifcarriage of the crops in the fucceeding year: and the reafon is plain; for thefe exceffive ftorms wafh away the fine mould into the rivers, which carry it into the fea, and it is a long time before the land recovers itfelf again. The remedy to the famine, which fome countries are fubject to from this fort of mifchief, is the planting large orchards and groves of fuch trees as bear efculent fruit; for it is an old obfervation, that in years, when grain fucceeds worft, thefe trees produce moft fruit of all. It may partly be owing to the thorough moiftening of the earth, as deep as their roots go, by thefe rains, and partly to their trunks ftopping part of the light mould carried down by the rains, and by this means furnifhing themfelves with a coat of new earth. Phil. Tranf. N° 90.

The water afforded by rain is found highly refrefhing to almoft all forts of vegetable crops, and to promote their growth in a rapid manner, when not produced in too great abundance at a time. This effect, which may often be perceived to take place in a fudden manner, after warm fhowers in the early fpring months, is probably caufed by the large proportion of oxygen that is contained in rain-water, as well as from the neceffary moifture being afforded to the fibres of the roots of the plants. Too much rain may be injurious, however, by leffening the neceffary cohefion and compactnefs of foils, by which they may not afford proper firmnefs to the roots of growing vegetables. And another injury may be produced by the too frequent occurrence of hafty fhowers, by which a large proportion of the decompofing vegetable and animal materials of lands, which are foluble or diffufible in water, may be conveyed away into the ditches, rivers, and ultimately into the fea, and of courfe prove the caufe of infertility. In hilly fituations, this effect may arife from even flight fhowers; on which account, they have been advifed to be ploughed in a flanting direction, as by that means the rains may be more perfectly detained in the foils. And it has been fuggefted by Dr. Darwin, that as the foliage or buds of plants require more moifture for their vigorous growth than their flowers, in this climate, continued rains may be liable not only to wafh off the farina from

from the burfting anthers, and in that way prevent the impregnation of the piftillum, but alfo delay the ripening of the feeds or fruit, from the want of a due evaporation of their perfpirable matter, as well as from the lefs folar light in cloudy feafons. On this account it is, he fuppofes, that in the north of Scotland the oats are faid feldom to ripen till the froft commences, with the dry feafon which accompanies it.

Thus, as the effects of rain are fo very confiderable on vegetation, it would be highly ufeful to afcertain the quantity or depth of rain that falls annually in different diftricts, and the difference in the effects which are produced by it. See WATER and WEATHER.

The vaft quantities of rain which fall in fome diftricts, from the peculiar nature of their fituations, efpecially where they are of the grazing or pafture kind, as thofe of Chefhire, Lancafhire, and fome others, are often highly beneficial to their general fertility; the natural grafs paftures of which diftricts, though frequently of inferior qualities to thofe in many other places, are, in confequence of this circumftance, rendered fuperior in their abundance of grafs, the ftrength of its vegetation, and the richnefs of its quality. The former of the above counties may indeed, without any impropriety, be reckoned one of the moft productive grafsland diftricts in the kingdom, as is fully evinced by the great abundance and fuperiority of its dairy products. The grafs lands in this tract of country moftly retain their full verdure during the moft fultry and parching feafons, except where they are of a fandy or gravelly nature in their under ftrata. Where they are near to the fea, however, in this as well as other parts, they are liable to become moffy, or be covered with the mofs plant, either in confequence of fo much of the fpray from it falling in the manner of flight rain, or fome other caufe of that kind.

The quantity of rain falling upon land has much influence upon its temperature, or ftate of heat, and, of courfe, great effect on vegetation in that way; and the nature of its mixture with it, or the manner in which it is diftributed through its parts, or combined with its different earthy materials, is another means by which it becomes of great importance, as it relates to the fupplying of nourifhment and fupport to vegetables as crops.

Rain falling in large quantities, on particular forts of retentive foils, is a frequent caufe of that kind of injurious wetnefs, which ftands fo much in need of furface-draining to remove it. See SURFACE-*Draining*.

The nature and caufes of fhowers and rain are extremely curious and interefting in feveral different points of view, both to the agriculturift and the philofophical inquirer.

RAINS, *Preternatural.* We have numerous accounts in hiftorians of preternatural rains, fuch as the raining of ftones, of duft, of blood, nay, and of living animals, as young frogs, and the like. We are not to doubt the truth of what thofe who are authors of veracity and credit relate to us of this kind, fo far as to fuppofe that the FALLING *of Stones* (which fee) and duft never happened; the whole miftake (if it be fo with regard to the firft inftance) is the fuppofing them to have fallen from the clouds; but as to the blood and frogs, it is very certain that they never fall at all, but the opinion has been a mere deception of the eyes. Men are extremely fond of the marvellous in their relations; but the judicious reader is to examine ftrictly whatever is reported of this kind, and is not to fuffer himfelf to be deceived.

There are two natural methods by which quantities of ftones and duft may fall in certain places, without their having been generated in the clouds, or fallen as rain. The one is by means of hurricanes: the wind which we frequently fee tearing off the tiles of houfes, and carrying them to confiderable diftances, being equally able to take up a quantity of ftones, and drop them again at fome other place. But the other, which is much the moft powerful, and probably the moft ufual way, is for the eruptions of volcanos, and burning mountains, to tofs up, as they frequently do, a vaft quantity of ftones, afhes, and cinders, to an immenfe height in the air; and thefe being hurried away by the hurricanes and impetuous winds, which ufually accompany thofe eruptions, and being in themfelves much lighter than common ftones, as being half calcined, may eafily be thus carried to vaft diftances, and their falling in places where the inhabitants know nothing of the occafion, they cannot but be fuppofed by the vulgar to fall on them from the clouds. It is well known, that in the great eruptions of Ætna and Vefuvius, fhowers of afhes, duft, and fmall cinders, have been feen to obfcure the air, and overfpread the furface of the fea for a great way, and cover the decks of fhips; and this at fuch a diftance, as it fhould appear fcarce conceivable that they fhould have been carried to; and probably, if the accounts of all the fhowers of thefe fubftances mentioned by authors be collected, they will all be found to have fallen within fuch diftances of volcanos; and if compared, as to the time of their falling, will be found to correfpond in that alfo with the eruptions of thofe mountains. We have known inftances of the afhes from Vefuvius having been carried thirty, nay forty leagues, and peculiar accidents may have carried them yet farther.

The raining of blood has been ever accounted a more terrible fight, and a more fatal omen, than the other preternatural rains already mentioned. It is very certain that nature forms blood no where but in the veffels of animals, and therefore fhowers of it from the clouds are by no means to be credited. Thofe who fuppofe that what has been taken for blood, has been actually feen falling through the air, have had recourfe to flying infects for its origin, and fuppofe it the eggs or dung of certain butterflies difcharged from them as they were high up in the air. But this feems a very wild conjecture, as we know of no butterfly whofe excrements, or eggs, are of fuch a colour, or whofe abode is fo high, or their flocks fo numerous, as to be the occafion of this.

It is moft probable that thefe bloody waters were never feen falling, but the people feeing the ftanding waters blood-coloured, were affured, from their not knowing how it fhould elfe happen, that it had rained blood into them. A very memorable inftance of this there was at the Hague in the year 1670. Swammerdam, who relates it, tells us, that one morning the whole town was in an uproar, on finding their lakes and ditches full of blood, as they thought, and having been certainly full of water the night before, they agreed it muft have rained blood in the night; but a certain phyfician went down to one of the canals, and taking home a quantity of this blood-coloured water, he examined it by the microfcope, and found that the water was water ftill, and had not at all changed its colour, but that it was full of prodigious fwarms of fmall red animals, all alive, and very nimble in their motions, whofe colour and prodigious number gave a red tinge to the whole body of the water they lived in, on a lefs accurate infpection. The certainty that this was the cafe, did not however perfuade the Hollanders to part with the miracle; they prudently concluded, that the fudden appearance of fuch a number of animals was as great a prodigy as the raining of blood would have been; and are affured at this day, that this portent foretold the fcene of war and devaftation which Lewis XIV. afterwards brought into that country, which had before enjoyed forty years uninterrupted peace.

The

The animals, which thus colour the water of lakes and ponds, are the *pulices arborefcentes* of Swammerdam, or the water-fleas with branched horns. Thefe creatures are of a reddifh-yellow, or flame colour; they live about the fides of ditches, under weeds, and among the mud, and are therefore the lefs vifible, except at a certain time, which is in the end of May or beginning of June: it is at this time that thefe little animals leave their receffes to float loofe about the water, to meet for the propagation of their fpecies, and by that means become vifible in the colour they give the water. This is vifible, more or lefs, in one part or other of almoft all ftanding waters at this feafon; and it is always at this feafon that the bloody waters have alarmed the ignorant.

The raining of frogs is a thing not lefs wonderful in the accounts of authors who love the marvellous, than thofe of blood, or of ftones; and this is fuppofed to happen fo often, that there are multitudes who pretend to have been eye-witneffes of it. Thefe rains of frogs always happen after very dry feafons, and are much more frequent in the hotter countries than the cold ones. In Italy they are very frequent; and it is not uncommon to fee the ftreets of Rome fwarming both with young frogs and toads in an inftant, in a fhower of rain; they hopping every where between the people's legs, as they walk, though there was not the leaft appearance of them before. Nay, they have been feen to fall through the air down upon the pavements. This feems a ftrong circumftance in favour of their being rained down from the clouds, but when ftrictly examined, it comes to nothing; for thefe frogs, that are feen to fall, are always found dead, lamed, or bruifed by the fall, and never hop about as the reft; and they are never feen to fall, except clofe under the walls of houfes, from the roofs and gutters of which they have accidentally flipped down.

To the raining of frogs we ought to add the raining of grafs-hoppers and locufts, which have fometimes appeared in prodigious numbers, and devoured the fruits of the earth. There has not been the leaft pretence for fuppofing that thefe animals defcended from the clouds, but that they appeared on a fudden in prodigious numbers. The naturalift, who knows the many accidents attending the eggs of thefe, and other the like animals, cannot but know that fome feafons will prove particularly favourable to the hatching of them, and the prodigious number of eggs that many infects lay, could not but every year bring us fuch abundance of the young, were they not liable to many accidents, and had not provident nature taken care, as in many plants, to continue the fpecies by a very numerous ftock of feeds, of which perhaps not one in five hundred need take root, in order to continue an equal number of plants.

The raining of fifhes has been a prodigy alfo much talked of in France, where the ftreets of a town at fome diftance from Paris, after a terrible hurricane in the night, which tore up trees, blew down houfes, &c. were found in a manner covered with fifhes of various fizes. Nobody here made any doubt of thefe having fallen from the clouds; nor did the abfurdity of fifh, of five or fix inches long, being generated in the air, at all ftartle the people, or fhake their belief in the miracle, till they found upon enquiry that a very well-ftocked fifh-pond, which ftood on an eminence in the neighbourhood, had been blown dry by the hurricane, and only the great fifh left at the bottom of it, all the fmaller fry having been toffed into their ftreets.

Upon the whole, all the fuppofed marvellous rains have been owing to fubftances naturally produced on the earth, and either never having been in the air at all, or only carried thither by accident.

Rain, *Freezing.* See Freezing.

Rain-*Bird*, in *Ornithology.* See Cuculus *Pluvialis.*

Rain-*Fowl*, an Englifh name given by many to the common green woodpecker, or *picus viridis*, from an obfervation that it is always moft clamorous when rainy weather is coming on. The Latins have, for the fame reafon, called it the *pluvialis avis.* See Picus.

Rain-*Gage*, called alfo *Ombrometer* and *Pluviameter*, an inftrument for meafuring the quantity of rain that falls. That which is mentioned under the article Ombrometer, confifts of a tin funnel *d* (*Plate* XXIV. *Mifcellany*, *fig.* 2.), whofe furface is an inch fquare, a flat board *a a*, and a glafs tube *b b*, fet into the middle of it in a groove, and an index with divifions *c*, *c*; the board and tube being of any length at pleafure. The bore of the tube is about half an inch, which, fays Mr. Pickering, the inventor, is the beft fize. This machine is fixed in fome free and open place, as the top of the houfe, &c.

The rain-gage employed in the houfe of the Royal Society, is defcribed by Mr. Cavendifh in the Phil. Tranf. for 1776, p. 384. The veffel which receives the rain is a conical funnel, ftrengthened at the top by a brafs ring, twelve inches in diameter. The fides of the funnel, and inner lip of the brafs ring, are inclined to the horizon, at an angle of above 65°, and the outer lip at an angle of above 50°, which are fuch degrees of fteepnefs, that there feems to be no probability either that any rain which falls within the funnel, or on the inner lip of the ring, fhould dafh out, or that any which falls on the outer lip fhould dafh into the funnel. A vertical fection of the funnel appears in *Plate* XXIV. *Mifcellany*, *fig.* 3; A B C and *a b c* being the brafs ring, B A and *b a* the inner lip, and B C and *b c* the outer. This veffel is placed on fome flat leads, on the top of the fociety's houfe. It can hardly be fcreened from any rain by the chimnies, as none of them are elevated above it in an angle of more than 25°, and as it is raifed $3\frac{1}{2}$ feet above the roof, there feems no danger of any rain dafhing into it by rebounding from the lead.

In fixing rain-gages care fhould be taken that the rain may have free accefs to them, without being impeded or overfhaded by buildings, &c. and therefore the tops of houfes are to be preferred. Alfo, when the quantities of rain collected in them, at different places, are compared together, the inftruments ought to be fixed at the fame height above the ground at both places; becaufe at different heights the quantities are always different, even in the fame place. And hence alfo, any regifter or account of rain in the gage ought to be accompanied with a note of the height at which the inftrument is placed above the ground. Dalton found the rain of a gage 50 yards high, in fummer two-thirds, and in winter one-half as much as that of a gage below. Mr. Dalton obferves, that a ftrong funnel, made of fheet iron, tinned and painted, with a perpendicular rim, two or three inches high, fixed horizontally in a convenient frame, with a bottle under it to receive the rain, is fufficient for this purpofe.

The rain-gage is an invention which fhould be in the poffeffion of every correct farmer in every part of the kingdom, and which would thereby have much tendency to the improvement of agriculture as contributing to the knowledge of the degree of moifture which prevails in the foils, after fhowers or heavy rains, with greater accuracy and correctnefs than has been hitherto the cafe.

It is noticed by Mr. Naifmith, in his Agricultural Survey of Clydefdale, that profeffor Anderfon, of the univerfity of Glafgow, has invented, perhaps, the moft ingenious and accurate rain-gage of any that has yet been known. It receives the

the rain at a little more than one hundred feet above the level of the fea ; accounts of which have been regularly kept fince the year 1781 ; but previoufly to that period the rain was meafured by an old rain-gage. It is to be regretted, however, that the exact nature of this invention is not more fully explained ; and that other cheap plain inventions of this nature are not better known to the farmer.

RAIN-*Water*. See WATER.

RAINS, in the *Sea Language*, denote all that tract of fea to the northward of the equator, between four and ten degrees of latitude ; and lying between the meridian of Cape Verde and that of the eafternmoft iflands of the fame name.

It takes its name from the almoft continual calms, conftant rains, and thunder and lightning, to a great degree, always found there. The winds, when they do blow, are only fmall uncertain gufts, and fhift about all round the compafs ; fo that fhips are fometimes detained here a long while, and can make but very little way.

RAINANGBONG, in *Geography*, a town of the Birman empire, fituated near a river in which there are feveral wells of petroleum, whence its name fignifying a town through which flows a river of earth-oil. N. lat. 20° 26′. E. long. 94° 46′.

RAINBOW, *Iris*, or, fimply, the *bow*, a meteor in form of a parti-coloured arch, or femicircle, exhibited in a rainy fky, oppofite to the fun, by the refraction of his rays in the drops of falling rain.

There is alfo a fecondary, or fainter bow, ufually feen invefting the former at fome diftance. Among naturalifts, we alfo read of *lunar* rainbows, *marine* rainbows, &c.

The rainbow, fir Ifaac Newton obferves, never appears but where it rains in the fun fhine ; and it may be reprefented artificially by contriving water to fall in little drops, like rain, through which the fun fhining, exhibits a bow to a fpectator placed between the fun and the drops ; efpecially if a dark body, *e. gr.* a black cloth, be difpofed beyond the drops.

That the rainbow is oppofite to the fun, has always been obferved. It was, therefore, natural to imagine, that the colours of it were produced by fome kind of reflection of the rays of light from drops of rain or vapour. The regular order of the clouds was another circumftance that could not have efcaped the notice of any perfon. But though mere reflection had in no other cafe been obferved to produce colours, and it could not but have been obferved that refraction is frequently attended with that phenomenon, fo that fome of the ancients, as we learn from Ariftotle's tract on meteors, knew that the rainbow was caufed by the refraction of the fun's light in drops of falling rain ; yet no perfon feems to have thought of having recourfe to a proper refraction in this cafe before one Fletcher of Breflaw, who, in a treatife which he publifhed in 1571, endeavoured to account for the colours of the rainbow by means of a double refraction, and one reflection. But he imagined that a ray of light, after entering a drop of rain, and fuffering a refraction, both at its entrance and exit, was afterwards reflected from another drop, before it reached the eye of the fpectator. He feems to have overlooked the reflection at the farther fide of the drop, or to have imagined that all the bendings of the light within the drop would not make a fufficient curvature, to bring the ray of the fun to the eye of the fpectator. Antonio de Dominis, bifhop of Spalato, whofe treatife, " De Radiis Vifus et Lucis," was publifhed by I. Bartolus, in 1611, was the firft perfon who advanced, that the double refraction of Fletcher, with an intervening reflection, was fufficient to produce the colours of the rainbow, and alfo to bring the rays that formed them to the eye of the fpectator, without any fubfequent reflection. He diftinctly defcribes the progrefs of a ray of light entering the upper part of the drop, where it fuffers one refraction, and after being thereby thrown upon the back part of the inner furface, is from thence reflected to the lower part of the drop ; at which place undergoing a fecond refraction, it is thereby bent fo as to come directly to the eye. To verify this hypothefis, he procured a fmall globe of folid glafs, and viewing it when it was expofed to the rays of the fun, in the fame manner in which he had fuppofed that the drops of rain were fituated with refpect to them, he actually obferved the fame colours which he had feen in the true rainbow, and in the fame order. The theory of A. de Dominis was adopted, and in fome degree improved, by Defcartes. Philofophers were, however, for a long time at a lofs when they endeavoured to affign reafons for all the particular colours, and for the order of them. Indeed, nothing but the doctrine of the different refrangibility of the rays of light, which was a difcovery referved for the great fir Ifaac Newton, could furnifh a complete folution of this difficulty.

Dr. Barrow, in his " Lectiones Opticæ," (Lect. 12. n. 14.) fays, that a friend of his, meaning Mr. Newton, communicated to him a method of determining the angle of the rainbow, which was hinted to Newton by Slufius, without making a table of the refractions, as Defcartes did. The doctor fhews the method, with other curious particulars. But the fubject was given more perfectly by Newton afterwards, in his " Optics," prop. 9 ; where he makes the breadth of the interior bow to be nearly 2° 15′, that of the exterior 3° 40′, their diftance 8° 25′, the greateft femidiameter of the interior bow 42° 17′, and the leaft of the exterior 50° 42′, when their colours appear ftrong and perfect.

RAINBOW, *Theory of the*. To conceive the origin of the rainbow, let us confider what will befall rays of light coming from a very remote body, *e. gr.* the fun, and falling on a globe of water, fuch as we know a drop of rain to be.

Suppofe, then, A D K N (*Plate* XVIII. *Optics*, *fig.* 1.) to be a drop of rain, and the lines E F, B A, O N, to be rays of light coming from the centre of the fun ; which, on account of the immenfe diftance of the fun, we conceive to be parallel.

Now the ray B A being the only one that falls perpendicularly on the furface of the water, and all the reft obliquely, it is eafily inferred, that all the other rays will be refracted towards the perpendicular. (See REFRACTION.) Thus the ray E F, and others accompanying it, will not go on ftraight to G ; but as they arrive at H I, they will deflect from F to K ; where fome of them, probably, efcaping into the air, the reft are reflected upon the line K N, fo as to make the angles of incidence and reflection equal.

Farther, as the ray K N, and thofe accompanying it, fall obliquely upon the furface of the globule, they cannot pafs out into the air, without being refracted, fo as to recede from the perpendicular L M ; and, therefore, they will not proceed ftraight to Y, but will deflect to P.

It may be here obferved, that fome of the rays, arriving at N, do not pafs out into the air, but are again reflected to Q ; where being refracted, like the reft, they do not proceed right to Z ; but, declining from the perpendicular T V, are carried to R ; but fince we here only regard the rays as they may affect the eye placed a little below the drop, *e. gr.* at P, thofe which deflect from N to Q, we fet afide, as ufelefs ; becaufe they never come to the eye. On the contrary, it is to be obferved, that there are other rays,

rays, as 2 3, and the like; which, being refracted from 3 to 4, and reflected to 5, and from 5 to 6, may at length, by refraction at 6, arrive at the eye 7, placed beneath the drop.

Thus much is obvious; but to determine precisely the quantities of refraction of each ray, there must be a calculation; by such calculation it appears, that the rays which fall on the quadrant A D, are continued in lines, like those here drawn in the drop A D K N; wherein there are three things very considerable: first, that the two refractions of the rays, in their ingress and egress, are both the same way; so that the latter does not destroy the effect of the former. Secondly, that of all the rays passing out of A N, N P, and those adjoining to it, are the only ones capable of affecting the sense, as being sufficiently close and contiguous, and because they come out parallel; whereas the rest are diverging, and dispersed too far to have any sensible effect, at least to produce any thing so vivid as the colours of the bow. Thirdly, that the ray N P has shade or darkness under it; for, since there is no ray comes out of the surface N 4, it is the same thing as if the part were covered with an opaque body. We might add that the same ray N P has darkness above it; since the rays that are above it are ineffectual, and signify no more than if there were none at all.

Add to this, that all the effectual rays have the same point of reflection, *i. e.* the parallel and contiguous rays, which alone are effectual after refraction, will all meet in the same point of the circumference, and be reflected thence to the eyes.

Farther, it appears, that the angle O N P, included between the ray N P, and the line O N drawn from the centre of the sun, is the angle by which the rainbow is distant from the opposite point of the sun, and which makes the semidiameter of the bow. The method of determining it will be seen in the sequel of the article. But since, besides those rays coming from the centre of the sun to the drop of water, there are many more from the several points of its surface; there are a great many other effectual rays to be considered, especially that from the uppermost, and that from the lowest part of the sun's body.

Since, then, the apparent semidiameter of the sun is about 16 minutes, it follows, that an effectual ray from the upper part of the sun will fall higher than the ray E F by 16 minutes: thus does the ray G H (*fig.* 2.) which, being refracted as much as E F, deflects to I, thence to L, and at length emerging equally refracted with the ray N P, proceeds to M; and makes an angle O N M with the line O N. In the like manner, the effectual ray Q R coming from the lowest part of the sun, falls on the point R, 16 minutes lower than the point F on which the ray E F falls; and this, being refracted, declines to S, whence it is reflected to T; where, emerging into the air, it proceeds to V; so that the line T V, and the ray O T, contain an angle whose magnitude will be ascertained. Again, upon computing the deflections of the rays, which like that 23 (*fig.* 1.) coming from the centre of the sun, and being received into the lower part of the drop, we have supposed to be twice reflected, and twice refracted, and to enter the eye by lines like that 67 (*fig.* 3.) we find that which may be accounted effectual, as 67 with the line 86 drawn from the centre of the sun, contains an angle 867; whence it follows, that the effectual ray from the highest part of the sun, with the same line 86, includes an angle less by 16 minutes; and that from the lowest part of the sun, an angle greater by 16 minutes.

Thus, since A B C D E F is the path of the efficacious ray from the highest part of the sun to the eye in F, the angle 86 F becomes of a certain magnitude ascertained below. In like manner, since G H I K L M is the way of an effectual ray from the lowest part of the sun to the eye, the angle 86 M becomes greater than the former by 16 minutes.

Since, then, we admit several rays to be effectual, besides those from the centre of the sun, what we have said of the shade will need some alteration; for of the three rays described (*figs.* 2 and 3.), only the two extreme ones will have a shadow joined to them, and that only on the outer side. Hence it is evident, that these rays are perfectly disposed to exhibit all the colours of the prism.

For the great quantity of dense or intense light, *i. e.* the bundle of rays collected together in a certain point, *v. gr.* in the point of reflection of the effectual rays, may be accounted as a lucid or radiant body, terminated all around by shade. But the several rays, thus emitted to the eye, are both of different colours; that is, they are fitted to excite in us the ideas of different colours; and are differently refracted out of the water into the air, notwithstanding their falling alike upon the refracting surface.

Hence it follows, that the different or heterogeneous rays will be separated from one another, and will tend separate ways; and the homogeneous rays will be collected, and tend the same way; and, therefore, this lucid point of the drop in which the refraction is effected, will appear fringed or bordered with several colours; that is, red, green, and blue colours will arise from the extremes of the red, green, and blue rays of the sun, transmitted to the eye from several drops, one higher than another, after the same manner as is done in viewing lucid or other bodies through a prism.

Thus, adds sir Isaac Newton, the rays that differ in refrangibility, will emerge at different angles; and, consequently, according to their different degrees of refrangibility, emerging most copiously at different angles, they will exhibit different colours in different places.

A great number, then, of these little globules being diffused in the air, will fill the whole space with these different colours; provided they be so disposed as that effectual rays may come from them to the eye; and thus will the rainbow, at length, arise.

Now, to determine what that *disposition* must be, suppose a right line drawn from the centre of the sun through the eye of the spectator, as the line V X (*fig.* 2.) called the *line of aspect*, or *axis of vision*; being drawn from so remote a point, it may be esteemed parallel to all other lines drawn from the same point; but a right line, falling on two parallels, makes the alternate angles equal.

If, then, an indefinite number of lines be imagined drawn from the spectator's eye to a part opposite to the sun where it rains; which lines make different angles with the line of aspect, equal to the angles of refraction of the differently refrangible rays, these lines, falling on drops of rain illumined by the sun, will make angles of the same magnitude with rays drawn from the centre of the sun to the same drops. And, therefore, the lines thus drawn from the eye will represent the effectual rays that occasion the sensation of any colour.

Now it is known, that the eye, being placed in the vertex of a cone, sees objects upon its surface, as if they were in a circle; and the eye of our spectator is here in the common vertex of several cones, formed by the several kinds of efficacious rays, with the line of aspect. Now in the surface of that whose angle at the vertex, or eye, is the greatest, and in which the others are included, are those drops, or parts of drops, which appear red; and in the furface of that cone whofe angle is leaft, are the purple drops; and in the intermediate cones, are the green, blue, &c. drops. Hence, then, feveral kinds of the drops muft appear as if difpofed into fo many circular coloured fafciæ, or arches, as we fee in the rainbow. (Rohault's Syftem of Nat. Phil. vol. ii. part iii. cap. 17.) This part of the folution fir Ifaac Newton expreffes more precifely, thus: fuppofe O (*fig.* 4.) the eye, and O P a line parallel to the fun's rays; and let P O E, P O F, be angles of 40° 17′, and 42° 2′. And fuppofe the angles to turn about their common fide O P, with their other fides O E and O F, they will defcribe the bounds, or verges, of the rainbow.

For if E, F be drops placed any where in the conical furface defcribed by O E, O F, and be illuminated by the fun's rays S E, S F; the angle S E O being equal to the angle P O E, or 40° 17′, fhall be the greateft angle in which the moft refrangible rays can, after reflection, be refracted to the eye; and, therefore, all the drops in the line O E fhall fend the moft refrangible rays moft copioufly to the eye, and therefore ftrike the fenfes with the deepeft violet colour in that region.

And in like manner the angle S F O being = to the angle P O F = 42° 2′, fhall be the greateft in which the leaft refrangible rays after one reflection can emerge out of the drops; and thefe rays fhall come moft copioufly to the eye from the drops in the line O F, and ftrike the fenfes with the deepeft red colour in that region.

And, by the fame argument, the rays which have intermediate degrees of refrangibility, fhall come moft copioufly from drops between E and F, and fo ftrike the fenfes with the intermediate colours, in the order which their degrees of refrangibility require; that is, in the progrefs from E to F, or from the infide of the bow to the outfide, in this order; violet, indigo, blue, green, yellow, orange, red; though the violet, by the mixture of the white light of the clouds, will appear faint, and incline to a purple.

Here it may be obferved, that all the rays but the violet in the line S E will emerge from E in a greater angle than S E O made by the violet, and confequently will pafs below the eye; and all the rays but the red in the line S F will emerge from F in a lefs angle than S F O made by the red, and confequently will pafs above the eye; by which means only red will appear in the line S F, and only violet in the line S E.

And, fince the lines O E, O F, may be fituated any where in the above-mentioned conical furface; what is faid of the drops and colours of thefe lines, is to be underftood of the drops and colours throughout the whole fuperficies. Thus is the *primary* or *inner bow* formed.

Rainbow, *Secondary*, or *Outer*. As to the fecondary, or fainter bow, ufually furrounding the former, in affigning what drops would appear coloured, we excluded fuch as lines drawn from the eye, making angles a little greater than 42° 2′, fhall fall upon, but not fuch as fhould contain angles much greater.

For, if an indefinite number of fuch lines be drawn from the fpectator's eye, fome of which make angles of 50° 57′, with the line of afpect, *e. gr.* O G; other angles, of 54° 7′, *e. gr.* O H; thofe drops on which thefe lines fall muft of neceffity exhibit colours; particularly thofe of 50° 57′.

E. gr. The drop G will appear red; the line G O being the fame with an effectual ray; which, after two reflections, and two refractions, exhibits a red colour. Again, thofe drops which receive lines of 54° 7′, *e. gr.* the drop H, will appear purple; the line O H being the fame with an effectual ray; which, after two reflections and two refractions, exhibits purple.

Now there being a fufficient number of thefe drops, it is evident there muft be a fecond rainbow, formed after the like manner as the firft.

Thus, according to fir Ifaac Newton, in the leaft refrangible rays, the leaft angle at which a drop can fend effectual rays after two reflections, is found by computation to be 50° 57′; and in the moft refrangible, the leaft angle is found 54° 7′.

Suppofe, then, O the place of the eye, as before, and P O G, P O H, to be angles of 50° 57′, and 54° 7′; and thefe angles to be turned about their common fide O P; with their other fides O G, O H, they will defcribe the verges, or borders, of the rainbow C H D G.

For, if G, H be drops placed any where in the conical fuperficies defcribed by O G, O H, and be illuminated by the fun's rays, the angle S G O, being equal to the angle P O G, or 50° 57′, fhall be the leaft angle in which the then leaft refrangible rays can, after two reflections, emerge out of the drops; and, therefore, the leaft refrangible rays fhall come moft copioufly to the eye from the drops in the line O G, and ftrike the fenfes with the deepeft red in that region.

And the angle S H O being equal to P O H, 54° 7′, fhall be the leaft angle in which the moft refrangible rays, after two reflections, can emerge out of the drops; and, therefore, thofe rays fhall come moft copioufly to the eye from the drops in the line O H, and fo ftrike the fenfes with the deepeft violet in that region.

And, by the fame argument, the drops in the region, between G and H, fhall ftrike the fenfes with the intermediate colours, in the order which their degrees of refrangibility require; that is, in the progrefs from G to H, or from the infide of the bow to the outer, in this order: red, orange, yellow, green, blue, indigo, violet.

And fince the lines O G, O H, may be fituated any where in the conical furface; what is faid of the drops and colours in thefe lines is to be underftood of the drops and colours every where in this fuperficies.

Thus are formed two bows, an *interior* and ftronger, by one reflection; and an *exterior* and fainter, by two; the light becoming weaker and weaker by every reflection.

Their colours will lie in a contrary order to one another; the firft having the red without, and the purple within; and the fecond, the purple without, and red within; and fo of the reft.

Rainbow, *Artificial*. This doctrine of the rainbow is confirmed by an eafy experiment; for upon hanging up a glafs globe, full of water, in the fun-fhine, and viewing it in fuch a pofture as that the rays, which come from the globe to the eye, may, with the fun's rays, include an angle either of 42°, or 50°; if, *e. gr.* the angle be about 42°, the fpectator, fuppofed at O, will fee a full red colour in that fide of the globe oppofite to the fun, as at F. And if that angle be made a little lefs, fuppofe by depreffing the globule to E, the other colours, yellow, green, and blue, will appear fucceffively, in the fame fide of the globe, alfo exceedingly bright.

But if the angle be made about 50°, fuppofe by raifing the globule to G, there will appear a red colour in that fide of the globe towards the fun, though fomewhat faint; and if the angle be made greater, fuppofe by raifing the globe to H, this red will change fucceffively to the other colours, yellow, green, and blue.

The fame thing is obferved in letting the globe reft, and raifing or depreffing the eye fo as to make the angle of a juft magnitude.

magnitude. Newton's Optics, part ii. prop. 9. prob. 4. p. 147, ed. 3.

RAINBOW, *Dimenſion of the*.—Deſcartes firſt determined its diameter by a tentative and indirect method; laying it down, that the magnitude of the bow depends on the degree of refraction of the fluid; and aſſuming the ratio of the ſine of incidence to that of refraction to be in water as 250 to 187.

But Dr. Halley has ſince, in the Philoſophical Tranſactions, N° 267, given us a ſimple direct method of determining the diameter of the rainbow from the ratio of refraction of the fluid being given; or, *vice verſâ*, the diameter of the rainbow being given, to determine the refractive power of the fluid.

The principles of Dr. Halley's conſtruction for this purpoſe, illuſtrated and facilitated by Dr. Morgan, biſhop of Ely, will be underſtood from the following view of them. Let S N, *s n*, (*Plate* XVIII. *Optics*, *fig.* 5.) be two of the efficacious rays incident upon a drop of rain; theſe, when refracted to the ſame point F, and thence reflected to G, *g*, will have the parts within the drop on one ſide N F, *n* F, equal to thoſe on the other ſide F G, F *g*, from the nature of the circle, and becauſe the angles of incidence C F N, C F *n*, are equal to the angles of reflection C F G, C F *g*. And ſince the parts within the drop are equal and alike ſituated, they will be ſimilarly ſituated with regard to the drop itſelf; and, conſequently, as the incident rays S N, S *n*, are ſuppoſed to be parallel, the emergent rays G R, *g r*, will be alſo parallel. From C, the centre, draw the radii C N, C *n*, C F, then will C N F = C F N be the angle of refraction, and the ſmall arc N *n* is the naſcent increment of the angle of incidence B C N; and as it meaſures the angle at the centre N C *n*, it is double of the angle at the circumference upon the ſame arc, *viz.* N F *n*, which is the naſcent increment of the angle of refraction N F C. Farther, let the ray S N (*fig.* 6.) enter the lower part of the drop, and be twice reflected within the drop at F and G; then is the ray N F equal to the ray F G, and the arc N F = the arc F G. Draw *f g* parallel to F G, and it will be the reflected part of ſome ray *s n*, whoſe obliquity to the drop makes it croſs the ray N F in its refraction; then will the part *n f* = *f g*, and the arc *n f* = *f g*, and the ſmall arc F *f* = G *g*. Therefore, 2 F *f* = (F *f* + G *g* = the arc F G − *f g* = N F − *n f* =) N *n* − F *f*; conſequently N *n* = 3 F *f*, *i. e.* the naſcent increment of the angle of incidence is equal to three times that of the angle of refraction. After a like manner it may be ſhewn, that after three, four, five, &c. reflections, the increment of the angle of incidence will be four, five, ſix, &c. times greater than that of the angle of refraction. Hence, in order to find the angle of incidence of an efficacious ray, after any given number of reflections, we are to find an angle whoſe naſcent increment has the ſame ratio to the increment of its correſponding angle of refraction, generated in the ſame time, as the given number of reflections (*n*) increaſed by unity has to unity; *i. e.* as *n* + 1 to 1. But theſe increments are as the tangents of the reſpective angles directly. For, let A C D, A B D (*fig.* 7.) be the angles of incidence and refraction propoſed; and if we ſuppoſe the line A C to move about the point A in the plane of thoſe angles, the extremity of it, C, will deſcribe the circular arc C *c*; and when A C is arrived at the ſituation A *c*, the line B D will be thereby removed into the ſituation B *d*. Draw *c* D, then is the angle A C D = A B C + C A B, and the angle A *c d* = A B *c* + *c* A B; therefore the exceſs of A *c d* above A C D, or the increment of A C D, is equal to both the angles C B *c* and C A *c*. But ſince the angle A *c* C differs infinitely little from a right one, a circle deſcribed on the diameter A C ſhall paſs through the points D and *c*; and, therefore, the angles C A *c*, C D *c*, (inſiſting on the ſame arc C *c* of the ſaid circle) will be equal; and, therefore, the increment of the angle A C D is equal to C B *c* + C D *c* = D *c d*. But the naſcent angles D *c d* and D B *c* are as their ſines, that is, as their oppoſite ſides B D and D *c* = D C, the angle C D *c* being infinitely ſmall; but B D : C D :: D E : D A (the line B E being parallel to A C) :: tangent of the angle E B D = A C D : tangent of the angle A B D. Therefore the increment D *c d* of the angle A C D is to the increment C B *c* of the angle A B D (generated in the ſame time) as the tangent of the former to the tangent of the latter directly. Hence the praxis is as follows:

Firſt, *The ratio of the ſine of incidence* I, *to the ſine of refraction* R, *being given; to find the angles of incidence, and refraction of a ray, which becomes effectual after any given number* (*n*) *of reflections.*—Suppoſe any given line, as A C (*fig.* 8.) which divide in D; ſo as that A C : A D :: I : R; and again divide it in E, ſo that A C may be to A E as the given number of reflections, increaſed by unity, is to unity; *i. e.* as *n* + 1 : 1. Upon the diameter C E deſcribe a ſemicircle C B E, and from the centre A, with the radius A D, deſcribe an arc D B interſecting the ſemicircle in B; then drawing A B, C B, and letting fall the perpendicular A F on C B produced; A B C, or its complement to two right angles, A B F, will be the angle of incidence; and A C B the angle of refraction required. For, drawing B E parallel to A F, the triangles A C F and E C B are ſimilar. Now, the ſine of the angle A B C, or A B F, is to the ſine of A C B as A C to A B = A D, *i. e.* as I to R; therefore if A B F be the angle of incidence, A C F will be the angle of refraction. Moreover, the naſcent increment of A B F is to that of A C B (generated in the ſame time) as C F : B F :: C A : A E, on account of the ſimilar triagles; *i. e.* as *n* + 1 to 1, by conſtruction. The ratio, therefore, of the naſcent increment of the angle of incidence A B F to that of the angle of refraction A C B, is that which is required in the angles of incidence and refraction of an efficacious ray, after a given number of reflections; conſequently the angles A B F and A C F are thoſe required. From this conſtruction we may eaſily deduce ſir Iſaac Newton's rule for finding the angle of incidence A B F. See his Optics, p. 148, 149.

For $AC : AB :: I : R$; whence $AC = \frac{I}{R} \times AB$; and $CF : BF :: n + 1 : 1$; therefore $CF = \overline{n+1} \times BF$; or (putting $n + 1 = m$) $CF = m \times BF$; and, on account of the right angle at F, $AC^2 - CF^2 = AB^2 - BF^2$, *i. e.* $\frac{II}{RR} AB^2 - m^2 BF^2 = AB^2 - BF^2$; and, therefore, $m^2 BF^2 - BF^2 = \frac{II}{RR} AB^2 - AB^2$; and, conſequently, $\frac{BF}{AB} = \sqrt{\frac{II - RR}{m^2 R^2 - R^2}}$. Hence, becauſe in the firſt bow, the ray emerges after one reflection, we have $n = 1$, $m = 2$, $m^2 = 4$, and $m^2 - 1 = 3$; therefore, $\sqrt{3RR} : \sqrt{II - RR} :: AB : BF ::$ radius : coſine of the angle of incidence. In the ſecond bow, where there are two reflections, $m^2 - 1 = 8$; whence $\sqrt{8RR} : \sqrt{II - RR} :: AB : BF$. In the third bow, after three reflections, $m^2 - 1 = 15$; and $\sqrt{15RR} : \sqrt{II - RR}$ :: A B

× A B : B F, and so on for any given number of reflections. Wherefore, supposing the ratio of refraction to be, as sir Isaac Newton has determined it, *viz.* as 108 to 81 in the red rays, and as 109 to 81 in the violet rays; we shall have I (in the least refrangible rays) = 108, I I = 11664; and R = 81, and R R = 6561, and $I^2 - R^2 = 5103$, $\sqrt{3 R R} = 140.3$, and $\sqrt{I^2 - R^2} = 71.4$: therefore,

As $\sqrt{3 R R} = 140.3$, whose logarithm is	2.147045
Is to $\sqrt{I^2 - R^2} = 71.4$ - -	1.853913
So is radius - - - -	10.000000
To the cosine of the angle of incidence, B A F = 30° 37′ - -	9.706868

Hence the angle of incidence A B F is 59° 23′ in the red rays.

Secondly, *Having given the angle of incidence, and the ratio of* I *to* R, *or of refraction; to find the angle which a ray of light emerging out of a refracting sphere, after a given number of refractions, makes with the axis of vision, or an incident ray; and, consequently, to find the diameter of the rainbow.* The angle of incidence, and the ratio of refraction, being given, the angle of refraction is given; which angle being multiplied by double the number of reflections increased by 2, and double the angle of incidence subtracted from the product, the angle remaining is the angle sought.

In order to find the angle of refraction, say

As I = 108, whose logarithm is -	2.033424
Is to R = 81 - - -	1.908485
So is the sine of incidence 59° 23′ -	9.934798
To the sine of the angle of refraction 40° 12′	9.809859

Then, making the angle C N F (*fig.* 9.) = 40° 12′, N F will be the refracted ray, which at F is reflected into F G, and at G emerges in G R. Produce the incident and emergent rays S N and R G, till they intersect each other at X, and as C F bisects the angle N F G, it will, if produced, bisect the angle S X R. Then C F N = C X N + F N X; but F N X = C N X − C N F, or C F N; therefore C F N = C X N + C N X − C F N; that is, 2 C F N − C N X = C X N; or 80° 24′ − 59° 23′ = 21° 1′ = C X N; therefore 2 C X N = S X R = 42° 2′, which is the measure of the angle that the incident and emerging rays, which are the least refrangible, contain with each other. If instead of the ratio 108 to 81, we take that of 109 to 81, we shall find the values of $\sqrt{3 R R}$, and $\sqrt{I^2 - R}$, such as will give the angle of incidence B C N, and the arc B N = 58° 40′, and the angle S X R = 40° 17′, for the most refrangible, or extreme violet rays.

If the ray be twice reflected, *viz.* at F and G, as in the production of the extreme bow, and emerges at H in the direction H A, interfecting the incident ray S N in Y, we may find the angle A Y S thus: produce A H till it meets G X, produced in R; then in the triangle H G R, the external angle H G X = H R G + G H R. But because of equal angles of reflection at F and G, G H R = F G X, therefore H G X − F G X = H G F = H R G = 2 C G F, or C N F. But S X R = 4 C N F − 2 C N X; therefore in the triangle Y X R we have the two internal angles R + X = 6 C N F − 2 C N X = the external angle at Y, *viz.* A Y N. In this case, to find the angles of incidence and refraction, we have $\sqrt{8 R R} : \sqrt{I - R^2}$ :: radius : cosine of the angle of incidence; whence the said angle will be found 71° 50′ = C N X. And as 108 : 81 :: sine of 71° 50′ : sine of 45° 27′ = C N F, the angle of refraction; therefore $\overline{6 \times 45° 27'} - \overline{2 \times 71° 50'}$ = 129° 3′ = A Y N; and, therefore, its complement A Y S = 50° 57′, the angle required for the least refrangible rays. But for the most refrangible rays, where I : R :: 109 : 81, we have the angle of incidence 71° 26′, and the angle of refraction 44° 47′; and, therefore, the angle A Y S = 54° 7′. In the same manner the same angles are calculated after three or four reflections.

From the preceding problems we obtain the following results, *viz.*

I. Rainbow,	Red	42°	2′	The spectator's back being turned to the sun.
	Violet	40	17	
II. Rainbow,	Red	50	57	
	Violet	54	7	

If the angle made by a ray, after three or four reflections, were required, and therefore the diameters of the third and fourth rainbow (which are scarcely ever seen, on account of the great diminution of the rays, by so many repeated reflections) they will be found,

III. Rainbow,	Red	41°	37′	The spectator being turned towards the sun.
	Violet	37	9	
IV. Rainbow,	Red	43	52	
	Violet	49	34	

Dr. Morgan's Dissertation upon the Rainbow, among the notes upon Rohault's System of Philosophy, part iii. chap. xvii.

Hence, the breadth of the rainbows is easily found: for the greatest semi-diameter of the first bow, *i. e.* from red to red, being 42° 2′, and the least, *viz.* from violet to violet, 40° 17′, the breadth of the fascia or bow, measured across from red to violet, will be 1° 45′; and the greatest diameter of the second bow being 54° 7′, and the least 50° 57′, the breadth of the fascia will be 3° 10′. And hence the distance between the two will be found 8° 55′.

In these measures the sun is only esteemed a point; wherefore, as his diameter is really about 30′, or 32′, so much must be added to the breadth of each fascia or bow, from red to violet, and so much must be subtracted from the distance between them.

This will leave the breadth of the primary bow, 2° 15′; that of the secondary bow, 3° 40′; and the interval between the bows, 8° 25′; which dimensions, deduced by calculation, sir Isaac Newton assures us from his own observations, agree very exactly with those found by actual mensuration in the heavens. Optics, p. 153. ed. 3.

Rainbow, *Particular Phenomena of the.* From this theory of the rainbow, all the particular phenomena of it are easily deduced: hence we see why the iris is always of the same breadth; because the intermediate degrees of refrangibility of the rays between red and violet, which are its extreme colours, are always the same. See *Apparent* Magnitude.

Secondly, Why it is more distinctly terminated on the side of the red than on that of the violet? there being no efficacious rays in the space adjoining to the red drops, *i. e.* to the space between the bows, whence it terminates abruptly; whereas, in the space on the side of the violet ones, there are some rays emitted to the eye, which, though too feeble to affect it strongly, yet have this effect, that they soften the violet edge insensibly, so that it is difficult to determine precisely where it terminates.

Thirdly, Why the bow shifts its situation as the eye does; and, as the popular phrase has it, *flies from those who follow it; and follows those that fly from it?* the coloured drops being disposed under a certain angle about the axis of vision, which is is different in different places: whence alfo it follows, that every different fpectator fees a different bow.

Fourthly, Why the bow is fometimes a larger portion of a circle, fometimes a lefs? its magnitude depending on the greater or lefs part of the furface of the cone, above the furface of the earth, at the time of its appearance; and that part being greater or lefs, as the line of afpect, or axis of vifion, is more inclined or oblique to the furface of the earth; which inclination, or obliquity, is greater as the fun is higher: whence, alfo, the higher the fun, always the lefs the rainbow.

Fifthly, Why the bow never appears when the fun is above a certain altitude? the furface of the cone, in which it fhould be feen, being loft in the ground, at a little diftance from the eye, when the fun is above 42° high.

Sixthly, Why the bow never appears greater than a femicircle, on a plane? fince be the fun ever fo low, and even in the horizon, the centre of the bow is ftill in the line of afpect; which, in this cafe, runs along the earth, and is not at all raifed above the furface.

Indeed, if the fpectator be placed on a very confiderable eminence, and the fun in the horizon, the line of afpect, wherein the centre of the bow is, will be notably raifed above the horizon (confidering the magnitude of the circle whereof the bow ufes to be a part). Nay, if the eminence be very high, and the rain near, it is poffible the bow may be an entire circle.

Seventhly, How the bow may chance to appear inverted, *i. e.* the concave fide be turned upwards? *viz.* a cloud happening to intercept the rays, and prevent their fhining on the upper part of the arch: in which cafe, only the lower part appearing, the bow will feem as if turned upfide down; which, probably, has been the cafe in feveral prodigies of this kind, related by authors.

Indeed the bow may appear inverted from another caufe: for, if when the fun is 41° 46′ high, his rays fall upon the fmooth furface of fome fpacious lake, in the middle of which a fpectator is placed; and if, at the fame time, there be rain falling, to which the rays may be reflected from the lake, it will be the fame as if the fun fhould fhine below the horizon, and the line of view be extended upwards: thus the furface of the cone, wherein the coloured drops are to be placed, will be wholly above the furface of the earth.

But fince the upper part will fall among the unbroken clouds, and only the lower part be found among the drops of rain, the arch will be inverted.

Eighthly, Why the bow fometimes appears inclined? the accurate roundnefs of the bow depending on its great diftance, which prevents us from judging of it exactly; if the rain, which exhibits it, chance to be much nearer, we fhall fee its irregularities; and if the wind, in that cafe, drive the rain fo that the higher part be farther from the eye than the lower, the bow will appear inclined.

Ninthly, Why the legs of the rainbow fometimes appear unequally diftant? if the rain terminate on the fide of the fpectator, in a plane fo inclined to the line of afpect as to make an acute angle on the left hand, and an obtufe angle on the right, the furface of the cone, which determines what drops will appear, will fall upon them in fuch manner as that thofe on the left hand will appear farther from the eye than thofe on the right. For the line of afpect being perpendicular to the plane of the bow, if you fuppofe two rectangular triangles, a right and left, the cathetus of each to be the line of view, and the bafe of the femi-diameter of the bow, inclined as above; it is evident, fince thofe angles of the triangles, next the eye, muft always be the fame (*viz.* 43° in the inner bow), the bafis of the right-hand triangle will, in this cafe, appear much longer than that of the left.

Dr. Langwith, in the Phil. Tranf. N° 375, defcribes a remarkable rainbow, in which he obferved feveral feries of colours, which increafed the bow to a breadth far exceeding what had been determined by calculation. The colours of the primary rainbow, he fays, were as ufual; under this was an arch of green, and then alternately two arches of reddifh-purple, and two of green, and under all a faint appearance of another arch of purple. The order of the colours was, 1. Red, orange, yellow, green, light blue, deep blue, and purple. 2. Light green, dark green, and purple. 3. Green and purple. 4. Green, and faint vanifhing purple.

M. Bouguer frequently faw a phenomenon of this kind, when he was upon the mountains of Peru, where the fky is often extremely ferene. Similar appearances have been alfo obferved by others. Dr. Pemberton has attempted to explain them by means of the Newtonian doctrine of fits of eafy reflection and tranfmiffion; but he goes upon the fuppofition that the differently-coloured rays have their feparate fits, on their arrival at the furface of any medium, without any regard to the thicknefs of it; whereas it is plain, that, in fuch a cafe, all kinds of rays are reflected or tranfmitted promifcuoufly. It is moft probable that thefe colours are formed in very minute drops of water or vapour, intermixed with the larger drops, that their formation depends upon the fame principle with the colours of thin plates, and that they are fimilar to thofe of feveral kinds of halos. Dr. Pemberton himfelf obferves, that it is moft likely that thefe additional rings of colours are formed in the vapour of the cloud, which the air, being put in motion by the fall of the rain, may carry down along with the large drops. This, he fays, may be the reafon why thefe colours appear under the upper part of the bow only, this vapour not defcending very low. As a farther confirmation of this, thefe colours, he obferves, are feen ftrongeft when the rain falls from very black clouds, which caufe the fierceft rains; by the fall of which the air will be moft agitated. Phil. Tranf. abr. vol. vi. p. 140. Prieftley on Light and Colours, p. 593.

It has been a fubject of controverfy among biblical critics, whether the antediluvian atmofphere prefented any fuch phenomenon as a rainbow. The occafion of this debate is a paffage in Genefis, ch. ix. 12—17. Mr. Whitehurft, in his "Inquiry into the original State and Formation of the Earth, &c." attempts to eftablifh the probability that the antediluvian atmofphere was fo uniformly temperate, as to be fubject to no ftorms, tempefts, or rain. The opinion is by no means probable, nor does the above-cited paffage warrant any fuch conclufion. The rainbow was then made the fign or token of God's covenant with Noah, that no fuch calamity fhould again take place. אות denotes a fign or token, and in this fenfe it is ufed in the cafe of Cain, Gen. iv. 15. The mark fet upon Cain was, as Shuckford conceives, a fign or token (אות) given to him, that he fhould be preferved from the evil which he deprecated.

Rainbow, *Lunar.* The moon fometimes alfo exhibits the phenomenon of an iris, or bow, by the refraction of her rays in the drops of rain in the night-time.

Ariftotle fays, he was the firft that ever obferved it; and adds, that it never happens, *i. e.* is never vifible, but at the time of the full moon; her light, at other times, being too faint to affect the fight after two refractions, and one reflection.

The lunar iris has all the colours of the folar, very diftinct and pleafant; only faint, in comparifon of the other; both

both from the different intenſity of the rays, and the different diſpoſition of the medium.

In that mentioned, Philoſophical Tranſactions, N° 331, Mr. Thoreſby obſerves, the largeneſs of the arch was not ſo much leſs than that of the ſun, as the different dimenſions of their bodies, and their diſtances from the earth, ſhould ſeem to require; but as to its entireneſs, and the beauty of its colour, it was admirable. This continued about ten minutes before the interpoſition of a cloud hindered its obſervation.

Rainbow, *Marine*. The marine or ſea-bow is a phenomenon ſometimes obſerved in a much agitated ſea; when the wind, ſweeping part of the tops of the waves, carries them aloft; ſo that the ſun's rays, falling upon them, are refracted, &c. as in a common ſhower, and paint the colours of the bow.

F. Bourzes, in the Philoſophical Tranſactions, obſerves, that the colours of the marine rainbow are leſs lively, leſs diſtinct, and of leſs duration, than thoſe of the common bow; that there are ſcarce above two colours diſtinguiſhable, a dark yellow on the ſide next the ſun, and a pale green on the oppoſite ſide.

But theſe bows exceed as to number, twenty or thirty being ſometimes ſeen together: they appear at noon-day, and in a poſition oppoſite to that of the common bow, *i. e.* the concave ſide is turned upwards, as indeed it is neceſſary it ſhould be, from what we have ſhewn in accounting for the phenomena of the ſolar bow. A coloured bow is always to be ſeen in the ſcattered water of a jet, a broken caſcade, and the like, when the ſun and the ſpectator are in proper ſituations.

To this claſs of bows may be referred a kind of white or colourleſs rainbows, which Mentzelius, and others, affirm to have ſeen at noon-day. M. Mariotte, in his fourth Eſſai de Phyſique, ſays, theſe bows are formed in miſts, as the others are in ſhowers; and adds, that he has ſeen ſeveral, both after ſun-riſing, and in the night.

The want of colours he attributes to the ſmallneſs of the vapours which compoſe the miſt; but we ſhould rather account for it from the exceeding tenuity of the little veſiculæ of the vapour; which being, in effect, only little watery pellicles bloated with air, the rays of light undergo but little refraction in paſſing out of air into them; too little to ſeparate the differently-coloured rays, &c.

Hence, the rays are reflected from them, compounded as they came, that is, white.

Rohault mentions coloured rainbows on the graſs, formed by the refractions of the ſun's rays in the morning dew. Trait. de Phyſ.

Rainbows have been alſo produced by the reflection of the ſun from a river; and in the Philoſophical Tranſactions, vol. l. p. 294. we have an account of a rainbow, which muſt have been formed by the exhalations from the city of London, when the ſun had been ſet twenty minutes, and conſequently the centre of the bow was above the horizon. The colours were the ſame as in the common rainbow, but fainter.

The beſt way of forming a reſemblance of a rainbow is to faſten a number of ſmall ſolid glaſs balls, or a number of ſmall glaſs bubbles full of water, upon a dark board, and to preſent the board thus furniſhed to the ſun at a proper inclination, which experience eaſily finds, whilſt you turn your back to the ſun, and look at the board.

RAINFELDEN, in *Geography*, a town of Auſtria; 2 miles W. of Hainfelden.

RAINHAM, a townſhip of Norfolk county, in Upper Canada; being the firſt townſhip fronting on lake Erie, weſt of the grand river Lands.

RAINSBRON, a town of Germany, in the margraviate of Anſpach; 3 miles N. of Creglingen.

Rainy Lake. See *Le Plue*.

RAJODE, a town of Hindooſtan, in Malwa; 30 miles E. of Tandla.

RAJOORA, a town of Hindooſtan, in Dowlatabad; 18 miles W.N.W. of Kondur.—Alſo, a town of Bengal; 65 miles N. of Dacca.

RAJOUR, a town of Hindooſtan, in Lahore; 36 miles N.W. of Jummoo.

RAJOWLY, a town of Hindooſtan, in Bahar; 30 miles S. of Bahar.

RAJPOOTANA, a country of the Rajpoots, generally denoting *Agimere* (which ſee), and the original country of the founder of the Mahratta ſtate, whoſe rulers, about half a century ago, aſpired at univerſal empire in Hindooſtan; but they have been reduced to their preſent low ſtate, by the depredations of Mahratta detachments, which, being compoſed of light horſe, and accuſtomed to ſeparate into ſmall parties, have, by their deſultory movements, at once ſpread deſolation, and eluded the attacks of the inhabitants. This is the fact with regard to the open parts of Rajpootana; the mountainous parts remaining free from their incurſions.

Rajpootana was divided into three great principalities, under the names of Oudipour, Joodpur, and Ambeer (or Amere), now better known by that of Joinagur, or Jyenagur. (See each reſpectively.) In Acbar's diviſion of the empire, theſe principalities were claſſed as belonging to the ſoubah of Agimere, ſometimes called Marwar. It is not eaſy to aſſign the preciſe limits and dimenſions of theſe principalities, which occupy the ſpace between the weſtern confines of Agra and the north-eaſt part of Guzerat, and between the ſandy deſert (or Regiſtan) and Malwa; that is, an extent of 330 Britiſh miles from N.E. to S.W., and 200 broad in the wideſt part. Jyenagur or Jyepour lies to the N.E., Oudipour to the S.W., and Joodpour to the N.W., bordering angularly on the other two. Pere Wendell's MS., cited by Rennell, ſtates the revenues of Oudipour at 10 lacks of rupees, Marwar at 40, and Jyenagur at 40, *per annum*, in the year 1779. The whole revenue of the ſoubah of Agimere, in the time of Acbar, appears to have been only about 75 lacks. Aurungzebe is ſaid to have doubled the land-tax on the Rajpoots, and accordingly in Mr. Fraſer's account, Agimere is ſtated at 163 lacks of rupees. The two former, *viz.* Oudipour and Marwar, are very mountainous, with a ſandy ſoil in the vallies; the latter is the moſt fertile, and was, about the middle of the laſt century, in a high ſtate of improvement, under the government of the celebrated rajah Jyeſing, or Jeſſing, who founded the new capital of Jyepour, whence the name of the province was changed to that of the capital. Jyepour was a place of great wealth and commerce in 1779, being the entrepot of the principal part of the goods that are brought from every quarter of India. The rajah built an obſervatory in his capital; but the confuſions that have ſo long prevailed in this province, muſt have greatly reduced the wealth and importance of the capital. Sindia, as Rennell informs us, received the tribute of all the three Rajpoot provinces, and converted it to his uſe; and he alſo made conſiderable conqueſts in them, particularly in Jyenagur. In early times the whole Rajpootana probably conſtituted one entire kingdom, or empire, under the rana or prince of Oudipour, the head of the Rajpoot ſtates; the antiquity of whoſe houſe may be inferred from the name

Rhanna

Rhanna appearing in Ptolemy, nearly in its proper pofition, as a province. See Oudipour.

The province of Agimere in general (fee Agimere) has ever been the country of the Rajpoots; that is, the warrior tribe among the Hindoos, and which are noticed in Arrian and Diodorus; and Cheitore, or Oudipour, (confidered by Rennell as fynonimous,) is, in his opinion, reckoned the firft among the Rajpoot ftates. (See Cheitore.) From the Ayin Acbaree we derive fome new ideas refpecting the divifion of the foubah of Agimere. It confifted at that time of three grand divifions, Marwar, Meywar, and Hadowty (or Nagore); and thefe contained feven circars or fubdivifions, Agimere, Cheitore, Rantampour, Joudypour, Sirowy, Nagore, and Beykeener (or Bicaneer). Marwar, as including the circar and fortrefs of Agimere, has become almoft fynonimous with Agimere, in common acceptation. The extent of this province, as given by the fame book, is 168 coffes, or about 320 Britifh miles, from E. to W.; and 150 coffes, or 285 Britifh miles, from N. to S. Such is the province of the Rajpoots. From the indulgence granted to this tribe throughout India, *viz.* that of feeding on goats' flefh, it may be inferred, fays Rennell, that the cuftom originated in this mountainous country. The grain cultivated there is chiefly of the dry kind. The taxes amounted, in the time of Acbar, to no more than a feventh or eighth of the produce of the harveft. Rennell's Memoir.

RAJPOOTS, the inhabitants of *Rajpootana;* which fee. They were not confined entirely to the foubah of Agimere; as fome inferior tribes of them are fettled in Bundelcund, and in Gurry-Mundella. Others, according to Thevenot, are fettled in Moultan; and indeed he reprefents Moultan as the original country of the Kuttries, from whom the Rajpoots fprung.

The Kuttries or Catries, who formed a particular fect of Hindoos at Moultan, were the Catheri of Diodorus, and the Cathei of Arrian, with whom Alexander carried on war, on the borders of the Malli. The Rajpoots are ordinarily divided into two tribes or claffes, *viz.* thofe of Rathore, and Chohan or Seefodya. Marwar, or the N.W. divifion of Agimere, is the proper country of the former; and Meywar, or Oudipour, of the latter. The Rathore tribe were originally the moft numerous of the two; and it has been faid by colonel Dow, among others, that the Mahratta chiefs had their origin from the Rathore tribe: and in proof of this it has been alleged, that the etymology of the name Mahratta has been deduced from Rathore, prefixing to it "maha," or great. (See Mahratta.) The Rajpoots are reprefented by Thevenot as having fpread from Moultan, their proper country, over all the Indies. Diodorus Siculus diftinguifhes them by the cuftom of their women burning themfelves alive, on the funeral piles of their hufbands; which is indeed a cuftom among them, as well as fome other Hindoos, at this day. Rennell.

RAJPOUR, a town of Bengal, on the bank of the Ganges; 10 miles N.N.E. of Curruckdeagh.

RAISE, in the *Manege*, is ufed for working. See Raising.

Raise is likewife ufed for placing a horfe's head right, and making him carry well, and hindering him to carry low, or to arm himfelf.

Raise *Tacks and Sheets*, in *Sea Language*, the order to let them go in the article of tacking, that the fails may be fet on the contrary tack they were on before.

To Raise *a fiege.* See Siege.

RAISED Airs. See Air.

Raised *Plan.* See Plan.

RAISEEN, in *Geography*, a town of Hindooftan, in Malwa; 15 miles S. of Bilfah. N. lat. 23° 16′. E. long. 77° 49′.

RAISER, in *Building*, a board fet on edge under the forefide of a ftep, a ftair, &c. See Stair, &c.

RAISIN, in *Geography*, a river of America, which runs into lake Michigan, N. lat. 43° 12′. W. long. 85° 42′. —Alfo, a river of America, which runs into lake Erie, N. lat. 43° 20′. W. long. 82° 55′.

Raisin *Ifland*, a fmall ifland in lake St. Francis. N. lat. 45° 6′. W. long. 74° 27′.

Raisin, or *Raifen*, *Market*, a fmall market-town in the eaft divifion of the wapentake of Walfhcroft, parts of Lindfey, and county of Lincoln, England, is fituated on the banks of the river Raifen, whence it derives its name, at the diftance of 15 miles N.E. from Lincoln, and 149 miles N.W. from London. According to the population returns of 1811, it contains 164 houfes, and 964 inhabitants. Here is a weekly market on Thurfday, and there are fairs every alternate Tuefday, after Palm Sunday, and on the 25th of September. The church is an ancient ftructure, and is remarkable for the peculiar form of the upper windows in its embattled tower. Thefe have a pointed arch, divided into two pointed lights, and a quaterfoil head. Up the centre runs a ftrong mullion, croffed by a tranfom, terminating at the impofts, as happens in the church of Yarborough, near Louth, which renders it probable that both edifices were erected by the fame architect. The living is a vicarage in the gift of the crown; and by the endowment the vicar is entitled to the unufual tythe of ale. Befides the church, there are in Raifin a Roman Catholic chapel, and a Methodift's meeting-houfe; alfo a free-fchool, and an hofpital for poor old men.

At a fhort diftance from Market-Raifin, are the villages of Middle and Weft Raifin. Middle Raifin was formerly divided into two parifhes, called Drax and Tupholm, but thefe are now united. At Tupholm ftood an abbey of Premonftratenfian canons, which was founded in the reign of Henry II., by Alan de Neville, and his brother Gilbert. Previous to the diffolution, it was inhabited by nine monks, whofe annual income, according to Speed, amounted to 119*l.* 2*s.* 8*d.* The church is a fmall, but ancient building, confifting of a nave and chancel, which are feparated by elegant fcreen work, beneath a pointed arch, fupported by circular columns. The nave appears to have had fide-aifles, as the pillars and pointed arches ftand in relief from the prefent wall.

The principal feats in this vicinity are Willingham-houfe, a feat of the Boucherett family; and Thurgundy, the property of lord Middleton. The latter anciently belonged to the Willoughbys. The houfe is fituated on an eminence, commanding an extenfive view over the vale to Swinhop, and is furrounded by pleafure-grounds, finely varied by wood and lawn. Beauties of England and Wales, vol. ix. by John Britton, 1807.

RAISING, in the *Manege*, one of the three actions of a horfe's legs; the other two being the ftay, and the tread. The raifing or lifting up of his legs in caprioles, curves, &c. is efteemed good, if he perform it hardily, and with eafe; not croffing his legs, nor carrying his feet too much out or in; yet bending his knees as much as is needful.

Raising *the Land*, in *Sea Language*. See *Laying the* Land.

Raising *a Purchafe*, denotes the act of difpofing certain inftruments or machines in fuch a manner, as that, by their mutual efforts, they may produce a mechanical force fuffi- cient

cient to overcome the weight, or refiftance, of the object to which the machinery is applied.

RAISING-*Pieces*, or *Reafon-pieces*, in *Architecture*, are pieces that lie under the beams, and over the pofts or puncheons: thofe lying on the brick-work are called plat-bands.

RAISINS, grapes prepared by drying them in the fun, or in the air; to fit them for keeping, and for fome medicinal purpofes.

Of thefe there are various kinds: as, raifins of Damafcus, thus called from the capital city of Syria, in the neighbourhood of which they are cultivated. They are much ufed in the compofition of ptifans, together with jujubes and dates; they are brought flat, and feeded, of the fize of the thumb; whence it is eafy judging of the extraordinary bulk of the grape, when frefh. Travellers tell us of bunches weighing twenty-five pounds. Their tafte is faintifh and difagreeable.

Raifins of the fun are a kind of raifins brought from Spain, of a reddifh or blueifh colour, feeded, and very agreeable to eat.

There are various other forts, denominated either from the place where they grow, or the kind of grape, &c. as raifins of Calabria, Mufcadine raifins, &c.

The fineft and beft raifins are thofe called in fome places Damafcus and jube raifins. Thefe are the fruit of the *vitis Damafcena*, and are diftinguifhable from the others by their largenefs and figure; they are flat, and wrinkled on the furface; foft and juicy within, near an inch long, and femipellucid, when held againft a good light; they have a fweet, agreeable, and vinous tafte; and when frefh, and growing on the bunch, are of the fize and fhape of the large olive.

The common raifins are the fruit of feveral fpecies of grape, which are better or worfe, according as they have been more or lefs carefully cured. The raifins of the fun, or jar-raifins, fo called, becaufe they are imported in jars, are all dried by the heat of the fun; and thefe are the forts ufed in medicine.

The common way for drying grapes for raifins is to tie two or three bunches of them firmly together, while yet on the vine, and dip them into a hot lixivium of wood-afhes, with a little olive oil in it. This difpofes them to fhrink and wrinkle; and after this they are left on the vine three or four days, feparated on fticks in an horizontal fituation, and then dried in the fun at leifure, after being cut from the tree. Some raifins are dried by the heat of an oven; and the difference between thefe and fuch as are dried in the fun, is obvious; the latter are fweet and pleafant, but the former have a latent acidity with the fweetnefs, that renders them much lefs agreeable. See CURRANTS.

All the kinds of raifins have much the fame virtues; they are nutritive and balfamic, but they are very fubject to fermentation with juices of any kind; and hence, when eaten immoderately, they often bring on colics. They are allowed to be attenuant, and are given in cafes where the humours are too thick and vifcid, and they are faid to be very good in nephritic complaints; they are, however, too familiar in our foods, to be much regarded at prefent as a medicine. They are an ingredient, indeed, in our pectoral decoctions, and in fome other medicines of that intention; in which cafes, as alfo in others where aftringency is not required of them, they fhould have the ftones carefully taken out. The are ufed in fome compofitions rather with an intent of taking off the naufeous tafte of other ingredients, and for obtunding their acrimony, than of doing any extraordinary fervice themfelves

RAISIN-*Brandy*, a name given by our diftillers to a very clean and pure fpirit, procured from raifins fermented only with water. Thus treated, they yield a fpirit, fcarce at all diftinguifhable from fome of the wine-fpirits; for there are as many kinds of wine-fpirits as there are of grapes. The coarfer the operation of diftilling is performed in this cafe, the nearer will be the refemblance of the wine-fpirit; that is, there will be moft of this flavour in the fpirit, when as much as can be of the oil is thrown up with a galloping heat.

The diftillers are very fond of the wine-fpirit, with which they hide and difguife the tafte of their naufeous malt, and other fpirits; and in defect of that fpirit, this of raifins, made in this coarfe manner, will go almoft as far. It is indeed furprizing how extenfive the ufe of thefe flavouring fpirits is, ten gallons of raifin-fpirit, or fomewhat lefs of the wine-fpirit, being often fufficient for a whole pipe of malt-fpirit, to take off its native flavour, and give it an agreeable vinofity. It is no wonder, therefore, that the diftillers, and ordinary rectifiers, are fo fond of this, as it is a good cloak for their defects, and the imperfection of their proceffes.

When raifin-brandy is intended for common ufe, the fire fhould be kept flower and more regular in the diftillation; and the fpirit, though it hath lefs of the high flavour of the grape, will be more pleafant and more pure.

RAISIN-*Wine*. See WINE.

RAIT, in *Rural Economy*, a term ufed to fignify the procefs or operation of diffipating the fap of vegetables, by expofure to moifture, or the influence of the atmofphere. It is moftly applied to hemp, flax, or other fimilar fubftances, and fometimes to hay, when it has been much expofed to alternations of wet and dry weather.

When the procefs is performed by means of water, as is moftly the cafe with hemp, frequently but not always with flax, and occafionally with other articles of the fame nature, it is ufually denominated water-raiting, and the article is faid to be *water-raited;* but where it is effected by expofure to the air, upon the ground, when fpread out, it is generally called ground-raiting, and the fubftance is faid to be *ground-raited*. In the performance of thefe operations or proceffes with hemp, flax, and fuch like fubftances, there is great nicety and attention required to fee that they are carried to a fufficient length, without going too far, fo as to injure the textures of the fubftances in their cortical parts. This may probably be accomplifhed with the greateft certainty by the frequent examination of the materials themfelves; keeping them perfectly under the water in the former cafe, and frequently turned with new furfaces to the atmofphere in the latter, never having the graffy furface on which they are fpread out of too great a length. The effects of heavy rains, when long continued, muft likewife be carefully attended to in this latter inftance. See FLAX, HEMP, and WATER-*raiting*.

RAITAPOUR, in *Geography*, a town of Hindooftan, in the circar of Rajamundry; 12 miles N. of Rajamundry.

RAITCH, in *Rural Economy*, a term fignifying a line or lift of white, down the face of a horfe. It is a very common mark in the faces of horfes.

RAITENBACH, in *Geography*, a town of Germany, in the principality of Culmbach; 8 miles E.N.E. of Wonfiedel.—Alfo, a town of Bavaria, in the bifhopric of Aichftadt; 8 miles N. of Aichftadt.

RAITENBURG, a town of the duchy of Carniola; 3 miles N. of Rudolfswerth.

RAITING, GROUND, in *Rural Economy*, that method of raiting or accomplifhing the feparation of the barks or coverings of the ftems of flax, hemp, and other fimilar plants, by by means of fpreading them out in a thin manner upon clofe graffy furfaces, inftead of putting them into ponds or pools of ftagnant water, in order that they may be expofed to the atmofphere. It is occafionally employed for flax and other fmall ftalked plants, but feldom or never for hemp and thofe which have large ones. It is a practice which ftands in need of confiderable attention and management. See RAIT.

RAJUAPOUR, in *Geography*, a town of Mocaumpour; 18 miles S. of Bargao.

RAIVATA, in *Hindoo Mythological Hiftory*, one of the faints or fages included in the denomination of Menus. Raivata is faid to have been the fon of Agni, the regent of fire, alfo called *Pavaka*, (which fee), and *Menu*.

RAJYA, in *Geography*, a town of Hindooftan, in Bahar; 20 miles E.S.E. of Bahar.

RAKAPORAH, a town of Hindooftan, in the circar of Jufhpour; 10 miles N.E. of Odeypour.

RAKAS, a town of Tranfylvania, on the Alaut; 16 miles N.W. of Cronftadt.

RAKE, in *Agriculture*, a tool of the toothed kind, made ufe of for many purpofes of hufbandry, as for collecting together hay, corn, ftubble, roots, leaves, and other fimilar forts of materials. It is a very ufeful and convenient kind of tool in all fuch intentions. There are many defcriptions of this fort of implement.

RAKE, *Bean-Stubble*, a tool of the rake kind, conftructed for the purpofe of clearing bean-ftubbles. It is employed on fome farms in Effex, as by Mr. Ketcher, at Burnham, where it is found to be well adapted to this ufe, and to do its work in a perfect manner. The head, which is feven feet eight inches in length, is formed with a very flight curve, having teeth fet in it in rather a clofe manner, which are one foot and a half in length, bending or curving a little forwards at the points. It is attached by a frame to the axle of the wheels, which is three feet two inches long; and the wheels are two feet fix inches in their diameter. The hooks and fhafts for the horfe are four feet in length. This is a very fimple conftruction of this nature, and one which is capable of eafy application. The teeth fhould be made ftrong, whether they are of wood or iron. This is an implement which wants to be better known in other diftricts.

RAKE, *Corn*, a large ftrong rake, made ufe of in different diftricts for bringing together the mown grain crops. It is fometimes conftructed with wooden teeth, but a better mode is to have them of iron, being a little bent forward, having the length of feven or eight inches. As it requires much exertion to perform the work with them, they fhould always be made as light as poffible, fo as to have fufficient power to perform the work. It has been ftated by Mr. Somerville, in his Agricultural Survey of the Diftrict of Eaft Lothian, that though the common hay-rake is moftly ufed there, a different kind for grain has been partially tried, and found to anfwer the purpofe much better. In this, the length of the head is from ten to fifteen feet, the handle about feven feet, with a piece of wood acrofs the end of it, by which it is drawn by two men. The teeth are of wood or iron; the laft are the beft, as well as the moft durable, and are a little bent forward at the point, which gives them the power of retaining and carrying the ears along with them, much better than they would otherwife do. To make clean work, efpecially if the ridges are gathered, the field is raked acrofs: in that way, every thing is taken up. But when it is preferred to draw the rake in the direction of the ridges, it may be confiderably improved, by cutting the head into two or three lengths, and joining them with hinges, which will allow it to bend and accommodate itfelf to the curvature of the ridges. The advantage of this kind of rake has been found confiderable, even in cafes where every poffible attention has been paid to the cutting of the crop; but it frequently happens, that, owing to the dampnefs, greennefs of the ftraw, or a foul graffy bottom, it is neceffary to leave the crop unbound for a day or two, during which, if it be overtaken by a high wind, much of it will be fcattered and loft, unlefs confiderable pains are taken to gather it by hand-raking, or otherwife. Where the long rake is ufed for that purpofe, the expence will in no inftance, he thinks, exceed four-pence fterling *per* acre. An experiment made on a field of 30 acres, will convey fome idea of the benefit that may be derived from the ufe of that inftrument. The field was in barley, and the rakings, when threfhed, yielded

	£	s.	d.
$7\frac{1}{2}$ bolls, fold at 28*s. per* boll - -	10	10	0
150 ftones ftraw, fold at 6*d. per* ftone -	3	15	0
Total produce	14	5	0
Expence of raking 31 acres, at 4*d. per* acre	0	10	4
Bread and beer to the rakers - -	0	1	6
Carting from the field, ftacking, &c. -	0	2	6
Threfhing - - - - - - -	0	7	6
Total expence	1	1	10

Which deducted from 14*l.* 5*s.*, leaves a profit of 13*l.* 3*s.* 2*d.* fterling. It is neceffary to obferve, that about ten acres of the field were left unbound, and a good deal difordered by a high wind; but as confiderable pains were taken in the binding, the proportion obtained from thefe ten acres did not greatly exceed what was got from the reft of the field, the whole of which was cut with a great deal of care.

But though this mode of working the rake affords confiderable profit and advantage, they would be a great deal more, by having recourfe to horfes in the draught of them. One horfe in each would do as much labour as feveral men, in a given time; and by having fhafts and low wheels fixed to the tool, it could be readily adapted to this method of being wrought.

RAKE, *Couching*, a large fort of ftrong horfe-rake, with long round tines or teeth, crooked or bent forward in a gentle manner, and placed about two inches diftant from each other; and a fmall beam in the middle, with fide pieces, and an apparatus for attaching the horfe to it. It is found very ufeful in bringing together the roots of couch, and other weeds, in order to their being burnt, or carried off the land, and in other ways deftroyed. See COUCH-*Rake*, QUITCH-*Rake*, and RAKE-*Twitch*.

RAKE, *Dew*, a fort of large rake, or hand drag, fo named from being ufed before the dew is off the ground, or other fort of harveft work can be begun. It is a powerful convenient fort of implement for harveft work.

RAKE, *Garden*, a well-known fort of tool for raking the ground, as well as for putting in feeds, &c. In order to fuit every kind of gardening work with rakes, there fhould be three or four different fizes, from about fix to eighteen inches long in the head, having handles from fix to eight feet in length, and the heads toothed with iron teeth two or three inches long, being placed from one to two inches afunder, according to their refpective fizes. The firft or largeft rake fhould have the head about fifteen to eighteen inches long, the teeth three inches, and placed two inches afunder, which is proper for raking ftubborn or rough dug ground, and for putting in large kinds of feeds, raking off large weeds after hoeing, and many other pur-

 pofes

poses in large gardens. The next size should have the head twelve inches long, the teeth three inches, being placed one inch and half asunder, which is proper for all common raking in ordinary light ground, and for raking in most kinds of small seeds, as well as other purposes. A third sort of small rake should have the head about nine inches long, the teeth two and a half, being placed one inch asunder; proper for fine-raking beds, borders, &c. and raking in some particular fine seeds; as well as between rows, &c. of certain plants occasionally, where larger rakes cannot be introduced. And the smallest sort should have the head six inches long, the teeth two and a half, and placed one inch asunder; being very useful for raking between small plants in beds and borders, and other small parts, where the plants stand close, as well as several other purposes of that kind.

It may be noticed, that all these sorts of rakes are constructed both with wooden heads and iron teeth, and with the heads and teeth wholly of iron in both; of which the teeth are generally flattened, the back edge rounded off, and narrowing gradually to the point; the other straight, and placed on the heads edgeways across, with the back edge outward, and with the points all inclining very moderately inward, in a regular manner: the wooden-headed rakes having each end of the head hooped with a thin flat iron ring, to secure it from splitting. It is very seldom that wooden teeth are employed in this way, or for these uses.

Those of the first sort are generally the lightest and cheapest, being proper for any kind of garden raking; but the latter, or iron-headed rakes, when made neat and as light as possible, with the teeth well set, in a proper position, and firmly fastened, are equally proper, and in some cases preferable, as in some wettish or moist soils, as not being liable to clog so much as wooden rakes, and at the same time more durable. They are, however, more proper for middling and small rakes than for large ones; as, in strong raking, the teeth are more liable to get loose than in the wooden-headed rakes. Both the sorts, in their different sizes, are sold at the principal ironmongers' shops, both with and without handles.

And rakes having the heads, teeth, and handles, wholly of wood, may sometimes be used for particular purposes; such as raking in light kinds of kitchen-garden seeds in light ground, and taking off large hoed-up weeds in wide clear spaces, raking up swarths of mowed short grass before the sweepers, also fallen leaves of trees in autumn, and clippings of hedges, &c. as well as several other uses about the pleasure-garden.

Rake, *Hay*, a well-known tool, with short teeth and a long handle, made use of in making hay. It is usually made of willow, or some other similar wood, in order that it may be light and handy. The teeth should not be too long, as, when that is the case, they are apt to hang and pull among the stubs of the grass in raking with them, and thereby retard the operation, as well as cause much fatigue to the labourer.

Different improvements have been made on this implement. A late useful alteration is the making the teeth to screw into the head, and fasten with screw nuts, by which the inconvenience of their dropping out in dry seasons is obviated. It has been observed, that with the spring-toothed rake, the operator is capable of performing much more work than by the common one. They are likewise capable of being conveniently made use of both for hay and corn. They were originally made and sold by Mr. Cort, of Leicester.

Another improvement is mentioned in Young's Agricultural Report of Norfolk, which is the addition of wheels. It is stated, that the "hand wheel-rake" of Fleg is an excellent implement for both hay and corn: it is to answer the purpose of the common hay-rake, and is about four feet long in the rake; and the two wheels, of nine inches diameter, so fixed, that the teeth are kept in any posture, at the will of the holder.

In some parts of Lancashire, they make use of a large horse-rake for collecting the hay together, and raking it up from the ground, which is found to be highly convenient and beneficial; as one horse, in one of these rakes, will perform as much labour as a great number of men, in a certain space of time; and besides the expedition, the work is considerably better done, in consequence of the greater weight of the implement.

The head of the rake has something of a large easy half circular form, into which two strong pieces of wood are fastened, which constitute the shafts for the horse. There are two low wheels behind, and the head has long teeth, curving a little forward, fixed into it at two or three inches from one another. The teeth may be made either of wood or iron, and should have considerable strength. The whole has no very great weight, though it must obviously be considerably heavier than the common rake; which is found of much advantage in its working, as has been hinted at above.

Rake, *Horse*, an implement used in Norfolk and Suffolk, on the large and middling-sized farms, and, from its great utility, extending itself into other districts. It is employed for barley and oat crops, being drawn by a horse. And it has been stated by Mr. Young, that one man and a horse, driven by means of a line or rein, are capable of clearing from twenty to thirty acres, in a moderate day's work; the grain being deposited in regular rows or lines across the field, by simply lifting up the tool, and dropping it from the teeth, without the horse being stopped. It cost from four to five pounds.

Figures of it may be seen in the above Agricultural Reports. Horses have now been employed for working other sorts of rakes, and found of great advantage, as has been already seen.

Rake, *Horse Stubble*, a large heavy kind of horse-rake, having strong iron teeth, fourteen or fifteen inches in length, placed at five or six inches from each other, and a beam four inches square, and eight or ten feet in length. In drawing it, two horses are mostly made use of, by which it is capable of clearing a considerable quantity of stubble in a short time. Tools of this sort are highly useful on corn farms, for collecting this useful material, and should be much more frequently employed than they are at present.

Rake, *Twitch*, a large horse-rake, employed in certain cases for clearing lands from the roots of couch, twitch, or quitch-grass, as well as those of other sorts. It is constructed in different ways, as with one or two rows of teeth; but the latter is probably the best method, as by placing one row opposite the intervals of the other, it must be rendered a very effective tool.

Rake *of a Ship*, is so much over her hull as overhangs at both ends of her keel.

That part of it which was before, is called the *rake forward-on;* and that part which is at the setting on of the stern-post, is called her *rake-aft*, or *afterward-on*.

When a ship hath but a small rake forward-on, but is built with her stern too straight up, she is called *bluffe-headed*.

Rake *of the Rudder*, is the hindermost part of it.

Rake, among *Hunters*. See Rag.

Rake, in the *Manege*. A horse rakes, when being shoulder-splaid, or having strained his fore-quarter, he goes so lame, that he drags one of his fore-legs in a semicircle; which

which is more apparent when he trots, than when he paces.

RAKE, or *Vein*, in *Geology*, the moſt common repoſitory of metallic ores. Theſe veins interſect mountains nearly vertically, or more or leſs inclined from the perpendicular. They are filled with ores, intermixed with the peculiar minerals accompanying each kind of metal. They vary from a few inches to ſome feet or yards in width, and extend to a very conſiderable depth and diſtance. The upper ſide of the vein is provincially called the *hanger*, and the lower ſide the *ledger*; and the inclination from the perpendicular is called the *hade* of the vein. For a particular account of the ſtructure and formation of veins, ſee VEINS, *Metallic*.

RAKEL, in *Geography*, a town of Dobruzzi Tartary, on the Danube; 15 miles W. of Iſakzi.

RAKESBURG, or RAKELSPURG, a town of the duchy of Stiria, ſituated on an iſland in the Muehr; the inhabitants of which carry on a conſiderable trade with Hungary and Croatia; 36 miles S.E. of Gratz. N. lat. 46° 45′. E. long. 15° 36′.

RAKING ſignifies ſloping or winding, as when a wall is not built up right or ſtraight.

RAKING, in *Agriculture*, the operation of performing work with a rake. It is a ſort of work that requires little art or trouble in its execution; but whether performed with the common or horſe-rakes, it ſhould always be done in an effectual manner. In the buſineſs of hay-making, clean raking not only affords a neatneſs in the appearance, but, over a great extent of ſurface, a conſiderable ſaving of hay. See HAY-*Making*.

In raking hay lands, where horſes are employed, ſome degree of care is neceſſary in directing the work, and driving the animals, in order that no inconvenience of delay may be experienced, and that every part of the land may be gone over in the moſt regular manner. Small boys may ſerve to direct the horſes by riding upon them, and ſome ſaving be made in that way.

In raking cut corn crops with horſe-rakes, eſpecially thoſe of oats and barley, it is ſometimes the beſt method to proceed in a croſs direction of the ridges, drawing up the produce into long rows at ſuitable diſtances; the horſes being driven by the men, who know the management of the handles of the rakes, by means of whip reins brought from the horſes to the ſtilts of the implements. It ſeldom happens that ſo good work can be made in going the lengthways of the lands, particularly where they are much rounded, and of a ſmall ſize in breadth, as the tools will not fit well to their rounded form, unleſs where they are conſtructed in ſeparate parts in their heads, ſo as to admit of motion by means of joints. In this mode of raking, the corn may ſometimes be readily tied up into ſheaves.

But in the raking of ſtubbles, it is more uſual to paſs in the direction of the ridges, though the contrary method is not unfrequently had recourſe to. In thoſe caſes, as well as in the others, the ſtrawy grains or ſtubbles are always brought together into lines or rows, in order to be more readily taken up by the carts either bound or unbound.

In the raking of the roots of weeds together upon lands, it is conſtantly the beſt practice to perform the work in both directions; as, by ſuch means, the whole of them may be laid hold of in a more complete and effectual manner than could otherwiſe be done. See RAKE.

RAKING, in *Gardening*, a neceſſary operation in the garden, to break the ſurface of the ſoil ſmall, and render it fine for the reception of particular ſorts of ſmall ſeeds and plants, previous to ſowing and planting, as well as to render it neat and even to the eye. It is alſo employed in raking in ſeeds, as being an expeditious mode of covering them in. In all kinds of ſmall ſeeds, or hardy plants, the ground being dug, &c. and the ſurface remaining rough after the ſpade, the ſeed is ſown, and then raked in with an even hand, once or twice in a place, as a back and a fore ſtroke, or more as may be neceſſary.

And this operation is uſeful alſo among growing plants, that ſtand diſtant enough to admit the rake, particularly where the ſurface is inclinable to bind, or where numerous ſmall ſeed-weeds appear, as it looſens the ſoil, and retards the growth of the weeds, and promotes the growth of the young plants. It is alſo good culture at particular ſeaſons, to annoy ſlugs, eſpecially in kitchen-gardens, to rake between the rows of ſmall plants in autumn and winter, &c. The raking of the beds, borders, and other compartments of pleaſure-grounds, now and then, ſmooth and even, likewiſe gives an air of culture and neatneſs to the whole.

It may be obſerved, that this ſort of work ſhould generally be performed in dry weather, and when the ground is alſo moderately dry; as when done in rainy weather, or when the ground is very moiſt and cloggy, the ſurface is apt to cake and bind hard. This ſhould be well attended to in ſowing ſeeds. Rough dug ground does not rake well, when it is become very dry at top, eſpecially if it was dug wet, and ſuffered to lie till the clods have become very dry and hard; in which caſe it will not rake well, until mellowed or pulverized by a ſhower of rain. But common light garden ground generally rakes beſt when freſh dug, perhaps the ſame day, or day after at the fartheſt, before dried too much by the ſun and wind, or rendered wet by rain, &c. The operation ſhould, however, be performed when the ground is in ſuch order as the clods will readily break and fall to pieces under the rake, without clogging much to it, or the mould become even without running into lumps.

RAKING *of a Horſe*, is the drawing his ordure with the hand out of the fundament, when he is coſtive, and cannot dung. In order to do this, the hand muſt be anointed with ſallad-oil, or butter.

RAKING *a Ship*, is the act of cannonading a ſhip on the ſtern or head, ſo that the balls ſhall ſcour the whole length of her decks, which is one of the moſt dangerous incidents that can happen in a naval action, ſo much ſo, that the men are ordered to lie down at their quarters. This is frequently called raking fore and aft, being the ſame with what is called enfilading by engineers. See ENFILADE.

RAKING-*Knees*. See KNEES.

RAKING-*Table*, or *Raked Table*, among *Architects*, a member hollowed in the ſquare of a pedeſtal, or elſewhere. See CAVETTO, and SCOTIA.

RAKOKIE, in *Geography*. See RACH-KOKE.

RAKONITZ, or RAKOWNITZ, a town of Bohemia, and capital of a circle of the ſame name, which is mountainous and covered with foreſts, but fertile in corn, and affording ſome excellent horſes. It was made a royal town in 1588. It is celebrated for its beer, which is the principal article of its commerce; 22 miles W. of Prague. N. lat. 50° 5′. E. long. 13° 57′.

RAKORA, a town of European Turkey, in Bulgaria; 40 miles S.S.E. of Viddin.

RAKOW, or RACOW, a town of Auſtrian Poland, in the palatinate of Sandomirz, formerly populous; the Socinians had a college and printing-houſe here, but were expelled in 1643; 40 miles W. of Sandomirz. See RACOW.

RAKOWEENA, a harbour on the coaſt of Kamtſchatka, in Awatſka bay, three miles long, and one and a half

half broad, with water from thirteen to three fathoms, and a bar at its entrance: it runs at firft in a fouth-eaft and afterwards in an eafterly direction; three miles S. of St. Peter and St. Paul.

RAKSHA, in *Hindoo Mythology*, a fpecies of malignant demon, of whom great ufe is made in their epic machinery and popular tales. They are of various fhapes and colours, and fuppofed to be animated by the fouls of bad men of earlier exiftence, receiving punifhment in thefe forms as enemies to the gods, and obftructors of their beneficent intentions towards mankind. Another clafs of thefe evil genii comprehends thofe called Yakfha. Rakfhafa and Yakfhafa are the plurals, and Rakfhni and Yakfhni the feminine; for thefe evil doings are not confined to fex. Ravena, the giant king of Lanka, or Ceylon, who oppofed Rama, aided by the gods in the invafion of his kingdom, is fometimes called the lord of Rakfhafas. See RAVENA.

RAKULSKOI, in *Geography*, a town of Ruffia, in the province of Ufting, on the Dwina; 20 miles N. of Krafnoborfk.

RALEGH, *Sir* WALTER, in *Biography*, a diftinguifhed character in the reigns of queen Elizabeth and James I., was fecond fon of a gentleman of an ancient family in Devonfhire. Few names, fays fir Walter's biographer, Mr. Cayley, vary fo much in the manner of writing it. By fir Robert Naunton and lord Bacon it is written *Rawleigh;* in fome old deeds the orthography is *Rale* or *Ralega;* while king James, Hooker, and other refpectable writers, adopt the mode of fpelling which is ftill common in this country, *viz. Raleigh;* but the original letters of fir Walter himfelf, wherever the fignature is preferved, have *Ralegh,* and on that account we choofe to adopt it in this work. Sir Walter, of whom we are treating, was born at a farm called Hayes, in that part of Devonfhire that borders on the fea, in the year 1552. By his mother he was related to thofe famous knights, fir John, fir Humphrey, and fir Adrian Gilbert. After he had received the ufual fchool education, he was fent to Oriel college, Oxford, where he diftinguifhed himfelf by a proficiency in learning far beyond his age; but the active difpofition and martial ardour with which he was endowed, foon put an end to his learned career. About the year 1569, he, in company with many young gentlemen of the beft families in the country, went into France, as well to inftruct themfelves in the art of warfare, as to affift the Proteftants in that kingdom, who were then grievoufly oppreffed. In this fchool he was employed five or fix years, but by what means he efcaped the horrible maffacre of Paris, and the provinces, on the famous St. Bartholomew's day, we have no knowledge. He returned to England in 1575, and it fhould feem he immediately became a refident in the Middle Temple, whence a commendatory poem of his, prefixed to a work of George Gafcoigne's, is dated in 1576. That he was not a ftudent in the law, at this time, he has himfelf declared, and he fhortly after paffed into the Netherlands, where he ferved fome time againft the Spaniards. In this, and other tranfactions of the fame kind, he followed the fafhion of the times. France and the Netherlands were in thofe days the fchools of Mars; to which all were obliged to refort who meant to purfue the fortune of arms. Many young men returned to their native country ruined in their fortunes, their conftitution, and morals; but Ralegh had made a good ufe of his time, gained a large ftock of ufeful knowledge, and was fo completely polifhed in his manner of addrefs, that he was now confidered as one of the beft bred and moft accomplifhed gentlemen in England.

On his return in 1578, he found his half-brother, fir Humphrey Gilbert, engaged in a defign of making difcoveries in North America, for which he had obtained a patent, and for the furtherance of which he had procured the affiftance of many friends. Ralegh was delighted with the defign, and embarked in it cordially. This project proved very unfortunate to the adventurers, but it gave young Ralegh an introduction to the fea fervice, in which he afterwards fo much diftinguifhed himfelf. From this unlucky adventure, Mr. Ralegh arrived fafe in England in the fpring of the year 1579, and very foon after he appears to have offered his fervices to the queen to go to Ireland, to the inhabitants of which, pope Gregory VIII. and the Spaniards had fent men, money, and other affiftance, to enable them to take arms againft the eftablifhed government. He obtained a captain's commiffion, and ferved in Munfter under the earl of Ormond. In this petty warfare he difplayed fo much good conduct, vigour, and courage, that he was afterwards made governor of Cork; and as a reward for his fervices, he received from the crown the grant of a confiderable eftate in Ireland. A mifunderftanding with the lord-deputy Grey put a ftop to his farther rife in the army; he returned to England, and was quickly introduced to the queen's notice, and by his own merits attained a large fhare in her favour. As he was forward to diftinguifh himfelf in all public fervices, fo on the return of the duke of Anjou into the Netherlands, he was one of thofe who accompanied him out of England, by the exprefs command of queen Elizabeth, and on his coming to England in 1582, he brought over the prince of Orange's letters to her majefty. Some months after this he refided at court, and was honoured with the favour and protection even of contending ftatefmen, who were proud of fhewing the true judgment which they had of real merit, by becoming patrons to Ralegh. In 1583 he was concerned in his brother Gilbert's fecond attempt, and though he did not venture in perfon, yet he built a new fhip, called the bark Ralegh, and furnifhed it completely for the voyage; "the unfuccefsful end of which," fays Campbell, "it feemed to predict, by its untimely return in lefs than a week to Plymouth, through a contagious diftemper which feized on the fhip's crew."

While at home Ralegh was not negligent of pufhing his fortune as a courtier. He had a good perfon and addrefs, made an elegant appearance, and put on that air of gallantry which was fo meritorious in the eyes of Elizabeth. It is faid, that he was once attending the queen in a walk, when fhe came to a fpot, that by its mire obftructed her courfe; he immediately took off his rich cloak, and fpread it on the ground for her to walk on. Pleafed with this attention, it is obferved, that the facrifice of a *cloak* obtained for him many a *good fuit.* The enterprifing fpirit of Ralegh was fhewn in the year 1584, in a fcheme which he formed of making difcoveries and fettlements in thofe parts of North America which had not been fubjected to any European power. His intereft at court, and his ability in ftating and fetting forth his plans to the beft advantage, obtained for him an extenfive patent for executing his purpofe; and, in confequence, with the help of a fociety of his friends, he fitted out fhips under the command of captains Amadas and Barlow, which failed from Plymouth in that year, and took poffeffion of an ifland near the mouth of Albemarle river, in what is now called North Carolina. From the terms of the patent, it appears, that the great object of thefe adventurers, as it was of all others in that reign, was the fearch after mines of the precious metals. Ralegh was not himfelf in this expedition: the fhips returned in the autumn with fome commodities which fold fo well, that the company was encouraged to fit out a fleet of feven veffels for the following year, of which the command was given to fir Richard

Richard Greenville, Ralegh's relation. During this voyage they took posseſſion of that tract of country which has been ſo famous, by the name beſtowed upon it by queen Elizabeth, and not given, as it has been generally ſuppoſed, by Ralegh, of Virginia. After expending a large ſum in repeated attempts to repair the misfortunes that had happened to the newly eſtabliſhed colony, he aſſigned over his patent to a company, reſerving to himſelf only a portion of the expected gold and ſilver ore. This enterpriſe probably made England firſt acquainted with tobacco, and alſo conferred upon it the much greater benefit of introducing the culture of the potatoe, firſt practiſed on Ralegh's eſtate in Ireland.

About this time he was choſen knight of the ſhire for the county of Devon, and very ſoon after the queen conferred upon him the honour of knighthood, an honour which ſhe did not render cheap by proſtituting it. In the year 1585 he fitted out another fleet for Virginia, in which he had good ſucceſs, his ſhips, in their return, taking a prize worth 50,000*l*. He was likewiſe concerned in captain Davis's undertaking for the diſcovery of the north-weſt paſſage, on which account a promontory in Davis's ſtreights was called Mount Ralegh. For theſe public-ſpirited and expenſive projects, the queen was pleaſed to make him ſome profitable grants; particularly two, the firſt giving him authority to licenſe the retailers of wine throughout the kingdom, and the other of a ſeigniory in Ireland, conſiſting of twelve thouſand acres, which he planted at his own expence, and many years after ſold to Richard Boyle, the firſt earl of Cork. In 1586 he was appointed ſeneſchal of the duchies of Cornwall and Exeter, and lord-warden of the ſtannaries; and ſo high did he ſeem riſing in the queen's favour, that the favourite miniſter, the earl of Leiceſter, took the alarm, and brought forward the earl of Eſſex as his competitor. But her majeſty's partiality was fully juſtified; it was, in this inſtance, extended to a man, who at all times purſued whatever appeared to him conducive to the public good, how little ſoever it turned to his private advantage. "With juſtice, therefore," ſays Campbell, "was the wiſe queen Elizabeth liberal to ſuch a man, who, whatever he received from her bounty with one hand, beſtowed it immediately in acts glorious to the nation with the other." In the year preceding the attempt of the famous Spaniſh armada, ſir Walter was captain in the queen's guard, and her lieutenant-general for Cornwall. In the latter capacity he was active in diſciplining the militia of the county; and he was one of the council of war to whom the conſideration of the beſt means of oppoſing the dangers of that momentous period was committed. When the armada appeared in the Channel, he was one of the gallant volunteers who nobly joined the Engliſh fleet with ſhips of their own, and had a ſhare in the defeat of the enemy. In 1589 he was among thoſe who accompanied the expelled king of Portugal in his attempt to reinſtate himſelf. The queen ſhewed her continued approbation of his ſervices, by making him gentleman of her privy-chamber, and augmenting the profits of his other places. This laſt was no ſmall favour in Ralegh's eſtimation, for though in many reſpects of an elevated mind, fond of glory, ſplendid and liberal, he was likewiſe intent upon gain, and neglected no ſource of emolument which his court intereſt placed within his reach. He did not ſcruple, we are told by ſome of his biographers, though the fact is not noticed by Campbell and others, to take direct bribes for the exertion of his influence; and he is ſaid to have received no leſs than ten thouſand pounds for procuring a pardon for Mr. Littleton. See Biog. Brit. article *Littleton.*

On his return from his Portugal voyage he viſited his Iriſh eſtates, and there either formed or renewed his acquaintance with the poet Spencer, who celebrates him under the title of the "Shepherd of the Ocean," and acknowledges the obligation of having firſt made him known to the queen. To his Fairy Queen he likewiſe prefixed a letter to Ralegh, explanatory of its plan and deſign. The patronage of literature was one of the beſt traits in the public characters of an age, in which meanneſs was ſingularly mixed with heroiſm. The naval enterprizes of the reign of Elizabeth were for the moſt part predatory expeditions, ſet on foot by individuals for their private benefit, and encouraged, though but feebly aided, by the crown. In 1592 ſir Walter Ralegh engaged in a conſiderable undertaking of this kind, with a view of attacking Panama, and intercepting the Spaniſh Plate fleet. He fitted out thirteen ſhips, by himſelf and his aſſociates, which were joined by two of the queen's men of war, and he was appointed general of the whole fleet. Scarcely had he ſet ſail when he was recalled by his ſovereign; proceeding, however, to Cape Finiſterre, he divided his fleet into two ſquadrons, with cruizing orders, and then returned. One of the ſquadrons fell in with a rich carrack, the capture of which was the only inſtance of ſucceſs which attended the expedition. His ardour for war was ſhewn by his ſupport in parliament of a motion, that certain ſubſidies granted to the crown ſhould be for the expreſs purpoſe of carrying on a war offenſive and defenſive againſt Spain. To undermine his credit with the queen, Parſons, a Jeſuit, publiſhed a libel againſt him, charging him with Atheiſm; the queen is ſaid to have imbibed ſome prejudice againſt him on this account, but he incurred her heavy diſpleaſure by an intrigue with one of her maids of honour, the daughter of ſir Nicholas Throgmorton. The conſequences of this amour brought a ſcandal upon the court of the virgin queen; and though he made the beſt reparation in his power, by marrying the lady, his offence was puniſhed by an impriſonment in the Tower of ſome months, and a ſubſequent baniſhment from the queen's preſence.

During his impriſonment he projected an expedition for the diſcovery of the empire of Guiana, which had already been viſited by the Spaniards, and the extent and opulence of which had been the ſubject of many marvellous tales. Having obtained ſome preliminary information, from an old navigator whom he diſpatched for the purpoſe, he embarked in perſon, in the month of February 1595, with a ſquadron of ſhips fitted out at a great expence, and ſailed to the iſland of Trinidad, where he made himſelf maſter of the town of St. Joſeph; he then proceeded up the great river Oroonoko, but was obliged by the heat of the weather, and the difficulties of the navigation, to return, with doing nothing more than merely taking poſſeſſion of the country in her majeſty's name. Unwilling to return without appearing to have done ſomething, he publiſhed a work, entitled "Diſcovery of the large, rich, and beautiful Empire of Guiana:" which was evidently the reſult of a fertile imagination rather than of real obſervation, and which Hume ſtigmatizes as a production "full of the groſſeſt and moſt palpable lies that were attempted to be impoſed on the credulity of mankind."

Sir Walter had ſo far regained the good opinion of the queen, that he had a naval command in the expedition againſt Cadiz, in 1596, under the earl of Eſſex and lord Effingham. In the attack he was one of the leaders of the van, and by his valour and prudence contributed a full ſhare to the ſucceſs of the glorious action. In the following year he ſailed as rear-admiral in the expedition of which Eſſex was commander-in-chief, and the purpoſe of which was to intercept the Spaniſh Weſt India fleet. Arriving firſt with

his

his squadron at Fayal, after waiting some time for Essex, he thought it expedient to make an attack on the place by himself, which proved successful. The commander-in-chief was mortified with this action, thinking it was designed to rob him of the glory due to him, and would have cashiered Ralegh, if lord Thomas Howard had not interposed his services to effect an apparent reconciliation. On their return lord Essex published some remarks upon what had happened in the course of the voyage, in which he questioned every body's conduct but his own. "The queen, however," says Campbell, "taking time to inform herself, made a right judgment of the whole affair; in consequence of which she paid a due respect to every man's merit, and greater to none than to that of sir Walter Ralegh."

During the remainder of this reign Ralegh chiefly appears as a member of parliament, and as an assertor of the privileges and interests of the people in the west, over whom his authority extended. That he was completely restored to the favour of his royal mistress is evident from the circumstance, that in 1661 he attended her in a progress through part of the kingdom. He was likewise appointed by her to receive the duke of Biron on his arrival as ambassador from France, and conferred with him on the subject of his mission. In the queen's last parliament sir Walter was a very active member, and distinguished himself upon all occasions, by opposing such bills as, under colour of deep policy, were contrived for the oppression of the middle and lower ranks of society. He witnessed the ruin of his great antagonist the earl of Essex, whose execution he indecently urged upon the minister Cecil; and he was even an eye-witness of the deed. Campbell, endeavouring to justify him in every thing, is evidently, in some instances, a panegyrist rather than a faithful historian. The decease of the queen, which soon followed the execution of her former favourite lord Essex, and which was probably hastened by it, gave a final, and to Ralegh a very unexpected, blow to his own prosperity.

When James came to the crown it was a sort of contest between sir Walter Ralegh and sir Robert Cecil, who should obtain the confidence of his majesty; the latter, however, was admitted to the royal councils, to the exclusion of sir Walter Ralegh. In truth, James had a prepossession against Ralegh, as having been the enemy of Essex, and still more, as having, with some others, entertained a design of forcing the king to agree to certain limitations with respect to the number of his countrymen whom he was to bring with him. Sir Walter's martial and enterprising spirit was also obnoxious to a prince of a pacific disposition. He was, therefore, received, barely with civility, a circumstance which preyed upon his high spirit, and was probably the means of throwing him into the party of the discontented. A conspiracy, for the purpose of placing upon the throne lady Arabella Stuart, was at this time formed, in which Ralegh in some measure participated. He was apprehended, and brought to trial on a charge of high treason; but, says the historian, his condemnation, upon the evidence produced, was one of the most disgraceful instances on record, of the base subservience of an English jury to the vindictive wishes of a court. His only accuser was lord Cobham, a man of bad character, and one who was deeply implicated in the plot, to whose proposals he had given ear, but probably without entering into, or even approving them. In his defence he displayed so much eloquence, temper, and force of argument, that some, who had been highly prejudiced against him, were brought to regard him as an innocent victim, and, it should seem, from the testimony of contemporary historians, that all parties were ashamed of the injustice of his condemnation. It is said that even Coke, the attorney-general, who treated Ralegh on his trial with all the abuse that belonged to his character, and was thought authorised by his office, expressed surprize at the sentence, and declared that he had charged him with no more than misprision of treason. Three were executed for this plot, two were pardoned, and Ralegh was only reprieved and committed to the Tower. His wife, at her own earnest solicitation, was permitted to become his fellow-prisoner, and his youngest son was born in the Tower.

In Mr. Cayley's life of sir Walter Ralegh, published in London in 1806, we have a curious letter of lord Cecil, then secretary of state, to sir Thomas Parry, the English ambassador in France, in which he gives an account of the conspiracy just referred to, and of the motives which led the different persons to take a part in it. Sir Walter was indicted for conspiring to deprive the king of his government, to raise up sedition within the realm, to alter the religion and bring in the Roman superstition, and to procure foreign enemies to invade the kingdom. The principal overt act laid in the indictment was, that sir Walter had a conference with lord Cobham, as to the best means of advancing Arabella Stuart to the crown and throne of this kingdom, and that they should apply to the king of Spain to procure his assistance in this cause. Sir Walter made an able stand in his trial against the legality of conviction upon the evidence of a single witness, but the judge, rendered infamous by his conduct on the trial, over-ruled the objections.

The active mind of sir Walter Ralegh was now left to exert itself within the walls of a prison, and its employment conduced more to his honour than his liberty perhaps would have done. Here he composed the greater part of his works, especially his "History of the World." Prince Henry, a youth of most amiable qualities, and as unlike his father as possible, contracted a generous admiration for the splendid talents of Ralegh, and cheered him in his solitary confinement by his friendship and correspondence. "No king," said the royal youth, "but my father would keep such a bird in a cage." Henry, however, died, and with him the hopes of deliverance vanished from the mind of the state prisoner. At length, however, after twelve years' confinement, sir Walter obtained his liberation, but probably not without the use of bribes, applied to the new favourite Villiers. For the purpose of repairing his fortunes, he planned a new expedition to Guiana, and his report of a rich gold mine existing in that country was a sufficient inducement for a number of adventurers to engage in the scheme. He obtained a patent under the great seal from the king, for making a settlement in Guiana. James, however, in order to retain his hold upon him, did not grant him a pardon of the treasons of which he had been convicted. There is no doubt but sir Walter might have *purchased* a pardon, and, at one time, had thoughts of doing so. He even consulted sir Francis Bacon, whether it would not be adviseable for him to give a round sum of money for a pardon in common form; to which the learned lawyer answered; "Sir, the knee timber of your voyage is money; spare your purse in this particular, for, upon my life, you have sufficient pardon for all that is past already, the king having under his broad seal made you admiral of your fleet, and given you power of the martial law over your officers and soldiers." Ralegh having employed all his resources in fitting out the expedition, sailed for Guiana with twelve armed vessels in July 1617. He had not set sail long before he was obliged to put into the harbour of Cork, by stress of weather, where he remained till the 19th of August. In November he arrived at Guiana,

Guiana, where he was received with the utmost joy by the Indians, who not only rendered him all the service in their power, but endeavoured to persuade him to end all his labours there, and take upon himself the sovereignty of the country, which, however, he steadily refused. A violent and long continued sickness prevented him from undertaking the discovery of the mine in person. This important affair he entrusted to one of his captains, Keymis: the scheme, however, proved abortive, the Spaniards having been before hand with him in the search of gold. Hume, for the purpose of exculpating James, endeavours to shew that the real intention of sir Walter Ralegh was to plunder the Spanish settlements, and neither to colonize, nor to work the mines. He assumes that Ralegh was a wilful deceiver in the expectations he had raised of vast subterraneous riches; but considering his character, it is surely more reasonable to believe that he was carried away by some vague ideas of this kind, and Hume admits that the Spaniards were at the very time working some mines. It will be readily admitted, that James did not imagine he was giving Ralegh a commission of hostilities against Spain, yet he must have known that the exclusive claims of that crown in South America rendered every interference with its dominion hostile in its eyes. The fact seems to be, that the expedition was undertaken with an intention to make the most of it, by any means within the power of the armament, and that the commander trusted to its success for justification before a court where bribery to favourites was omnipotent.

In this expedition Ralegh's eldest son lost his life, of which, and of the unfortunate issue of Keymis's undertaking, he reproached his captain very severely, who, without hesitation, put an end to his own life. Ralegh, with a heavy heart, steered homewards. In July 1618 he arrived at Plymouth, and in his journey to London he was arrested, and carried back to Plymouth. Twice he attempted to escape, but was secured and committed a prisoner to the Tower. James was exasperated at the injury which had been inflicted on Spain, a power then in amity with England, and which had been complained of by the Spanish court in very strong terms. He was, moreover, about to enter into a more intimate connection with that court, and therefore, without hesitation, determined to sacrifice Ralegh to its resentment. Though his death had been determined on, it was difficult to take away his life. His conduct in the late expedition, though the want of success had rendered it criminal in the eyes of the court, was far from being so in the sight of the nation; and though judges might have been found who would pronounce it treason, yet even in those days it was not easy to find a jury who would, without evidence, have found him guilty. The commissioners therefore, who had been appointed to enquire into the matter, and who had frequently examined him, finally reported, that no ground of legal judgment could be drawn from what had passed in the expedition. Upon this, it was resolved to call him down to judgment upon his former sentence, which, says Campbell, was done, with all the circumstances of iniquity and brutality that can well be conceived. Being brought before the court of king's bench, his plea of an implied pardon, by his having acted under the king's commission since sentence had been pronounced, was over-ruled, and he was not permitted to enter into a vindication of his conduct in the late voyage. Execution was accordingly awarded, and the king's warrant for it produced, which had been signed and sealed before-hand.

"That this judgment was illegal," observes Dr. Campbell, "and that sir Walter was really murdered, has often been said, and, I believe, seldom doubted; but I think it has not been made so plain as it might be, and, therefore, in respect to his memory, I will attempt it, by shewing that the judgment was absolutely illegal, as well as manifestly iniquitous.

"It is a maxim in our law that the king can do no wrong; and most certain it is, that no king can do legal wrong, that is to say, can employ the law to unjust purposes. Sir Walter Ralegh, after his conviction, was dead in law, and, therefore, if king James's commission to him had not the virtue of a pardon, what was it? Did it empower a dead man to act, and not only to act, but to have a power over the lives and estates of the living? It either conveyed authority, or it did not. If it did convey authority, then sir Walter was capable of receiving it; that is, he was no longer dead in law: or, in other words, he was pardoned. If it conveyed no authority, then this was an act of legal wrong. I cannot help the blunder; the absurdity is in the thing, and not in my expression. A commission under the privy seal, if not under the great seal, granted by the king, with the advice of his council, to a dead man; or, to put it otherwise, a lawful commission given to a man dead in law, is nonsense not to be endured; and, therefore, to avoid this, we must conceive, as sir Francis Bacon, and every other lawyer did, that the commission included, or rather conveyed, a pardon. Indeed, the same thing may be made out in much fewer words. Grace is not so strong a mark of royal favour as trust; and, therefore, where the latter appears, the law ought, and, indeed, does, presume the former. This judgment, therefore, did not only murder sir Walter Ralegh, but, in this instance, subverted the constitution, and ought to be looked upon, not only as an act of the basest prostitution, but as the most flagrant violation of justice that ever was committed."

The sentence of death was pronounced on him one day, and put in execution on the following, Oct. 29, 1618, in Old Palace Yard. His behaviour on the scaffold was calm and manly. He addressed the people at some length: he said he never feared death, and much less at that time; that as to the manner of it, though to others it might seem grievous, yet for himself, he had rather die in this way than in a burning fever. He desired to see the axe, and feeling the edge of it, said to the sheriff, "this is a sharp medicine, but a sure remedy for all evils." Being asked which way he chose to place himself on the block, he replied, "so the heart be right, it is no matter which way the head lies," and giving the signal, he received the stroke with the most perfect composure. Such was the end of the illustrious sir Walter Ralegh, in the 66th year of his age, by a sentence which was regarded as one of the most dishonourable measures of an odious administration. The panegyric upon his character by Dr. Campbell is much too highly coloured: sir Walter Ralegh was not faultless, though in extent of capacity and vigour of mind he had few equals in an age that abounded with great men. His imprisonment was the occasion of his obtaining a high reputation as an author. His writings were on various topics, and are classed as poetical, geographical, political, philosophical, and historical. They are now but little known. His "History of the World," though not much read, is regarded with respect, as one of the best specimens of the English language of that time: the style is pure, nervous, and without pedantry. It is the style of a man of business as well as of a scholar. It has been many times reprinted, but the best edition is that of Oldys, in 1736. He brought down his history no farther than the overthrow of the Macedonian empire. Of his miscellaneous works, a collection in two volumes 8vo. was printed in 1748. Biog. Brit. Hume. Campbell. Cayley.

RALEIGH, or RAYLEIGH, in *Geography*, a market-town and

and pariſh in the hundred of Rochford, and county of Eſſex, England, is ſituated at the diſtance of 14 miles S.E. by S. from Chelmsford, and 34 miles E. by N. from London. This place appears to have been anciently of conſiderable note. It was the head of the barony of Swene, and had a caſtle adjoining to it, of which ſome fragments and earth-works ſtill remain. Theſe conſiſt of a mount, with an oval-ſhaped baſe, ſurrounded by a double ditch and rampart, and ſeveral outworks, particularly on the eaſt ſide. The ſummit of the mount is divided; the weſtern diviſion being of a circular form, and 100 feet high; and the eaſtern one of an oval form, and lower: the principal ditch varies in width from 36 to 50 feet, and the interior vallum is 50 feet high. The church here is an acient edifice, and contains an old tomb, greatly mutilated, but diſplaying the remains of very beautiful workmanſhip in the pointed ſtyle. The perſon whoſe memory it was intended to preſerve is now unknown; the upper part, to which the inſcription was probably affixed, being totally deſtroyed. The market at Raleigh is held on Sadurday, weekly; and there is an annual fair on Trinity Monday. Hearne, in his edition of Leland's Itinerary (vol. iii. p. 8.), informs us that a cuſtom-court is kept here, yearly, the Wedneſday next after Michael's day. "The court," ſays that author, "is kept in the night, and without light, but as the ſkye gives, att a little hill without the town, called the King's hill, where the ſteward writes only with coales, and not with incke; and many men and mannors of great worth hold of the ſame; and do ſuite unto this ſtrange court, where the ſteward calls them with as low a voice as poſſible he may; giving no notice when he goes to the hill to keepe the ſame court; and he that attends not is deeply amerced, if the ſteward will. 'Tis commonly called *Lawleſs-Court.*" Weever, in his "Funeral Monuments," adds, reſpecting this cuſtom, that he was informed, "that this vile attendance was impoſed at the firſt upon certaine tenants of divers mannors hereabouts, for conſpiring in this place, at ſuch an unſeaſonable time, to raiſe a commotion." According to the parliamentary returns of 1811, Raleigh pariſh contains 162 houſes, and 1131 inhabitants. Beauties of England and Wales, vol. v. By E. W. Brayley and John Britton, F.S.A. 1810.

Raleigh, a townſhip of Eſſex county, in Upper Canada, W. of Harwich, bounded on the N. by the Thames, and S. by lake Erie.

Raleigh, a town of America, in Wake county, North Carolina, the preſent ſeat of government, about ten miles from Wake court-houſe. The general aſſembly of the ſtate in December 1791, appropriated 10,000*l.* towards erecting public buildings, and named it after the celebrated ſir Walter Raleigh, under whoſe direction the firſt ſettlement in North America was made at Roanoke iſle and in Albemarle ſound. The ſtate-houſe is a large handſome building, and coſt 6000*l.* The plan of the town is regular; the ſtreets interſecting each other at right angles. It is, however, ſubject to the diſadvantage of being remote from navigation; 61 miles N.E. of Fayetteville, 147 from Peterſburg in Virginia, and 448 S.W. of Philadelphia.

RALEMO, a river of Chili, which runs into the Pacific ocean, S. lat. 37° 55′.

RALENDORF, a town of the duchy of Carinthia; 12 miles S. of Saxenburg.

RALESTEDE, a town of the duchy of Holſtein; 8 miles E. of Hamburg.

RALICOTTA, a town of Hindooſtan, in Viſiapour; 31 miles N. of Anamſagar.

RALLENTANDO, Ital., a muſical term of late invention, for relaxing the meaſure at particular parts of a compoſition, which, when done by a great maſter, manifeſts feeling and intelligence; but when attempted by mean performers, it has no other effect upon an audience than that of breaking time: and we think that this refinement is often abuſed. It has been chiefly practiſed in France, and favours of affectation, and that *overcharged tenderneſs* which renders the national *airs tendres* ſo diſagreeable, or ſo ridiculous, to the natives of all other countries.

RALLUS, the *Rail*, in *Ornithology*, a genus of birds of the order Grallæ: the generic character is, that the bill is thickiſh at the baſe, attenuated on the back towards the tip, compreſſed, a little incurved, pointed; the tongue is rough at the tip; the body is compreſſed; the tail is ſhort; the feet have four cleft toes. There are ſeventeen

Species.

* Crex; land rail, crake, corn crake, daker hen, &c. Of this ſpecies the wings are of a ruſty red; the bill and legs of a browniſh-aſh; the irides are of a hazel colour; the feathers of the body are of a reddiſh-brown; the upper ones are black in the middle; the chin is very pale, and the belly is of a whitiſh-yellow. It is about nine or ten inches long, and inhabits the ſedgy parts of Europe and Aſia. From the circumſtance of its appearing at the ſame time with the quail, and frequenting the ſame places, it has been denominated the king of the quails. Its well-known cry is firſt heard as ſoon as the graſs becomes long enough to ſhelter it, and continues till the graſs is cut. The bird, however, is ſeldom ſeen, as it ſkulks in the thickeſt parts of the herbage, and runs ſo nimbly through it, winding and doubling in every direction, that it is difficult to come near it. When it is hard puſhed by the dogs, it ſometimes ſtops ſhort and ſquats down, by which means its too eager purſuer overſhoots the ſpot and loſes the trace. It ſeldom ſprings but when driven to extremities, and generally flies with its legs hanging down, but never to a great diſtance. As ſoon as it alights, it runs off, and before the fowler has reached the ſpot, the bird is at a conſiderable diſtance. It emigrates, appearing with us about the latter end of April, and departing in October. On its firſt appearance, and till the female begins to ſit, the male is frequently heard to make a ſingular kind of noiſe, much reſembling that of a comb when the finger is drawn along the teeth of it, and which has been uſed as a decoy. When they firſt arrive, they are very lean, but before their departure, they become exceſſively fat, and are much ſought after for the delicacy of their fleſh. They lay from twelve to ſixteen eggs in the graſs, of a dirty whitiſh colour, with a few yellow ſpots: the fleſh is excellent. There are two varieties, thus deſcribed: 1. Rufous brown, beneath paler; wings and tail deeper; the chin and vent are white; the legs are duſky red. This is found in the iſland of Jamaica. The bill is larger and black. 2. Reddiſh-grey beneath, and wing-coverts ruſty brown. This ſpecies inhabits China; the legs are of a duſky colour.

Aquaticus; Water Rail. Wings grey ſpotted with brown; flanks ſpotted with white; bill orange beneath, but black and reddiſh at the baſe; the irides are red; the feathers of the upper part of the body are of an olive-brown, and black in the middle; the lower ones are cinereous; thoſe of the lower part of the belly and vent are edged with rufous; quill-feathers duſk; the lower tail-coverts are white; the tail-feathers are ſhort and black; the two middle ones at the tip, and the others, are edged with ferruginous; the legs are of a duſky red. It is about twelve inches long, but does not weigh more than four ounces. It is found in the watery places in Europe and Aſia. It is ſometimes, but not in any

any great numbers, met with in various parts of Great Britain, in low ſituations, about water courſes and rivulets, where it ſeeks ſhelter among ſedge, ruſhes, and reeds, and is ſeldom put to flight, depending on its legs. for ſafety. When rouſed it flies only to ſmall diſtances, and in a heavy and very awkward manner, with its legs hanging down. It runs nimbly, and frequently fli ts up its tail. The neſt is made of ſedge and coarſe graſs, among the thickeſt aquatic plants, or in willow beds. The female lays ſix or more eggs, rather larger than thoſe of a blackbird, of a pure white colour. This bird continues with us all the year, and by many it is erroneouſly believed to be the land rail metamorphoſed in the autumn; but the different bills which the two birds have conſtitute an eſſential diſtinction.

* Porzana; ſpotted gallinule, or ſpotted water hen. This ſpecies has the two middle tail-feathers edged with white; the bill and legs are of a pale olive. It inhabits Europe and North America, and is generally found on the ſides of ſmall ſtreams, hiding itſelf among the buſhes; it is nine inches long. This bird is deſcribed as having a greeniſh-yellow bill; its irides are hazel, and head brown, ſpotted with black. The line over the eyes is of a pale grey; the neck above and flanks are of a brown-aſh, with ſmall white ſpots; the back and wing-coverts are olive, with black ſtripes, and near the edges of the feathers with white ſpots, the greater with white ſtripes and lines; the cheeks, chin, and throat, are of a pale grey, with brown ſpots; the breaſt is brown, with white ſpots; the belly is varied with cinereous and white; the vent is of an ochre-yellow. This bird is extremely timid and ſequeſtered, and is but ſeldom ſeen in Great Britain, eluding obſervation by its perpetual vigilance and lurking habits. Its neſt is formed, with ſingular care, of matted ruſhes, and materials which will float on the water, on which it remains tied, by ſome filaments, to the ſtalks of reeds, by which it is prevented from being carried away by the tide or current. The bird is in great eſteem for the table.

Crepitans; Clapper Rallus. Bill and legs brown; body above olive, the feathers aſhy at the edges; chin white, throat and breaſt yellowiſh-brown. This ſpecies inhabits New York, and is from fourteen to ſixteen inches long.

Fuscus; Brown Rallus. This is brown, as its ſpecific name imports; its vent is waved with white; the legs are yellow. It inhabits the Philippine iſles, and is ſeven inches long. The body beneath is light cheſnut, on the belly it is inclining to grey; the tail is barred with white and black.

Striatus; Streaked Rallus. Blackiſh, waved with white; chin reddiſh. The bill of this ſpecies is of a horn colour; the crown is varied with duſky and bay; the nape is bay; neck, back, ſhoulders, and rump, brown, with whitiſh ſpots; the wing-coverts are marked with a few tranſverſe whitiſh ſtreaks; the chin is of a reddiſh-white; the cheeks, throat, breaſt, and upper part of the belly, cinereous, with a tinge of olive; the lower part is barred with duſky and white; quill-feathers brown, the outer bands reddiſh-white, the inner are white; the tail is brown with white lines; the legs are of a greyiſh-brown. It inhabits the Philippine iſlands, is eight inches long, and is probably a variety of the philippenſis.

Torquatus; Banded Rallus. Brown, beneath waved with white; it has a white line below the eyes. This alſo is found in the Philippine iſles, and is twelve inches long. The bill and legs are grey-brown; cheeks and chin black. The body beneath is tranſverſely ſtreaked with black and white; the collar is of a bay colour; the quill-feathers on the outer edge paler; bands within on the firſt three white, the ſix next reddiſh-bay.

Philippensis; Philippine Rallus. The ſpecific character of this bird is brown, but beneath it is barred with grey; the eye-brows are white, and the neck beneath has a reddiſh caſt. There are three other varieties, thus deſcribed: 1. Red-brown, ſpotted and ſtreaked with black and white; head cheſnut; body beneath and eye-brows cinereous; this, notwithſtanding its name, is found at Otaheite. 2. Brown, ſpotted and ſtreaked with white, beneath white; eye-brows grey; the tail is barred with brown and white: this inhabits Tongataboo. 3. Above brown, beneath aſhy; back and wings lined with white ſpots; the belly beneath is white, with blackiſh bars. This is about eleven inches long, and is found in the Philippine iſlands.

Ecaudatus; Tailleſs Rallus. Olive; beneath bluciſh; body tranſverſely waved with black; eye-brows white. It inhabits Otaheite. The bill is blackiſh, and the upper part of the head is of a pale brown; the orbits are black; over the eyes, on each ſide the head, it has a broad white line; the body above is of a deep-gloſſy olive, with a tinge of olive on the ſhoulders; the vent is of a pale yellow; the tail is ſo ſhort as to be ſcarcely perceptible; the coverts are of a pale blue.

Carolinus; Soree. This bird is brown; the frontlet is black; the breaſt is of a lead colour; the bill is yellow; the legs are greeniſh. It inhabits Virginia, and is from ſeven to eight inches long: this is a capital bird for the table. The irides of this bird are red; the crown and body above are brown, marked with black ſpots; the face and chin are black; but the reſt of the neck, temples, and breaſt, are of a blueiſh-aſh; the belly and outer edge of the wings are white; the wings and tail are brown.

Phœniculus; Red-tailed Rallus. This ſpecies is black but beneath it is white; the bill and legs are greeniſh; the front is naked and of a fleſh colour; the vent and tail of a ruſty red. It is found in the iſland of Ceylon, and is about nine inches long. The bill and legs are tinged with red; the crown and cheeks are pure white; the quill-feathers are ſpotted with blue. There are two varieties. 1. Above cinereous, beneath white; the belly and vent are red. This is an inhabitant of China, and is fifteen inches long. 2. The front of this is white; the vent is red, and the legs are yellow. It is found in Madagaſcar, and is longer than the laſt.

Virginianus; Virginian Rallus. Brown, without ſpots; the bill and legs are brown. It inhabits Virginia, and is probably a variety of the R. aquaticus.

Ferrugineus; Red-breaſted Rallus. This bird is duſky above, and cinereous beneath; the neck and breaſt are ferruginous; the bill is pale, and the legs yellow. It is nine inches long; the eye-brows are pale, and the flanks are marked with tranſverſe, narrow, white lines.

Capensis; Cape Rallus. This ſpecies is of a ferruginous colour; but the lower part of the breaſt, belly, vent, wings, and tail, are waved with black and white; the bill is black, and the legs are of a blood-red. It inhabits the Cape of Good Hope and Ceylon, and is of the ſize of the R. crex. The two middle tail-feathers are ferruginous.

Cæruleus; Blue-necked Rallus. This is of a bay colour above, but blueiſh beneath; the bill and legs are red; the vent is white, and the belly is marked with tranſverſe black ſtreaks. It inhabits the Cape of Good Hope; it is ſeven and a half inches long.

Zeylanicus; Ceylon Rallus. The head of this bird is duſky; the body above is ferruginous, beneath it is reddiſh, waved with brown; the firſt quill-feathers are black; the bill

bill and legs are red. It is found, as its name imports, at Ceylon; it is larger than the R. aquaticus, and has a long tail.

Australis; Troglodyte Rallus. Rufty afh; wings and tail deep brown; the feathers are barred with black. It inhabits New Zealand, and is feventeen inches long. The bill and legs are yellowifh; the body above is of a rufty brown, beneath rufty afh; quill and tail-feathers are waved with black.

Pacificus; Pacific Rallus. Black, fpeckled with white; wings barred; body beneath whitifh; the head is brown, the breaft is of a blueifh-afh. It is found in Otaheite, and the neighbouring ifles. Bill red, the legs are of a flefh colour; the chin and eye-brows are white; the nape of the neck is rufty.

Tabuensis; Tabuan Rallus. Brownifh-black; beneath it is of a dufky colour; the bill is black, and the legs are bay. A variety has its vent ftreaked with black and white; the legs are red. It inhabits the South-fea iflands, and is fix inches and a half long. The eye-lids and irides are red.

Niger; Black Rallus. Black; bill red at the bafe, brown at the tip; the legs are brown or red. This is an African bird, and is nine inches long.

Sanduicensis; Sandwich Rallus. This is of a pale ferruginous colour; but the bill is of a dufky afh; the legs are of a dull flefh colour. A variety has a yellowifh bill and legs. It inhabits the Sandwich iflands; and another variety is very fmall, and found in the Tanna ifles.

Taitiensis; Otaheite Rallus. Cinereous; body above red-brown; the bill, rounded tail, and claws, are black. This inhabits Otaheite and the Friendly ifles, and is about fix inches long. The quill-feathers are dufky and edged with white; the legs are yellow.

Obscurus; Dufky Rallus. This is brown ftreaked with black, beneath it is of a rufty brown; the bill is black, and the legs are of a red-brown. It inhabits the Sandwich iflands, and is fix inches long; the edge of the mandibles is yellowifh.

Longirostris; Long-billed Rallus. The upper part of this fpecies is cinereous, fpotted with brown, beneath it is rufty white; the flanks are tranfverfely waved with white, the bill is long and of a ferruginous colour. It inhabits Cayenne, and is from nine to twelve inches long. The bill is tipt with brown; the legs are yellowifh, and the chin whitifh.

Variegatus; Variegated Rallus. This bird is ftreaked and fpotted with white and black; the hind-head is dufky; the bill is yellowifh; the chin is white; and the legs are yellow. It inhabits Cayenne, and is eleven inches long. The wings are brown, the coverts are fpotted with white; fome of the middle tail-feathers are edged with white.

Cayennensis; Cayenne Rallus. The crown of this bird is rufous; the body above is of an olive-brown; beneath it is rufous; the ocular band is blackifh; the quill-feathers are black; the bill is brown, and the legs bay. There is a variety having its crown bay; chin and vent reddifh-white. It inhabits Cayenne and Guiana; it is eight inches long: in the evening it is noify and gregarious, by day it is folitary; it builds in the forked branch of a fhrub, near the ground. The vent is pale.

Jamaicensis; Jamaica Rallus. Above reddifh-brown with black ftreaks; the bill and chin are black; the throat and breaft are of a blueifh-afh; the belly is marked with white and brown lines. It, as its name imports, inhabits Jamaica, and is fix inches long. The bill is reddifh at the bafe; wing-coverts brown, fpotted with white; the quill-feathers are of a reddifh-brown, with black lines, the fecondaries and tail-feathers are fpotted with white, and the legs brown.

Minutus; the Little Rallus. This is brown, but beneath it is yellowifh; eye-brows, ftreaks on the back, and fpots on the wing-coverts, white; tail barred black and white. A variety has the middle of the neck above rufous; the belly and vent are waved with black and white. It inhabits Cayenne and Jamaica, and is five inches long. The bill is brown; the wing-coverts are black; the chin is whitifh, and the legs are yellow.

Pusillus; Dwarf Rallus. Striped with ferruginous and black; the body beneath is blackifh, with narrow white bands; the throat and breaft are blueifh. This is found near falt lakes of Dauria, and is of the fize of a lark. The face, neck beneath, and middle of the breaft longitudinally, are blueifh; the middle of the chin is whitifh; the longitudinal band through the eyes of a pale rufty colour; the back is fcattered with white longitudinal lines; the legs are greenifh.

Barbaricus; Barbary Rallus. This is of a ferruginous colour; the bill is black; the wings are fpotted with white; the rump is ftreaked above with white and black, and beneath with white; the legs are of a dufky brown. This, as its name imports, is an inhabitant of Barbary, and is the fize of a plover.

Dubius; Doubtful Rallus. Striped with brown and ferruginous; the belly is white; the flanks are barred with brown and rufty afh; the firft quill-feathers without are longitudinally white. It is the fize of the common gallinule. The face is of a pale rufty colour; the chin is of a dirty white, furrounded with a broad brown collar; the fides are brown; the bill and legs greenifh-black.

RALLYING, in *War*, the reaffembling, or calling together of troops, broken, routed, and put to flight.

RALPH, James, in *Biography*, a mifcellaneous writer, defcended probably from mean parentage, was the intimate friend of Dr. Franklin, who fpeaks of him as ingenious and fhrewd, genteel in his addrefs, and extremely eloquent. Franklin knew him in America, and though he does not mention what Ralph's fituation then was, yet as he wrote a fine hand, and was well verfed in accounts, it is imagined he was a fchoolmafter. In 1725 Ralph accompanied Franklin to England, with a refolution of not returning to America, where he left his wife, with whom, and with whofe family, he had lived on ill terms. In London he was, for a confiderable time, fupported by his friend Franklin, till their intimacy was diffolved, when Ralph confidered the quarrel as a complete difcharge of the debt which he owed his benefactor. Ralph changed his name to that of Franklin, which he thought neceffary, having formed a new female connection, and fettled as a fchoolmafter in a village in Berkfhire. From this time there is no regular narrative of his life, which was probably paffed as a hired party writer. He is fpoken of with much contempt in the Dunciad, as the author of a poem called Night:—

"Silence, ye wolves! while Ralph to Cynthia howls,
And makes night hideous—Anfwer him, ye owls."

In a note, it is faid he wrote a fwearing piece, entitled "Sawney," very abufive of Swift, Gay, and Pope; that he panegyrifed his own works in the journals, was wholly illiterate, wrote plays, and was employed in a political newfpaper. The fatire of Pope muft be taken with much limitation, it being infpired by party motives: Ralph having recommended himfelf to perfons in power at the beginning of George II.'s reign, would for that reafon be obnoxious to Pope and his friends. He became an able writer

writer in profe, and was author of many political pamphlets, which were much applauded in their time; but his chief work was "The Hiftory of England during the Reigns of William, Anne, and George I., with an introductory Review of the Reigns of the Brothers Charles II. and James II., in which are to be found the Seeds of the Revolution. By a Lover of Truth and Liberty," 2 vols. fol. 1774—6. This work obtained the plaudits of Mr. Fox, who, in his pofthumous hiftorical fragment, fpeaks of the author as an hiftorian of great acutenefs as well as diligence. The laft publication of this author was entitled "The Cafe of Authors by Profeffion or Trade, ftated with regard to Bookfellers, the Stage, and the Public," which is faid to contain much good fenfe and lively fatire. Mr. Ralph died at Chifwick, in the year 1762. Gen. Biog.

RAM, in *Geography*, a town of European Turkey, in Servia, on the S. fide of the Danube; 10 miles E. of Paffarowitz.

RAM, in *Agriculture*, the male of the fheep kind. It may be obferved, that the rams of different breeds of fheep vary greatly in their forms, wools, and fleeces, and other properties; but the following defcription by that excellent ftock-farmer, Mr. Culley, deferves the attention of the breeder and grazier. According to him, his head fhould be fine and fmall, his noftrils wide and expanded, his eyes prominent, and rather bold or daring, ears thin, his collar full from his breaft and fhoulders, but tapering gradually all the way to where the neck and head join, which fhould be very fine and graceful, being perfectly free from any coarfe leather hanging down; the fhoulders broad and full, which muft at the fame time join fo eafy to the collar forward, and chine backward, as to leave not the leaft hollow in either place; the mutton upon his arm or fore-thigh muft come quite to the knee; his legs upright, with a clean fine bone, being equally clear from fuperfluous fkin and coarfe hairy wool from the knee and hough downwards: the breaft broad and well forward, which will keep his fore-legs at a proper widenefs; his girth or cheft full and deep, and inftead of a hollow behind the fhoulders, that part by fome called the fore-flank fhould be quite full; the back and loins broad, flat, and ftraight, from which the ribs muft rife with a fine circular arch; his belly ftraight; the quarters long and full, with the mutton quite down to the hough, which fhould neither ftand in nor out; his twift, or junction of the infide of the thighs, deep, wide, and full, which, with the broad breaft, will keep his fore-legs open and upright; the whole body covered with a thin pelt, and that with fine, bright, foft wool. It is obferved, that the nearer any breed of fheep comes up to the above defcription, the nearer they approach towards excellence of form.

But though this is a very correct, appropriate, and admirable defcription of a finely-formed ram, objections have been made by fome to a few of the properties which are laid down. Width and expanfion of the noftrils in fheep, it is fuppofed, are liable to caufe the lower parts of the nofes to be too thick and large; while in naturally good and improved forms, the lower parts of the nofes and mouths are for the moft part fmall. Nor is the prominent and bold daring eye held in more eftimation, as it is thought not to fhew a good difpofition; but, on the contrary, to difplay too much quicknefs and activity, or wildnefs of nature in the animal. Opinions, however, differ much on this point among fheep-farmers; and a lively quick eye is almoft always confidered as favourable to a good difpofition.

Rams naturally poffefs more boldnefs and courage than either wethers or ewes; and they are very apt, unlefs great care is taken, to acquire mifchievous habits of attacking perfons or animals that may by accident approach them.

In fome fheep-diftricts the breeders are greatly in favour of large rams, but in others thofe of a fmaller fize are preferred; the choice of the fize of the rams fhould, however, in every inftance, be regulated by the nature and abundance of the keep, or the quality of the lands, as it is utterly impoffible that the inferior forts of paftures can keep fheep-ftock of the large fize, as in thofe of the better kinds; and it would be highly difadvantageous in the beft rich forts to have a fmall-fized ftock when they could fupport a large one in an equally perfect manner. Middle-fized rams are, upon the whole, the moft fuitable and proper for lands in general, and for all the purpofes of the breeder.

The growth and conftitutions of young rams fhould never be fuffered to be endangered by their having too great a number of ewes, as is too frequently the practice with fheep-breeders.

It is a very improper cuftom, but one which prevails with the graziers in fome fheep-diftricts, to keep all their rams, perhaps to the amount of from twenty to fifty or more of all kinds, in one field or pafture; as their contentions are often fo violent, efpecially about the riding time, as to caufe the lofs of one or two rams to each in all fuch cafes. This practice is the moft common in the fheep-diftricts towards the fouthern part of the ifland, being feldom met with in thofe of the midland or more northern parts. It ought to be every where done away with.

The old rams are now almoft always got quit of by being fattened as rams, and fold at the neighbouring markets, or to butchers, at a very inferior price, there being often much competition for this fort of low-priced meat in fome fituations. It was formerly, however, the cuftom in fome places to *knit* them before they were fattened and fold to the butchers or otherways, but much injury and lofs being found to be fuftained by that method, it has been left off; it being now concluded, on the whole, that the lofs by knitting the rams is greater than that which is fuffered in the reduction of the price of ram mutton.

The practice of letting out rams in the midland diftricts for the purpofe of improving the breeds of fheep, having produced fuch beneficial effects, the rife, nature, and progrefs of it may deferve the attention of the ftock-farmer. It has been ably and accurately delineated, in the following manner, by Mr. Marfhall, in his Rural Economy of that part of the kingdom.

It is ftated, that in this diftrict, in general, the management refpecting rams is fimilar to that of other parts of the ifland; the breeders *rearing* or *purchafing* them. But that it is obfervable, however, that the advocates of the old breeds, though they will not adopt the modern ftock, have fallen, in fome degree, into the modern practice of *letting* by the *feafon*. But that the rams of the *modern* breed are never *fold*; but are paffed from breeder to breeder, by the *feafon* only. And that for the purpofe of promoting this intercourfe, each principal breeder has his *fhow* of rams; commencing, by common confent, the 8th of June, and lafting until Michaelmas, or until the feafon of letting be paft. That during a few weeks after the fhows commence, every ram-breeder may be faid to keep open houfe. Breeders and others, from all quarters of the kingdom, as well as the promoters of the breed who refide in the neighbourhood, attend thefe fhows; going, in parties, from one to another: fome to take, others to fee and pafs their judgment. And that thefe private exhibitions clofe with a *public fhow*, at Leicefter, the 10th of October; when rams of every defcription, but moftly an inferior fort of the improved

proved breed, are collected; being brought in waggons; many of them from a considerable distance; some to be *sold*, but chiefly to be *let* for the season. That this show has been held, he believes, time immemorial; not, however, for the purpose of *letting*, but for that of *sale*. But the letting of rams by the season, has long, he understands, been a practice in Lincolnshire. However, the origin, in the midland districts, may be traced—to a ram let by Mr. Bakewell, at Leicester fair, about forty years ago, at the low price of sixteen shillings. But humble, however, as was this beginning, it proved, Mr. Marshall says, to be the first stone of the foundation of a department of rural business, that has already risen to an astonishing height, and may, for some length of time, continue to bring in a copious source of wealth to the country. In the management of this business, the principal ram-breeders save annually, twenty, thirty, or perhaps forty ram-lambs; castration being seldom applied, in the first instance, to the produce of a valuable ram. For, in the choice of these lambs, they are led more by blood, or parentage, than by form; on which, at an early age, little dependance can be placed. He adds, that their treatment, from the time they are weaned, in July or August, until the time of shearing, the first week in June, consists in giving them every indulgence of keep; in order to push them forward for the show: it being the common practice to let such as are fit to be let the first season; while they are yet yearlings—provincially *sharhogs*. Their first pasture, after weaning, is pretty generally, he believes, clover that has been mown early, and has got a second time into head: the heads of clover being considered as a most forcing food for sheep. After this goes off, turnips, cabbages, colewort, with hay, and report says, with corn. But the use of this the breeders severally deny, though, collectively, they may be liable to the charge. However this may be, something considerable depends on the *art* of making *up*,—not lambs only, but rams of all ages. Fat, like charity, covers a multitude of faults; and, beside, is the best evidence their owners can produce, of their *fatting quality*, —their natural propensity to a state of fatness; while in the fatness of the sharhogs is seen their degree of inclination to fat at an *early* age. And that the fatting quality being the one thing needful in grazing stock: and being found, in some considerable degree at least, to be hereditary,—the *fattest* rams are of course the *best*; though other attachments, well or ill placed, as to form, or fashionable points, will perhaps have equal or greater weight in the minds of some men, even in this enlightened age and district. And the shearlings, which will not make up sufficiently, as to form and fatness, are either kept on to another year, to give them a fair chance, or are castrated, or butchered, while sharhogs.

With regard to the showing, it is remarked, that the shows of the principal breeders consist, by common consent, of forty rams each, mostly from one to five years old, they being seldom found efficient after that age; some, however, will continue in vigour to the sixth or seventh year. And that, during the show, they are mostly kept in small inclosures, of two, three, or four acres; with three, four, or more rams in each, according to their ages, and the advancement of the season. And in a corner, or other convenient part of each paddock, a small pen, made with hurdles, is placed; for the purpose of handling them. Into these pens they go, through custom, as tractably as worked oxen to their stalls. Indeed, the old rams, from the unwieldiness of their frame, and the load of fat they have to carry at this season, as well as from habit, will suffer themselves to be handled abroad; and even appear to take pleasure in the respect which they have shewn them. But it is observed, that of late a new method of showing has been struck out by the leading breeder, and adopted by *one* at least of his followers. Instead of showing them abroad, and driving three or four of them up together in a pen, they are shut up in hovels, and brought out separately, being *never seen* together. He thinks, that among accurate judges, this mode of showing may be well enough; but to those who have had less experience it gives offence, as it deprives them of their best guide, comparison; and he can see no fair advantage accruing from it to the latter.

It is remarked, that though the desirable *points* of a ram are such as have been noticed, the choice of the hirer is determined, in some measure, by the intention for which he is about to hire: as whether it be that of getting wedders, or mere grazing stock: or rams for the purpose of letting. Hence the grazier and the ram-breeder choose different sheep, so as to suit their different purposes. He adds, that the characteristic difference between what is termed a *ram-getter* and a *wedder-getter*, or a good grazier's sheep, is that of the former being every where cleaner and finer, the head small, the bone and offal light, the flesh good, and the form beautiful. The mere grazier likes a ram no worse for having a strength of frame, and is less scrupulous about his form than the ram-breeder, whose great object is fineness: his ewes, and the natural tendency of the breed, serve to give his offspring size and substance when it is wanted.

In respect to the practice of letting, it is observed, that a novel circumstance has likewise taken place lately in the business of letting. The long established custom of setting a price was exploded, at least by the late Mr. Bakewell, and one of his disciples; whose customers were left to make their own valuations, and bid what they pleased. But this, as well as shewing them separately, it is observed, gives great offence, especially to strangers, who cannot brook the idea of being both buyers and sellers. The latter, however, has more than one advantage in reserving the price, provided he do not thereby drive away his customers: he is, in effect, letting to the best bidder. Beside, he is, through this mean, enabled to *regulate* his *prices* to his customers, without giving any of them pointed offence: for as the principal breeders are, in the nature of their business, competitors, it is no more than common good policy, in the leader at least, to advance himself, and keep back those who press upon him closest. It is, therefore, good management, Mr. Marshall thinks, in him to let a superior ram to an inferior breeder, whose ewes are yet of base blood, at a lower price than to one who is farther advanced, and whose ewes perhaps are nearly equal to his own: for if the hirer may not thereby be able to get the lead from him, he may run away with part of the best prices; and the only line the leader has to tread is, either to refuse him, or to make him pay in the first instance. And again: sometimes two or three capital breeders will join in the hiring of one superior ram; and, in this case, the blood being more widely dispersed, the price ought to be, and always is advanced, in proportion to the number of partners there may be in the business. Hence, in the leader, a reservation of price may be allowable, especially in the letting of first-rate rams.

He observes, in regard to the conditions of letting, that notwithstanding the number of years the letting of rams has now been in use, and the extraordinary height to which the prices have risen, the transaction does not appear to have yet received any settled form; nor to have been rendered *legally* binding, by any written articles, or conditions of letting; much being still left to the *honour* of the parties. It is, however, generally understood, that the price agreed upon

upon ſhall not be paid, unleſs the ram in contract, *or another as good*, impregnate the ſtipulated number of ewes. If, through accident or inability, part only be impregnated, a proportional part of the price is abated. If he die while at ride, the loſs falls on the letter, whether his death happens through accident or neglect; no *caſe*, he underſtands, having yet been otherwiſe determined. It is likewiſe underſtood, that the hirer ſhall not ſuffer him to ſerve any other than his own ewes; and of theſe, no more than a ſtipulated number, which is proportioned to the age or ability of the ram, and the mode of uſing him. And further, that if a grazier hire a valuable ram, at a wedder-getter's price, (which is not unuſual at the wane of a ſeaſon, when valuable rams happen to be unlet,) it is underſtood, or rather agreed, that he ſhall not rear rams from him; a condition which may frequently be advantageous to both parties. The letter pockets five or ten guineas, which otherwiſe he might not have had; and the hirer, by ſuffering himſelf to be "tied down," as it is termed, gets a greater improvement in his ſtock than otherwiſe he could have got for the ſame money. He adds, that the time of paying the money is, he underſtands, unfixed; ſeldom, he believes, until after the ewes have brought proofs of the ram's efficiency, or after the lambing ſeaſon.

It is obſerved, that with regard to the prices for letting rams by the ſeaſon, that from the firſt letting to the year 1780, the prices kept gradually riſing from *ſixteen ſhillings* to a *guinea*, and from one guinea to *ten*. In 1780, Mr. Bakewell let ſeveral at *ten guineas* each; and what is *rather* inexplicable, Mr. Parkinſon of Quarendon let one, the ſame year, for *twenty-five guineas*, a price which then aſtoniſhed the whole country. That from that time to 1786, Mr. Bakewell's ſtock roſe rapidly, from ten to a *hundred guineas;* and that year he let two-thirds of one ram (reſerving one-third of the uſual number of ewes to himſelf) to two principal breeders, for an hundred guineas each; the entire ſervices of the ram being rated at *three hundred guineas*. This excellent breeder making that year, by letting twenty rams only, more than a thouſand pounds! and that, ſince that time, the prices have been ſtill riſing. *Four hundred guineas* have been repeatedly given. The above breeder, this year (1789), makes, he underſtands, twelve hundred guineas by three rams, (brothers he believes,) two thouſand of ſeven, and of his whole letting full three thouſand guineas! And that he now lets nothing under twenty guineas; a well-judged regulation, which Mr. Marſhall thinks will probably be beneficial both to himſelf and his cuſtomers.

It is added, that, beſide this extraordinary ſum made by Mr. Bakewell, there are ſix or ſeven other breeders who make from five hundred to a thouſand guineas each. The whole amount of monies produced this year, in the midland counties, by letting rams of the modern breed for one ſeaſon only, is eſtimated, by thoſe who are adequate to the ſubject, Mr. Marſhall ſays, at the almoſt incredible ſum of *ten thouſand pounds*. He knows that it is a popular idea, eſpecially of thoſe who, living at a diſtance, have only heard of theſe extraordinary things, without having an opportunity of coming at facts, that the extravagant prices which are talked of are merely nominal; the principal part of the money being returned, the actual prices given being ſmall, in proportion to thoſe held out. This, however, is, he believes, and on the beſt authority, an erroneous idea. At the firſt ſetting out of the high prices, there might be ſome tranſactions of that nature; but if ever they exiſted, they have ceaſed long ago. Mr. Bakewell at preſent has the name, at leaſt, of being parſimonious, even to the ſhepherds of the flocks on which his rams are employed. His higheſt preſent, he underſtands, is five ſhillings; if the price be under fifty guineas, only half-a-crown. But the enormouſneſs of theſe prices may be explained, he thinks, on other grounds. The *high* prices are not given, he ſays, by graziers, for the purpoſe of getting wedders, as grazing ſtock; but by ram-breeders, for the purpoſe of getting rams, to be let to graziers: the *higheſt* being given by the principal breeders only, not for the purpoſe of getting rams to let to graziers as wedder-getters, but for that of getting rams, to be let out again to inferior tup-men, as ram-getters.

It is further ſtated, that the graziers' prices run, even now, from one to ten guineas. He has not heard of more than ten guineas being given, by a mere grazier, for a ram, for the ſole purpoſe of getting grazing ſtock: five or ſix guineas is the common price. And ſuppoſing he gives the higheſt price, ten guineas, and that the ram ſerves a hundred ewes, (ſome ſingle, ſome double,) the expence of getting amounts to no more than two ſhillings a head; which is inconſiderable, compared with the difference between a well and an ill grazing ſheep, between a ſheep that will get as fat at two years old as another will at three; or, in other words, which will, at two years and a half old, fetch ten or fifteen ſhillings more than his comrades of another breed, but of the ſame natural ſize, and going in the ſame paſture, or feeding on the ſame ſort of food. In reſpect to the *middle* prices, as thoſe from twenty to fifty guineas, they are, under the preſent circumſtances, equally reconcileable, he thinks, to common ſenſe. If a breeder, who gives fifty guineas, rear ten tolerable rams fit for the grazier's uſe, and let them at five guineas each, he brings himſelf home, even the firſt ſeaſon of letting, beſide having the rams for another and another ſeaſon, and beſide a general improvement in his ſtock for the future. And thoſe who give the higher prices, as one to two hundred guineas, have, or ought to have, proper baſes to build upon, ſufficient ſtocks of well-bred ewes; in which caſe, they have a fair chance of producing ram-getters, worth, while the preſent ſpirit of improvement laſts, twenty to fifty guineas a ſeaſon. And that with reſpect to the *very high* prices, they are given by a few firſt-rate breeders, who are playing a high game, running a hard race, for the pride and profit of being a leader, when Mr. Bakewell is not; a contention which may laſt as long as Mr. Bakewell, and be at once an honour to his genius, and a reward of his ſervices.

In reſpect to the treatment of rams after letting, it is remarked that the breeders of rams, as well as of bulls, find it expedient to reduce them from the cumbrous ſtate in which they are ſhewn, previouſly to the ſeaſon of employment; the old rams, in particular, being frequently returned upon their hand, non-efficient. Hence, as they are let, they are transferred to private paſtures, and moderate keep; it being a pretty general rule not to ſhew a ram after he is let, or contracted for to a perſon.

In the ſending out let rams, the uſual time of beginning is the middle of September: the means of conveyance, carriages of two wheels with ſprings, or hung in ſlings; ſome of them being large enough to hold four rams. In theſe they travel from twenty to thirty miles a day; being ſometimes ſent, in this way, two or three hundred miles, and ſometimes more.

It has been obſerved by the ſame writer, that the manner of uſing theſe rams has lately received a very great improvement. Inſtead of turning them looſe among the ewes at large, as heretofore, and agreeably to the univerſal practice of the iſland, they are kept apart, in a ſeparate paddock or

ſmall

ſmall incloſure, with a couple of ewes only each, to make them reſt quietly; having the ewes of the flock brought to them ſingly, and leaping each only once. He thinks, by this judicious and accurate regulation, a ram is enabled to impregnate near twice the number of ewes he would do, if turned looſe among them, eſpecially a young ram. And he adds, that, in the old practice, ſixty or eighty ewes were eſteemed the full number for a ram: in the new, from a hundred to a hundred and twenty are allowed. Seven ſcore have been ſerved by one ram in a ſeaſon: this is, however, much too great a number.

And while at ride, the treatment of the ram is merely that of keeping him well, and free from diſorders; ſuffering him to ſerve no other than the hirer's own ewes, and of theſe the limited number only, and to return him ſafe when he has done; generally the beginning of December: or, if the hirer nas met him on the road, (which is cuſtomary,) the latter, in return, meets him on his journey home. And the after treatment conſiſts in ſtriving, by every deviſeable means, to reload his carcaſe, and make him fat and handſome for the enſuing ſhow, in order that he may be let again with advantage.

This is the whole of the plan that was purſued in that diſtrict, which has led the way to ſo much improvement in the breeding of ſheep ſtock; and from which the country has derived ſuch vaſt benefits, and ſuch a number of advantages. But though the above practices have not been lately carried on to their former extent, they are ſtill very conſiderable. See Sheep.

It is remarked, that the practice of hiring rams in Romney Marſh is not carried on with the ſame degree of ſpirit as it is in Leiceſterſhire, and that rams were of more value for the hiring ſeaſon ſome time ago than they are at preſent, eſpecially when the croſs of the above county took place, as then from twenty to one hundred guineas were frequently given. One grazier ſome time ſince let rams to the amount of twelve hundred guineas; but the rage is now over, the people not being ſo fooliſh as to be duped out of their money, without the proſpect of being repaid. It is here the practice with ſome to ride their ram lambs; but they are ſaid always to be injured in their growth, if not in their conſtitutions and diſpoſitions, by it. When a ram dies while at ride, the loſs falls on the owner, and, beſide, he is not paid for the riding. The time of paying is when the rams are removed from the ewes. This is done by carrying them away in carts, or leading them by ropes. The ram lambs are here now moſtly ſelected and ſaved, in ſuch numbers as are proper for the hirers.

Some time before the riding ſeaſon, the graziers call and agree for the hiring or purchaſing of rams, the general price uſually from three to five guineas; but a ſuperior one will bring ten in particular caſes, though many good uſeful ones let at three guineas. Some purchaſe them to ride, and immediately afterwards ſell them in the markets. The rams, which are to be hired, are here ſhewn all together in paſture fields, which is a diſadvantageous method.

In Suſſex, until lately, ten guineas were the higheſt price that was heard of for the ſale of any ram. Now ſome let many of their three-years old rams for fifty; and inferior ones at thirty, twenty, and ten guineas. Some have even been let ſo high as one hundred guineas.

Ram is alſo a term uſed to ſignify any thing which has a ſtrong ſmell or taſte.

Ram, in *Aſtronomy*. See Aries.

Ram *of M. Montgolfier, Hydraulic*, in *Mechanics*, a machine for raiſing water to any given height, which has lately attracted much attention in France. The firſt perſon who employed this method was Mr. Whitehurſt, and it was afterwards improved by Mr. Boulton. Its conſtruction and uſe may be ſufficiently underſtood by the following ſtatement. It ſerves to raiſe water by means of the momentum of a ſtream of water flowing through a long pipe. The paſſage of the pipe being ſtopped by a valve, which is raiſed by the ſtream, as ſoon as its motion becomes ſufficiently rapid, the whole column of fluid muſt neceſſarily concentrate its action almoſt inſtantaneouſly on the valve, and in this manner it loſes the characteriſtic property of hydraulic preſſure, and acts as if it were a ſingle ſolid; ſo that, ſuppoſing the pipe to be perfectly elaſtic and inextenſible, the impulſe muſt overcome any preſſure, however great, that might be oppoſed to it; and if the valve open into a pipe leading to an air-veſſel, a certain quantity of the water will be forced in, ſo as to condenſe the air, more or leſs rapidly, to the degree that may be required, for raiſing a portion of the water contained in it to any given height. Young's Courſe of Lectures on Nat. Philoſ. vol. i.

Ram, in *Mythology*, the name of the higheſt god among the Gentoos. When a widow offered herſelf to be burnt on the funeral pile of her huſband, ſhe was encouraged by the preſence of a number of attendants, who formed a circle around her, and offered her freſh betel, intreating that, as ſhe would in a ſhort time appear with her huſband in the preſence of Ram, or their higheſt god, ſhe would ſupplicate for various favours for them; and above all, that ſhe would ſalute their deceaſed friends, whom ſhe might meet in the celeſtial abodes, in their names.

Ram, *Battering*. See Aries.

Ram's-*Horns*, in *Fortification*, a name given by M. Belidor to the tenailles.

Ram-*Head*, on board a *Ship*, the name of a great block belonging to the fore and main halliards. It hath in it three ſhivers, into which the halliards are put, and at its head the tyes are reeved into a hole made there for that purpoſe.

Ram-*Head*, in *Geography*, a cape on the S. coaſt of Ireland, and county of Waterford; four miles E. of Youghal bay. N. lat. 51° 56′. W. long. 7° 44′.—Alſo, a cape on the S.E. coaſt of New Holland. S. lat. 36° 56°. E. long. 149° 35′.—Alſo, a cape of England, on the S. coaſt of Cornwall, in the Engliſh Channel, between Whiteſand bay and Plymouth ſound. N. lat. 50° 19′. W. long. 4° 12′.

Ram-*Hormuz*, a town of Perſia, in Chuſiſtan; 65 miles S.E. of Suſter or Shuſter.—Alſo, one of the moſt romantic vallies in Perſia, which has been lately placed under the beglerbeg of Bebahan. It is fifteen furſungs in length (the furſung being eſtimated at $3\frac{3}{4}$ Engliſh miles), and from ſix to eight miles in breadth. The river Jeraki, entering at the eaſtern extremity, flows through the centre of it, when meeting the Kkoorkhankende, which deſcends from the mountains ſix miles E. of the town of Ram-Hormuz, they together force a paſſage through a low ridge of hills, which ſkirt the valley to the ſouth. This fertile ſpot is, at preſent, in the hands of five hoſtile chiefs; the firſt of whom is an Arab, who reſides in a mean village, ſituated at the W. end of the valley, and built amidſt the ruins of the ancient city of Ram-Hormuz. The remaining four are Perſians, and brothers, who have each a caſtle, or fortified village; from which they make frequent ſallies, and carry off the corn and cattle of their rivals. A great battle was fought in this valley, between Artaxerxes Babegan, and Artabanes, in which the former was victorious, and firſt aſſumed the title of "Shah en Shah," or king of kings. Kinneir's Perſ. Emp. 1813.

Ram's *Iſland*, an iſland in lough Neagh, Ireland, about two miles from the ſhore, and containing about ſix acres.

acres. It is in the weftern part of the lough, in what is called Sandy bay, and is the only ifland. One of the round towers, fo frequent in Ireland, is found here, and renders it an interefting object from the neighbouring grounds. Dubourdieu's Antrim.

RAMA, or RAMLA, a town of Paleftine, which was formerly large, and defended with ftrong walls; celebrated as the place where St. Paul cured Æneas. The Muffulmen reverence here the tomb of Locman the wife, and the fepulchres of feventy prophets, faid to have been buried here. The church of St. George is the only object now worthy of notice. The place has a kind of market for gall-nuts, fena, and gum arabic, which the Arabs bring hither for fale; 20 miles N.W. of Jerufalem.

RAMA, a town of Dalmatia; 20 miles S.W. of Moftar.

RAMA, or *Ramah*, fignifying an eminence, in *Scripture Geography*, a town of Judea, in the tribe of Benjamin, according to the book of Jofhua, ch. xviii. v. 20. It was fituated towards the mountain of Ephraim, between Gaba and Bahel, about feven miles from Jerufalem, according to St. Jerom. This city lay on the road from Samaria to Jerufalem; for which reafon Baafha, king of Ifrael, caufed it to be fortified, to obftruct the paffage from the land of Judah into that of Ifrael. This is the Ramatha, or *Ramathaim-Zophim*, the country of the prophet Samuel. 1 Sam. i. 1—19. and ii. 11. &c. It was on the frontiers of Ephraim and Benjamin; and frontier cities were inhabited by both tribes. Jeremiah probably fpeaks of this Ramah. Jer. xl. 1, 2, 3. See alfo ch. xxxi. 15, 16, 17.

RAMA, a city of Naphtali (Jofh. xix. 36.), on the frontier of Afher (Jofh. xix. 29.)

RAMA, in *Hindoo Mythology*, is the name of a diftinguifhed mortal, in whom their deity Vifhnu was incarnated for the purpofe of relieving mankind from the tyranny and oppreffion of Ravena, the malignant king of Lanka, or Ceylon. This incarnation is one of the ten avataras, or defcents of Vifhnu, and is, in its fuppofed importance, fecond only to that of Krifhna. It is fimilarly a popular hiftory, and allufions to it perpetually occur in the writings and converfation of the Hindoos. The invafion and conqueft of Lanka is the fubject of one of their fineft poems, entitled the Ramayana; it furnifhed fubjects for the drama, for itinerant bards, and for every purpofe of poetry, being replete with magnificent imagery, and abounding in ftriking incidents. (See RAMAYANA.) The mortal parents of this divine hero were Raja Dafaratha, king of Ayodetra (Oude), and his firft wife Kahunfilya. Hence this Rama is fometimes ftiled Dafrat Rama, to diftinguifh him from other heroic Ramas; and fometimes Rama Chandra, meaning of lunar defcent.

There are three perfons of the name of Rama, recorded as incarnations of Vifhnu. One is Bala Rama, the elder brother, by the fame parents, of Krifhna; the fecond, Parafu Rama; and the third, Rama Chandra, the fubject more immediately of this article. But it has been made a queftion, whether they be not three reprefentations of one perfon, or three different ways of relating the fame hiftory; and whether any or all of them mean Rama the fon of Cufh, fir W. Jones (Af. Ref. vol. i.) fays he leaves others to determine. He deems Rama to be the fame as the Grecian Dionyfos, who is faid to have conquered India with an army of fatyrs, commanded by Pan; and Rama was alfo a mighty conqueror, and had an army of large monkeys or fatyrs, commanded by Maruty, fon of Pavan. (See MARUTY.) Rama is alfo found, in other points, to refemble the Indian Bacchus: he is, notwithftanding his lunar appellation above noticed, fabled to be a defcendant of the fun, his wife's name is Sita; and it is very remarkable that the Peruvians, whofe Incas boafted of the fame defcent, ftiled their great feftival Ramafitoa.

In a charge delivered by Dr. Watfon, afterwards bifhop of Landaff, to the clergy of the archdeaconry of Ely in May 1780, are many curious and fhrewd obfervations on oriental ufages. He notices a "ftring of cuftoms wholly the fame amongft people fo far removed from each other as the Egyptians and Peruvians. The Egyptian women, he fays, made facred cakes of flour, which they offered to the queen of heaven, at their principal folar feftivals called Raymi and Citua: the Peruvian women did the fame." Almoft all the cuftoms defcribed as common to thefe diftant people, the Egyptians and Peruvians, as well as th... ...cted, are Hindoo cuftoms, ancient and exifting.

All the Ramas are famed as great warriors and as youths of perfect beauty. In the Gita, an epifode of the Mahabarat, Krifhna, defcribing himfelf to Arjun as pre-eminent among all things and perfons, fays, "Among thofe who carry arms, I am Rama." It is Rama Chandra, however, and his lovely Sita, who are the favourite fubjects of heroic and amatory poetics: he is defcribed in the Ramayana "of ample fhoulders; brawny arms, extending to the knee; neck fhell-formed; cheft circular and full, with aufpicious marks; body hyacinthine; with eyes and lips of fanguine hue; the lord of the world; a moiety of Vifhnu himfelf; the fource of joy to Ikfhwaku's race." He is fuitably mated in his faithful Sita, one of the moft interefting females in Hindoo poetry. (See under her name for fome account of her, and a defcription of her perfon.) Rama is alfo called *Raghuva*, or fon of *Raghu*, (fee thefe articles,) like Ikfhwaku, one of his mortal anceftry. Kaka-pakfna-dara, or crow-winged, is an epithet given to the Ramas, and to other warriors, from a certain mode of fhaving the head, leaving the hair over the ears only, refembling crow's wings, as is fancied. Shyamula, or blue-bodied, is an appellation of Rama, as well as of Krifhna, and of their common prototype, Vifhnu; all being reprefented of hyacinthine hue. It may be here remarked, that feveral incidents in the Sri-Bhagavat, (a hiftory of Krifhna,) and in the Ramayana, told fimilarly of their feveral heroes, feem to mix or approximate, though perhaps fcarcely to identify, the characters of Krifhna and Rama. Each won a wife by bending an unyielding bow, not very unlike the ftory of Ulyffes. Each is defcribed as overcoming the demon Kumbakarna, and others. Krifhna defcended into hell; fo did Sita, the fakti, or energy of Rama. Both have adventures with the bear Jamba. See JAMBA, &c.

All fects and tribes, who, under the denomination of *Vaifhnavas* (which fee), worfhip Vifhnu, (bating fuch deiftical philofophers as fceptically deny the perfonal exiftence of inferior deities, attributes, or avataras, of whom fee under JAIMINI,) agree in ftating, that, with the exception of Krifhna, the potentiality of the preferving power was never exhibited in fuch plenitude as in the avatara of Rama. In popularity, and in dramatic, hiftoric, and poetic fhapes, it rivals that of Krifhna. And as one or more fects adore Krifhna as the deity himfelf, and draw rules for their religious and moral conduct from the Sri-Bhagavat; fo the fect called Ramanuj fimilarly clothe Rama in almighty attributes, and deem the Ramayana a complete body of ethics and morality. See RAMANUJ.

In the feries of incarnations of Vifhnu, called *das-avatara*, or the *ten defcents*, to diftinguifh them from others of lefs importance, the avataras of Parafu Rama and Rama Chandra are ufually placed fixth and feventh, as given under VISHNU. Sometimes Krifhna is altogether omitted; in which cafe, Bala

Bala Rama ranks as the eighth. *Mufali* is a name of the third Rama, under which word fome notice is taken of him. And of *Parufa* or *Parufha Rama*, fee under that article. The name of Rama, or perhaps more correctly of Rami, is one of the many names of Parvati, confort of Siva. The name is alfo ufed, beyond the pale of his own fectaries, in fupplication and praife. Ram-Ram is a ufual falutation, like our good morrow, between friends at meeting or parting, and is ufed by both Vaifhnavas and Saivas; and it is reverently reiterated in times, and in aid, of abftraction (fee JAP); and under the operation of feelings of enthufiafm or diftrefs.

The hiftory of the Ramas mixes itfelf with that of fo many others of Hindoo mythological perfons, that in many of our accounts of fuch perfons, &c. particulars occur refpecting them. Thofe defirous of farther notice of the Ramas are, therefore, referred, in addition, to the following articles: CEYLON, JAYA, KAHUNSILYA, LAKSHMAN, LANKA, MARUTY, RAVENA, RAMAYANA, RUNEKA, SITA, &c. from which other references point to articles on fubjects connected herewith.

RAMADA, or *New Salamanca*, in *Geography*, a town of South America, in the province of St. Martha; 90 miles E. of St. Martha. N. lat. 11° 10'. W. long. 72° 20'.

RAMADAN, a fort of lent obferved by the Mahometans, in obedience to the exprefs command of the Koran, during which they faft the whole day, from the time the new moon firft appears, till the appearance of the next new moon, with fuch extreme fuperftition, that they not only abftain from eating, drinking, and women, but dare not wafh their mouth, nor even fwallow their fpittle, from day-break till night, or fun-fet.

The men, indeed, are allowed to bathe themfelves; but it is on condition they do not plunge the head under water, left fome drops enter by the mouth or ears, &c. But as for the women they are ftrictly forbidden bathing. Some are fo cautious, that they will not open their mouth, to fpeak, left they fhould breathe the air too freely. The faft is alfo deemed void if they kifs or touch a woman. To make amends, they feaft all night till day-break; though the more rigid begin the faft again at midnight; and ufually fpend more in this month than in fix others.

The Ramadan happens at different feafons of the year; and when it is in the fummer it is very hard on the labourers. This month once in thirty-three years is in every feafon of the year, the Turkifh month being lunar, and they beginning at the day they can fee the moon; whereas the Jews begin their account from the day the moon makes, which is a day before the Turks.

The reafon given why the month of Ramadan was fixed upon for this purpofe is, that on this month the Koran was fent down from heaven. From this faft of Ramadan none are excufed, except travellers and fick perfons, under which latter denomination are included all thofe whofe health would be manifeftly injured by keeping the faft; but then they are obliged, fo foon as the impediment is removed, to faft an equal number of other days; and breaking of the faft is ordered to be expiated by giving alms to the poor.

RAMAG, a word ufed by fome of the chemical writers to exprefs afhes.

RAMAGE, a term ufed for the boughs or branches of trees. Hence,

RAMAGE-*Hawk*, or *Falcon*, one that is wild and coy, as having been long among the boughs, preying for itfelf. All falcons retain this name till they have left the aery; being fo called in May, June, July, and Auguft. Thefe are very rarely reclaimed. See BRANCHER, FALCON, and HAWKING.

RAMAGE *Velvet*. See VELVET.

RAMAGURRY, in *Geography*, a town of Hindooftan, in the Carnatic; 30 miles W. of Tritchinopoly.

RAMAH, a town of Arabia, in the province of Nedsjed; 120 miles N.W. of Jamama.

RAMAH, or *Ramalla*, *Ramola*, *Ramula*, *Ramba*, *Ruma*, or *Remphtis*, a city W. of Jerufalem, between Lydda and Joppa, according to St. Jerom; or between Joppa and Jerufalem, as modern travellers defcribe it. This is the place which Eufebius and St. Jerom took for Arimathea, the country of Jofeph. Matt. xxvii. 57.

RAMAI, in *Natural Hiftory*, a name given by many old writers to bole armenic.

RAMAK, in *Ichthyology*, a fpecies of *Sciæna*; which fee.

RAMALINGA, in *Geography*, a town of Hindooftan, in Coimbetore; 16 miles S.S.W. of Erroad.

RAMALIS VENA, a name given by fome anatomical authors to the vena portæ.

RAMANUJ, the name of a religious fect of Hindoos, of the great fubdivifion of Vaifhnava, who worfhip Vifhnu, the perfonification of the preferving power of the deity, in his incarnation of Rama. Of this fect fome worfhip Rama only, fome his fpoufe Sita, and fome both Rama and Sita conjointly. (See RAMA.) Among the Ramanuj none are addicted to the indecent, or left-handed, mode of worfhip noticed under the article RADHA as difgracing her votaries. (See farther under SAKTA, and SECTS *of Hindoos*.) The different fects of Hindoos are diftinguifhable by a variety of marks on their foreheads; of which a great many are reprefented in the fecond plate, with copious explanations in page 404, of the Hindu Pantheon. The fect of Ramanuj are known by a double upright white line on the forehead, with a red line between, or fometimes a circlet or dot. Sometimes the lines are red and the circlet black.

RAMAS, CAPE, in *Geography*, a cape on the W. coaft of Hindooftan; 21 miles S. of Goa.

RAMASSERAM, a town of Hindooftan, in the circar of Rajamundry; 35 miles S.S.E. of Rajamundry.

RAMAYANA, the title of a poem in the Sanfcrit language, of great celebrity in India, and regarded as facred by fome fects of Hindoos, and greatly venerated by all. Its fubject is the exploits of three perfons named Rama; but more efpecially the wars conducted by one of them, named Rama Chandra, for the conqueft of Lanka or Ceylon, from its powerful fovereign Ravena, or rather, indeed, for the refcue of his wife from the hands of that tyrant. It is comprifed in feven kandas, or books, containing 24,000 fhlokas, or metrical ftanzas; named thus: 1. Adi-kanda, containing 64 fections, and 2850 ftanzas; 2. Ayodhya-kanda, 80 fections, and 4170 ftanzas; 3. Aranyaka-kanda, 114 fections, and 4150 ftanzas; 4. Kefhkinda-kanda, 64 fections, 2925 ftanzas; 5. Sundara-kanda, 43 fections, 2045 ftanzas; 6. Yudha-kanda, 105 fections, 4500 ftanzas; 7. Uttara-kanda, 90 fections, 3360 ftanzas. The Ramayana may be called an epic poem, as it is on one continued, interefting, and heroic action. It is fecond in celebrity only to the Mahabarat, and perhaps fuperior to it in reputation for holinefs. (See MAHABARAT.) We have the authority of fir William Jones for faying, that this great epic poem, in unity of action, magnificence of imagery, and elegance of diction, far furpaffes the elaborate work of Nonnus, in forty-eight books, entitled Dionyfiaca; and for believing that the heroes of the poems Rama (patronimically diftinguifhed by the name of Dafrat Rama) and Dionyfos are the fame.

A curious parallel might be drawn between the manners and customs described in these two works, the Dionysiaca and Ramayana. The processions and rites detailed in the former seem descriptive, with a little licence for poetical embellishment, of those in usage to this day in India. Some of these Bacchic orgia are noticed under our articles DIONYSIA and NONNUS; which see. A keen etymologist would find innumerable lingual coincidencies; and, in truth, many of the names of persons, Bacchus and Dionysos, and of places, as well as original persons, seem soberly traceable to the sacred language and rites of the Brahmans.

So highly is the Ramayana venerated, that the fourth class of Hindoos, the Sudra, is not permitted to read it. At the end of the first book, a promise is made of great benefit to any individual of the three first classes or tribes who shall duly read it. "A Brahman, reading it, acquires learning and eloquence; a Kshetriya will become a monarch; a Vaisya will obtain vast commercial profits; and a Sudra, *hearing* it, will become great." Of these distinctions of tribes or classes, the reader will find due notice under SECTS *of Hindoos*. Under RAMA we have stated that his name reiterated is used by several sects as a sort of salutation, or benediction. The author of the Ramayana, in the vanity of playful egotism, which, from its frequency with oriental poets, has ceased to seem assuming, calls on his readers to "salute Valmiky, the kukila (cuckoo), who, mounted on the branch of poesy, sounds the delightful note of Rām-Rām."

It has been surmised that the Ramayana, like the Mahabarat, is allegorical, so far as relates to personal adventures; which, in both cases, are mere machinery for the introduction of a concealed system of philosophy and ethics: in the first instance the allegory is *physical*, in the latter *moral*. Under the article MAHABARAT the allegorical nature of that extraordinary poem is sufficiently shewn. The Kurus and Pandus, the heroes of that poem (see KURU and PANDU), are personifications of virtues and vices. The Ramayana and the Dionysiaca relate how their respective Indian conquerors led armies of satyrs. (See hereon under MARUTY and RAMA.) These satyrs, or monkies, we apprehend to be personifications of winds, or gazeous metaphors. In the Ramayana we find the machinery to consist of the sun and planets, fire, the firmament, wind, water, &c. personified in the gods or regents of those bodies, elements, &c. It has been farther surmised, that whenever these two extraordinary poems, the Mahabarat and Ramayana, shall appear in English, and their allegories be more fully examined, it may possibly be found, that not only the three Ramas will melt into one, but that all will amalgamate with Krishna. Some objections to the identity of the Ramas have been offered of a chronological nature. Parasu Rama, it is contended, reigned or flourished eight generations before Rama Chandra. Their poetical identity, however, is sufficiently established; and one can scarcely bring such a tissue of allegory, incarnations, and whimsical adventures, to the test of sober historical and chronological accuracy. Persons of these names may have reigned or flourished at any given period, for they have always been very common, and are so still.

The Ramayana is so replete with incident, that it is scarcely possible to give any analysis of its subject with sufficient brevity for this work. Unity of action is, however, its characteristic, namely, the recovery of Sita from the hands of her ravisher Ravena, the gigantic tyrant of Ceylon. It may be noticed in passing, that the Ramayana, like the Iliad, is founded on a rape, and that Sita is the Helen of the Hindoo epic. (See SITA.) So inseparably intermixed are the varied subjects of the Hindoo mythological history, that the discussion of one necessarily brings another under notice. This is the cause of such frequent references to and from the articles under which we have endeavoured to give a succinct account of such a number of subjects of that description, distinct apparently, but in reality connected, and often confounded with each other. On the subject of this article, the Ramayana, or for quotations from it, we may therefore refer to the following, among others: CEYLON, LAKSHMI, LANKA, MANTRA, PARASU RAMA, MENAKA, RAVENA, RHEMBA, in addition to those pointed to in earlier passages of this article, and in those articles just named.

What precedes, referring to the poem bearing the title of this article, is offered respecting the Ramayana of Valmiki. There are many other poems of the same name in Sanscrit, Prakrit, Hindvi, and many other Hindoo dialects; as well as in Arabic, Persian, Malayan, and others derived from the like source. These are of course of unequal celebrity and merit; and acknowledged to be greatly distant from Valmiki's divine poem. Even of this it may be said, that the style is frequently flat and diffuse, deficient in ornament, and abundant in repetitions. As well as Valmiki's work, several others, under the same title, are usually considered with more respect than mere profane poems. One is ascribed to Vyasa, the reputed author or compiler of the *Vedas* and *Puranas*. (See those articles.) A considerable portion of several of the latter mythological romances is occupied by the same subject, to wit, the adventures of Rama; but in the Vedas no mention is made of this person, except, indeed, in some detached parts, reasonably suspected to have been interpolated by zealous sectaries. The titles even of the philosophical and profane poems, commentaries, &c. that in divers languages owe their origin to the Ramayana, would require a catalogue of no inconsiderable extent to contain them. Among these are included many dramatic works. The quotations from, and allusions to its mythological personages and fables, in the works of the minor poets, are incessant; and upon the whole, there is no subject, perhaps, in the whole range of Hindoo mythology, or history, so often in the minds and mouths of that race of all ranks and sects, as the story of the Ramayana in some of its bearings. That of Krishna rivals it in popularity. Both are chanted by itinerant bards, who illustrate their subjects by exhibiting a series of pictures from the Ramayana and Mahabarat. Women singers frequently accompany these eastern troubadours, who are commonly met with in every city, camp, and town of India.

RAMAZZINI, BERNARDIN, in *Biography*, an Italian physician of distinction, was born at Carpi, near Modena, in 1633, where his father was a respectable citizen. Having received a classical education from the Jesuits at his native town, he went to Parma for the study of philosophy at the age of 19, undecided what profession to adopt: at the end of three years he selected that of physic, and received the degree of doctor at Parma in the beginning of 1659. He then repaired to Rome for the completion of his studies, and settled in practice in the duchy of Castro. He was soon obliged by ill health, however, to return to his native air; and, on his recovery, he married, and pursued his profession at Carpi. Finding his reputation increasing, he removed to Modena, at the solicitation of some friends, in 1671, where he met with merited success, and excited the jealousies of his brethren. In 1682 he was appointed professor of the theory of medicine in the university, which had been recently established at Modena, by duke Francis II.; and he continued to fill this office for eighteen years, attending at the same time to practice, and not neglecting the cultivation of polite literature, to which he was particularly partial. The elegance

elegance of his Latin ſtyle in his writings, evinces the ſucceſs with which he purſued the ſtudy of the claſſics. In 1700 he was invited to a profeſſorſhip at the more diſtinguiſhed univerſity of Padua, and removed thither. Though ſomewhat advanced in age, he fulfilled the duties of his chair with an ardour, not to be ſurpaſſed by his junior colleagues, for the ſpace of three years, when he was attacked with a diſeaſe of the eyes, which threatened to deſtroy his viſion, and which, in fact, did ultimately deprive him of that faculty. Having loſt the pleaſure of reading, which was the only ſource of his regret, he ſupplied that amuſement by the aſſiſtance of his grand-children, who read to him, and acted as his amanuenſes. In 1708, however, the ſenate of Venice appointed him preſident of the college of phyſicians of that capital, and in the following year raiſed him to the firſt profeſſorſhip of the practice of medicine. He continued to perform the duties of theſe honourable poſts, at the earneſt ſolicitations of his conſtituents and pupils, with great diligence, to the end of his life, and died on his birth-day, November 5th, 1714, in conſequence of an attack of apoplexy, which ſeized him while he was preparing for his lectures, at the age of 81.

Ramazzini was a member of ſeveral of the academies of ſcience eſtabliſhed in Germany, Berlin, &c., and left ſeveral works; the principal of which, and one which will ever be held in eſtimation, is his treatiſe on the diſeaſes of artiſts and manufacturers, entitled "De Morbis Artificum Diatriba," firſt publiſhed in 1700, and frequently reprinted. He alſo publiſhed ſome tracts relative to certain epidemics, both among men and cattle; ſome "Ephemerides Barometricæ;" a work on the abuſe of Peruvian bark; and ſeveral orations delivered in his profeſſorial capacity. All his works have been collected and publiſhed together at Padua, Geneva, London, and Naples; the edition of London is the moſt correct. Eloy Dict. Hiſt. de la Med. Hutchinſon's Biog. Med.

RAMBANG, in *Geography*. See REMBANG.

RAMBERVILLER, or REMBERVILLEE, a town of France, in the department of the Voſges, and chief place of a canton, in the diſtrict of Epinal; 19 miles E. of Merecourt. The place contains 4926, and the canton 14,014 inhabitants, on a territory of 317½ kiliometres, in 28 communes. N. lat. 43° 21′. E. long. 6° 43′.

RAMBIN, a town of Anterior Pomerania; 10 miles W.S.W. of Bergen.

RAMBLE, a town of Spain, in the province of Cordova; ſeven miles N.W. of Montella.—Alſo, a town on the W. coaſt of the iſland of Teneriffe; three miles W. of Laguna.

RAMBOUILLET, a town of France, in the department of the Seine and Oiſe, and chief place of a canton, in the diſtrict of Verſailles, the ſeat of a tribunal, and of a national farm, where the ſheep are much celebrated for the fineneſs of their wool; 27 miles S.W. of Paris. The place contains 2586, and the canton 9652 inhabitants, on a territory of 305 kiliometres, in 17 communes. N. lat. 48° 39′. E. long. 1° 54′.

RAMBURE, a town of France, in the department of the Somme; 3 miles W. of Oiſemont.

RAMBURELLES, a town of France, in the department of the Somme; 9 miles S. of Abbeville.

RAMCHUND-POUR, a town of Bengal; 30 miles N.E. of Calcutta.

RAMCHUNDRA, a town of Hindooſtan, in the circar of Mohurbunge; 23 miles S.S.E. of Harriopour.

RAMCHUNPOUR, a town of Bengal; 60 miles N. of Dacca.

RAMCOTTA, a town of Thibet; 18 miles S.W. of Sirinagur.

RAMCOUTY, a town of Hindooſtan, in Bahar; 28 miles N.E. of Goorackpour. N. lat. 26° 51′. E. long. 84° 8′.

RAMDILLY, a town of Hindooſtan, in the Nayrs; 25 miles N.N.W. of Tellicherry.

RAMEAU, JOHN PHILIP, in *Biography*, chevalier de St. Michel, compoſer to the king of France, and to l'Academie Royale de la Muſique, or ſerious opera at Paris, was born at Dijon in 1683. He went early in his life to Italy, and at his return was appointed organiſt at Clermont en Auvergne, where his "Traité de la Muſique" was written, in 1722. He was afterwards elected organiſt of St. Croix de la Bretonnerie at Paris. Here his time was chiefly employed in teaching; however, he publiſhed harpſichord leſſons, and ſeveral other theoretical works, without diſtinguiſhing himſelf much as a vocal compoſer, till the year 1733, when, at fifty years of age, he produced his firſt opera of "Hippolite et Aricie." The muſic of this drama excited profeſſional envy and national diſcord. Party rage was now as violent between the admirers of Lulli and Rameau, as in England between the friends of Bononcini and Handel, or, in modern times, at Paris, between the Gluckiſts and the Piccíniſts.

When the French, during the laſt century, were ſo contented with the muſic of Lulli, it was nearly as good as that of other countries, and better patronized and ſupported by the moſt ſplendid prince in Europe. But this nation, ſo frequently accuſed of more volatility and caprice than their neighbours, have manifeſted a ſteady perſevering conſtancy in their muſic, which the ſtrongeſt ridicule and contempt of other nations could never vanquiſh.

Rameau only anſwered his antagoniſts by new productions, which were ſtill more ſucceſsful; and, at length, he was acknowledged by his countrymen to be not only ſuperior to all competition at Paris, but ſole monarch of the muſical world. From 1733 to 1760 he compoſed twenty-one operas, of which the names and dates are annually publiſhed in the "Spectacles de Paris," and in many other periodical works.

Rameau's ſtyle of compoſition, which continued in favour almoſt unmoleſted for upwards of forty years, though formed upon that of Lulli, is more rich in harmony, and varied in melody. The *genre*, however diſpleaſing to all ears but thoſe of France, which had been nurſed in it, was carried by the learning and genius of Rameau to its acme of perfection; and when that is achieved in any ſtyle, it becomes the buſineſs of ſubſequent compoſers to invent or adopt another, in which ſomething is ſtill left to be done, beſides ſervile imitation.

The opera of "Caſtor and Pollux" having been long regarded in France as the maſter-piece of this compoſer, we ſhall here inſert a few remarks upon it, that have been made on a recent examination.

The overture is the beſt of this author, upon Lulli's plan. The opening ſymphony is beautiful; but why the ſame melody was not applied, in the ſame meaſure, to the poetry, we know not, unleſs the verſification required a change of time; but, in that caſe, why write the ſymphony on a ſubject that would not ſuit the words? But thoſe eternal changes in the meaſure, which teaze and diſappoint the ear of all that are uſed to other muſic, is general in ſerious French operas, and ſeems as much the fault of the poet as muſician. It is, however, wonderful, that this defect was not ſooner diſcovered. The over-charged tenderneſs of Rameau's muſic appears in all his ſlow movements, which are in one ſtyle, and generally in triple time. This maſter perpetually

tually discovers himself to be a great harmonist; but inured to a bad taste and style of composition, as well as to bad singing, he has only augmented the defects of his predecessors, and rendered what was rude and clumsy in Lulli still more offensive, by endeavours at sweetness or high seasoning. The appoggiaturas, or leaning notes, being so frequently incorporated in the harmony, renders it crude, and the hanging on every note, as if unwilling to relinquish it, checks and impedes the motion of the air, and gives it a slow and languid effect, however lively the theme on which it is composed. Every passage in such melody resembles a French heroic verse:

> "Each is an *Alexandrine*, through the song,
> That, like a wounded snake, drags its slow length along."

The opening of the second act, "Que tout gemisse," is very fine, and the pathos well applied; but the subsequent air, which is cast in an admirable mould, is spoiled by frequent and unnecessary changes of measure; and yet in spite of these defects, and the vocal outrages of mademoiselle Arnould, we were more pleased and affected by this scene, than any other we ever heard at the French serious opera. The march, which has few appoggiaturas in it, is like other Christian music.

The *prelude tendre*, at the opening of the third act, abounds with too many of these drags, which being equally harsh to the ear and injurious to pulsation, seem to prevent the performer from ever falling on his feet; and bar eleventh, the chord of the superfluous fifth, which makes all nature shudder, except our Gallic neighbours, is here continued so long, that it distorts the countenance of every other hearer, like *hiera picra*. The major minuet, page 121, after so long and tiresome a minority, is rich in harmony and graceful in melody. The voice is worse used by the composer than the most insignificant instrument. For after several symphonies that are extremely promising, and the ear has been made to expect a continuation of the prefatory strain, nothing is given to the vocal part but broken accents and dislocated measures. In the *chaconne*, which is admirable, the measure is well marked and well accented. This must long have preceded Jomelli's favourite chaconne, and have served as a model to him, Theller, and others, in composing this species of dance. More genius and invention appear in the dances of Rameau than elsewhere, because in them, there is a necessity for motion, measure, and symmetry of phrase. And it may with truth be said, that nothing in Lulli's operas was imitated or adopted by the rest of Europe, but the style of his overtures, or in Rameau's, but the dances.

But though the several merits of this musician have been too much magnified by partizans and patriots in France, and too much depreciated by the abettors of other systems and other styles, as well as patriots of other countries, yet Rameau was a great man; nor can the professor of any art or science mount to the summit of fame, and be elected by his countrymen supreme dictator in his particular faculty, without a large portion of genius and abilities.

The successful revival of his opera of "Castor and Pollux" in 1754, after the victory obtained by his friends over the Italian burletta singers who had raised such disturbance by their performance of Pergolesi's intermezzo, the "Serva Padrona," was regarded as the most glorious event of his life. The partizans for the national honour could never hear it often enough. "This beautiful opera," says M. de la Borde, "without any diminution in the applause or pleasure of the audience, supported a hundred representations, charming at once the soul, heart, mind, eyes, ears, and imagination of all Paris."

From this era to the time of his death, in 1767, at eighty-four years of age, Rameau's glory was complete. The Royal Academy of Music, who all regarded themselves as his children, performed a solemn service in the church of the Oratory, at his funeral. And M. Philidor had a mass performed at the church of the Carmelites, in honour of a man whose talents he so much revered. See Base, Basse *Fondamentale*, and Counterpoint.

RAMED, a name given by some chemical writers to rhubarb.

RAMEDEGA, in *Geography*, a town of Hindoostan, in the circar of Gangpour; 15 miles S.W. of Pada.

RAMEE, a town of Bengal; 50 miles S. of Islamabad.

RAMEEAPATAM, a town of Hindoostan, in the Carnatic; 30 miles S. of Ongole.

RAMEEPOUR, a town of Hindoostan, in Allahabad; 35 miles E.N.E. of Gazypour.

RAMELLI, Agostino, in *Biography*, a celebrated Italian mechanist and engineer, was born, in 1530, at Masanzana, in the diocese of Milan. Having entered the army, he served a considerable time under the marquis de Marignano, a general of Charles V. After this, he served under the duke of Anjou as captain, or engineer, at the siege of Rochelle, in 1573, where he was dangerously wounded, and taken prisoner. When that prince, afterwards Henry III., was called to the crown of Poland, he was the friend of Ramelli, and he nominated him his engineer when on the throne of France. In 1588 he published a work in Italian and French, entitled "Le Diverse et Artificiose Machine del Capitono Agostino Ramelli," &c. with nearly 200 figures, describing a great number of machines for various purposes, most of his own invention, and which exhibit much ingenious contrivance. The work is very scarce, and is much prized by the curious.

RAMELSPACH, in *Geography*, a town of Austria; 5 miles S.E. of Meissai.

RAMELTON, or Rathmelton, a small post-town of the county of Donegal, Ireland, situated on a bay at the bottom of lough Swilly. It is 117 miles N.W. by N. from Dublin.

RAMENAPILLY, a town of Hindoostan, in the circar of Rajamundry; 42 miles E. of Rajamundry.

RAMENTUM, in *Botany*, a form of pubescence in plants, which, as the name signifies, has the appearance of a shaving, being flat, membranous, mostly irregular in size and shape, quite unlike the uniform hairs or bristles of which the clothing of most plants consists. (See Pubescence.) The above term was first used, if we recollect rightly, by l'Heritier, and occurs in some species of *Begonia*. The scaliness of Ferns is of a similar nature.

RAMERUP, in *Geography*, a town of France, in the department of the Aube, and chief place of a canton, in the district of Arcis-sur-Aube; 6 miles E. of Arcis-sur-Aube. The place contains 493, and the canton 8870 inhabitants, on a territory of 440 kiliometres, in 29 communes.

RAMESAN, an oriental term for a month of fasting, very religiously observed among the Turks, and otherwise called *Ramadan*; which see.

RAMESERAM, in *Geography*, a town of Hindoostan, in the circar of Cuddapa; 6 miles E. of Gandicotta.

RAMETTA, a town of Sicily, in the valley of Demona; 6 miles W. of Messina.

RAMEX, (*ramus*, a branch,) in *Surgery*, a rupture, or hernia. See HERNIA.

RAMEX *Varicosus*. See CIRSOCELE.

RAMGAD, in *Geography*, a town of Hindooftan, in Bahar; 10 miles W. of Bahar.

RAMGARY, a town of Hindooftan, in the country of the Nayrs; 19 miles W.N.W. of Palicaudchery.

RAMGAUT, a town of Hindooftan, in the fubah of Delhi; 37 miles S.E. of Secundara.

RAM-GETTER, in *Rural Economy*, a term applied by the midland breeders to fuch rams as are proper for getting ram-ftock, in contradiftinction to fuch as are fit only for getting wedder-ftock. See RAM.

RAMGONGA, in *Geography*, a river of Afia, which rifes in Thibet, and runs into the Ganges, 10 miles N. of Canoge.

RAMGOT, a town of Hindooftan, in Conean; 25 miles N. of Goa.

RAMGUR, a circar of Bengal, bounded on the N. by Bahar, on the N.E. by Curruckdeagh, on the S.E. by Pachete, on the S. by Nagpour, and on the W. by Koonda and Toree; about 90 miles long, and 60 broad.—Alfo, the capital of this circar; 175 miles W.N.W. of Calcutta. N. lat. 23° 40′. E. long. 83° 42′.—Alfo, a town of Hindooftan, in Dowlatabad; 35 miles S. of Neermul. N. lat. 18° 30′. E. long. 79° 11′.—Alfo, a town of Hindooftan, in Malwa; 8 miles S. of Ragoopour.—Alfo, a town of Hindooftan, in the fubah of Delhi; 5 miles N. of Coel.—Alfo, a town of Hindooftan, in Guzerat; 50 miles E.S.E. of Surat.—Alfo, a town of Bengal; 13 miles N.W. of Midnapour.

RAMGUR. See SESVAH.

RAMGURRA, a town of Hindooftan, in the Myfore, captured by the Englifh in 1791; 42 miles N.E. of Seringapatam.

RAMHYTTE, a town of Sweden, in Weftmanland; 36 miles from Stromfholm.

RAMI, in *Hindoo Mythology*, one of the many names of the goddefs *Parvati*; which fee. Under this name fhe is faid to be worfhipped at the fplendid temple on the ifland called Ramiferam, between Ceylon and the cape named by us Comorin, but which fhould be called cape Kaumari, or Kumari, another of the names of this goddefs, and meaning the virgin. (On this point fee LANKA and PARVATI.) Sami is the name of a tree or wood facred to Parvati, and fhe is fometimes called Sami Rami, and it has been upheld that this is the origin of the Semiramis of the Greeks, (See hereon Af. Ref. vol. iv. p. 382. vol. viii. p. 256. 8vo. ed.) A defcription of the celebrated temple of Ramiferam will be found under that article. See alfo SAMI.

RAMJAVENPOUR, in *Geography*, a fort of Bengal; 27 miles S.S.W. of Burdwan.

RAMIFICATION, the production of boughs or branches, or of figures refembling branches.

RAMIFICATIONS, in *Anatomy*, are the divifions of the arteries, veins, and nerves, arifing from fome common trunk.

RAMIGRI, a word ufed by fome writers as a name for colophony.

RAMILLIES, in *Geography*, a village of France, in the department of the Sambre and Meufe, at the fource of the river Geete; worthy of being recorded on account of a battle fought here in the year 1706, between the allies commanded by the duke of Marlborough, and the French under marfhal Villeroy. The confederates took the whole of the enemy's baggage and artillery, and about 120 ftandards, 600 officers, and 6000 private foldiers: about 8000 were killed or wounded. The lofs of the allies did not exceed 3000 men; 13 miles N. of Namur.

RAMING, a town of Auftria; 11 miles S. of Steyr.—Alfo, a town of Perfia, in the province of Irak; 40 miles E. of Confar.

RAMINGAM, a town of Hindooftan, in Dowlatabad; 10 miles N. of Oudigher.

RAMINGSDORF, a town of Auftria; two miles E. of Steyr.

RAMINGUE, in the *Manege*. A horfe gets this name that is reftive, and refifts or cleaves to the fpurs; that is, defends himfelf with malice againft the fpurs; fometimes doubles the reins, and frequently yerks to favour his difobedience. See TICKLISH and DOUBLE.

RAMIS, BARTOLOMEO, in *Biography*, a Spaniard, the firft modern who fuftained the neceffity of a temperament in mufical inftruments, of which the tones are fixed. He was contemporary with Franchinus, and in 1482 publifhed a work, entitled "De Mufica, Tractatus, five Mufica practica."

He feems to have converted Pietro Aaron to his opinion: as that theorift manifeftly exalts the character of Ramis on all occafions at the expence of Franchinus.

The Spaniard was attacked in a rough manner by Nicholas Burtius, for differing from Guido in his divifion of the monochord, in a tract entitled "Mufices Opufculum cum Defenf. Guidonis Aretini adverfus quendam Hifpanum veritatis prævaricator." Bonon. 1487. This tract, printed in black letter, is in the Afhmol. Collect. among the books of Ant. Wood.

Burtius imagined the honour of Guido to be injured by the Spaniard, as Guido ufed the Pythagorean proportions, and had never thought of a temperament. Burtius, in his turn, was handled very roughly by Spataro, the difciple of Ramis (Joannes Spadarius Bononienfis, Mufices ac Bartolomii Rami Paulo ejus Præceptoris honefta Defenfio in Nicol. Burtij Parmenf. Opufc. Bologna, 1491.); and the venerable Franchinus, finding himfelf very rudely handled in the difpute by the favourers of temperament, in 1522, when he was upwards of feventy years of age, took up the defence of Pythagoras, as Fontenelle, at near a hundred, did of Des Cartes. After this, the war became general, and continued to rage with great violence for more than a century, between the friends of tempered fcales, and the adherents to ancient proportions and equal harmony.

RAMISERAM, in *Geography*, an ifland in the Indian fea, between the ifland of Ceylon and the coaft of Coromandel; to which there is a paffage of about 12 or 14 leagues from the ifland of Manaar, on the coaft of Ceylon. But the advantages that might be derived from this fpeedy communication are in a great meafure prevented by the numberlefs fhallows and fand-banks, which every where interrupt the paffage, and which are fo high, that many of them are dry except during the monfoons. There is in particular a line of fand-banks, which runs quite acrofs from Manaar to Ramiferam, denominated Adam's bridge, and alfo Rama's bridge, becaufe God is faid to have come by this way into Ceylon. (See ADAM's *Bridge* and MANAAR.) From Rama, Ramiferam takes its name, and it has a large temple dedicated to him. The fhortnefs of the paffage from Ramiferam to Manaar is particularly ufeful on account of the fpeedy conveyance it affords to people on bufinefs, and the communication of intelligence. The meffengers who ufually go from Columbo to Manaar, a diftance of 160 miles, in three days, take boat here, and crofs over by Adam's bridge to Ramiferam, and then proceed along the Coromandel coaft to Madras. An exprefs in favourable weather will run from Columbo to Madras in eight days, and the journey has been accomplifhed once in feven days. (See MANAAR.) The ifle of Ramiferam, which is the limit of the Hindoo religion in more modern times, and of the conquefts of the Muffulman princes, is, as we have faid, feparated from Ceylon by Adam's bridge. The ifland is low, fandy, and uncultivated, except with a few fcattered Palmira and cocoa-trees. The pagodas, for which it is fo famous, lie on the Ceylon fide, near the fea, and are the refort of innumerable multitudes of different fects of religion in India, during the feafon of certain feftivals. The numerous pagodas are conftructed in the fame ftile with thofe on the Coromandel coaft; and they are furrounded with the houfes of the brahmins, priefts, and other religious perfons, whofe zeal leads them to attend on their temples; among whom, in particular, may be feen the defcendants of the Tamuls, Telingas, Canarians, Mahrattas, and Orias, who compofe a great body of the original inhabitants of the fouthern peninfula. Their houfes are built of the cocoa-tree, in fmall fquares and ftreets, where their families are feen reclining on the little mud terraces, and under the payals or virandahs. They do not allow Europeans to enter thefe temples; but they are known to refemble thofe of the coaft in their crowded ornaments, fpires of brickwork, long porches in front, and viftas, at the extreme end of which are placed the deities, in an obfcure fituation, furrounded by lamps burning day and night. The fame referve to ftrangers fubfifts among all the fouthern brahmins. The brahmins allow no labour or cultivation to be carried on in the ifland of Ramiferam, confidering it altogether as facred. The contributions of thofe who vifit it are fufficient for the fupport of the temples. Several of the neighbouring Poligar chiefs contribute largely, and fome of thefe rajahs have ftatues erected to them for their gifts. The chief pagoda has feveral of thefe ftatues in its different fquares. Low as the fand lies in this ifland, good water is eafily procured; for on fcooping it up, the water collects immediately in the holes; but this is not the cafe in Manaar and the weft coaft of Ceylon.

The guardianfhip of this facred ifle belongs to a family of devotees, called "Byragees," the chief of whom is always doomed to celibacy: the fucceffion being carried on by the fifters or the collateral branch, who only are permitted to marry. This inftitution is fimilar to that of the fovereignty of the Travancorians and Nairs of the Malabar coaft. The clothes and turbans of the devotees are of a tawny red colour, decorated with large black beads, of a particular kind of wood. From the pagodas juft mentioned there runs out a long narrow piece of fand, terminating in a point, within a mile of which is a choultry at Tona Goody. This is a fquare of houfes with a court inclofed for the accommodation of pilgrims, who come to the fartheft point of the ifland to perform their ablutions in the fea, the moft facred and the pureft of their ceremonies. A brahmin takes care of this choultry, and a pole with a light is fixed at the end of the point to direct the pilgrim. N. lat. 9° 18′. E. long. 79° 22′. Percival's Ceylon.

Of the temple in this ifland we fhall give fome account, extracted from a publication of Mr. Cordiner, who vifited it. The external appearance is not remarkably grand, and at a diftance, no idea is excited of the minute ornaments and laboured workmanfhip which ftrike the eye on a nearer infpection. All the architecture feen without doors is infignificant, compared with the magnificence of the interior. After an examination of the whole ftructure, which is entirely of hewn ftone, Mr. C. deemed the extent of mafonic labour in its erection, muft have been equal to that of any of the moft fplendid cathedrals of Europe. "On entering it we were," he fays, "completely aftonifhed at the grandeur of the workmanfhip, and extent of the dimenfions, which far furpaffed any idea that we had formed of Indian magnificence." From the weft gate a low gallery, 144 feet in length, with three rows of pillars on each fide, leads down to the centre of the building; where it branches off, in galleries fimilarly conftructed, to the right and left, each extending 150 feet, then running from weft to eaft 500 feet, and enclofing an oblong rectangular fpace. The gallery runs alfo along the centre of the temple 788 feet, and a fimilar gallery runs acrofs from north to fouth, where are like entrances, interfecting the former in the centre of the rectangular fpace. All the galleries have on each fide triple rows of maffy ftone pillars, of highly laboured workmanfhip. Thofe in the front line are the largeft and moft fuperb, having a huge lion, with the mouth wide open, fculptured in bas relief, above three diftinct capitals, over which are a fcroll, and a richly ornamented cornice. Statues of the fize of life are attached to many of the pillars, reprefenting gods and deified perfons. The pillars ftand on a continued bafement, forming the floor of the galleries, raifed three feet, with fteps to afcend by, all of ftone. The roofs of all the galleries are flat, formed of ftones reaching acrofs, from the projection of one cornice to that of the other. The galleries are eighteen feet wide, and in the centre thirty feet high from the floor. The number of pillars within the temple amounts to 2628. The edifice is inclofed by a heavy ftone wall, 20 feet high, 830 feet from eaft to weft, and 625 from north to fouth. Large as thefe dimenfions may appear, they are ftated to be but fmall compared with thofe of temples on the continent of India, one of which covers a fquare mile of ground. The covered gallery, fronting the fouth gate, which feems unfinifhed, ftrikingly refembles the entrance of the Elephanta cavern, near Bombay. Solid pyramidal erections furmount the weftern and eaftern entrances, compofed externally of a great number of fmall pillars, two and two, in the form of window frames or gateways, rifing one above another, in feven different ftories. That over the weftern, which is the principal entrance, appears to be 150 feet high; the eaftern feems lower, and unfinifhed. The north and fouth gates are lefs majeftic than the others; but their completion is faid to be intended, when they will be fimilarly furmounted and ornamented as the weftern portal. Privileged perfons, among whom were women carrying water-pitchers, appeared conftantly paffing and re-paffing about the interior of the temple.

Two hundred Brahmins are attached to this temple, and fupported in eafe and luxury by its endowments. It is dedicated to Siva, the deftroying power, called by the vulgar Rama Lingam. It contains likewife, Mr. Cordiner fays, images of Vifhnu the preferver, and of all the fubordinate divinities. Of Brahma, the creator, he ftates, the Hindoos never dare to form any likenefs. This is a common error, that is explained and corrected in the article IDOLATRY of this work.

A broad ftreet runs parallel to each fide of the temple compofed of comfortable houfes, and large choultries for the accommodation of pilgrims and travellers, of ftone, with flat roofs fupported in front by pillars; the fronts being open. In one of thefe Mr. Cordiner obferved two ivory palankeens inlaid with gold, the property of officers belonging to the fanctuary. In others he noticed five carriages, called by the Englifh Swamy coaches, ufed for the purpofes of carrying the idols in proceffion: the ufe to which the ivory palankeens are, we apprehend, alfo applied.

Thefe

These carriages are described as solid masses of wood, of a pyramidal shape, intended to symbolize the Linga. (See LINGA.) The exterior of these coaches are covered with grossly obscene carving.

At the external corners of the temple, and in the streets of the town, there are smaller temples in honour of different deities, and containing images. In some of the streets spreading trees, among them the ficus religiosa and tamarind, are surrounded with square stone terraces, on which are placed little images of Pollear or Ganesa, (see POLLEAR,) the Linga, two serpents entwined, and other emblems of Hindoo mythology. These terraces are used for contemplation, or more active religious duties, as noticed under the article PRADAKSHNA. Rows of fruit-trees, among them the cocoa-nut, plantain, and pomegranate, stand in gardens beyond the north and south walls of the temple.

On the opposite side of the island, near the sea, distant about eight miles from the temple, is the ancient fort and choultry of Pombom. The road between is very elegantly paved with smooth stones, each six feet by four; and the greater part of the road is nobly shaded by the most beautiful and majestic trees. The larger trees of this superb avenue are surrounded by smooth raised terraces of masonry, on which travellers rest in comfort, completely shaded. About half way between the grand temple and Pombom is a very elegant small temple, built on the same general plan with the larger, having two massy towers raised in the centre of the oblong area, and a covered walk, with three rows of pillars on each side, all round. The outside of the towers is completely covered with statues in miniature, representing all the variety of their mythological divinities. The choultry, for the accommodation of pilgrims and travellers at Pombom, has two fronts, and three inclosed squares; and is surrounded by piazzas raised several feet, with square pillars and terraced roofs. Contiguous is a small temple, the door of which was open, displaying an image of Ganesa or Pollear, in the usual form, elephant-headed and pot-bellied, ornamented with necklaces of flowers.

There are several other elegant temples on this interesting island, which is entirely dedicated to the purposes of religion. No plough is allowed to break the soil, and no animal, wild or tame, is ever killed on it.

Dancing girls, mountebanks, and beggars, abound here, as in other resorts of the idle and wealthy.

The small remains of antiquity still extant on Ceylon, sufficiently prove that similar religious institutions did once exist there, and that choultries and temples were erected at the different stages, all the way from Manaar through the island, 200 miles, to Dondra, its southern extremity, and the ultimate extent of Hindoo pilgrimage. At the latter place, the ruins of a temple dedicated to Siva are still to be recognized; but only some rows of scattered pillars, and a few remnants of broken images, have survived the fanatic fury of the early European invaders. Rama's peaceful island falling under the protection of a more liberal and enlightened government, fortunately escaped those religious tempests, which spread destruction round the coasts of Ceylon.

Lord Valentia has more recently visited this interesting scene, and Mr. Salt, who accompanied his lordship, has published a very elegant view of the temple. The entrance is described to be through a gateway, about 100 feet high, covered with carved work to the summit. The door is 40 feet high, composed of single stones placed perpendicularly, with others crossing. This massive workmanship reminded lord Valentia of the ruins of Egyptian architecture. He describes the quadrangle to be about 600 feet each side, and says that, on the whole, this temple is the finest piece of architecture that he had seen in the east. Words, he says, cannot describe its magnificence. The concourse of pilgrims is very great, and brings in a large sum; each paying according to his rank. The raja of Tanjore had been expected the year before, but could not afford it; as in presents and various expences, it was estimated that his highness could not have performed this act of devotion under 60,000 pagodas, about 25,000*l.* sterling. His whole family would of course have expected to participate in the happiness and benefits of the pilgrimage. The idol uses no water but what is brought from the Ganges by fakirs: with this it is bathed every morning; and this holy water, thus acquiring additional sanctity, is sought and purchased by the devout for sin-expelling purposes.

RAMISTS, in the *History of Learning*, the disciples of Peter Ramus, who was born in a small village in Picardy, in 1515, and from being a servant in the college of Navarre at Paris, became, by his talents, industry, and perseverance, one of the most famous professors of the sixteenth century. By attacking the authority of Aristotle, and attempting to substitute in the place of his logic a method of reasoning better adapted to the use of rhetoric and improvement of eloquence, he excited a terrible uproar in the Gallic schools; so that the two first books he published, *viz.* his "Institutiones Dialecticæ," and "Aristotelicæ Animadversiones," were prohibited through the kingdom of France, and the author prohibited from any more teaching philosophy. His enemies persecuted him with lampoons and satires, and even held him up to public ridicule on the stage. However, Ramus afterwards recovered his credit, so that he obtained the royal professorship of philosophy and eloquence, and afterwards of mathematics, at Paris, in 1547. But his enemies were inveterate in their persecution of him, and as soon as it was known that he favoured the party of the Hugonots, he was obliged once again to withdraw himself from the effects of their resentment. In the intervals of peace, he returned to his station; but in 1568, when the civil war was a third time renewed, he resolved to leave France, and make a tour through Germany. After spending three years in visiting the principal German universities, and receiving many tokens of respect, he resolved, fatally for himself, in 1571, to return to his own country. Accordingly he settled at Paris, where he perished in the massacre on St. Bartholomew's day. On the tumult of this execrable day, Charpentaire, professor of mathematics, who had been eclipsed by the superior talents of Ramus, seized the opportunity of being revenged upon his rival, and, under the pretence of religion, employed assassins to murder him. His body was afterwards thrown into the street to the enraged pupils of Charpentaire, who dragged it ignominiously along the streets, and then cast it into the Seine.

The disciples of Ramus, such was the astonishing influence of their master's learning and character, prevailed so far as to banish the Peripatetic philosophy from several seminaries of learning, and to substitute in its place the system of their master, which was of a more practical kind, and better adapted to the purposes of life.

Although he had considerable merit in exposing the defects and inconsistencies of the Aristotelian philosophy, he does not seem to have been equally successful in his attempt to establish a new logical institute. The general outline of his plan is as follows. Considering dialectics as the art of deducing conclusions from premises, he endeavours to improve this art, by uniting it with that of rhetoric. Of the several branches of rhetoric he considers invention and disposition pofition as belonging equally to logic. Following chiefly the example of Cicero, he divides his treatife on Dialectics into two parts; the firft of which treats of the invention of arguments, the fecond of judgments. Arguments he derives not only from what the Ariftotelians call middle terms, but from any kind of propofitions, which, connected with another, may ferve to prove any affertion. Of thefe he enumerates various kinds. Judgments he divides into axioms, or felf-evident propofitions, and "dianoëa," or deductions by means of a feries of arguments. Both thefe he divides into various claffes; and illuftrates the whole by examples from the ancient orators and poets.

In the logic of Ramus, many things are borrowed from Ariftotle, and only appear under new names; and many others are derived from other Grecian fources, and particularly from the dialogues of Plato, and the logic of the Stoics. Whilft the author has the merit of turning the art of reafoning from the futile fpeculations of the fchools to forenfic and common ufe, his plan is defective in confining the whole dialectic art to the fingle object of difputation, and in omitting many things which refpect the general culture of the underftanding, and the inveftigation of truth. Defective as the fyftem of Ramus is, lord Bacon (Augm. Sc. l. vi. c. 2.) has paffed too fevere a cenfure upon him, and others have concurred in it: for he is unqueftionably entitled to great commendation for having, at the period in which he lived and wrote, with fo much firmnefs and perfeverance, afferted the natural freedom of the human underftanding. The logic of Ramus obtained great authority in the fchools of Germany, Great Britain, Holland, and France; and fcience derived ultimate advantages from the contefts which were maintained between the followers of Ramus and thofe of the Stagyrite. But the fame of Ramus vanifhed before that of Des Cartes. Brucker's Phil. by Enfield, vol. ii.

RAMLA, in *Geography*, the original *Arimathea*, a town of Paleftine, diftant one-third of a league from the village of Loudd, or the ancient Lydda and Diofpolis. This town is almoft in as ruinous a ftate as Loudd itfelf. Within its boundaries nothing is found but rubbifh; neverthelefs, the aga of Gaza refides here in a ferai, the floors and walls of which are tumbling down. He maintains about 100 horfemen, and as many Barbary foldiers, who are lodged in an old Chriftian church, the nave of which is ufed as a ftable, and in an ancient kan, which is difputed with them by the fcorpions. The adjacent country is planted with lofty olive trees, difpofed in quincunces. Amidft thefe plantations, which are decaying, are found dry wells, cifterns fallen in, and vaft vaulted refervoirs, which prove that, in ancient times, this town muft have been upwards of 1½ league in circumference. At prefent it fcarcely contains 200 families. The little land, which is cultivated by a few of them, belongs to the mufti, and two or three of his relations. The reft content themfelves with fpinning cotton, which is chiefly purchafed by two French houfes eftablifhed there. At Ramla there is alfo a foap manufactory, the produce of which is almoft wholly fent to Egypt. In 1784 the aga built here a wind-mill, which, fays Volney, is the only one I have feen in Syria or Egypt, though they are faid to have been invented in thefe countries. The only remarkable antiquity at Ramla is the minaret of a ruined mofque on the road to Yafa. By an Arabic infcription, it appears to have been built by Sai-el-din, fultan of Egypt. From the fummit, for it is very lofty, the eye difcerns the whole chain of mountains, which begins at Nablous, and fkirting the plain, lofes itfelf toward the fouth. Volney's Travels in Egypt and Syria, vol. ii.

RAMLEAH, a mountain of Arabia, in the province of Nedsjed, extending from S.W. to N.E. about 250 miles; the S.W. extremity being 80 miles E. of Kalaat el Moilah.

RAMLER, Charles-William, in *Biography*, a celebrated German poet and profeffor of belles lettres at Berlin, was born at Colberg in the year 1725. He was diftinguifhed at a very early period by his poetical genius; and in 1754 publifhed a poem, entitled "The Game of Chefs," which difplayed a confiderable fhare of genius. In 1758 he tranflated the abbè Batteaux's Treatife on the Belles Lettres, which he adapted to the genius of his native language, and added fome differtations on the German ftyle and verfification. In the following year he publifhed, in conjunction with Leffing, the epigrams of Logan, an author who, notwithftanding his great merit, had been fuffered to remain in obfcurity. In 1760 he publifhed "Sacred Cantatas," which were followed, during the next 20 years, by a great number of other publications, chiefly poetical, of which a lift is given in the General Biography. In the year 1780 Ramler turned his attention to feveral of the old German poets, and publifhed at Leipfic the Epigrams of Wernike, Opitz, Tfcherning, Andrew Gryphius, and Adam Olearius. He was fo fuccefsful in polifhing the works of others, and gave fuch proofs of his tafte and critical talents, that Göze, one of the moft diftinguifhed German amatory poets, allowed him full liberty in his laft will to retain or reject fuch parts of his poems as he might think proper. In 1782-3 he publifhed at Berlin a tranflation of the poetical pieces in the different volumes of the Spectator, which he followed, in the fubfequent ten years, by a variety of other works on different fubjects; among which may be mentioned "A fhort Introduction to Mythology, in two Parts." Ramler has been ftyled the German Horace; and his biographer fays, that though his verfes difplay perhaps lefs boldnefs and fimplicity than thofe of the Roman, they equal them in fublimity, and furpafs them in harmony. It has been remarked to the honour of Ramler, that he attached to him Frederic the Great, and his fucceffor, by his poetical talents: from the latter he had a confiderable penfion paid him during the clofing years of his life. Ramler was one of the directors of the national theatre at Berlin, and profeffor of the belles lettres in the fchool of the corps of cadets; but the latter office he refigned in 1790. Gen. Biog.

RAMME, in *Geography*, a river of the duchy of Bremen, which joins the Ofte, near its fource.

RAMMED *Earth Buildings*, in *Rural Economy*, are fuch as are raifed with fome fort of earthy material. This mode of building with earthy materials is fuppofed by fome to have been known at a very early period, and has been long practifed with fuccefs in the fouthern parts of France, efpecially about Lyons, though but little underftood in any other part of Europe until lately. This method has, however, appeared to have fo many advantages, that it was made trial of in different places in this country; and the refult has been fo favourable, that the practice feems to deferve the attention of the proprietors of land, in all fituations where buildings are to be erected on a cheap and economical plan. In order to facilitate the knowledge of the art, Mr. Holland has prefented the public with the method of performing the bufinefs, in a paper, tranflated from a French work on the fubject, inferted in the firft volume of Communications to the Board of Agriculture, in which he fays that the French writer, M. Francois Cointeraux, remarks, that the poffibility of raifing the walls of houfes two or even three ftories high, with earth only, which will fuftain floors loaded with the heavieft weights, and of building the largeft manufactories in this manner, may aftonifh every one who has not become an eye-witnefs of fuch things. It is a method, which in the above diftrict of France is known by the term *pifé;* but as it is accomplifhed by the ramming or compreffing earth, or earthy fubftances, in moulds or cafes, the above term has alfo been applied to it. See Pisé, *Building in.*

RAMMEKENS, in *Geography*, a fea-port town of Holland, in the ifle of Walcheren, formerly one of the beft harbours in Zealand. This town, which was conftructed as a fortrefs in the year 1547, and called "Zeebourg," was one of the towns pledged to queen Elizabeth by the ftates general for the fuccours fhe lent them againft Spain in the year 1585; three miles E. of Flufhing.

RAMMEL, in *Agriculture*, a term applied to a fubftance which forms a part of the fubfoil or fubftrata of particular diftricts. It is ufually covered with a thin weak earth or mould in fome places. It is penetrable by the roots of fome plants, but notwithftanding that, is very unfriendly to the vegetation of plants in general. It is frequently met with in Chefhire and fome other counties. See Soil.

The term fignifies a compofition of various kinds of clay, white fand, and gravel, which is intimately intermixed with a fmall portion of oxyd of iron. It is for the moft part found under a weak brown or grey earth which is rarely more than four or five inches in depth in the above diftrict, lying in ftrata of from eighteen to thirty inches in thicknefs, upon a white or red fand or clayey marle, the latter often partaking of its nature for the depth of fome feet. Rammel or rammelly foils are therefore conftantly of a barren and unproductive nature.

RAMMELBERG, in *Geography*, a large and lofty mountain in Weftphalia, celebrated for its mines. Thefe mine-works yield lead, copper, filver, fome gold, borax, lapis calaminaris, zinc, fulphur, jet, vitriol, and yellow ochre. It lies near Goflar.—Alfo, a town of Weftphalia, in the county of Mansfeld; three miles S.E. of Wippra.

RAMMELLY, in *Agriculture*, a word ufed to fignify fuch crops as are tall or rank, as beans, &c.

RAMMER, a well-known implement formed of wood in different ways, according to the purpofe for which it is to be ufed. Thefe implements are very neceffary in putting pofts into the ground, in inclofing land, in order to clofe the earth firmly about them, as well as for laying down turf or fward, in order to render it fmooth and even. See Beetle.

Rammer *of a Gun*, the *gun-ftick;* a rod or ftaff ufed in charging a gun, to drive home the powder to the breech, as alfo the fhot, and the wad, which keeps the fhot from rolling out.

The rammer of a great gun is a cylinder of wood, whofe diameter and length are each equal to the diameter of the fhot, with a handle fixed to it. See Spunge.

RAMNA, in *Geography*, a mountain of Bofnia; 16 miles N. of Orach.

RAMNAGUR, a town of Hindooftan, in Bahar; 42 miles N.E. of Durbungah.—Alfo, a town of Bengal; 10 miles N.E. of Kifhenagur.—Alfo, a town of Hindooftan, in Oude; 27 miles N.E. of Lucknow.

RAMONCHAMP, a town of France, in the department of the Vofges, and chief place of a canton, in the diftrict of Remiremont. The place contains 2385, and the canton 11,325 inhabitants, on a territory of 245 kiliometres, in 6 communes.

RAMONDON, Lewis, in *Biography*, an Englifh finger, who firft appeared on the ftage of Drury-lane in 1706. But he fung in Arfinoe, and Pyrrhus and Demetrius, when thefe operas were performed at the Queen's theatre in the Haymarket. He appears no more as a public finger after this period, but his name occurs as a compofer in a collection of fongs called the "Merry Mufician," 1716; and as the editor of "the fong tunes in the opera of Camilla, contrived and fitted to the harpfichord or fpinet;" in the title of which it is faid, "that the leffons being placed on five lines render them proper for a violin and a bafe." Almoft all organ and harpfichord mufic was till this time written and printed on fix lines.

RAMOO, in *Geography*, a town of Aracan; 60 miles N.N.W. of Aracan.

RAMOR, Lough, a lake of Ireland, in the fouthern part of the county of Cavan, which contains feveral iflands, on which are beheld the ruins of fome ancient caftles. Thefe were formerly adorned with wood, but are now bleak and defolate. The river Blackwater, which iffues from it, joins the Boyne at Ravan. Lough Ramor is about 13 miles S. from Cavan.

RAMOS, or Lamos, a river of Africa, which runs into the Atlantic, 60 miles N.N.W. of cape Formofa. N. lat. 5° 45'.

Ramos, *Dos*, an ifland in the river of the Amazons, about 70 miles long, and from 10 to 20 broad; 60 miles above Pauxis.

RAMOSE Leaf, in *Botany*. See Leaf.

RAMOTH, in *Scripture Geography*, a famous city of Paleftine, in the mountains of Gilead, and hence called Ramoth-Gilead. This city belonged to the tribe of Gad. It was affigned to the Levites, and was one of the cities of refuge beyond Jordan. According to Eufebius, it was 15 miles E. from Philadelphia; but St. Jerom places it in the vicinity of Jabok, and confequently N. of Philadelphia.

RAMOUCH, in *Geography*, a river of Thibet, which runs into the Dewa, N. lat. 30° 20'.

RAMOURY, a town of Hindooftan, in the circar of Hindia; 20 miles E. of Hurdah.

RAMPAH, a town of Hindooftan, in the circar of Rajamundry; 40 miles N. of Rajamundry.

RAMPANT, in *Heraldry*, is applied to a lion, bear, leopard, or other beaft, in pofture of climbing, or ftanding upright upon his hind-legs, and rearing up his fore-feet; fhewing only half of his face, as one eye, and one ear.

The term is French; and fignifies, literally, *creeping*.

It is different from *faliant*, which denotes a pofture lefs erect, or fomewhat ftooping forwards, as if making a fally.

This pofture is to be fpecified, in blazoning, in all animals, except in the lion and gryphon; it being their natural fituation.

RAMPARA, in *Geography*, a town of Hindooftan, in Concan; 20 miles N. of Gheriah.

RAMPART, or Rampier, in *Fortification*, a maffy bank, or elevation of earth about the body of a place, to cover it from the direct fire of the enemy, and of fufficient thicknefs to refift the efforts of the cannon for many days; and formed into baftions, curtains, &c.

The word is formed from the Spanifh *amparo, defence*, or *covering*.

Upon the rampart the foldiers continually keep guard, and pieces of artillery are planted there for the defence of the place. Hence, to fhelter the guard from the enemy's fhot, the outfide of the rampart is built higher than the infide, *i. e.* a parapet is raifed upon it with a platform. Hence, alfo, earth not being capable to be raifed perpendicularly, like ftone, the rampart is built with a talus or flope, both on the inner and outer fide.

The rampart is fometimes lined, *i. e.* fortified with a ftone wall withinfide, otherwife it hath a berme.

It is encompaffed alfo with a moat or ditch, out of which the earth that forms the rampart is dug.

The height of the rampart fhould not exceed three fathoms, this being fufficient to cover the houfes from the battery of the cannon: neither ought its thicknefs to be above ten or twelve, unlefs more earth be taken out of the ditch than can be otherwife beftowed. See Construction, *according to M. Vauban's firft Method.*

The ramparts of half-moons are the better for being low, that the fmall fire of the defendants may the better reach the bottom of the ditch; but yet they muft be fo high as not to be commanded by the covert-way.

Rampart is alfo ufed, in *Civil Architecture*, for the fpace left void between the wall of a city and the next houfes. This is what the Romans call *pomærium*, in which it was forbid to build, and where they planted rows of trees, for the people to walk and amufe themfelves under.

RAMPARTS, in *Geography*, a town of Bengal; 8 miles S.E. of Rungpour.

RAMPERING, or Sodding, denotes the procefs of building fod or turf walls, or banks.

RAMPFERSGRUBE, in *Geography*, a town of Germany, in the county of Henneberg; fix miles W. of Meinungen.

RAMPHASTOS, the *Toucan*, in *Ornithology*, a genus of birds of the order Picæ, of which the generic character is as follows: Bill very large, light, hollow, convex, ferrate at the edges; each mandible incurvate at the tip; noftrils behind the bafe of the bill, long, narrow; the tongue is feathered at the edges, the feet moftly climbers.

The birds of this genus firft became known to naturalifts on the difcovery of South America, and to the warmer regions they appear, in general, to be confined. Like the hornbills, they are diftinguifhed by the fize of their beaks, which, in fome fpecies, is nearly equal to that of the whole body. It is, howevor, of a very light fubftance, and, in the living bird, it is compreffible between the fingers. Both mandibles are ferrated in an outward direction; the tongue is of a highly fingular form, reprefenting the appearance of a very narrow lanceolate feather, being of a fomewhat horny or cartilaginous nature, and divided on each fide into innumerable fhort and clofe-fet fibres; in confequence of which ftructure it was defcribed by fome early writers on natural hiftory as a real feather, fupplying the place of a tongue. The orbits of the eyes are generally bare. The toucans are fuppofed to feed on fruits, but in a ftate of captivity they will eat animal food. They depofit their eggs, which are ufually two in number, in the hollows of trees, on the furface of the decayed wood. Thefe birds have been as yet met with only in South America, and there merely between the tropics, being totally incapable of fuftaining the cold. They are eafily tamed and familiarized, and feveral fpecies have been brought to England, where fruits, fifh, and flefh have been promifcuoufly devoured by them with confiderable voracity. Whatever was received by the bill was thrown into the air, and on its return caught, and, without the flighteft maftication, inftantly devoured. There are feventeen fpecies enumerated by Gmelin, though Mr. Latham mentions only fifteen.

Species.

Viridis; Green Toucan. Green, with a yellow belly, and red rump. This fpecies is found in Cayenne, and is about fourteen inches long. The upper mandible is yellow, with red fides, and a black line in the middle; the lower one is black, the bafe and round the noftrils are red; the teeth in both are white; the irides and naked orbits are yellow; the legs are of a lead colour; the claws are black; the tail is wedged, beneath inclining to afh; head, chin, and throat, in the male black, in the female bay, terminated by a black narrow tranfverfe band.

Edentulus; Toothlefs Toucan. In this the bill is not ferrate at the edges. It inhabits Cayenne, and is twelve inches long. The upper part of the body is green, but beneath it is more of a yellowifh colour; the head and neck are chefnut; the rump is red; the upper mandible is brown, the lower black; the thighs green, and it is thought to be a variety of the *viridis*.

Pavonicus; Pavonine Toucan. The general colour of this is green; but the feathers are fprinkled with red fpots. It is alfo known by a mixture of red and changeable or peacock-coloured feathers interfperfed. The bill is variegated yellow and black; the legs and claws are black.

Piperivorus; Piperine Toucan. Green; the fore parts are black; the vent and thighs red. This fpecies has been defcribed by Edwards under the name of the green toucan. Its length is about feventeen inches, and its general colour is of a dull green; the head, neck, and breaft, are of a deep black; behind each ear is a fomewhat lengthened orange-coloured fpot, and immediately behind the lower part of the neck is an orange-coloured bar or collar; the belly is pale and yellowifh-green; the thighs are purple; the vent is red, and the tail, which is cuneated, flightly tipped with dull red; the bill is about three inches long, and of a black colour, but towards the bafe it is varied with red, whitifh, and orange-yellow. In the female the head, neck, and breaft, are brown inftead of black, and the lower part of the belly is grey. It is a native of Cayenne, and faid to feed on the pepper of the country. The female of this fpecies has been known to vary in having the bill of a horn colour, with a black bar near the end, and two others near the edge; the ridge alfo being black, and the yellow crefcent at the neck is wanting.

Aracari. This fpecies is green, but the abdominal band, vent, and rump, are red; the belly and breaft are yellow. It is a native of Brazil, Surinam, and Cayenne, and is full fixteen inches long. The upper mandible is black on the back and tip, but the fides are whitifh. The bafe is three-lobed at the noftrils, with a white arch at the root, lower black; the head, the wings, and tail, are black; the breaft and body are yellow and fcarlet, with a black roundifh fpot in the middle of the breaft, and a fimilar tranfverfe one on the beginning of the belly; the thighs are tawny.

Torquatus; Collared Toucan. This bird is black above, and beneath it is whitifh; the belly is green, the hind part is red, and the collar red. It inhabits the coafts of New Spain, is about eighteen inches long, and feeds on fifh. The upper mandible is blackifh, and the lower black; the irides are of a reddifh-yellow; the head and neck are black; the lower tail-coverts are red; the thighs purple; the legs are of a greenifh-afh colour; the claws are black.

Piscivorus; Brazil Toucan. This is blackifh, but the abdominal band and vent are red; the rump is white. It inhabits South America, and is twenty-one inches long. The bill is yellow, with a fcarlet fpot on the tip; the lower mandible is blue; the cap, back, wings, tail, belly, and thighs, are black; the temples, chin, breaft, and rump, are white.

Erythrorynchos; Red-beaked Toucan. Blackifh; cheeks, chin, and throat, white; upper tail-coverts fulphur, but the lower and crefcent on the breaft are red. This is

 found

found in various parts of South America. The base and back of the bill are yellow; tip of the upper mandible, and hollow of the lower, red; the nostrils are edged with black; the orbits are blueish; the legs are plumbeous, and the claws are black.

Tucanus; Yellow-breasted Toucan. This is also blackish; the abdominal band, vent, and rump, yellow. It measures about nineteen inches in length, and has been described by Mr. Edwards from a living specimen brought into England. According to this gentleman, the bill of this species is large in proportion to the size of the bird; it is compressed sideways, having a sharp ridge along its upper part, and toothed on its edges; the upper mandible is green, with a long triangular spot of orange colour on each side, and the ridge on the upper part yellow; the lower mandible is blue, with a shade of green in the middle; the point is red; it has about five transverse faint dusky bars, which cross the joinings of the two mandibles; the nostrils are invisible in the black line that surrounds the bill; the iris of the eye is of a fair green colour; round the eye is a broad space of naked skin, of a violet colour; the skin beneath the feathers is of a violet colour, below which is a bar of scarlet feathers, which parts the yellow on the breast from the black on the belly; the covert-feathers of the tail are white above, and those beneath are of a fine red; the crown of the head, upper part of the neck, the back, wings, belly, and tail, wholly black, though on the upper side of the wings and tail it has a changeable gloss of blueish-purple; the legs and feet are all of a blue or violet colour. The specimen from which this description was made, was brought from Jamaica, but the bird is a native of the hotter parts of South America.

Picatus; Preacher Toucan. Blackish; breast yellow, vent and tips of the tail-feathers red, rump black. It inhabits Guinea and Brazil, and is more than twenty inches long. The bill is yellowish-green, tipt with reddish; the belly is red; the tail is dotted with red at the tip. This bird is said to have a frequent habit of moving its head from side to side, while uttering its notes; hence it has obtained the name of preacher.

Dicolorus; Yellow-throated Toucan. Blackish; breast, belly, vent, and rump, red; the chin is yellow. It inhabits Cayenne, and is seventeen inches long. The bill is olive, with a black base; the mandibles are edged with red; the cheeks are of a sulphur colour; the throat is orange, but edged with sulphur.

Toco; White-throated Toucan. Blackish; chin, throat, and rump, white; orbits, circle on the breast, and vent, red. It inhabits Cayenne, and is about nine or ten inches long. The bill is of a reddish-yellow, the base is black; the upper mandible is black at the tip.

Indicus; Indian Toucan. The throat, quill-feathers, and tail, black; the cheeks and breast are white; belly and thighs are yellow; the crown is of a reddish-orange; rump crimson. It is found in divers parts of India. The bill is hardly serrate, and not so large as in the others.

Luteus; Yellow Toucan. This is of a yellowish-white; the neck is marked with two black lateral stripes; the tail and wings are variegated with black and white; the lesser wing-coverts are yellow. It inhabits New Spain, and is about the size of a pigeon. The bill is black; the irides are yellow; the legs are brown; the claws are yellowish.

Cæruleus; Blue Toucan. Blue mixed with cinereous. It inhabits the coasts of New Spain. The bill is longer than the body; the eyes are black and the irides are tawny.

Dubius. This is the blue-throated toucan of Mr. Latham, described from a catalogue of the museum of baron Fangeres of Montpellier, where it is announced as an undescribed species.

Albus; White Toucan. This is entirely white.

RAMPICHERLA, in *Geography*, a town of Hindoostan, in the circar of Guntoor; 12 miles N.E. of Innaconda.

RAMPIN, in the *Manege*. See Toe.

RAMPION, in *Botany*. See Rapunculus, of which Dr. Johnson supposes it a corruption. See also Phyteuma.

Rampions, *Crested*, a species of the *lobelia*.

Rampions, *Common esculent*, a species of the *campanula*; which see.

RAMPOUR, in *Geography*, a town of Bengal; 13 miles N. of Curruckpour.—Also, a town of Hindoostan, in Bahar; 31 miles N.W. of Bettiah.—Also, a town of Almora; 30 miles N.N.W. of Bereilly. N. lat. 28° 45′. E. long. 79° 22′.—Also, a town of Hindoostan, in Oude, on the Ganges; 34 miles N.W. of Manickpour.—Also, a town of Hindoostan, in Oude, on an island formed by the divided stream of the Dewah; 35 miles N.E. of Lucknow.—Also, a town of Hindoostan, in Oude; 25 miles E.S.E. of Goorackpour.—Also, a town of Hindoostan, in Oude; 30 miles N.E. of Goorackpour.—Also, a town of Hindoostan, in the Carnatic; 30 miles S.W. of Nellore.—Also, a town of Hindoostan, in the circar of Boggilcund; 20 miles W. of Rewah.—Also, a town of Hindoostan, in Benares; 20 miles N.W. of Bidzigur.—Also, a town of Hindoostan, in the circar of Schaurunpour; 23 miles S.S.W. of Schaurunpour.—Also, a town of Hindoostan, in the circar of Oudipour; 40 miles E.N.E. of Oudipour.

RAMPS, in *Fortification*, are gentle slopes made for the cannon to be drawn up and down by, and also for the easy communication of the troops posted in a battery that is raised above the level of the ground on which it is built. The rise of these slopes is about two inches, on twelve of base, or the length of the ramp's base is six times the height, and this is general for the draught of carriages; but footways need not be of so gentle a slope, as a rise in one foot in three may answer the purpose; or, instead of ramps, stairs may be, and commonly are, used for the passage of the foot. The breadth of a carriage ramp is usually about nine or ten feet, that breadth being sufficient both for the carriage and footway; but those for foot-passage only need not be above three or four feet wide. Ramps may either rise on the side of an elevated work, or against a saliant angle of that work, or on each side of an entering angle.

RAMQUILLA, in *Geography*, a town of Sweden, in the province of Smaland; 5 miles N.W. of Calmar.

RAMSAY, Allan, in *Biography*, a poet of considerable celebrity, who wrote in the Scottish dialect, was born in the year 1686, in the parish of Crawford, Lanerkshire. He received no other education than that of the parish school, and was apprenticed to a barber in Edinburgh. It has not been ascertained when he first began to make verses; but about the year 1715, several of his poems had been published. Soon after this he laid aside the trade to which he had been brought up, and adopted the more congenial one of a bookseller. In 1721 his detached poems were published, by subscription, in a quarto volume. In 1724 he began to publish his collection of songs, entitled "The Tea-table Miscellany," which at length extended to four volumes. This work was followed by one, entitled "The Evergreen," being a collection of songs written by the ingenious before the year 1600. These publications were well received; but his fame was greatly extended by his

"Gentle Shepherd," which was afterwards enlarged from two paſtoral poems, in the form of a regular drama. He now held a correſpondence with ſeveral poets and other ingenious perſons of the time, and his ſhop in Edinburgh was the reſort of the men of letters who then flouriſhed in the capital of Scotland. He is ſuppoſed to have opened the firſt circulating library in that city, and in 1736 he built a play-houſe, which was the firſt ever known at Edinburgh; but the act prohibiting the exhibition of plays in unlicenſed buildings, cauſed it to be ſhut up. Ramſay, towards the middle of his life, withdrew from the field of authorſhip, and attended to the much more profitable buſineſs of ſelling, rather than writing of books. He died in 1758, at the age of 71. The poems of Allan Ramſay, ſays an eminent critic, "diſplay none of the fire of the genius ſo conſpicuous in thoſe of Burns, but have occaſionally an agreeable paſtoral ſimplicity, and are often marked with a vein of humour, natural, though coarſe. The Gentle Shepherd is, perhaps, one of the beſt paſtorals with reſpect to the pictures of real life, which are drawn with great propriety, and generally preſent pleaſing images."

Ramsay, Allan, ſon of the preceding, was born at Edinburgh about 1709, and having devoted himſelf to painting, went at an early period of his life to ſtudy in Italy, and there received inſtructions from Solimene and Imperiale.

After his return, he practiſed in Edinburgh for ſome time, but afterwards removed to London, and by the influence of his countryman, the earl of Bute, was introduced into the vortex of the court, painted the prince of Wales, and on the death of Shakleton in 1767, was appointed principal painter to the crown; although Reynolds was then in poſſeſſion of the higheſt reputation.

Ramſay never ventured to attempt the higher walks of the art, but confined himſelf ſolely to portraits, which he painted agreeably. Not poſſeſſed of brilliancy of genius ſufficient to attempt ſtrong character, with ſtriking effects in his pictures, he contented himſelf with that portion of art which meets the expectations of common obſervers; never offending with affectation or neglect, he finiſhed his pictures with care and neatneſs, and retained his friends and reputation till he ceaſed to practiſe. He was ſo far attached to his art, that he viſited Italy four times: to what purpoſe does not appear, unleſs it were to derive benefit from the portraits of Pompeo Battoni; for no traces of higher character are obſervable in his productions. Yet he was a man of ſound ſenſe and ſtrong underſtanding; poſſeſſed of literary acquirements, and devoted to ſtudy. Though he underſtood the Latin, French, and Italian languages, he was not ſatisfied till he added a knowledge of the Greek, acquired when he was advanced in life. Thus endowed, he was emulous of literary fame, and publiſhed, under the title of "The Inveſtigator," Eſſays on Ridicule, as the teſt of truth, on the Naturalization of Foreigners, on Taſte, &c.; and, as occaſion prompted, the town was favoured by him with ſome fugitive pieces on the politics of the day. He was always held to be highly eſtimable as a man, and enjoyed his fame and good fortune to about the advanced age of 75.

Ramsay, Andrew Michael, called the chevalier Ramſay, was born at Ayr, in Scotland. He received a good education at Edinburgh, where he diſtinguiſhed himſelf ſo much, that he was choſen to attend the ſon of the earl of Weemys at St. Andrew's. After this he went to Leyden, with the view to farther improvement, where he became acquainted with Poiret, one of the leaders of the Quietiſts, ſome of whoſe doctrines he imbibed. He next went on a viſit to the celebrated Fenelon, archbiſhop of Cambray, who converted him to the Roman Catholic religion, and Ramſay ever after this conſidered himſelf as the diſciple of that excellent prelate. Upon his works he formed his literary taſte, and he even adopted France for his country, and made uſe of its language in his writings. Here he obtained ſome poſts of honour and emolument, and was made knight of the order of St. Lazarus, whence he had the title of chevalier. His reputation cauſed him to be invited to Rome by the Pretender, in order that he might undertake the care and education of his children. This he accepted; but having found that little court ſo divided by faction, he quickly reſigned his office, and returned to Paris. In the next year, 1725, he re-viſited his native country, and reſided ſome years with the duke of Argyle, employing himſelf in the compoſition of ſeveral works. After his return to France, he entered into the ſervice of the prince of Turenne, duke of Bouillon. He died in 1743, at St. Germain-en-Laye, the retreat of the exiled Stuart family, at the age of 57. His principal writings were, "L'Hiſtoire de la Vie et les Ouvrages de M. de Fenelon;" "Eſſai ſur le Gouvernement Civil;" "Diſcours ſur le Poeme Epique;" "Le Pſychometre," being remarks on lord Shafteſbury's Characteriſtics; "L'Hiſtoire du Marechal de Turenne;" and "Les Voyages de Cyrus." The laſt is that which is by much the beſt known, and it has been frequently printed in the French and Engliſh languages. Voltaire has ſtyled it a feeble imitation of Telemachus; it is, however, written with elegance, but is tedious. Another of the chevalier's works was "A Diſſertation on Free-Maſonry," of which he was grand chancellor in France. In this he traces the origin of the inſtitution to Paleſtine, in the time of the Cruſades; and having found a great declenſion of the myſtical ceremonies formerly practiſed, he ſtrongly urged their renewal, and propoſed a general aſſembly of the brotherhood of all nations to be held at Paris. Biog. Brit.

Ramsay, in *Geography*. See Ramsey.

Ramsay *Point*, a cape on the S.E. coaſt of the iſland of Lewis. N. lat. 57° 44′. W. long. 6° 36′.

RAMSBURY, a village and pariſh in the hundred of Ramſbury, and county of Wilts, England, is ſituated about ſix miles to the eaſtward of the town of Marlborough, and 70 miles weſt by ſouth from London. In the time of the Saxons it was a place of ſo much importance, as to be conſtituted the ſeat of the ſee, when Wiltſhire was made a diſtinct biſhopric by Plegmund, archbiſhop of Canterbury, in the year 909. Ramſbury church was then the cathedral church of the dioceſe, and continued to be ſo till biſhop Herman prevailed upon king William the Conqueror to unite the biſhoprics of Wiltſhire and Sherborne, and fixed his epiſcopal ſeat at Old Sarum. The church, an ancient building, is divided into a nave, two aiſles, and a chancel, with a maſſive ſquare tower at its weſtern extremity. In the chancel is a long ſtone, which tradition affirms to be the grave-ſtone of a giant; alſo an old altar tomb of Purbeck marble, without any inſcription, and ſeveral monuments commemorative of the Joneſes of Ramſbury manor, or park. This ſeat is now the property of ſir Francis Burdett, bart. in right of his mother, ſecond daughter of the late William Jones, eſq. The houſe was deſigned in the Grecian ſtyle, by John Webb, nephew to Inigo Jones. The incloſures are extenſive and well wooded, and are interſected by a branch of the river Kennet, which ſpreads itſelf out in the form of a lake, from the ſides of which the grounds riſe in eaſy, ſloping lawns.

Littlecot park, the ſeat of major-general Edward Leybourne

bourne Popham, is ſituated partly in the pariſh of Ramſbury, and partly in that of Chilton-Foliot. The houſe is a large ancient ſtructure, built by one of the Darells, the former poſſeſſors of this domain, about the time when feudal warfare ceaſed, and defence was no longer an object in a country manſion. Notwithſtanding many late alterations, the interior ſtill preſerves many of its original features. The great hall is very ſpacious, floored with ſtones, and lighted by large and very lofty windows. In it ſtands a large oaken table, at which the vaſſals of the domain were wont to feaſt at the expence of their lord. The remainder of the furniture is in a ſuitable ſtyle, particularly an arm-chair, which is ſaid to have been uſed by ſir John Popham, chief juſtice of the court of king's bench in the reigns of queen Elizabeth and king James I., who purchaſed the houſe and manor from the laſt of the Darells. There is alſo a curious inſtrument for the puniſhment and confinement of ſervants; by faſtening their thumbs between two boards. The walls of the hall are decorated by numerous guns, carbines, piſtols, doublets, &c.: and here are alſo two very fine candelabras, deſigned and executed by Mr. George Bullock of London, in an admirable ſtyle, as adapted to the age and character of the manſion. One of the bed-rooms is ſaid to have been the ſcene of a ſingular and myſterious murder, the incidents attending which are recorded in a note to Scott's poem of Rokeby. In the gallery, which is about 110 feet in length, are portraits of judge Popham and Nell Gwyn; alſo a curious piece of needle-work, repreſenting a large Roman teſſellated pavement, which was diſcovered in the adjoining park in 1728, by Mr. George (ſteward to Edward Popham, eſq.), who made a coloured drawing of it, and communicated the ſame to the Society of Antiquaries. This pavement conſiſted of two diviſions, which appear to have formed the floor of a temple. The interior diviſion was ornamented with the figure of Apollo playing on a harp; and in four ſurrounding compartments were four female figures riding on different animals, and deſigned to repreſent the Horæ, or Seaſons. Exterior to the circle incloſing them were three other compartments, each diſplaying a face of the ſun. From theſe circumſtances the temple is ſuppoſed to have been dedicated to Apollo; but ſome emblems on its exterior diviſion referring to Ceres and Neptune, it may, perhaps, be more properly eſteemed a ſort of pantheon. Another ſmaller Roman pavement, and a curious cup or patera of braſs, were likewiſe diſcovered by Mr. George on Rudge-farm, adjoining the northern boundary of Littlecot park. The cup was adorned with foliage, and was inſcribed with the names of five Roman ſtations. It was conjectured by Gale to have been a libation cup uſed at an annual feaſt inſtituted by the inhabitants of theſe towns.

Pickedfield, in this vicinity, is a government depôt for the interior, eſtabliſhed in 1803. It includes about forty acres of ground, on which are erected three magazines for powder, barracks for a detachment of the military, and various neceſſary houſes and offices. Beauties of England and Wales, vol. xv. by John Britton, F.S.A.

RAMSDAL. See Remsdal.

RAMSDEN, Jesse, in *Biography*, an eminent Engliſh mathematical and aſtronomical inſtrument-maker, the ſon of an inn-keeper at Salterhebble, near Halifax, in Yorkſhire, where he was born in the year 1735. At nine years of age he was admitted into the Halifax free-ſchool, where he acquired, during three years, the elements of claſſical learning; after which he was removed to the care of an uncle at Craven, by whom he was ſent to a clergyman of the name of Hall, who had acquired much reputation by teaching at his ſchool the mathematical ſciences. Under this gentleman's inſtructions, young Ramſden became a proficient in geometry and algebra, and was advancing rapidly in theſe and other collateral branches of ſtudy when his father ſent for him home, to apprentice him out with a clothier at Halifax. At the age of twenty he went to London, where he became clerk in a wholeſale cloth warehouſe. This ſituation he retained about two years and a half, when his inclination for the ſciences revived ſo ſtrongly, that he reſolved to qualify himſelf for ſome buſineſs which ſhould prove ſuitable to the bent of his mind. With this view he bound himſelf apprentice for four years to Mr. Burton in the Strand, who was eſteemed one of the beſt workmen of his time in making thermometers and barometers, and in engraving and dividing mathematical inſtruments. After the expiration of his apprenticeſhip, he worked as journeyman with a perſon of the name of Cole, with whom he afterwards aſſociated himſelf as partner. This connection did not laſt long, when Mr. Ramſden opened a workſhop on his own account, in which he ſoon recommended himſelf to the employment of the principal mathematical inſtrument-makers in London. In the courſe of his buſineſs his repeated examination of the inſtruments which were ſent him to be engraved or divided, led him to diſcover their defects, and his genius ſuggeſted to him the means of removing them, or of conſtructing better inſtruments. In order to put his plan into execution, he made himſelf maſter of the practical operations of the trade, and formed the deſign of examining every aſtronomical inſtrument in uſe, with the view of correcting thoſe which, being founded on good principles, were faulty only in the conſtruction, and of proſcribing thoſe which were defective in both theſe reſpects. About this time, by his marriage with Miſs Dollond, he became poſſeſſed of a part of Mr. Dollond's patent for achromatic teleſcopes. In the year 1766, Mr. Ramſden opened a ſhop in the Haymarket, where he continued till 1774, when he removed to Piccadilly, where he remained till the time of his death. Before his ſettlement in the Haymarket, he had improved the ſextant, and he had invented his celebrated dividing machine. (See the art. Engine.) Having ſpent ten years in bringing this machine to perfection, he obtained from the Board of Longitude a premium of 1000*l*. Mr. Ramſden conſtructed an inſtrument for dividing ſtraight lines, which has been deſcribed in a former volume of the New Cyclopædia, and while he was employed on his dividing-machine he made great improvements in ſeveral other inſtruments. The Theodolite (ſee the article), before his time, conſiſted merely of a teleſcope, turning on a circle, divided at every three minutes, by means of a Vernier, which ſee; but in the hands of Mr. Ramſden it became a new and perfect inſtrument, ſerving for meaſuring heights and diſtances, as well as taking angles. The largeſt and moſt perfect theodolite ever conſtructed was made by him for general Roy, for the purpoſe of meaſuring the ſeries of triangles in England. Though this inſtrument is only of eighteen inches radius, its accuracy is ſo great as not to admit of an error of a ſingle ſecond. With this inſtrument general Roy meaſured the angle between the polar ſtar and the ſides of his triangles, in order to have the exact difference between the obſervations of Paris and Greenwich, which he found to be 9′ 20″. Mr. Ramſden was a great improver of the barometer for meaſuring the height of mountains, which he could obtain to a degree of accuracy that was very ſurpriſing, and he cauſed to be engraved a table to accompany his barometers, which, without the trouble of calculation, gives the heights of places, according to the heights of the mercury, and even at different temperatures. He alſo pointed

pointed out a new method and apparatus adapted to the conveyance and fupport of the portable barometer. Mr. Ramfden made improvements on the electrical machine; and on manometers for meafuring the denfity of the air: he invented an inftrument for meafuring inacceffible diftances: affaying balances which turn with lefs than a ten thoufandth part of the weight ufed: levels and a variety of other inftruments. The pyrometer alfo exercifed his talents, and on this occafion, as on all others, Mr. Ramfden fhewed a fort of natural and almoft intuitive fagacity in difcovering the effential faults of an inftrument, and in inventing the moft fimple and exact methods of correcting them. With refpect to optics, he difcovered a method of correcting, in a new and perfect manner, the aberration of fphericity and refrangibility in compound eye-glaffes applied to all aftronomical inftruments. Opticians had imagined that the purpofe might be accomplifhed by making the image of the object-glafs fall between the two eye-glaffes, which was attended with this great inconvenience, that the eye-glafs could not be touched without deranging the line of collimation, and the value of the parts of the micrometer. To remedy this inconvenience, he fet out from a fimple experiment, *viz.* that the edges of an image obferved through a prifm are lefs coloured, according as the image is nearer the prifm. This led him to attempt placing the two eye-glaffes between the image of the object-glafs and the eye, without failing to correct the two aberrations; which he did by changing the radii of the curves, and placing the glaffes in a manner very different from that commonly employed. In the Philofophical Tranfactions for the year 1779, Mr. Ramfden has defcribed a new reflecting object-glafs micrometer; to the paper on this fubject we refer our readers, and alfo to the article MICROMETER in this Dictionary. With this micrometer the diameters of the planets may be meafured; it may be adapted to all kinds of achromatic telefcopes; it may be brought near to, or removed from, the object-glafs at pleafure, to render vifion diftinct; and it may be removed from the telefcope, if the obferver wifh to ufe the latter without a micrometer. The high degree of merit to which Mr. Ramfden's many and important inventions were intitled, led his friends to propofe him as a member of the Royal Society, and he was elected in the year 1786.

The *Equatorial* or *Tranfit* inftrument (fee the articles) received great improvements in the hands of Mr. Ramfden, who rejected the endlefs fcrew, which by preffing on the centre deftroyed its precifion; he placed the centre of gravity on the centre of the bafe, and caufed all the movements to take place in every direction; he pointed out the means of rectifying the inftrument in all its parts, and he applied to it a very ingenious fmall machine, for meafuring or correcting the effect of refraction. The greateft equatorial inftrument ever attempted, is that which he conftructed for fir George Shuckburg, on which he employed feveral years, and of which we have given a defcription and figure. Mr. Ramfden's meridian telefcopes which he made for Blenheim, Manheim, Dublin, Paris, and Gotha, are alfo remarkable for the excellence of their object-glaffes. With that of Dublin, Mr. Ufher obferved ftars of the fourth magnitude in the open day, and thofe of the third very near their conjunction with the fun. Thefe telefcopes are eight feet in length. There is a five-feet one at the obfervatory at Palermo. Mr. Ramfden made great improvements in the mural quadrant, of which a full account will be found in the article CIRCLE, to which we refer our readers for much valuable information on the fubject of aftronomical inftruments. Having in various parts of our work entered into the nature of Mr. Ramfden's improvements and inventions, it is unneceffary to repeat here what has already been fully explained.

The field in which the inventive genius and fuperior talents of Mr. Ramfden were exercifed, was, as we have feen, very extenfive. In order that every part of his inftruments might be fabricated under his own infpection, he collected in his workfhops men of every branch of trade neceffary for their conftruction. So important did he confider the principle of divifion of labour, that he always confined the fame workmen to the fame branch, and by that means arrived at the greateft correctnefs and nicety in executing it. Notwithftanding the great perfection of his inftruments, which ought to have fecured to Mr. Ramfden a large fortune, he fold them cheaper than any other artift in London, fometimes even one-third below the ufual price. Such was the demand for them, from almoft all parts of the world, that though he employed fixty men, he was unable to execute all the orders which he received. His great attention to bufinefs injured his health, and haftened his death. He died at Brighton, where he had been for the benefit of the fea-air, November 5, 1800, in the fixty-fixth year of his age. He had been elected a member of the Imperial Academy of Sciences at Peterfburg in 1794, and in the following year he was prefented with the gold medal, adjudged by the Royal Society to perfons diftinguifhed for their fcientific talents.

Mr. Ramfden was by nature endowed with uncommonly ftrong reafoning powers, and a moft accurate and retentive memory, but, at the fame time, with fuch a quicknefs of penetration, that he could, as it were, with a fingle glance, view in every light the fubject on which he thought, and adopt the moft advantageous mode of confidering it. He poffeffed, in an exquifite degree, that quality of mind which is emphatically ftyled elegance, which in the abftract fciences leads to clearnefs, fimplicity, and precifion, as in the fine arts and literature, it gives the laft polifh to genius, and is more generally known by the appellation of tafte. In his habits he was temperate to abftemioufnefs, fatisfied with fmall quantities of food, and a fmall portion of fleep. Unacquainted with diffipation or amufement, and giving but little time even to the fociety of his friends, the whole of thofe hours which he could fpare from the duties of his profeffion, he devoted either to further improvements in his inftruments, or to the perufal of books of fcience, particularly thofe mathematical works of the fublime writers which had any connection with the fubject of his own purfuits. Mr. Ramfden's only relaxation from almoft conftant and fevere ftudies, was the occafional perufal of the beft authors, both in profe and verfe; and when it is recollected that at an advanced age he made himfelf fo completely mafter of the French language, as to read with peculiar pleafure the works of Boileau and Moliere, no one can believe that he mis-fpent even his hours of amufement. Short and temperate as were his repafts, a book or a pen was the conftant companion of his meals; and when illnefs broke his fleep, a lamp and a book were ever in readinefs to beguile the fenfe of pain, and make bodily ficknefs minifter to the progrefs of his mind. He was well fkilled in the abftrufer parts of mathematics, and converfant with the beft writers on the fciences; and fuch was his manual dexterity, that there was not one tool in any of the numerous branches of his profeffion which he could not ufe with a degree of perfection equal to that of the very beft workman in that particular branch, and he could have begun and finifhed every fingle part of his moft complicated inftruments. For this article we are chiefly indebted to a very elaborate and excellent original memoir in the 8th vol. of the Gen. Biog.

RAMSDORF, in *Geography*, a town of Saxony, in the bishopric of Naumburg; three miles N.E. of Zeitz.

RAMSEA, or Ramsey, a market and sea-port town in the parish of Kirk-Maughold, Isle of Man, Great Britain, is situated at the distance of fourteen miles north-east from Douglas, the chief town in the island. Anciently this place was of considerable note, but it is now comparatively decayed. The bay upon which it is built might be rendered capable of affording anchorage and security to very large vessels, but it is much choaked up with sand at the entrance to the harbour, and is therefore little frequented, though protected by a fort, mounted with several pieces of cannon. At the extremity of the pier is a light-house, the lower division of which is used as an occasional prison. The chief article of export from Ramsea is grain, the produce of the vicinity which is among the best cultivated districts in the British islands. Several boats, with good accommodation for passengers, sail weekly from hence to Liverpool, and to Whitehaven; but what gives most importance to the town at present is, the circumstance of its being the seat of the courts of justice for the northern district. According to the population returns of 1792, (the last returns made for the island,) Ramsea contained 1100 inhabitants, but their number is now probably increased to 1400.

In the parish of Kirk-Andreas, to the north of Ramsea, are several curiosities, particularly an ancient intrenchment at Ballachurry, which occupies a small isolated eminence, in a very level tract of country. This earthen work is of a square form, and is surrounded by a wide and deep fosse and rampart, flanked at each angle by a very noble bastion. The area within is much sunk below the level of the works, which are in a state of excellent preservation, and might easily be rendered effectual for the purposes of modern warfare. This district abounds with sepulchral tumuli; some of them environed by large upright stones. Several of these barrows were opened, about twenty years ago, by Mr. Chaloner, and found to contain simple urn interments. In the church-yard here stands a square pillar of stone, bearing a Runic inscription, which is thus translated by Mr. Beauford of Athy, in Ireland. "The son of Ulf of the Swedri (Swedes) erected this cross to the warrior Afterarin, the son of Cunnu." Another inscription on a similar monument is to be seen in the neighbouring church-yard of Kirk-Michael, which is an extensive village, pleasantly situated near the sea. In this parish is a monument of the cairn description, composed of small stones heaped together. It is called Cairn-Viael, but nothing is known respecting its origin, and peculiar appropriation. About a mile from hence is Bishop's-Court, the usual residence of the bishops of Man. The palace was nearly rebuilt about twenty years ago. It is an elegant and convenient mansion, surrounded by agreeable gardens and pleasure grounds. Beauties of England and Wales, vol. iii. By John Britton and E. W. Brayley, 1802. Carlisle's Topographical Dictionary of Scotland, 2 vols. 4to. 1813.

RAMSEIL, a town of Hindoostan, in Baglana; ten miles N. of Nasseck.

RAMSELE, a town of Sweden, in Angermanland; 70 miles N.W. of Hernosand.

RAMSENTHAL, a town of Germany, in the principality of Culmbach; four miles N. of Bayreuth.

RAMSEY, a market-town in the hundred of Hunstingstone, and county of Huntingdon, England, is situated on the banks of a small river, to which it gives name, at the distance of ten miles N.N.E. from the town of Huntingdon, and sixty-eight miles N.W. from London. It is particularly celebrated in history for its abbey, which was founded by the renowned duke Ailwin, at the persuasion of Oswald, bishop of Worcester, in the year 969. The buildings were completed in the course of five years, at the expiration of which, the monastery was dedicated to the Holy Virgin and St. Benedict, and filled with monks of the Benedictine order. Ailwin gave considerable possessions to his new establishment, and procured for it many valuable privileges from king Edgar. This monarch confirmed to the monks all their lands, and gave them the right of impressing the image of his royal person upon their seals. Several succeeding princes, and many private persons of rank and opulence, contributed to enrich the abbey, which afterwards became one of those distinguished by the title "mitred." Its abbots were consequently privileged to sit in parliament among the peers, and enjoyed all the other accustomed rights of mitred abbots. Many of the monks were men of pre-eminent genius and learning, and were especially noted for their proficiency in the Hebrew language. The library belonging to the monastery was extensive, and contained many books written in that tongue by its inmates. At the era of the dissolution, its annual revenues were estimated, according to Dugdale, at 1716*l.* 12*s.* 4*d.*; but Speed, on the authority of sir Robert Cotton, states their amount at 1987*l.* 15*s.* 3*d.* Some years after that event, the demesnes and lands of the abbey, with several lakes belonging to it within this parish, were granted to sir Richard Cromwell, ancestor to the Protector.

Ramsey consists chiefly of one long street, with another branching off from it, in a northern direction. The abbey stood at the upper end of the town, towards the south, near the manor-house, a large and elegant mansion, built out of its ruins. The only portion of the old buildings standing is a gateway, which appears, from the style of its architecture, to have been erected about the reign of Henry VI. Since the destruction of the abbey, it was for some time used as a prison. At a short distance from this relic stands the present church of Ramsey, a spacious and handsome edifice, consisting of a nave, chancel, and aisles, with an embattled tower at the west end. The nave is separated from the aisles by seven large and well-proportioned arches on each side, springing from clustered columns; and from the chancel by a still larger arch, with a screen richly carved in wood crossing the lower part. The windows are large, and, as is apparent from many fragments remaining, have once been filled with stained glass, exhibiting figures of angels, crowned heads, &c. Several branches of the Cromwell family were buried in this church, but there are no monuments to their memory. In this town is a free-school, founded and endowed in 1663, under a decree of chancery, but the establishment has been much neglected; also a charity-school for girls, instituted about a century ago by John Dryden, esq. who bequeathed 16,000*l.* for various charitable purposes. The market day here is Wednesday, weekly, and there is an annual fair on the 22d of July. Ramsey suffered greatly from the plague in the year 1665—6, that dreadful distemper having been introduced by the accident of major William Cromwell wearing a coat, the cloth of which had been brought from the metropolis. The number of deaths amounted to 400 within one month. This town likewise sustained much injury from fire in 1731; but the damage was soon repaired. According to the population returns of 1811, the parish contains 484 houses, and 2390 inhabitants.

The country around Ramsey is extremely marshy, and hence is intersected by numerous ditches, or drains to carry off the water. To the north-west about two miles, is a lake

lake called Ugg-Mere, and at the diſtance of a mile further northwards, is a ſtill larger collection of water, named Whittleſea-Mere; and there is a third to the north-eaſt of the town, ſtyled Ramſey-Mere. All theſe lakes abound with fiſh of various kinds. Running northwards from that laſt mentioned, is a high cauſeway, called King's-delf, or dyke, which is mentioned in record as early as the reign of king Edgar. It is commonly confounded with Cnuts-delf, or Swerdes-delf, called alſo Steeds-dyke, which forms the boundary of this county with Cambridgeſhire. Beauties of England and Wales, vol. vii. by E. W. Brayley, 1808.

Ramsey, *Iſle of*, an iſland in the cwmwd of Mynyw, cantref of Pybidiog, (now called the hundred of Dewiſland,) and county of Pembroke, South Wales, is ſituated in the Iriſh ſea, oppoſite to the promontory called St. David's Head, from which it is about three miles diſtant. This iſland is nearly four miles in length, and exceeds one mile in breadth. Throughout its whole extent the ſurface is lofty, and at each extremity a mountain ſhoots to a great height above the general level, giving the iſland a very romantic appearance. From the ſhore the aſcent is bold and precipitous on all ſides, and at one ſpot, called the Choir, the rocks aſſume an amphitheatrical form, and riſe perpendicularly to a ſtupendous elevation. Ramſey was formerly cultivated, but is now chiefly appropriated as paſturage for ſheep and horſes. It is abundantly ſupplied with freſh water, for which benefit tradition records that the iſland is indebted to Juſtinian, a devotee from Brittany, who ſettled here in the fifty century. Here were anciently two chapels, one ſacred to Devanus, or Devynoy, and the other to Juſtinian above-mentioned, who was murdered by his ſervants, and buried on the ſpot where the chapel was raiſed to his memory. Ramſey belongs to the biſhop of St. David's, as do likewiſe ſeveral ſmaller iſlands in its vicinity, of which ſeven are diſtinguiſhed by the appellation of the Biſhop and his Clerks. Innumerable flocks of birds frequent and breed on theſe iſlands, and, among other kinds, the celebrated hunting falcon is frequently ſeen. An Hiſtorical Tour through Pembrokeſhire, by Richard Fenton, F. S. A. Carliſle's Topographical Dictionary of Wales, 4to. 1813.

RAMSGATE, a member of the town and port of Sandwich, in the upper half hundred of Ringlow, Iſle of Thanet, lathe of St. Auguſtine, and county of Kent, England, is ſituated on the ſhore of the German ocean, at the diſtance of 72 miles S.E. from London. Like Margate, it was formerly only a ſmall fiſhing hamlet, conſiſting of a few mean, and indifferently built, houſes. In the reign of queen Elizabeth, indeed, it was returned in the maritime ſurvey as having no more than ſeventy ſailors belonging to it, and theſe chiefly fiſhermen. What firſt gave it importance was the extenſion of the Ruſſian trade after the revolution in 1688; but it is chiefly indebted for its preſent conſequence to the improvements made in the harbour ſince the middle of the laſt century; for although a pier for ſhipping exiſted here, at leaſt from the time of Henry VIII., yet it was altogether inadequate to afford ſecurity to the numerous ſhips driven on the coaſt in tempeſtuous weather. Parliament was therefore induced, at the petition of the merchants and ſhip-owners who were intereſted, to paſs an act, ordering a proper harbour to be formed for the reception "of ſhips of, and under, 300 tons burthen." Under this act truſtees were, as uſual, appointed; and in the year 1749-50, the work was begun, according to deſigns by William Ockenden, eſq., and captain Robert Brooke. So many difficulties, however, occurred in carrying it into execution, that the harbour was not completed till the year 1791. The ſum which the whole coſt exceeded 600,000*l.*; but that amount is trivial compared to the great benefit derived from it to our ſhipping intereſt. The area of the harbour is nearly circular, and comprehends about forty-ſix acres. The piers, baſin, &c. are conſtructed of Purbeck and Portland ſtone, principally the latter. The entire length of the eaſt pier, including its flexures, or angles, amounts to nearly 2000 feet; that of the weſt pier is about 1500 feet; the width of the entrance is 240 feet. The general breadth of the piers is twenty-ſix feet, including a ſtrong parapet, which defends the outer ſides next the ſea. What is called the Eaſt Channel, is formed by the paſſage between the eaſt pier and a large bank of ſand which nearly croſſes the harbour as far as the baſin, and is of conſiderable uſe for ſhips to bring up upon, in heavy gales, when driven into the harbour without anchors or cables. Near the north end of the weſt pier is a maſſive frame work of timber, and a ſtaircaſe, called Jacob's ladder, forming a communication from the top to the bottom of the cliff. The eaſt pier is a favourite promenade in ſummer, and is much admired for the peculiarly fine ſea-views which it commands.

In judicial proceedings, Ramſgate is technically denoted the *ville* of Ramſgate. It is in the pariſh of St. Lawrence, and is aſſeſſed to that church, but it maintains its own poor ſeparately, and the inhabitants have the right of chooſing one churchwarden from among themſelves. As an ancient member of the town of Sandwich, it is in ſubjection to the juſtices of that place. The mayor of Sandwich appoints a deputy, or conſtable, here, and the inhabitants are allotted by the commiſſioners of that borough, what proportion of land tax they ſhall pay. A ſmall annual ſum is alſo paid out of the duties collected at Ramſgate harbour towards the ſupport of Sandwich haven. The influx of viſitors to this town of late years has greatly increaſed, and has conſequently occaſioned a conſiderable extenſion of its buildings. A market has been eſtabliſhed for ſeveral years; and the ſtreets are paved, lighted, and watched, under the authority of an act of parliament paſſed in 1785. Here is a ſpacious chapel of eaſe, and ſeveral meeting-houſes for diſſenters of different denominations. The accommodation for the ſummer reſidents are ſimilar to thoſe at Margate, though perhaps leſs numerous, and ſcarcely ſo ſplendid. The aſſembly room and tavern is a ſpacious building adjoining the harbour. It is elegantly fitted up, and contains convenient tea and card-rooms, a billiard-room, and a coffee-room. Here are likewiſe ſeveral good inns, with bathing-rooms, libraries, boarding-houſes, &c. The bathing-place is a fine ſandy ſhore, beneath the cliffs to the ſouth of the pier: the machines are ſimilar to thoſe at Margate, *viz.* a ſort of cloſe caravan, having a door and ſmall flight of ſteps behind, by which the bathers deſcend to the water, and are concealed from view by a pendant covering of canvas. Within the laſt forty years the population of Ramſgate has increaſed almoſt in the ratio of three to one. In 1801, according to the parliamentary returns, it contained 726 houſes, and 3110 inhabitants; but, in 1811, the former were returned as amounting to 919, and the latter to 4221.

Half a mile weſtward from Ramſgate is Ellington, anciently a ſeat of a family of the ſame name, who, towards the end of the reign of Edward IV., were ſucceeded by the Thatchers, another ancient Kentiſh family, from whom it paſſed to the Sparklings. St. Lawrence is a large village, ſituated on the brow of the hill overlooking Ramſgate; the houſes forming a long winding ſtreet along the high road to London. The church here is a ſpacious edifice, conſiſting of a nave, aiſles, and three chancels, with a ſquare tower, ſupported upon four maſſive columns, between the nave and principal chancel. The tower, and part of the body, are of Norman architecture, and on the outſide of the former, by way of decoration,

decoration, appear ranges of fmall femicircular arches fpringing from plain octagon pillars; the capitals of the piers which fupport it alfo difplaying fome curious fculpture. Among the fepulchral memorials here, are feveral in memory of the Sparklings of Ellington, and the Manftons of Manfton-court, an ancient manfion, fituated about two miles to the north-weft of St. Lawrence, now converted into a farm-houfe. Minfter, another village in this vicinity, derives its name from a church or nunnery founded here in 670, by Domneva, wife to Merwald, fon of Penda, king of Mercia. In the early part of life fhe had been left, with her fifter Ermengitha, and her brothers Ethelred and Ethelbright, under the guardianfhip of her uncle Egbert, king of Kent, who murdered the princes, and in expiation of the crime offered to give to Domneva whatever fhe fhould afk. The lady demanded as much land as a tame deer would run over at one courfe, to endow a monaftery, which was accordingly granted to her. When her buildings were raifed, fhe placed therein 70 nuns, and, taking the veil herfelf, became their firft abbefs. She was fucceeded by her daughter St. Mildred, from whom the abbey afterwards was denominated St. Mildred's abbey. This eftablifhment was frequently plundered by the Danes during the eighth and ninth centuries, and at length was fet fire to, and totally deftroyed, together with the nuns, the clergy, and many of the people who had fled hither for fanctuary. The poffeffions of this abbey were fubfequently granted to the monks of the monaftery of St. Auguftine, in Canterbury, by king Canute, and by them the body of St. Mildred was removed to their own abbey. The parifh church of Minfter, which occupies the fcite of the ancient nunnery, appears to have been originally founded about the time of the conqueft, but it has undergone many alterations, and confequently exhibits various ftyles of architecture. The nave, which is the oldeft portion of it, is divided from the aifles by femi-circular arches fpringing from fhort maffive columns. The chancel is vaulted with ftone, as is likewife part of the tranfept. Beauties of England and Wales, vol. viii. by E. W. Brayley. Hiftory of Kent, by Edward Hafted, efq., 8vo. edit. vol. x. Lewis's Hiftory of the Ifle of Thanet, 4to.

RAMSHAGUR, a town of Bengal; 5 miles S. of Dinagepour.

RAMSHYDA, a town of Sweden, in the province of Nericia; 28 miles N. of Orehro.

RAMSIN, a town of Saxony; 3 miles W. of Bitterfeld.

RAMSONS, in *Botany*, a name given to the broad-leaved wild allium. See ALLIUM.

RAMSTADT, in *Geography*, a town of Heffe-Darmftadt; 3 miles S.E. of Darmftadt.

RAMTCHIEU, a lake of Thibet, formed by three feparate rivulets, and furrounded with an incruftation, of a white colour and faltifh tafte. This fubftance is collected and employed for cleanfing and wafhing woollen and cotton cloths, as a fubftitute for foap, to which the inhabitants of the adjacent country are utter ftrangers. Near this lake is a large monaftery, called Lubchea Goomba, feated amidft rocks, which protrude their bafes into the lake, and are bordered with a white foam, produced by its agitated waves. The banks of this lake are perforated with innumerable burrows of a fmall animal, to which they give the name of rat, larger than a mufk rat, of a cinereous grey, without a tail, conceived by Mr. Turner to have been the daman of Ifrael and Egypt, or the Schaphan of the Hebrews. The lake is alfo frequented by great abundance of water-fowl, wild geefe, ducks, teal, and ftorks, which, on the approach of winter, take their flight to milder regions. Prodigious numbers of fauraffes, the largeft fpecies of the crane kind, are here feen at certain feafons of the year, fo that any quantity of eggs may be collected. The lake gradually narrows, and from its northern edge fends off a fmall brook; and at the other extremity it difcharges itfelf into a much larger lake. This lake, it is faid, is held in high refpect by the inhabitants of Bootan, whofe fuperftition leads them to confider the increafe or decreafe of its waters as portentous of good or evil to their nation. They fancy it to be a favourite haunt of their chief deities. Turner's Thibet, p. 212, &c.

RAMTEAK, or RAMTEGH, a town of Hindooftan, in the circar of Goondwana, held facred by the Hindoos, who pretend that Ram collected his army here, prior to his expedition againft Rawun at Lanka, or Ceylon. The Hindoos believe all the Europeans to have defcended from Rawun, and Ceylon to be an immenfe mountain of gold invifible to them. Near the town is a temple, in which they offer up their facrifices and devotions; 15 miles N.E. of Nagpour. N. lat. 21° 23'. E. long. 79° 57'.

RAMTRUT, in *Mythology*, the name of a deity worfhipped by the Kanazins, a people of Hindooftan, where he has a celebrated temple, at Onor. The characters under which he is reprefented more refemble thofe of a monkey than of a man.

RAMULOSE LEAF, in *Botany*. See LEAF.

RAMUNDA, or ROMLA BODA, in *Geography*, a town of Sweden, in Nericia.

RAMURAH. See RAMGUR.

RAMUS, PETER, in *Biography*. See RAMISTS.

RAMUS, in *Anatomy*. This word, fignifying *branch*, and the term *ramification*, are ufed in defcribing the arteries, veins, and nerves, the divifions and fubdivifions of which bear fome analogy to the branching of a tree. In the fame way we fpeak of *trunks* of arteries, &c. and defcribe them as *branching* out.

RAMUS, in the *Anatomy of Plants*, a name given to the firft or lateral branches, which go off from the petiolum, or middle rib of a leaf. The fubdivifions of thefe are called *furculi*; and the final divifions of thefe into the moft minute of all, are by fome called *capillamenta*: but in general, both thefe kinds are comprehended under the name of *furculus*.

RAMUSIO, or RANNUSIO, GIAMBATISTA, in *Biography*, an early collector of voyages and travels, the fon of Paolo, an eminent lawyer, defcended from a learned and diftinguifhed family of Venetian citizens, was born at Venice in 1485. He was in early life deputed by the ftate upon public bufinefs to Switzerland, Rome, and France; and in the latter country he fo much ingratiated himfelf with Lewis XII., that he was by him caufed to travel through almoft the whole of his kingdom. As a reward for his fervices, he was made fecretary of the council of ten at Venice, which poft he at length refigned; and returning to Padua, employed himfelf in compiling his great work, "Raccolta delle Navigazioni e de Viaggi," which was publifhed at different periods between the years 1554 and 1559, in three volumes folio. He had prepared a fourth volume, which was burnt at the printer's. Ramufio died at Padua in 1557; of courfe, a part of his work was given to the world after his deceafe. Ramufio was author of a treatife "De Nili Incremento." He was a man of great learning, and was extremely converfant in hiftory, geography, and the ancient languages: he had fome knowledge in aftronomy, and held a correfpondence with many learned men and well informed perfons, both in Italy and Spain. It was by their affiftance, and at the defire of Fracaftoro, that he compofed the

the work already mentioned. This work was a collection of all the voyages and travels that had hitherto been publiſhed; in which he gave tranſlations of thoſe in foreign languages; and he prefixed diſſertations, in which he diligently examined the pretenſions of different authors, comparing them with one another.

RAN, in our *Old Writers*, is uſed for open and public robbery, ſo manifeſt that it cannot be denied. "Ran dicitur aperta rapina quæ negari non poteſt." Lamb. 125. Leg. Canut. cap. 58. Hence it is to this day vulgarly ſaid of one who takes the goods of another injuriouſly and violently, that he has taken or ſnatched all he could *rap* and *ran*.

RAN, twenty cords of twine, wound on a reel; and every cord ſo parted by a knot, as to be eaſily ſeparated.

RANA, in *Geography*, a town of Auſtria; 12 miles S. of Aigen.—Alſo, a town of Auſtria; 13 miles S.S.W. of Zwetl.

RANA, or *Oranoi*, one of the Sandwich iſlands, in the North Pacific ocean, ſituated about three leagues from Mowee and Morotoi, and lying to the S.W. of the paſſage between theſe iſlands. The country to the ſouth is high and craggy; but the other parts of the iſland had a better aſpect, and appeared to be well inhabited. It produces very few plantains, and bread-fruit trees; but abounds in roots, ſuch as yams, ſweet potatoes, and tarrow. The number of inhabitants is eſtimated at 20,400. Its S. point is in lat. 20° 46′. E. long. 203° 8′. Cook's Third Voyage, vol. iii.

RANA, in *Surgery*. See RANULA.

RANA, in *Zoology*, the frog, a genus of the claſs Amphibia, of the diviſion Reptiles, of which the generic character is: Body four-footed, naked; it generally has no tail, the hind legs are longer than the fore. This genus differs from the *Lacerta* (ſee the art. LIZARD), in having a ſhorter body, broader, thicker head, and in general no tail. The animals of it feed on inſects; they are full grown about the fourth year, and ſeldom live beyond the twelfth. Their fore-feet are moſtly cleft, having four toes: their hind-feet are palmate and five-toed; they are extremely ſalacious, ſticking to the female for days and weeks: the tadpole is excluded from the egg without feet, but with a tail reſembling a fiſh's, which drops off as the legs are protruded; in this ſtate they have likewiſe a ſort of gills and lungs, and many have a ſmall tube on the lower lip, by which they can affix themſelves to other bodies; near the left eye is a veſicle, from which they diſcharge water: in breeding time, the fore-thumb of the male is warty: toads, as we all know, are filthy in their aſpect, and live in damp, obſcure, dark places, and crawl out only by night: their eggs are in a long chain: frogs are more active, and more about by day; theſe lay their eggs in a confuſed maſs.

Dr. Shaw, in his entertaining and inſtructive Zoology, ſays this genus may be divided into three ſections; *viz.* 1. Frogs, commonly called *Ranæ*, with light active bodies, and which leap when diſturbed. 2. Slender-limbed frogs, *Hylæ*, *Calamitæ*, or *Ranæ arboreæ*, *viz.* ſuch as have light bodies, very ſlender limbs, and toes terminating in flat, circularly expanded tips, enabling the animal to adhere at pleaſure to the ſurface even of the ſmootheſt bodies. Several of this diviſion actually reſide on trees, adhering by their toes to the lower ſurfaces of the leaves and branches. 3. Toads, *Bufones*, or ſuch as have heavy bodies, ſhort thick limbs, and which rather crawl than leap when diſturbed.

Gmelin has given a different arrangement, which, according to our uſual cuſtom, we ſhall follow in this article. He divides the genus into three ſections, *viz.* A, thoſe with warty and puffed up bodies; and ſhort legs: theſe are *toads*. B, thoſe with bodies rather oblong, ſmooth and with longer legs: theſe are *frogs*, properly ſo called. And C, whoſe hind feet are very long; and whoſe claws are lenticulate. Dr. Shaw enumerates more than fifty ſpecies, but Gmelin deſcribes only thirty-ſix.

Section A.—*Body warty, puffed up: ſhorter Legs.*

Species.

PIPA; Surinam Toad. The toes of the fore-feet of this ſpecies are unarmed, four-cleft; thoſe of the hind-feet are clawed and palmate.

This hideous and deformed animal inhabits the waters of Guiana, and is actually eaten by the natives. The male, after the excluſion of the eggs, collects the maſs together, and ſmears it over the back of the females with its paws, where they are received into ſmall cells, impregnated by the males and cloſed up; after ſome time the perfect young are excluded from thoſe hollow tubercles on the back of the female.

The ſize of the *Pipa* conſiderably exceeds that of the common toad; the head is flat, broad, and very ſhort; the beak is ſpatula-ſhaped; the eyes very ſmall and remote; neck very ſhort, wrinkled; the body is orbicular, flat, with a hard cartilaginous ſkin; the fore toes are round, and the hind ones very long, connected by an undivided membrane. This ſpecies was firſt made known to the Europeans about the latter end of the 17th century.

MUSICA; Muſical Toad. The ſpecific character of this is, that it has gibbous ſhoulders that are dotted; the body is varied with lurid and brown; the fore-feet are cleft, and the hind-feet are ſubpalmate and five-toed, with ſcarcely any claws. It inhabits the freſh waters of Surinam: it is larger than the common toad: in the evening, and during the whole night, it keeps up a continual muſical kind of croaking; hence it takes its name.

*BUFO; Common Toad. Body lurid and brown: of this animal there are three varieties, as follows: the firſt has its back of an olive colour; and an unequal yellowiſh-red band down the ſide: the body of the ſecond is marked with confluent green ſpots and warts on the ſpots of the ſame colour, thoſe of the intervals red, the ſpaces between bicoloured. The third is particularly diſtinguiſhed for its ſize, being much leſs than the others. This of all the European toads ſeems to be the moſt univerſally known. It is found in ſhady places, in gardens, woods, and fields, and frequently makes its way into cellars, or any obſcure receſſes in which it may occaſionally conceal itſelf, and where it may find a ſupply of food, or a ſecurity from too great a degree of cold. In the early part of ſpring, like others of this genus, it retires to the waters, where it continues during the breeding ſeaſon, and depoſits its ova or ſpawn in the form of double necklace-like chains or ſtrings of beautifully tranſparent gluten, and of the length of three or four feet, in each of which are diſpoſed the ova in a continued double ſeries throughout the whole length, having the appearance of ſo many ſmall jet-black globules or beads; being in reality no other than the tadpoles or larvæ convoluted into a globular form, and waiting for the period of their evolution, or hatching, which takes place in the ſpace of about fourteen or fifteen days, when they break from the ſurrounding gluten, and like the tadpoles of frogs, ſwim about in the water, and are nouriſhed by various animalcules, gluten, leaves of water-plants, &c. &c. till, having arrived at their full growth, the legs are formed, the tail gradually

gradually becomes obliterated, and the animals leave the water, and betake themſelves to the ſurface of the ground. This generally happens early in the autumn, at which period it is not uncommon to find ſuch numbers of the young animals in ſome particular places, that their appearance has frequently given riſe to the vulgar idea of their having been ſhowered from the clouds.

The toad is an animal too well known to require any very particular deſcription of its form. It may be neceſſary to obſerve, that it is always covered by tubercles, or elevations on the ſkin, of larger or ſmaller ſize in different individuals, and that the general colour of the animal is an obſcure brown above, much paler and irregularly ſpotted beneath. The toad, however, is occaſionally found of an olive caſt, with darker variegations; and in ſome ſpecimens, more eſpecially in the earlieſt part of ſummer, the ſhoulders and limbs are marked with reddiſh ſpots, while a tinge of yellow often pervades the under parts both of the limbs and body.

The toad arrives at a conſiderable age; its general term of life being ſuppoſed to extend to fifteen, or even twenty years; and Mr. Pennant, in his Britiſh Zoology, gives us a curious account, communicated by Mr. Arſcott, of Teholt, in Devonſhire, of a toad's having lived, in a kind of domeſtic ſtate, for the ſpace of more than forty years, and of having been, in a great degree, tamed, or reclaimed from its natural ſhyneſs or deſire of concealment; ſince it would always regularly come out of its hole at the approach of its maſter, &c. in order to be fed. It grew to a very large ſize, and was conſidered as ſo ſingular a curioſity, that even ladies, laying aſide their uſual averſion and prejudices, requeſted to ſee the favourite toad. It was, therefore, often brought to table, and fed with various inſects, which it ſeized with great avidity, and without ſeeming to be embarraſſed by the preſence of company. This extraordinary animal generally reſided in a hole beneath the ſteps of the houſe door, fronting the garden; and might probably have ſurvived many years longer, had it not been ſeverely wounded by a raven, which ſeized it before it could take refuge in its hole, and notwithſtanding it was liberated from its captor, it never again enjoyed its uſual health, though it continued to live above a year after the accident happened.

The toad is looked upon with great averſion by the major part of mankind, and it muſt be confeſſed, that its appearance is diſguſting, yet the eyes are remarkably beautiful, being ſurrounded by a reddiſh gold-coloured iris, the pupil, when in a ſtate of contraction, appearing tranſverſe.

We ſhall conclude the hiſtory of this animal, with mentioning the very extraordinary circumſtance of its having been occaſionally diſcovered incloſed, or imbedded, without any viſible outlet, or even any paſſage for air, in the ſubſtance of wood, and even in that of ſtone or blocks of marble. "For my own part," ſays Dr. Shaw, "I have no heſitation in avowing a very high degree of ſcepticiſm as to theſe ſuppoſed facts, and in expreſſing my ſuſpicions that proper attention, in ſuch caſes, was not paid to the real ſituation of the animal. That a toad may have occaſionally latibulized in ſome part of a tree, and have been in ſome degree overtaken or incloſed by the growth of the wood, ſo as to be obliged to continue in that ſituation, without being able to effect its eſcape, may perhaps be granted: but it would probably continue to live ſo long only as there remained a paſſage for air, and for the ingreſs of inſects, &c. on which it might occaſionally feed: but that it ſhould be completely blocked up in any kind of ſtone or marble, without either food or air, appears entirely incredible, and the general run of ſuch accounts muſt be received with a great many grains of allowance for the natural love of the marvellous, the ſurprize excited by the ſudden appearance of the animal in an unſuſpected place, and the conſequent neglect of minute attention at the moment, to the ſurrounding parts of the ſpot where it was diſcovered."

* Rubeta; the Natter Jack. Of this the vent is obtuſe; and it has a yellow line on the back; the body beneath is ſpotted with black, but above it is of a dirty yellow, clouded with brown, and covered with porous pimples of unequal ſizes. This ſpecies frequents dry and ſandy places, and is found on Putney Common, and near Reeveſby-Abbey in Lincolnſhire, where it derives its trivial name. It never leaps, neither does it crawl, with the ſlow pace of a toad, but its motion is more like running. Several are frequently found together, and like others of the genus they appear in the evening.

Gibbosa; Gibbous Toad. Body oval, convex, with a longitudinal cinereous dentate band. A variety has its back marbled with red and yellowiſh-aſh; the belly is yellow, ſpotted with black. The firſt is found in divers parts of India, the ſecond at Surinam.

Bombina; Laughing Toad. Belly orange, ſpotted with ſky-blue; the pupil is triangular. Gmelin gives three varieties of this ſpecies; *viz.* 1. That which is diſtinguiſhed with a black belly, marked with clear white ſpots and points. 2. One which is brown with white ſpots; the ſides and round the joints are red. 3. One which is diſtinguiſhed for its loud ſonorous voice. It is found in the fenny parts of Germany and Helvetia; leaps like a frog; emits a clear ſound like a man laughing: it a good deal reſembles the common toad, but is ſmall, black, and every where rough, with dots on the upper part, and variegated beneath, with tranſverſe wrinkles under the neck.

Salsa; Salt Toad. Above of a dirty olive colour, but beneath it is white, ſpotted with black. This ſpecies is found in the ſtagnant waters of Berchteſgad, and is leſs than the R. arborea, hereafter to be noticed; it avoids the light, is inodorous, and emits no liquid from its minute perforated warts: the legs are marked with brown bands, beneath it is yellow.

Ventricosa; Tumid Toad. The mouth of this is ſemi-ovate, and the throat ovate. A variety is marked with pale white puſtules. It is found in South America, and in ſome parts of India. The body is brown and orbicular; the tubercles on the top of the neck longitudinally diſpoſed; the back has three longitudinal wrinkles; the flanks are tumid and dilated.

Marina; Marine Toad. Shoulders tumid; eye-lids warty, conchate; the hind feet are ſubpalmate: there is a variety, which is ſpotted with brown; beneath it is ſhaded with livid, the neck and ſhoulders are ſpotted with grey. This is found in various parts of America, and is more than ſix inches long. Its body is yellowiſh-grey, with a few rather tawny ſpots: the warts are diſtinguiſhed with an elevated bay ſpot in the middle: the protuberances of the ſhoulders are oval, ſmooth, and porous; the vent is ſurrounded with wrinkled radii; the hind toes are connected only as far as the firſt joint, the laſt joint is fringed with a bay membrane.

Brasiliensis; Braſil Toad. Yellowiſh-aſh, with red waved ſpots, beneath ſmooth.

Arunco; Chili Toad. All the feet of this ſpecies are palmate. It inhabits, as its name imports, the waters of Chili: in its ſize it reſembles the R. temporaria deſcribed below: on the hind toes there is a ſlight appearance of claws.

Lutea;

Lutea; Yellow Toad. The body of this is yellow; all the feet are fubpalmate. This is alfo found in Chili, and much refembles, in its habits, the R. efculenta, but is much lefs; the laft joints of the toes are not connected.

Margaritifera; Pearled Toad. Body brown-red, fprinkled with pale red fpots.

Cornuta; the Horned Toad. This takes its fpecific name from the circumftance of having its eye-lids horned. It inhabits Virginia and Surinam, and of the whole tribe it is the moft deformed. It is faid, indeed, to furpafs all animals in uglinefs. It is thus defcribed: the head is large, and rounded before; the mouth is exceffively large; the eye-lids are foft, mucronate, trifid at the point; the eyes are feated in the middle; the body is of a greenifh-brown, with broad longitudinal whitifh ftripes on the back; the legs are tranfverfely fafciate with brown: when full grown, the back, the thighs, and vent, are fpiny.

Sitibunda; Defart Toad. The fpecific character is, that above it is afhy-glaucous, varied with blackifh-green fpots, beneath of a dirty white; the hind feet are femi-palmate, with the appearance of feven toes. It inhabits the dry defarts near the Ural, fometimes hides itfelf in holes, and crawls out in the evening; it refembles the common toad, but is fomewhat larger.

Vespertina; Siberian Toad. This has a tranfverfe fpot between the eyes, forked behind, and other fpots running obliquely from the eyes to the nofe; the body above is cinereous, with longitudinal fubconfluent brown fpots, varied with different fhades of green; beneath it is dafhed with a whitifh-afh. As its trivial name imports, it inhabits Siberia, and is about the fize of a common toad; it leaps flowly: the head is fhort; the body above is fprinkled with fubwarty papillæ.

Ridibunda; Jocular Toad. Body brown, fpotted above with cinereous; the dorfal line is yellow, or greenifh; beneath it is fmooth, whitifh; haunches brown, fpotted with milk-white. The head of this fpecies is broad; the upper eye-lid is convex, fprinkled with pores; the apertures of the ears are flat; the back is porous; the fides are marked with obfolete warts; the fore thumb is divaricate, thick at the bafe; the next toe fhorter than the reft; the hind limb fubfafciate; the hind feet have a callus within, refembling a fixth toe; the toes have a wart beneath, near the joints.

This fpecies is found in great numbers near the rivers which empty themfelves into the Cafpian fea; it never ventures on the dry land; it is very large, and frequently weighs more than half a pound: it refembles the R. temporaria, but is broader and fhorter; its voice in the evening is like that of a man laughing.

Variabilis; Changeable Toad. Colour variable; back and fides gibbous; warts yellowifh in the centre; it is very fmall on the middle of the back, and larger on the moft prominent part of the flanks. It inhabits the fhady places in Germany, and is only about two inches long: in its habits, it holds an intermediate place between the toad and frog; when full awake its body is white, with green fpots; in the heat of the fun it is entirely cinereous; when afleep, the fpots are only cinereous, and when torpid the body has a flefh-coloured caft.

The head is rounded, and the mouth without teeth; the margin of the upper jaw is doubled; the tongue is flefhy, thick, placed far back, the bafe obfcurely bifid, very entire at the tip; it has hardly any upper eye-lid, the lower one is folding; cavities of the ears white; the warts refemble teats, very numerous on the groin; the chin is marked with prominent dots; the colour, when preferved in fpirits, is yellowifh, and above it is of a pale olive; the fore feet are three-toed, beneath they are emarginate, the thumb is larger; the fecond toe of the hind feet is very long.

Section B.—*Body more oblong, fmooth; Legs longer.* Frogs.

Species.

Typhonia; Hurricane Frog. Of this fpecies, the diftinguifhing characteriftic is, that the lobes of the ears are oval. It inhabits America, and is faid to make a noify croaking before hurricanes and whirlwinds. The back is marked with four longitudinal wrinkles, elevated points, and black fpots; the hind toes are narrow, without claws, the fecond is very long.

Pentadactyla; Mackarel Frog. All the legs are fafciate, five-toed; body veined, the dorfal ftreaks tranfverfe, the lateral ones are ocellate. There is a variety which is brown; the fore feet have four toes, with the rudiment of a fifth; the hind feet have five toes, with the rudiment of a fixth.

Ocellata; Ocellate Frog. The ears are marked with an ocellate fpot; feet with claws, the hind ones fub-palmate. It inhabits America.

Pipiens; Clamorous Frog. This is green, with numerous ocellate fpots, furrounded with a yellowifh ring. This fpecies is fmaller than the *green* frog, but, in its general habits, it bears a confiderable refemblance to that animal. It is a native of North America, and frequents rivulets and ditches of water, and is fo ftrong and vigorous, that it is faid it can leap to the diftance of five or fix yards. In the fpring and beginning of fummer, it is faid to indicate the approach of rain by the peculiar found which it emits. In the living animal the ears are of a fhining gold colour; the region of the anus is very much wrinkled; the third fore toe from the thumb longer than the reft; the body refembles that of the efculent, or green frog, but the hind thighs are longer; the fhanks are longer ftill, and hind feet are longer than thefe, marginate on each fide; the toes are connected nearly to the tip, the fourth is longer than the reft.

Bicolor; Blue and Yellow Frog. Colour blue, ochreous beneath, feet unwebbed; toes flattened and orbicular. This elegant fpecies is of a moderate fize; it meafures more than four inches in length. The whole of the upper furface is of a beautiful blue, while the under parts are of a pale orange, or ochre colour. The head is large, the mouth wide, and the tip of the nofe truncated. All the toes are furnifhed with a large orbicular tip, and beneath each of the joints there is a procefs or tubercle. The upper parts of the female have a deeper fhade of violet than thofe of the male. It is fuppofed to be a native of Surinam.

Maxima; the Great Frog. All the feet are palmate, as well as the toes, fafciate; body veined and variegated; the top of the back obliquely fpotted. Bands of the legs in pairs, approximate, above confluent.

Alpina; Alpine Frog. This is entirely black, and inhabits the declivities of the mountains in Auftria.

Venulosa; Veined Frog. Feet cleft; the body veined with confluent fpots. It inhabits India and South America.

Virginica; Virginian Frog. Cinereous, fpotted with red, beneath it is yellowifh; the back is five-angled, with as many ftripes. It is found in Virginia.

* Temporaria; or Common Frog. The back of this is flattifh and fub-angular. There is a variety, which is of a dirty olive colour, with large warty fpots, the head above plain, beneath whitifh; twice the fize of the common frog. Both are found in this country, and the latter alfo in Perfia; it lives, during the fpring, in water, among toads, and in the fummer

fummer on land, at which time it is filent; it feeds on various infects, and is the prey of ducks and cranes, croaks very much when in muddy ditches; the variety makes, by night, a noife like that of an angry man.

Of all the European fpecies this is the moft common. The general colour is of an olive-brown, variegated on the upper parts of the body with irregular blackifh fpots. The patch beneath each eye, which reaches to the fetting on of the fore-legs, feems to conftitute one of the principal fpecific diftinctions. The under part of the body is of a pale greenifh colour, and obfcurely fpotted. But it ought to be obferved, that the colour of the frog varies at different feafons of the year, and perhaps in different places. Towards the end of fummer, for inftance, the colours are much brighter; and as this fpecies frequently cafts its fkin, the cuticle falling off irregularly from different parts of the body, produces confiderable variations in the intenfity of the colours.

The frog has a light elegant form and a lively appearance; the limbs are well calculated for its peculiar motions, and the hind feet being ftrongly webbed, enable it to fwim well. The frog, it is faid, does not reach its full fize till it is five years old, and it lives from twelve to fifteen years. It retires during the heat of fummer to the water, and in winter it becomes torpid, and is generally found in the foft mud at the bottom of ftagnant waters, or in the cavities beneath their banks, where it remains till the return of fpring.

The frog, as well as many other of the reptile tribe, is extremely tenacious of life. It furvives, for a confiderable time, the lofs even of fome of its effential organs, and it has been found to exift for feveral days when entirely confined under water.

The frog depofits its fpawn in the month of March. This is compofed of a gelatinous tranfparent mafs, including the ova or eggs, in each of which is imbedded the embryo or tadpole, which has then the appearance of a round black globule. The period of hatching varies according to the temperature of the feafon, but it is commonly in about a month or five weeks. In its progrefs the egg becomes gradually larger, and before the tadpole is excluded, it is feen in motion within the furrounding gluten. When they are firft hatched, their only food is the remains of the gluten in which they were included. A few days afterwards, if they are minutely examined, a pair of ramified branchiæ, or temporary organs, may be obferved on each fide of the head, which after a fhort time difappear. The tadpole, which is fo extremely unlike the animal in its perfect ftate, feems to confift only of a head and tail. The head is large, black, and roundifh; the tail is flender, and margined with a broad tranfparent fin. The motions of the tadpole are very lively. Its food confifts of duck-weed and other fmall water plants, with different kinds of animalcula. The mouth is furnifhed with very minute teeth, and when the tadpole has reached a certain fize, it may fometimes be heard gnawing the edges of the leaves on which it feeds. By means of a fucker placed between the lower jaw, with which the animal in this ftate is furnifhed, it can attach itfelf at pleafure to the under furface of aquatic plants. When it is very young, it fometimes hangs from this part by means of a glutinous thread, fimilar to fome fmall flugs.

The internal ftructure of the organs of the tadpole is very different from that of the future animal. In no refpect is this difference greater than in the difpofition of the inteftines, which are coiled in the form of a flat fpiral, like a cable. The firft change which appears on the tadpole is at the end of five or fix weeks after it is hatched. It is about this time that the hind legs firft appear; and gradually increafing in length and fize, they are fucceeded about two weeks afterwards by the fore legs. Thefe latter, indeed, are formed at an earlier period beneath the fkin, and are fometimes protruded, and again drawn back by the animal, through a fmall hole on each fide of the breaft, before their complete evolution. The tail now gradually decreafes, and afterwards more rapidly, fo that in the fpace of a day or two, it is quite obliterated. After this change, the animal leaves the water, and covers the banks in myriads. The fudden appearance of fuch multitudes of young frogs, has probably induced the groundlefs but popular belief, of their having fallen from the clouds in fhowers. The frog having now arrived at its perfect form, it changes entirely the nature of its food. It lived formerly on vegetables, now it depends folely for its exiftence on animal food. It lives chiefly on fmall fnails, worms, and infects. To feize its prey, the ftructure and pofition of the tongue are remarkably well fitted. It is of confiderable length, and is attached to the fore part of the mouth; and when at reft it lies backwards. The extremity is bifid, and fecretes a glutinous matter, fo that in this way it can fecure its prey, by darting out its tongue with great celerity, and to fome diftance from the mouth. This it does with fo inftantaneous a motion, that it is fcarcely perceptible to the eye.

MARGINATA; Bordered Frog. The fides of this are marginate, and the feet cleft. It inhabits India and South America.

* ESCULENTA; Efculent, or Edible, or Green Frog. Of this fpecies the diftinguifhing characteriftics are, that it is of an olive colour, fpotted with black, with three yellowifh lines on the back; the abdomen is whitifh.

Of all the European frogs this is the largeft fpecies. The general appearance is very like that of the R. temporaria, but it is larger in fize, and of an olive-green colour, ftrongly marked on the upper part of the body with roundifh black fpots. The limbs are elegantly marked with tranfverfe bands of the fame colour. Three diftinct pale yellow ftripes run from the tip of the nofe down the whole length of the back; the middle one being flightly depreffed, but the two lateral ones are confiderably elevated. The head is proportionably larger than that of the common frog.

The green frog is rare in England, but is very common in France, Italy, and Germany, where it is employed as an article of food.

This fpecies, it is obferved by naturalifts, does not leave its winter retirement till a much later period than the common frog; and in thofe countries where it is ufed as food, it is worth while to attend to this fact: for if they are pretended to be brought to market at an earlier period, the common frog, and fometimes even toads, muft be fubftituted. During the breeding feafon, the croaking of the male is fo loud, that it may be heard at a great diftance; and in thofe places where they are numerous, it becomes fo intolerable to thofe who are unaccuftomed to hear them, that they are often deprived of fleep. At this time, too, a large inflected globular veficle is protruded from each fide of the head of the male. The globules of fpawn in the green frog are proportionally fmaller than in the former fpecies: they have fomewhat of a yellowifh caft. The progrefs of the tadpole, towards the evolution of the perfect animal, is confiderably flower in this fpecies. The fore legs do not appear before October, and the animal does not affume its perfect fhape till the beginning of November. The tail at this time begins to decreafe, and in the fpace of four days entirely difappears.

This fpecies is extremely voracious, feizing, it is faid, on young

young birds of different kinds, mice, and even ducklings, and, as it does with the reft of its prey, fwallowing them whole. At the end of four years it has reached its full growth. It begins to breed the year following, and the period of its life is fometimes extended to fixteen years.

Australisia; Auftralian Frog. The body of this is brown above, beneath blueifh; the fides are fpeckled with ochre colour; the toes of the fore feet are fpiny. It inhabits New Holland. The fecond toe of the hind foot is very long; the claws are red.

Paradoxa; Paradoxical Frog. This is of a yellowifh and olive colour, variegated with rufous bands; the hind legs or thighs are obliquely ftreaked.

In its general form this fpecies refembles the R. temporaria. The oblique longitudinal ftripes on the hind legs conftitute the principal mark of diftinction. There are four toes on the fore feet, and they are unwebbed; the hind feet have five toes, and are deeply palmated to the very ends of the toes. Near the fhorteft toe there is an oblong callus, forming a fpurious one. The upper jaw is befet with a row of fmall denticulations. This fpecies is a native of South America, and is more common in Surinam than in other places.

Naturalifts, fays Dr. Shaw, have been extremely puzzled with regard to the real nature of what has been taken for the tadpole of this frog. At one time it was confidered by Linnæus as a fpecies of lizard, and therefore arranged by him under the genus lacerta. At another time he has placed it under the prefent genus, with the fpecific name pifcis. It was defcribed by Edwards under the denomination of the frog-fifh of Surinam. The ftructure of the animal, which has been the fubject of fo much difcuffion, fhews clearly that it is the larva or tadpole of a frog; and it is fuppofed, with no fmall degree of probability, that the differences in the accounts given of this animal by naturalifts have arifen from the different ftages of its progrefs, in which it has been found. But as this tadpole is fo much larger in fize, in proportion to the perfect animal, than any other fpecies yet known, it may be the larva or tadpole of fome of the larger fpecies, and not that of the R. paradoxa, which is but a fmall frog.

C. *Hind Feet very long; the Claws lenticulate.*

Arborea; Tree-Frog. The body of this fpecies is green, beneath granulate; feet cleft. Gmelin enumerates five varieties of this fpecies. 1. Thofe which have four toes to their fore feet, and five to thofe that are behind; the knees are warty beneath. 2. Thofe that are of a green colour, with a ftraight yellow line on each fide. 3. The body of this variety is reddifh. 4. Of this it is brownifh-green. 5. The flendernefs of the body marks this variety.

"In the beauty of its colours," fays Dr. Shaw, "as well as in the elegance of its form, and agility of its movements, the tree-frog exceeds every other European fpecies. It is a native of France, Germany, Italy, and many other European regions, but is not found in the Britifh iflands. Its principal refidence, during the fummer months, is on the upper parts of trees, where it wanders among the foliage in queft of infects, which it catches with extreme celerity; ftealing foftly towards its prey, in the manner of a cat towards a moufe, and, when at the proper diftance, feizing it with a fudden fpring, frequently of more than a foot in height. It often fufpends itfelf by its feet, or abdomen, to the under parts of the leaves; thus continuing concealed beneath their fhade. Its fize is fmaller than any European frog, except the R. bombina. Its colour, on the upper parts, is more or lefs bright in different individuals; the abdomen is whitifh, and marked by numerous granules; the under furface of the limbs is reddifh; and the body is marked on each fide by a longitudinal blackifh or violet coloured ftreak, feparating the green of the upper parts from the white colour of the lower: the inferior edge of this dark lateral ftripe is tinged with yellow. The body is fmooth above, and moderately fhort or plump; the hind legs are very long and flender; the fore feet have four, and the hind feet five toes, all of which terminate in rounded, flat, and dilated tips, the under furface of which, being foft and glutinous, enables the animal to hang with perfect fecurity from the leaves of trees, &c. The fkin of the abdomen is alfo admirably calculated by nature for this peculiar power of adhefion, being covered with fmall glandular granules, in fuch a manner as to faften clofely even to the moft polifhed furface; and the animal can adhere at pleafure to that of glafs, in whatever pofition or inclination it be placed, by merely preffing itfelf againft it.

Though the tree-frog inhabits the woods during the fummer months, yet, on the approach of winter, it retires to the waters, and there fubmerging itfelf in the foft mud, or concealing itfelf beneath the banks, remains in a ftate of torpidity; and again emerges in the fpring, at which period it depofits its fpawn in the waters, like the reft of this genus. The male at this period inflates its throat in a furprifing manner, and exerts a very loud and fharp croak, which may be heard to a vaft diftance. The fpawn is depofited about the end of April, in fmall cluftered maffes; the inclofed globules or embryos being of a pale yellowifh-brown colour. The tadpoles become perfect frogs, by the total decay of the tail, about the beginning of Auguft; and foon begin to afcend the neighbouring trees, where they continue to refide during the remainder of the warm feafon; as do likewife the parent animals, after the breeding feafon is paft. During their refidence among the trees, they are obferved to be particularly noify on the approach of rain; fo that they may be confidered, in fome meafure, as a kind of living barometers; more efpecially the males, which, if kept in glaffes, and fupplied with proper food, will afford an infallible prefage of the changes of weather.

Leucophyla; White-fpotted Frog. Body fmooth, hoary, with oblong milk-white fpots; the fore feet are lobate, the hind feet palmate. It inhabits America, and weighs only about forty-fix grains. Eyes of a fine golden colour, and between thefe, on the fides and middle of the back, there are oblong white fpots; the haunches are flender.

Squantigera; Scaly Frog. In this a fcaly band reaches half-way round the back; the fides and throat have folds; the fore feet are femi-palmate, the hind feet are palmate. This is about two inches long, and is fuppofed to be an inhabitant of America. The body is varied with grey and brown in thick aggregate fpecks, and a few fpots down the hind part of the back, in a ferpentine direction; the band confifts of minute, fub-pellucid, rhomboid, imbricate fcales; the hind limbs are twice as long as the fore.

Boans; Croaking Frog. Body fmooth, with continuous dots beneath; feet palmate. There are two varieties. 1. The body above is of a blueifh lead-colour. 2. The body of this is inclining to orange. It is found in America, and differs only from the tree-frog in having the feet webbed, and the body marked with white fpots.

RANARIDL, in *Geography*, a town of Auſtria; 11 miles S. of Aigen.

RANASAGUR, a town of Hindooſtan, in Bahar; 18 miles W. of Arrah. N. lat. 25° 37′. E. long. 84° 31′.

RANCAGUA, a juriſdiction of South America, in Chili. It derives its name from the inhabitants living in ſingle houſes, without the appearance of a village; every family lodging in their lonely cottage, four, ſix, or more leagues from each other. It is not, however, without a capital, conſiſting of about 50 houſes, and between 50 and 60 families, moſt of them being Meſtizos, though their caſt is not perceivable by their complexion. The whole juriſdiction may contain about 1000 families, Spaniards, Meſtizos, and Indians. Ulloa's Voyage, vol. ii.

RANCE, Armand-John le Bouthillier de, in *Biography*, the inſtitutor of the order of La Trappe, was of noble deſcent, and born at Paris in the year 1626. At a very early period he exhibited an extraordinary genius for claſſical and polite learning; and at the age of 10 he had read many claſſical works, in the Greek as well as the Latin languages, and is ſaid at that early period to have underſtood Homer. When he was only 13 years of age, he prepared for the preſs a new edition of Anacreon, with notes, that diſplayed conſiderable talent and reſearch. This was publiſhed in 1639. Four years previouſly to this, he had received the clerical tonſure, and had been nominated a canon of Notre Dame at Paris. He was promoted by the king to the ſinecure priory of Boulogne, near Chambor; and he was ſubſequently promoted to three different abbies, among which was that of La Trappe, and to other places of honour and truſt in the church. He ſtudied divinity at the Sorbonne, and in 1651 he was ordained prieſt; and in leſs than three years, the degree of doctor of divinity was conferred upon him by the faculty of the Sorbonne. Having thus completed his ſtudies, he entered into the world, and, like one broken from his ſhackles, he devoted himſelf eagerly to its honours, pleaſures, and gaieties. He ſoon became a favourite at court, and was appointed almoner to the duke of Orleans, and one of the deputies of the ſecond order in the aſſembly of the clergy in 1655. On a ſudden, and for a cauſe that never was well underſtood, he became diſguſted with the world, and reſolved to renounce for ever its pleaſures, enjoyments, and vanities. No ſooner had the abbè de Rancè formed the reſolution than he withdrew to his eſtate in the country, to deliberate concerning the mode of life which he ſhould purſue. Having made up his mind to embrace the monaſtic life, he ſold his eſtate, and beſtowed the money which it produced on the Hôtel-de-Dieu at Paris. He alſo reſigned all his benefices and dignities, excepting his priory of Boulogne, and the abbey of La Trappe; the latter of which he retained by a ſpecial permiſſion of the king, in order to introduce into it a reformation of the ſtatutes and diſcipline. He took the habit, and made his profeſſion in the year 1664, and ſet about eſtabliſhing the gloomy and auſtere diſcipline of monkery in its full perfection. The place itſelf ſeemed peculiarly adapted to the horrid ſyſtem which he eſtabliſhed, being the moſt gloomy, barren, and deſolate ſpot in the whole kingdom of France. Here the days of the monks were conſtantly ſpent in prayers, tears, contemplation, ſilence, the peruſal of holy books, the hardſhips of bodily labour, and the practice of the moſt rigid auſterities. All other deſigns and occupations, however laudable and excellent in themſelves, they were to regard as vain and ſinful to perſons of their order. The leaſt relaxation, or amuſement of the moſt innocent nature, they were not allowed; and they were prohibited from engaging at all in literary ſtudies. Strange! that a mind ſtored with liberal knowledge, and diſtinguiſhed by good taſte, ſhould have been ſo far perverted by ſuperſtition and fanaticiſm, as to deviſe or ſanction ſuch regulations.

That the world might be acquainted with the diſcipline of his community, he publiſhed "A Treatiſe on the Sanctity and Duties of the Monaſtic State." As de Rance advanced in years, the ſevere diſcipline to which he ſtrictly conformed, rendered him ſo infirm, that, finding himſelf unequal to the duties of his poſt, he reſigned it into the king's hands, but was permitted to appoint his ſucceſſor. At length, worn out with infirmities and mortifications, and lying on a bed of aſhes and ſtraw, he died in 1700, in the 74th year of his age. He was author of a great number of theological and other pieces, among which may be mentioned "Moral Reflections on the Four Evangeliſts;" "The Conſtitution and Rules of the Abbey of La Trappe," in 2 vols.; and "A Diſcourſe on Purity of Intention." Moreri.

RANCHANO, a ſmall iſland near the coaſt of Darien, in the Pacific ocean.

RANCHERIA, a town of South America, in the viceroyalty of Granada, and province of St. Martha; 20 miles N.E. of Hacha. N. lat. 11′. W. long. 72° 36′.—Alſo, a ſmall iſland in the Pacific ocean, near the coaſt of Veragua. N. lat. 7° 50′. W. long. 82° 16′.

RANCHERIAS, a name given, in the province of Panama, to aſſemblages of Indian huts under the juriſdiction of a village. Theſe rancherias are ſituated to the ſouthward, in the ſmall chaſms or breaches of the mountains.

RANCID, in *Rural Economy*, from the Latin *rancidus*, of *rancio*, *to be rank*, a term applied to ſubſtances, which have contracted a ſtrong offenſive ſmell and taſte by keeping, as bacon, butter, and all fat ſubſtances are apt to do. It would be a very uſeful diſcovery, to find out any eaſy ſimple method of preventing this effect from taking place.

RANÇON, in *Geography*, a river of France, in the department of the Lower Seine, which runs into the Seine, at Caudebec.—Alſo, a town of France, in the department of the Upper Vienne; 8 miles E. of Bellac.

RANCONET, Aimar de, in *Biography*, a learned and worthy magiſtrate, who flouriſhed in the 16th century, was born at Bordeaux, in which city his father was an advocate of parliament. Having received the advantages of a good education, he became deeply ſkilled in the Roman law, to the ſtudy of which he joined that of philoſophy, mathematics, and antiquities. Having been ſome time a counſellor in the parliament of Bourdeaux, he was raiſed to the poſt of preſident of the fourth chamber of inqueſts in that of Paris. The religious contentions of the time were fatal to him. When the cardinal of Louvain aſſembled the parliament of Paris, to procure its opinion concerning the puniſhment of heretics, Ranconet brought the works of Sulpicius Severus, and read aloud the paſſage in which that writer cenſures the execution of Priſcilian; upon this the prelate cauſed him to be impriſoned in the Baſtille, where he died of grief in 1559, at the age of 60. His latter days had been ſingularly unfortunate. He was reduced by want to be a corrector of the preſs to the Stephenſes; he ſaw his daughter die on a dunghill, and his ſon executed, and his wife was killed by lightning. This learned man publiſhed ſcarcely any thing in his own name, but contributed much to the labours of others. He is ſaid to have had the chief part in the valuable treatiſe, "De Verborum Significatione," and in the "Formulæ" of Briſſon; and Pithou aſſerts,

asserts, that he compiled the Dictionary that bears the name of Charles Stephens. He wrote "Le Tresor de la Langue Françoise, tant ancienne que moderne." Moreri.

RANÇONNIERES, in *Geography*, a town of France, in the department of the Upper Marne; 9 miles W. of Bourbonne.

RANDAL, *Dr.* John, in *Biography*, organist, doctor in music, and music professor in the university of Cambridge. He was brought up in the king's chapel, was one of the children of that choir who first performed in Handel's oratorio of Esther, at the house of Bernard Gates, master of the boys in James-street, Westminster, on Wednesday, February 23, 1731, when it was performed in action, previous to its having been heard in public, or any where but at Cannons, the magnificent seat of the duke of Chandos, for whose chapel it was composed in 1720.

Randal was never rated very high in his profession: he was regarded as a slight organ-player, and had never distinguished himself as a composer. He obtained his degree at the installation of the duke of Grafton in the university of Cambridge, for which he composed the ode written by Mr. Gray, to the astonishment of all the musical profession, by undertaking to have it performed by the musicians resident in the university, without putting his grace to the expence of additional hands and voices from London, as Drs. Greens and Boyce had thought necessary on former occasions at Cambridge, and Dr. William Hayes at Oxford.

As Dr. Randal's professional life was unmarked by talents, his death, which happened in 1799, was hardly noticed, except by the candidates for the professorship, and his organist's places.

RANDALSTOWN, in *Geography*, a post-town of Ireland, in the county of Antrim, in the neighbourhood of which is Shanes castle, the seat of lord O'Neill. It is situated on the river Maine, to the northward of lough Neagh. Randalstown is 4 miles N.W. from Antrim, and 88 N. by W. from Dublin. Before the union, it was represented in parliament. Carlisle, &c.

RANDANS, a town of France, in the department of the Puy-de-Dôme, and chief place of a canton, in the district of Riom; 12 miles N.E. of Riom. The place contains 1047, and the canton 7996 inhabitants, on a territory of 130 kiliometres, in 11 communes.

RANDASALMI, a town of Sweden, in the government of Kuopio; 52 miles S. of Kuopio.

RANDAZZO, a town of Sicily, in the valley of Demona; 25 miles W. of Taormina. N. lat. 37° 57′. E. long. 15° 4′.

RANDEER, a town of Hindoostan, in Guzerat, on the Taptee, opposite to Surat.

RANDEGG, a town of Austria; 8 miles N.N.E. of Bavarian Waidhoven.

RANDERADT, a town of France, in the department of the Roer; 10 miles N.W. of Juliers. N. lat. 50° 59′. E. long. 6° 8′.

RANDERS, a town of Denmark, in North Jutland, on the Gulden. This town is reduced, and has now only one parish church, a grammar-school, an hospital, and a chapel near the town. The chief articles of trade consist of leather gloves, salmon, earthen-ware, and strong beer. It was formerly well fortified; 20 miles E. of Viborg. N. lat. 56° 28′. E. long. 10° 3′.

RANDERSACKER, a town of the duchy of Wurzburg, on the Maine; 2 miles S. of Wurzburg.

RANDIA, in *Botany*, was so named by Houstoun and Linnæus, in honour of Mr. Isaac Rand, F.R.S., an apothecary in London, who filled the place of lecturer and demonstrator of botany in the Chelsea garden, from the year 1722 to 1739. He published in 1730 an octavo index of the officinal plants of that collection, 518 in number, specifying the part of each used in physic. He also printed, in 1739, a general catalogue of the Garden. His name often occurs among the botanists of that period. The *Randia*, however, of which two supposed species are defined in Linn. Sp. Pl. 213, 214, by the names of *mitis* and *aculeata*, both West Indian shrubs, is now sunk in Gardenia; see that article, where we have suggested a doubt, possibly not well founded, of the propriety of this measure. Both species of *Randia* are united by Willdenow, Sp. Pl. v. 1. 1230, on the authority of Swartz, as well as in Ait. Hort. Kew. v. 1. 370, under the name of *Gardenia Randia.* This plant, sent by Houstoun to Miller, before the year 1733, does not appear to exist in our stoves at present. Its form may be seen in Browne's Jamaica, 143, t. 8. f. 1. That author says the pulp of the berries stains paper or linen of a fine permanent blue, which resists the action of soap and of acids. The shrub is frequent in the low lands of Jamaica, on the most barren clay soil.

RANDNITZ, in *Geography*, a town of Bohemia, in the circle of Schlan; 12 miles N.N.E. of Schlan. N. lat. 50° 23′. E. long. 14° 24′.

RANDOLPH, Thomas, in *Biography*, an English poet of great celebrity, was born at Newnham, in Northamptonshire, in 1605. He was educated at Westminster school, and having completed his course, he was elected to Trinity college, Cambridge. He shewed an early turn for poetry, and at ten years old wrote "The History of the Incarnation of our Saviour," in verse. He acquired an unfortunate, and, to him, a fatal habit of conviviality, which diverted him from the pursuit of any profession, and which led him to waste his scanty patrimony, and his health, in the company of wits and men of pleasure in the metropolis. He died in his 30th year, to the great regret of those who admired his poetry and loved his company. He possessed an excellent genius, and had his life been extended, it has been thought he might have attained to a very high rank among the poets of his age. His miscellaneous poems were collected after his death by his brother, who published them at Oxford, in 1640. They have been, but not of late years, several times reprinted. He likewise composed six dramatic pieces of the comic class, one of which, "Hey for Honesty, down with Knavery," was taken from the Plutus of Aristophanes. His pieces are said to be some of the best in the manner then prevalent, which consisted in playing with words and thoughts, and connecting remote ideas by fanciful resemblances. His expressions are often elegant, and his verses harmonious. His friend, sir Christopher Hatton, caused, at his own expence, a monument of white marble to be erected over his grave, the inscription on which, in Latin and English verse, was made by Peter Hausted. Biog. Brit.

Randolph, John, a learned prelate of the church of England, descended from a respectable family in Kent, was born July 6th, 1749. He was the younger son of Dr. Randolph, formerly president of Corpus Christi college, Oxford, who died in March 1783, after having presided over the college for the long space of 35 years. The president's father was recorder of Canterbury, and had several sons, among whom was Dr. Francis Randolph, principal of Alban Hall, Oxford. The whole family have been remarkable for their orthodox zeal and attachment to the established religion of the country. The subject of this article became a student of Corpus Christi college, Oxford, where he took his several degrees, that of D.D. he had by diploma in 1783. Previously

viously to this he had been appointed prelector of poetry, proctor, and in 1782 Regius professor of Greek. In this same year he was made prebendary of Salisbury, canon of Christ-church, and Regius professor of divinity; and in 1783 rector of Ewelme. In 1799 he was elevated to the bishopric of Oxford, from which he was translated to that of Bangor in 1807, and then to the metropolitan see of London in the year 1809. Notwithstanding these high preferments he passed a great part of his life in the university of Oxford, and it was generally believed that when he was elevated to the see of Oxford, the university was complimented with the nomination by the crown. His lordship was author of many single sermons, and charges delivered on different occasions: also of "De Græcæ Linguæ Studio Prælectio habita in Scholâ Linguarum," 1783, and "Concio ad Clerum in Synodo Provinciali Cantuariensis Provinciæ ad D. Pauli," 1790. His lordship was a zealous promoter of the *National schools* in opposition to those founded by Lancaster, and he was understood to be a violent opponent to the bible society, and to the spread of what has been termed Sectarism. One of his last works was a Report of the Progress made by the National Society, to which the general committee referred in terms of gratitude, at their first meeting after his lordship's decease, in the following terms; "whose latest employment had been to state, for the information of the public, the progress of a work to which he had contributed his time, his labour, and his counsels, the committee could not fail to entertain a common sentiment of profound regret for the loss which they have sustained, and to cherish in their minds the liveliest recollection of the service which has been so succesfsully fulfilled by him in this second report. They wish, therefore, to add to this document, designed for general circulation, their sense of what is due from the public, and themselves, to the memory of one who was a constant and assiduous promoter of this salutary institution, from its first establishment to the last hour of his life.—The committee trust, that this testimony, though limited to a single object in the large field of pastoral duty in which he was incessantly engaged, may serve to denote the benefits which have resulted from his prompt, unwearied, and effectual exertions." The following is the character drawn of him by Mr. archdeacon Jefferson, and which alludes to his zeal for the church of which he was an active member. "Fearless now of being censured for mercenary adulation, or reproved by unconscious merit, a just tribute may be paid to the character of that departed and exalted prelate, who is, and will be, most lamented where he was best and most entirely known. This opportunity, therefore, is willingly embraced of offering a heart-felt condolence to the ministry of the diocese on the affecting and important loss, which, in these perilous times of contending sects and unsettled opinion, has arisen to them, and to the church:—To them, in the premature privation of a diocesan, firm in his support of ecclesiastical authority, but considerate in its application; eminently versed in the letter of ecclesiastical law, but liberal in its practical construction, reluctant in interference, but determined in duty, slow in the profession of service, but prompt in its execution; disinterested in patronage, unwavering in measures, correct in judgment, attentive in counsel, and kind and compassionate to distress:—To the church, in the premature privation of a father, diligent in her rites and services, but unostentatious in piety and devotion; sound and unrelaxing in her doctrines and faith, but discreet in zeal, and comprehensive in charity; ever vigilant in defending her interests, ever forward in asserting her privileges, and ever able in the assertion and the defence." The bishop died suddenly on the 28th of July 1813. He was one of the governors of the Charter-house; trustee of the British Museum; dean of the Chapel royal; visitor of Sion college; and provincial dean of Canterbury. Gent. Mag.

Randolph, in *Geography*, a post-town of America, in Massachusetts, formed of the S. precinct of Braintree, in Norfolk county, in the year 1783; 15 miles S.E. of Boston. The inhabitants are mostly farmers, but manufacture large quantities of shoes for market.

Randolph, a county of Hillsborough district, in North Carolina, bounded N.E. by Orange, and N.W. by Guildford. The number of inhabitants is 10,112, and they are mostly Quakers; the other denominations are Presbyterians, Baptists, Methodists, and Universalists. Their good land produces 40 or 50 bushels of Indian corn, or 20 of wheat, *per* acre. The chief town is Ashborough.

Randolph, a county of Virginia, bounded N. by Monongalia, and S. by Pendleton. The number of inhabitants is 2854.

Randolph, a post-town in Orange county, Vermont, being the 4th town W. of Thetford, on Connecticut river. The number of inhabitants is 2255. White river, by its two branches, waters the E. and W. side of the town. It has a large bed of iron ore, two forges, and a slitting mill. The congregational meeting-house has a steeple, and is large; 47 miles from Rutland.

Randolph, a county of the Indiana territory.

Randolph, a town of Morris county, in New Jersey, containing 1271 inhabitants.

RANDOM, a township of Essex county, in Vermont, W. of Brunswick.

Random *Island*, a small island in Trinity bay, near the E. coast of Newfoundland. N. lat. 48° 15′. W. long. 53° 40′.

Random-*Shot*, a shot made when the muzzle of a gun is raised above the horizontal line, and is not designed to shoot directly, or point-blank.

The utmost random of any piece is about ten times as far as the bullet will go point-blank; and the bullet will go farthest when the piece is mounted to about forty-five degrees above the level range.

The space or distance of the random is reckoned from the platform to the place where the ball first grazes.

RANDOW, in *Geography*, a river of Brandenburg, which runs into the Ucker; three miles S. of Uckermunde.

RANDS, a lake of Norway, in the province of Aggerhuus, 35 miles long, and two broad; 20 miles N. of Christiania.

RANDSBERG, a town of Sweden, in West Gothland; 76 miles E. of Uddevalla.

RANDYCHOAR, a town of Bootan; 18 miles N. of Beyhar.

RANEA, a town of West Bothnia; 60 miles W. of Tornea.

RANELAGH, *Rotunda* and *Gardens*, built and opened for musical performances and public amusements in 1742. The building was erected in the spacious garden belonging to the residence, at Chelsea, of lord Ranelagh, one of the ministers of Charles II., when paymaster of the army.

It was planned by the late Mr. Lacey, afterwards joint-patentee of Drury-lane theatre with the great actor Garrick.

At the first opening of this stupendous building, several experiments were made in placing the orchestra, in filling it, and in the time of performance, before it was settled as an evening promenade. The orchestra was at first placed in the middle of the rotunda. The performance was in a morning; and oratorio chorusses chiefly furnished the bill of fare. Sir John Barnard complaining to the magistrates, that

that the young merchants and city apprentices were frequently feduced from their counting-houfes and fhops by thefe morning amufements, they were prohibited, and the doors opened at fix o'clock in the evening. The performance, however, did not begin till eight o'clock, but was ended at ten.

It was intended to rival Vauxhall, and was little injured by bad weather; as the company, at fuch times, had a fafe and pleafant retreat into the rotunda, and as few went thither but in carriages.

Its fuccefs as an evening's amufement remained undiminifhed more than 40 years. It was ruined by the late hours to which it was gradually brought by fine folks, who, at length, never came thither till paft ten o'clock, when the mufical performances were over, and fober people ufed to return home before eleven o'clock to their fupper, which enabled them and their fervants to go to bed, and rife, at their accuftomed time.

But, at length, perfons of rank and fafhion made a debauch of this innocent amufement, and went to it and departed from it as late as at a mafquerade. This precluded all that had any thing to do themfelves, or any employment for their fervants in the morning, and fo much refined the company, that at midnight there had been feldom fufficient money received at the entrance, to cover the expences of the lamps, the terms of admiffion being only 3*s*., for which, befides a good concert by the beft performers in London, the company was furnifhed with excellent rolls, butter, and tea. In the year 1803 it was fhut up, and only ufed occafionally for a mafquerade, a feftival, or an exhibition of fire-works. But fince the period juft-mentioned, the building has been pulled down, and the materials fold piecemeal, as was the cafe at Cannons, the fplendid manfion of the duke of Chandois, (or *Palazzo*, as it would have been called in Italy,) and the ground is now (1809) of no other utility than occafionally to drill and exercife the Chelfea volunteers.

RANES, in *Geography*, a town of France, in the department of the Orne; 10 miles S.W. of Argentan.

RANESTAD, a town of Sweden, in Angermannland; 50 miles N.N.E. of Hernofand.

RANFORCE Ring. See Reinforced *Ring*.

RANG, in *Geography*, a town of Sweden, in the province of Skonen; 11 miles S.S.W. of Lund.

RANGA, in *Hindoo Mythology*, one of the many names of Siva, the perfonification, according to the Hindoo mythologifts, of the deftructive or changing form of the deity. (See Siva.) The epithet Sri, meaning holy, or divine, or bleffed, prefixed, has given this name to the capital of Myfore; Sri Ranga-pattan being the city of the bleffed Ranga, altered by Europeans to Seringapatam. See Sri.

RANGALORE, in *Geography*, a town and fortrefs of Hindooftan, in the circar of Cicacole; 38 miles W. of Cicacole.

RANGAMATTY, a circar of Bengal, bounded on the N. by Bootan and Affam, on the E. and S. by Affam, and on the W. by Baharbund, Bettrebund, and Goollah; about 40 miles long, and from 10 to 40 broad. Rangamatty, the capital, is 128 miles N.N.E. of Moorfhedabad, and has a celebrated pagoda. N. lat. 26° 8′. E. long. 90° 6′.

RANGANJA, a town of Bengal; 15 miles N.E. of Chittigong.

RANGAPALEAM, a town of Hindooftan, in Coimbetore; eight miles N.N.E. of Daraporum.

RANGAPILLA, a town of Hindooftan, in the Carnatic; fix miles N.E. of Pondicherry.

RANGASUNDRUM, a town of Hindooftan; 15 miles W. of Tinevelly.

RANGE, in *Gunnery*, the path of the ball, or the line it defcribes from the mouth of the piece to the point where it lodges. The flight of a fhot is diftinguifhed, by artillerymen, into three different ranges, of which the firft is called the *point-blank*, the fecond the *random-fhot*, and the third the *ricochet*, or rolling and bounding fhot. The firft, or point-blank, is to fuppofe a piece ftood upon a level plain, and laid level, then the diftance between the piece and the point where the fhot touches the ground firft, is called the *point-blank range* of that piece; but as the fame piece ranges more or lefs, according to a greater or lefs charge, the point-blank range is to be underftood to be that, when the piece is loaded with that charge which is commonly ufed in action.

This range is much lefs than the greateft range, or random-fhot; but the piece cannot be levelled, or, as it is generally expreffed, *pointed* at an object intended to be battered, if that object is not within the diftance of the point-blank range; for beyond that the fhot is very uncertain, therefore rarely ufed in the fea-fervice, and on land only when the fhot cannot fail of doing great execution in the place on which it falls.

In ricochet firing, the piece is only elevated from three to fix degrees, and loaded with a fmall charge, in order that the ball may be bounded, and roll along the infide of the parapet. The fhot, thus difcharged, goes rolling and bounding, killing and maiming, or deftroying all it meets in its courfe, and creates much more diforder by going thus flowly, than if thrown from the piece with greater violence. See Cannon, Gun, and Projectile.

Range *of a Projectile, Amplitude of the*. See Amplitude.

Range, *Point-blank*. See Point-*blank*.

Range, in a *Ship*, denotes a fufficient length of the cable, drawn up on the deck, before the anchor is caft loofe from the bow, to let it fink to the bottom, without being interrupted, that the flukes may be forced the deeper into the ground, by the additional weight which the anchor acquires in finking. For this reafon, the range, which is drawn up out of the tire, ought to be equal in length to the depth of the water, where the fhip anchors.

RANGER, a fworn officer of the foreft, whofe bufinefs it is to walk daily through his charge, to drive back the deer out of the purlieus or difafforefted places into the foreft lands; and to prefent all trefpaffes done in his bailiwick at the next court held for the foreft.

The ranger is made by the king's letters, and has a fee paid yearly out of the exchequer, and certain fee-deer. In the Charta de Forefta mention is made of twelve kinds of rangers. It is now principally a honorary and finecure employment; but the holders fometimes likewife receive pay.

RANGES, in *Ship Building*, horned pieces of oak, like belaying cleats, but much larger, bolted to the infide of a fhip, in the waift, for belaying the tacks and fheets. Alfo thofe pieces of plank fixed between the ports, with femicircular holes in them for keeping fhot in.

RANGIFER, in *Zoology*, a variety of the Cervus *Tarandus*; which fee.

RANGING, in *War*, the difpofing of troops in a condition proper for engagement, or for marching.

In *Building*, the fide of a work that runs ftraight, without breaking into angles, is faid to *range*, or *run range*.

Ranging *out a canal*, denotes determining or fetting out on the ground the lines which are to be occupied by its middle and fides.

RANGLE, in *Falconry*, is when gravel is given a hawk to bring her to her ftomach.

RANGOON, in *Geography*, a fea-port town of the Birman

Birman empire, fituated on a branch of the Irrawaddy, called the Rangoon river, which forms the only communication that the Pegue river has with the fea. The town, in its prefent ftate, has been extended by increafing trade and confequent population far beyond the limits which formerly comprehended Rangoon, as it was originally founded, in 1755, by Alompra, the fovereign of the Birman empire. Rangoon, or Dzangoon, which fignifies victory achieved, was denominated Dagon, before Alompra took it, and laid the foundation of the prefent town. Here ftood, in former days, a large and populous city, called in the Pali, or facred language, Singounterra; the fcite of which Alompra diligently explored, and raifed on its ruins the prefent flourifhing fea-port of the Pegue dominions. Dagon, often called Shoe-Dagon, or the golden Dagon, is a name peculiar to the temple; a noble edifice, three miles diftant from the banks of the river. (See DAGOUNG.) Rangoon ftretches along the bank of the river about a mile, and is not more than a third of a mile in breadth. The city, or miou, (mious being a term applied either to a city or a diftrict,) is a fquare furrounded by a high ftockade, in the manner of the country, and on the N. fide it is further ftrengthened by an indifferent foffe, acrofs which a wooden bridge is thrown; in this face there are two gates, in each of the others only one. Wooden ftages are erected in feveral places within the ftockade, for mufqueteers to ftand upon in cafe of an attack. On the S. fide, towards the river, which is about 20 or 30 yards from the palifade, there are feveral huts, and three wharfs, with cranes for landing goods. A battery, of twelve cannon, fix and nine-pounders, raifed on the bank, commands the river; but the guns and carriages are in fuch a wretched condition, that they could do little execution. Clofe to the principal wharf are two commodious wooden houfes, ufed by the merchants as an exchange, where they ufually meet in the cool of the morning and evening, to converfe, and tranfact bufinefs. The ftreets of the town are narrow, and much inferior to thofe of Pegue, but clean and well paved; there are numerous channels to carry off the rain, over which ftrong planks are laid, to prevent an interruption of intercourfe. The improvement of the town has been very much owing to the activity of the defcendant of a Portuguefe family, named Jaunfee, of low origin, but advanced at length to the important office of Shawbunder, or intendant of the port, and receiver of the port-cuftoms. Under his direction and influence, the ftreets were paved, feveral well built wooden bridges were conftructed, and alfo a wharf, which, extending into the river, and raifed on pofts, enables the fhips to deliver and receive cargoes without the affiftance of river-craft; under his direction alfo a fpacious cuftom-houfe has been erected. This is the only lay building in Rangoon that is not conftructed of wood, it is compofed of brick and mortar, and the roof covered with tiles; within, there is a number of wooden ftages for the reception of bale goods. The houfes, in general, are raifed on pofts from the ground; the fmaller fupported by bamboos, the larger by ftrong timbers. All the officers of government, the moft opulent merchants, and perfons of confideration, live within the fort; fhipwrights, and people of inferior rank, inhabit the fuburbs; and one entire ftreet, called Tackally, is exclufively affigned to common proftitutes, who are not permitted to dwell within the precincts of the fortification. Swine are fuffered to roam about the town at large; they do not belong to any particular owners, but are regarded as fervants of the public, or common fcavengers; as they go under the houfes and deftroy the filth. The Birmans are alfo fond of dogs, numbers of which infeft the ftreets; the breed is fmall, and very noify. The borders of the terrace on which the temple of Dagoung is raifed, are planted with fhady trees in regular rows; and from this eminence there is a beautiful and extenfive profpect; the Pegue and Rangoon rivers are feen winding through a level woody country, and the temple of Syriam, little inferior to others at Pegue and Rangoon, ftands near the junction of the ftreams. The road leading from the city to the temple is formed with care, a wide caufeway in the centre throwing off the rain to the fides; and numberlefs little fpaces are ranged along the edge of the road, in which are niches to receive fmall images of their divinity Guadma. Several kioums or monafteries lie in this direction, generally removed at a fhort diftance from the public way, under the fhade of pipal or tamarind trees. The Birmans being, like other inhabitants of the eaft, fond of proceffions, fcarcely a week paffes in which there is not a religious difplay at Rangoon; either a funeral of fome perfon who leaves fufficient to defray the expence of a pompous public burning, or the ceremony of admitting youths into the convents of the Rhahaans, on which occafion parents and friends fpare no expence in entertainments and prefents to the Rhahaans. See RHAHAANS.

The population of Rangoon is confiderable; there are 5000 regiftered taxable houfes in the city and fuburbs; fo that if each houfe be fuppofed to contain fix people, the eftimate will amount to 30,000. Having long been the afylum of infolvent debtors from the different fettlements of India, it is crowded with foreigners of defperate fortunes, who find from the Birmans a friendly reception, and generally fupport themfelves by carrying on a fmall trade. The exchange, if it may be fo called, exhibits a motley affemblage of merchants, fuch as few towns of much greater magnitude can produce; Malabars, Moguls, Perfians, Parfees, Armenians, Portuguefe, French, and Englifh. The members of this difcordant multitude, engaged in various branches of commerce, are not only permitted to refide under the protection of government, but likewife enjoy the moft liberal toleration in matters of religion. They celebrate their feveral rites and feftivals, totally difregarded by the Birmans, who have no inclination to make profelytes. In the fame ftreet may be heard the folemn voice of the Muezim, calling pious Iflamites to early prayers, and the bell of the Portuguefe chapel tinkling a fummons to Romifh Chriftians. Proceffions meet and pafs each other without giving or receiving caufe of offence. The Birmans never trouble themfelves about the religious opinions of any fect, nor difturb their ritual ceremonies, provided they do not break the peace, or meddle with their own divinity Gaudma; but if any perfon commit an outrage, which the Muffulmen, in their zeal for the true faith will fometimes do, the offender is fure to be put into the ftocks; and if that does not calm his turbulent enthufiafm, he is baftinadoed into tranquillity.

The Parfees, the Armenians, and a fmall proportion of Muffulmen, engrofs the largeft fhare of the trade of Rangoon; and individuals from their number were frequently felected by government to occupy employments of truft, that related to trade and tranfactions with foreigners, the duties of which the Birmans conceive that fuch perfons could perform better than themfelves. Thefe people, particularly the Armenians, naturally behold with a jealous eye any ordinance of a commercial nature, that may tend to diminifh their influence, and deprive them of that dictatorial power, which they affume and exercife over all merchants and mariners that refort to Rangoon; but of none are they fo apprehenfive as of the Englifh: a connection with whom might teach the Birmans to tranfact foreign bufinefs without their affiftance, and give them a more adequate fenfe of their own intereft.

The

The French have long maintained an agent at Rangoon, and are thoroughly acquainted with the advantages which the country of Pegue affords. The imports into Rangoon from the Britifh fettlementss in the years 1794—5, amounted, according to Mr. Symes, to more than twelve lacks of rupees, about 135,000*l.* fterling: thefe confifted chiefly of coarfe piece goods, glafs, hardware, and broad cloth, the demand for the laft article being confiderable; and returns were almoft wholly made in timber. Teak, the moft durable wood that is known, and beft adapted for the conftruction of fhips, is produced in the Birman and Pegue empire in inexhauftible abundance. The river of Rangoon is equally commodious for the conftruction of fhips; the fpring tides rife 20 feet in perpendicular height; the banks are foft, and fo flat, that little labour is neceffary for the formation of docks: veffels of any burden may be built. Nature, fays Symes, has liberally done her part to render Rangoon the moft flourifhing fea-port of the eaftern world. The entrance of the river, about twelve miles below Rangoon, and the banks on each fide, bear a near refemblance to thofe of the Ganges; but the navigation is much more commodious. The channel is bold and deep, from fix and a half to eight fathoms, uninterrupted by fhoals or inequality of foundings. At this place the breadth of the river is eftimated to be from three quarters to one mile. On the bank of the river, oppofite to Rangoon, is a confiderable town, called Maindu, the refidence of the governor of the province of Dalla. This government is entirely diftinct from Rangoon, on the eaft fide. The city of Dalla, from which the province takes its name, is faid to be on the weft fide of the China Buckier river, and was formerly a place of confiderable importance. The town of Maindu is compofed of one long ftreet; at the eaft end is a creek, which goes all the way to Baffein, and has twelve feet depth of water, at high tide; on the weft fide is a fmaller creek, on the bank of which ftands a village called Mima-Shunrua, or the village of proftitutes, being wholly inhabited by women of that defcription. Rangoon lies in N. lat. 16° 47′. E. long. 96° 9′. Symes's Embaffy to Ava, in 3 vols. 8vo. See BIRMAN *Empire*.

RANGSIO, a town of Sweden, in Helfingland; 15 miles W.N.W. of Soderhamn.

RANGUANA, a fmall ifland in the bay of Honduras, near the coaft of Mexico. N. lat. 16° 25′. W. long. 88° 52′.

RANHADOS, a town of Portugal, in the province of Beira; 18 miles N.W. of Caftel Rodrigo.

RANINA, *Arteria et Vena*, in *Anatomy*. the artery and vein fituated on the inferior furface of the tongue. See ARTERY and VEIN.

RANISH, in *Geography*, a fmall ifland near the W. coaft of Scotland. N. lat. 57° 55′. W. long. 5° 5′.

RANK, a due order, or a place allotted a thing fuitably to its nature, quality, or merit.

Kings are perfons of the firft rank on earth. In cavalcades, proceffions, &c. every perfon is to obferve his rank.

RANK, in *Military Difcipline*, denotes a feries, or row of foldiers, placed fide by fide; a number of which ranks form the depth of the fquadron or battalion, as a number of files does the width.

When infantry is drawn up three deep, the firft rank is called the *front* rank; the fecond, the *centre* rank; and the third, the *rear* rank.

To *clofe the rank*, is to bring the men nearer; to *open* it, is to fet them farther apart. To *double the ranks*, is to throw two into the fpace of one, by which the files are thinned. See DOUBLING.

RANK, in the *Army* and *Navy*, is ufed for the order of *precedence;* which fee.

In the army the officers in the life-guards are entitled to the rank of lieutenant-colonel, when they obtain or purchafe a majority, provided they are of feven years ftanding. Their commiffions in this cafe run major and lieutenant-colonel. But if an officer fhould not have completed either of thofe periods, he obtains the rank of major only until its completion. A lieutenant-colonel attains to the rank of full colonel if he has been feven years major, or twenty-one years in the Britifh fervice. Cornets in the life-guards rank as fub-lieutenants in their own corps, and as firft lieutenants in the army. The Englifh fuzileers enjoy the fame privilege. Sub-lieutenants in the Welfh fuzileers, rank only as fecond lieutenants in the army. Marines do the fame.

Officers of the regular forces command the officers of equal degree belonging to the other fervices. Officers of the militia, fencibles, yeomanry cavalry, and volunteer corps, rank together, according to the dates of their refpective commiffions. Thefe regulations are fubject to fome exceptions, fpecified in the articles of war. Officers of the militia rank generally with the regular forces as junior of their refpective commiffions. An enfign in the guards ranks no higher than an enfign in the regulars. The chief of the engineers ranks as colonel; director, as lieutenant-colonel; fub-director, as major; engineer in ordinary, as captain; engineer extraordinary, as captain-lieutenant; fub-engineer, as lieutenant; practitioner-engineer, as enfign.

In the navy the admiral or commander-in-chief of his majefty's fleet has the rank of a field-marfhal; admirals, with the flags on the top-maft-head, rank with generals of horfe and foot; vice-admirals, with lieutenant-generals; rear-admirals, as major-generals; commodores with broad pendants, as brigadier-generals; captains of poft-fhips, after three years from the date of their firft commiffion, as colonels; other captains, commanding poft-fhips, as lieutenant-colonels; captains, not taking poft, as majors; and lieutenants, as captains.

RANK, *Brevet*, rank without pay, nominal diftinction, which fometimes entitles the holder of it to command in mixed fervice. The brevet rank in the militia is confined to the colonels and adjutants of the feveral corps in that eftablifhment. The former receive the brevet rank of colonels in the army whilft actually embodied for fervice, and command all lieutenant-colonels in the line when they do duty together. Adjutants in the militia may have the brevet rank of captain, provided they have ferved five years as lieutenants in the militia, or in other forces on the Britifh eftablifhment. In the line, an adjutant who has the rank of captain, may command as fuch when there is no fuperior officer on the parade, or for duty. This is not the cafe in the militia. No adjutant, let his brevet rank of captain be ever fo ancient, can command the youngeft captain of a company. The fame difference prevails with refpect to the captain-lieutenancy; which is literally brevet rank. In the regulars, a captain-lieutenant, the inftant he is promoted to a company, takes rank according to the date of his firft commiffion, and, as we have obferved, may be major by brevet; but no captain-lieutenant can ever avail himfelf of that feniority to the prejudice of a captain of a company in the militia; nor can an officer in the latter eftablifhment take advantage of his ftanding, when he quits one regiment to ferve in another, even in time of war, although he may have the requifite qualifications in both counties.

Brigade majors rank with captains, provided they have that

that rank in the army, independent of their staff appointment. But aids-de-camp do not possess any rank in that capacity with regard to the army. The latter constitute a part of the general's family, and are paid out of his allowance; they are in fact the mere carriers of his orders in the field, and his domestic inmates at home, &c. The former belong to the brigade, and are a necessary part of its effective force. It has been judiciously ordained, that both the one and the other should be regular officers.

There is likewise a sort of brevet rank which exists in the several regiments belonging to the British service, and is confined to the rank and file, or corporals and private soldiers. Thus a lance-serjeant is a corporal who does the duty of serjeant without the pay or emoluments of the latter; and a lance-corporal is a private soldier who does the duty of corporal. So that *lance*, which comes from *lansquenet*, and ought therefore to be written lans-serjeant, &c. is the abbreviation of that word, which signifies a private soldier, and is derived from the German, and when put before serjeant or corporal, points out, that a private soldier has the brevet rank of one of those situations. Captains of companies appoint or reduce lance-serjeants or corporals, according to their judgment.

RANK, in respect of ships. See RATE.

RANK *and File*, denote men carrying the fire-lock and standing in the ranks. Thus corporals are included in the return which is made under that head.

RANKS *and Files*, are the horizontal and vertical lines of soldiers, when drawn up for service.

RANK *Keel*, in *Ships*. See KEEL.

RANK *Modus*, in *Law*. See MODUS.

RANK is also a term provincially applied to signify any sort of crop of large growth, standing thick or close on the ground, as corn, pease, beans, &c. and even trees in woods. The term is often used to denote corn or grass crops, which are of such strong growths as to be laid down or lodged.

RANKAH, in *Geography*, a town of Bengal; 25 miles W.N.W. of Palamow.

RANKERAH, a town of Hindoostan, in Candeish; 25 miles S. of Burhanpour.

RANKNESS *in Cheese*, in *Rural Economy*, a term signifying its strong pungent quality arising from the impurity of the rennet or steep, either in consequence of neglect of the vessels holding it, the want of salt, or the imperfect separation of the curdy matter from the whey, by which fermentation and partial putrefaction occur and produce this taste. See CHEESE and DAIRYING.

RANKPORE, in *Geography*, a town of Hindoostan, in Guzerat; 45 miles E. of Radunpour.

RANNEE, a town of Hindoostan, in Orissa; 30 miles S.S.W. of Balasore.

RANNEL-BAUK, in *Rural Economy*, a word provincially used to signify the wooden bar or bauk laid across the cottage chimney, for hanging the pot-hooks on, &c.

RANNIGUNGE, in *Geography*, a town of Bengal; 76 miles N.N.E. of Dacca.

RANNING, a town of the duchy of Wurzburg; five miles N. of Schweinfurt.

RANNISERAI, a town of Hindoostan, in Allahabad; 35 miles N.W. of Gazypour.

RANNUTSCH, a town of Thibet; 36 miles E. of Jemlah. N. lat. 30° 42′. E. long. 82° 15′.

RANNY, in *Rural Economy*, a provincial word, applied to the small field-mouse.

RANNY *Bednore*, in *Geography*, a town of Hindoostan, in the circar of Sanore; 20 miles W. of Bisnagur. N. lat. 15° 18′. E. long. 75° 37′.

RANNYCOTTA, a town of Thibet; 35 miles S. of Gangotri.

RANNYDEE, a town of Bengal; 11 miles S. of Curruckdeagh.

RANNYGONG, a town of Hindoostan, in Dowlatabad; 15 miles S.S.W. of Amednagur.

RANNYGUNGE, a town of Bengal; 35 miles N. of Dinagepour.

RANNYPOOKRA, a town of Bengal; 30 miles W.N.W. of Rogonatpour.

RANO, a small island in the N. part of the gulf of Bothnia. N. lat. 65° 43′. E. long. 22° 52′.

RANRAN, a town of Cochinchina, and the capital of a province. N. lat. 12° 30′. E. long. 108° 56′.

RANSACKEN, a town of the duchy of Wurzburg; 3 miles S. of Wurzburg.

RANSOM, a sum of money paid for the redemption of a person out of slavery, or for the liberty of a prisoner of war.

With regard to prisoners of war, it is allowed that there is no obligation of releasing those who are detained as such, till after satisfaction has been obtained. Whoever makes a just war has a right, if he thinks proper, to detain his prisoners till the end of the war; and then, in releasing them, he may justly require a ransom, either as a compensation at a peace, or, if the war continue, for diminishing his enemy's prisoners, at the same time that he strengthens him with the return of soldiers. Prisoners of war, among European nations, are exchanged or ransomed during the war; and this is generally stipulated in a previous cartel. If sovereigns at war have agreed on a cartel for the exchange or ransom of prisoners, they are faithfully to observe it no less than every other convention; but if, as was formerly the general practice, the state leaves to every prisoner, at least during the war, the care of redeeming himself, such particular conventions offer many questions, of which some of the principal are the following. He who has acquired a lawful right of demanding a ransom from his prisoner, may transfer his right to a third person. This was practised in the last ages. But as the person taking a prisoner is obliged, for the sake of his reputation, to treat him with justice and humanity, he is not to transfer his right, in an unlimited manner, to one who might probably abuse it. When he has agreed with his prisoner, concerning the price of the ransom, he may transfer the right to whom he pleases. On the conclusion of an agreement made with a prisoner for the price of his ransom, it becomes a perfect contract, and cannot be receded from, under a pretence that the prisoner is discovered to be richer than was imagined; for there is no manner of necessity that he should be rated according to the wealth of a prisoner, because that is not the scale for measuring the right of detaining a prisoner of war. But it is natural to proportion the price of the ransom to the prisoner's rank and character; the liberty of an officer of distinction being of greater consequence than that of a private man, or inferior officer. If the prisoner has not only concealed, but disguised his rank, it is a sordid fraud, and gives a right for annulling the agreement. If a prisoner, having agreed on the price of his ransom, dies before payment, it has been queried whether this price be due, and whether the heirs are obliged to discharge it? Unquestionably, says Vattel, they are obliged to it, if the prisoner died in the possession of his liberty; for, from the moment of his release, in consideration of which he had promised a sum, this sum becomes due, and does not at all belong to his heirs; but if he had not

not obtained his liberty at the time of his death, it can be no debt to him, or to his heirs, unless the agreement was otherwise: and he is not reputed to have received his liberty, till he is absolutely permitted to depart free; when neither he whose prisoner he was, nor the sovereign, opposed his release and departure. If indeed he has only been permitted to take a journey for applying to his friends, or his sovereign, in order to obtain the means of ransoming himself, and he dies before he is possessed of his full liberty, before his final discharge from his parole, nothing is due for his ransom. If, after agreeing on the price, he is detained in prison till the time of payment, and he dies before, the debt is paid by his death, and does not affect his heirs; such an agreement on the part of him, who detains his prisoner, being no more than a promise of giving him his liberty for a certain sum paid down. A promise of buying and selling does not suppose the purchaser to pay the price of a thing, if it happen to perish before the bargain is concluded. But if the contract of sale be perfect, the purchaser shall pay the price of the thing sold, though it should happen to perish before the delivery of it, provided there was no fault or delay in the seller. F r this reason, if the seller has absolutely concluded the agreement of the ransom, and from that time owns himself a debtor for the stipulated sum, remaining no longer as a prisoner, but for the security of the payment, his intervening death does not extinguish the debt: the ransom agreed on remains still due. If the agreement says, that the ransom shall be paid on a certain day, and the prisoner happens to die before that day, then the heirs are bound to discharge it; for the ransom was due, and the day was assigned, only, as the term for payment. Upon the same principles, strictly speaking, it follows, that a prisoner, released on condition of procuring the release or discharge of another, should return to prison, in case the latter happens to die before he could procure him his liberty. Such an unfortunate case, however, is entitled to regard, and equity seems to require that this prisoner should continue in the enjoyment of liberty, provided he pays a just equivalent; it being now out of his power to purchase it precisely at the price agreed on. If a prisoner fully set at liberty, after having promised, but not paid, his ransom, happen to be taken a second time, it is evident that, without being exempted from paying his first ransom, if he is willing to be set at liberty, he must pay a second ransom. On the contrary, though the prisoner has agreed for the price of his ransom, if before the execution of the compact, before he is set at liberty in virtue of it, he be retaken by his party, he owes nothing. It is here evidently supposed, that the finishing hand was not put to the compact, and that the prisoner had not acknowledged himself debtor for the rate of his ransom. He whose prisoner he was, had, as it were, only made him a promise of selling, and he had promised to purchase; but the purchase and sale had not actually passed into effect; the property was not actually transferred. The property belonging to a person does not pass to him who takes him prisoner, unless at the same time he seizes on such things. Of this there is no doubt, especially in our times of moderation, when prisoners of war do not fall into slavery. And even by the law of nature, the property of a slave's goods does not, without some other reason, pass to the master of a slave. There is nothing in slavery of which this can itself be the natural effect. If a man obtain a power over the liberty of another, does it follow that he has likewise a right over his property? Therefore, if an enemy has not stripped his prisoner, or the latter has found means to conceal something from his search, what he has preserved should belong to him, or he may employ it towards the payment of his ransom. At present even prisoners are not always stripped. The death of a prisoner puts a period to the right of him who had taken him; therefore an hostage, given for the procuring of a person's liberty, is to be released the moment the prisoner expires; and if the hostage dies, the prisoner is not released by such death. The reverse of this is true, if one, instead of being an hostage for the other, had been substituted in his stead. Vattel's Law of Nations, b. iii. ch. 17.

Formerly it was a common practice to ransom British ships, when captured by an enemy, by delivering to the enemy what was called a ransom-bill, which secured to the captor the price agreed upon, and operated as a bill of sale of the ship and cargo to the original owners, and as a protection to the ship against other cruisers of the enemy during the remainder of the voyage. A hostage was delivered to the captor, for securing to him the punctual payment of the stipulated sum. This ransom-bill, independent of the hostage, was considered as a contract of the law of nations, and obligatory upon the owners, as well as upon the captain and hostage who signed it; and actions have been often brought upon them in our courts of common law. And where the ship or goods were insured, the amount of the ransom was usually taken to be the measure of the demand of the insured upon the underwriters, in respect of the capture. But this practice of ransoming ships captured by the enemy being found to operate more to the disadvantage than for the benefit of this country, it was thought proper at length to prohibit it altogether. And therefore by stat. 22 Geo. III. c. 25. § 1. it is enacted, that it shall not be lawful for any of his majesty's subjects to ransom, or to enter into any contract or agreement for ransoming, any ship or vessel belonging to any of his majesty's subjects, or any merchandizes or goods on board the same, which shall be captured by the subjects of any state at war with his majesty, or by any person committing hostilities against his majesty's subjects. By § 2. all contracts and agreements which shall be entered into, and all bills, notes, and other securities, which shall be given by any person or persons for ransom of any such ship or vessel, or of any merchandize or goods on board the same, shall be absolutely void in law, and of no effect whatever. And by § 3. a penalty of 500*l.* is given to the informer, for every offence against the act. This statute has put an end to all questions on the law of ransoms. Marshall's Treatise on the Law of Insurance, vol. ii.

In our *Law Books*, ransom is also used for a sum paid for the pardoning of some notorious crime.

Horn makes this difference between *ransom* and *amerciament*, that ransom is the redemption of a corporeal punishment due to any crime.

It is never usual to assess a larger fine than a man is able to pay, without touching the implements of his livelihood, but to inflict corporal punishment, or a limited imprisonment, instead of such fine as might amount to imprisonment for life. And this is the reason why fines in the king's court are frequently denominated *ransoms*, because the penalty must otherwise fall upon a man's person, unless it be redeemed or ransomed by a pecuniary fine (Mirr. c. 5. § 3. Lamb. Eirenarch. 57.); according to an ancient maxim, "qui non habet in crumena luat in corpore." Yet, when any statute speaks both of fine and ransom, it is holden, that the ransom shall be treble to the fine at least. Dyer. 232.

RANSTADT, in *Geography*, a town of Germany, in the principality of Stolberg; 17 miles N.E. of Frankfort on the Maine.

RANSTADT, or *Mark Ranstadt*, a town of Saxony, in the

the territory of Merfeburg; 10 miles S.S.E. of Merfeburg. N. lat. 51° 18′. E. long. 12° 14′.

RANT, in the *Drama*, an extravagant flight of paffion, overfhooting nature and probability.

Lee's tragedies abound with rants; yet the wildeft of them, it is obferved, have frequently met with applaufe on the ftage.

We find inftances of rants, even in our fevereft poets. Such, *e. gr.* is that in the beginning of Ben Johnfon's Cataline, where the parricide, in fpeaking to Rome, fays, "I'd plow up rocks, fteep as the Alps in duft; and lave the Tyrrhene waters into clouds, but I would reach thy head!"

RANTAMPOUR, in *Geography*, a circar of Hindooftan, in the country of Agimere, bounded on the N. by Jyenagur, on the E. by Agra, on the S. by Kottah, and on the W. by Oudipour and Sirowy.—Alfo, a town and fortrefs, being the capital of the above named circar; 86 miles E. of Agimere. N. lat. 28° 35′. E. long. 76° 58′.

RANTZAU, John, in *Biography*, a general in the Danifh fervice, was born in 1492, and at the age of 13 he entered into the army. In 1515 he began to travel into foreign countries, vifiting in fucceffion England, Spain, Germany, Italy, Greece, Syria, Paleftine, and other parts of the Eaft. In 1517 he was knighted at Jerufalem; and upon his return to Denmark, was appointed to accompany duke Chriftian, afterwards Chriftian III., on his tour to Brandenburg, and other towns of Germany. When Frederic I. accepted the crown of Denmark, he was promoted to be a general in 1553, and entrufted with the command of the troops in Holftein. He became greatly diftinguifhed in his military character, and on various diplomatic concerns, and died in 1565. As an author he is known by the following works: "A true and brief Account of the Wars carried on in 1559, by Frederic king of Denmark, and Adolphus duke of Holftein," &c.; "Defcriptio Cimbriæ," printed in Weftphalen's Monumenta inedita, tom. i. Gen. Biog.

Rantzau, in *Geography*, a county of Germany, in the duchy of Holftein, about ten miles long and fix broad. It takes its name from a feat feven miles N. of Eutyn.

RANTZEN, a town of the duchy of Stiria; 6 miles N.W. of Muckrau.

RANTZENBACH, a town of Auftria; 6 miles S.S.W. of St. Polten.

RANVILLE, a town of France, in the department of the Calvados; 5 miles N.E. of Caen.

RANULA, dim. of *rana*, *a frog*. This term is, in *Surgery*, applied to a fwelling of the falivary ducts under the tongue. Whether the tumour is fo named from a whimfical fuppofition that it bears a refemblance to a frog, or from its being fancied to oblige the patient to make a croaking noife, in attempting to articulate, is a point which furgical writers leave undetermined. The fwelling is round, of a greyifh colour like an hydatid, foft, compreffible, indolent, and, in the early ftage, almoft tranfparent. At firft, it is of about the fame fize as a nut, or cherry; but, by degrees, its volume becomes much more confiderable. It is very frequently met with in young children: its occurrence in adults is more uncommon. It confifts of a fucceffive dilatation of the excretory tube of the fubmaxillary, or elfe of the fublingual gland, the orifice of which duct is by fome caufe or another ftopped up, or obliterated; fo that the confined faliva accumulates, becomes vifcid, and ceafes to flow in the ufual manner. In proportion as the ranula increafes, the incipient ftate of it having been neglected, its enlarged fize raifes up the tongue, and forces it backward; the confequence of which is, that maftication, deglutition, and refpiration, are obftructed. The voice becomes indiftinct, and hoarfe; the motion of the tongue is reftrained: this organ cannot be put out of the mouth. By degrees, the incifor and canine teeth of the lower jaw are loofened; the layer of mufcles, compofing the lower parietes of the mouth, is depreffed; and the fwelling, having attained a confiderable fize, makes a very manifeft prominence beneath the chin. In this advanced ftage, that is to fay, when the ranula has exifted ten or twelve years, as practitioners occafionally fee inftances of, the appearance of the fwelling is quite altered from what it originally was. The tumour is now hard, elaftic, painful, ulcerated, and, as it were, farcomatous: it is as large as a turkey's egg, and not fituated at the fide of the frænum, but anteriorly under the tongue, to which it is clofely adherent. The mouth emits a very fetid fmell; and the breathing is fo much obftructed, that the patient, through fear of fuffocating, is obliged to lie with his mouth wide open, when he goes to fleep.

While a ranula is recent, the fluid which it contains is a vifcid faliva, refembling the white of egg, and fometimes of rather a yellow colour. In time it is gradually changed, becoming turbid and puriform; and, in certain inftances, foft, friable, greyifh concretions, from the fize of a pea to that of an almond, commonly called falivary calculi, are found in the kind of cyft, which is produced by the dilatation of the falivary duct. Thefe calculi effentially confift of a large proportion of the phofphate of lime, united with a mucilaginous fubftance; and concretions of the fame kind frequently occur in the tonfils, and in the falivary glands themfelves, as well as their excretory ducts. Foreftus, lib. xiv. obf. 26. p. 112. Blegney, Nouvelles Décovertes, &c. tom. i. ann. 1679, p. 230. Mém. de l'Acad. de Chirurgie, tom. v. p. 464. Petit, Œuvres Pofthumes, &c. tom. i. p. 188. Blafius, Obf. 14. p. 81.

A ranula, whether recent or inveterate, cannot be cured except by a furgical operation. The curative indication, in the firft of thefe ftates, is to make an outlet for the fluid accumulated in the tumour, and to make an opening fufficiently capacious to let the faliva readily pafs into the mouth. Merely making an incifion into the fwelling, or opening it with a trocar, or a feton drawn through it, are ftated to be ineffectual methods. The tumour does indeed fubfide as foon as the aperture is made; but the edges of the wound grow together again, and the difeafe recurs. There is an abfolute neceffity for firft making an incifion the whole length of the fwelling, and then removing, with the aid of fciffors and a pair of diffecting forceps, a portion of the edges of the recent wound. This flight lofs of fubftance prevents the return of the complaint, and always infures a free paffage for the faliva; an advantage of which there is no certainty in any other mode of proceeding. By this flight operation, ranulæ in children may be cured in the courfe of a few days, without the leaft occafion for the application of any dreffings whatfoever. It has been propofed to dilate the contracted orifice of the falivary duct with a probe. (Mém. de l'Acad. de Chirurgie, tom. iii. p. 460.) But this orifice is difficult of detection, and the fwelling cannot be in this manner eafily emptied. M. Laffus feems to entertain doubts whether Warton's canal can ever be made to refume its original ftate, after once being clofed. Pathologie Chirurg. tom. i. p. 405.

When a ranula has exifted a long while, is attended with confiderable hardnefs, and is of large fize, it is a tumour which requires to be completely extirpated. A tranfverfe incifion, parallel to the opening of the mouth, is to be made in it through its whole extent. The furgeon is then to cut out

out the upper portion of the ſwelling, ſituated in front of the frænum of the tongue, to which it is alſo adherent, and next the inferior portion, which ſometimes extends into the interſpace betwixt the genio-hyoidei and genio-gloſſi muſcles, with which it becomes confounded. A pair of forceps, a hook, ſciſſors, and a ſtraight biſtoury, are the inſtruments neceſſary for this operation. A degree of hemorrhage always enſues. The uſe of a detergent gargle, made of barley-water and honey of roſes, will ſerve to finiſh the cure in a very moderate ſpace of time.

In confirmation of the latter obſervation, Laſſus adduces the following caſe. A young man, aged 22, had a ranula, which had continued ever ſince he was born, and was equal in ſize to a turkey's egg. The inciſor teeth of the lower jaw were looſened, and forced forward by the ſucceſſive increaſe of the ſwelling. A ſeton had been paſſed quite through it, without any uſeful effect. The breath of the patient and his ſaliva were intolerably fetid. The tumour was cloſely adherent to the lower and anterior part of the tongue; and extending laterally, confounded itſelf with this organ, of which it impeded the motion. A ſtraight, narrow biſtoury was introduced into one of the openings at the ſide of the tumour, and carried completely acroſs to the oppoſite aperture. Thus a tranſverſe inciſion was made into the cavity of the diſeaſe. By means of the ſame inſtrument and a hook, the lateral portions of the ſwelling were removed. A profuſe hemorrhage enſued, cauſed by the total diviſion of the frænum, the raninal veins, and one of the raninal arteries. It was ſtopped by putting under the tongue a large quantity of dry lint, and by compreſſing the dorſum of the tongue ſeveral hours with the fingers, while the thumb was employed in compreſſing the parts behind the chin from below upwards. This double ſort of preſſure anſwered the purpoſe. No cautery was found neceſſary, and, by the uſe of detergent gargles, the patient was cured in about a fortnight.

When a ranula of long duration, ſituated at the ſide of the tongue, and of conſiderable ſize, forms a tumour, that makes its appearance outwardly towards the baſe of the jaw, Laſſus ſeems to diſapprove of making a free inciſion through the ſkin, for the purpoſe of extirpating that part of the ſwelling which cannot be removed through the mouth; a plan which was, in one inſtance, practiſed by Marchettis. Obſ. Med. Chirurg. obſ. 31. p. 48. See Laſſus' Pathologie Chirurgicale, tom. i. chap. 61.

RANULARES, in *Anatomy*. See RANINA.

RANUNCULACEÆ, in *Botany*, the 61ſt natural order in Juſſieu's ſyſtem, or the firſt of his 13th claſs, for whoſe character ſee GERANIA. The *Ranunculaceæ* are defined as follows.

Calyx of many leaves, ſometimes wanting. *Petals* definite, moſtly five. *Stamens* indefinite, except in *Myoſurus*; their anthers incorporated with the filaments. *Germens* ſeveral, indefinite or definite, rarely ſolitary, placed on a common receptacle; each of them furniſhed with a ſtyle, which is rarely wanting, and a ſimple ſtigma. *Capſules*, or rarely *berries*, as many as the germens; in ſome inſtances ſingle-ſeeded, and not burſting; in others many-ſeeded, ſplitting half way down, at their inner margin, into two valves, bearing the ſeeds at the edges. *Corculum* minute, lodged in a cavity at the upper part of the large horny *albumen*. *Stem* generally herbaceous. *Leaves* alternate; rarely (in *Clematis* and *Atragene*) oppoſite; ſome of them half ſheathing the ſtem; ſome compound, pinnate or fingered; ſome, as is more frequently the caſe, ſimple, and theſe are moſtly palmate or lobed, their ſinuſes often pale at the baſe. See RANUNCULUS.

Juſſieu divides the order in queſtion into four ſections.

Sect. 1. *Capſules ſingle-ſeeded, not burſting; berries in Hydraſtis.*

This ſection conſiſts of *Clematis*, *Atragene*, *Thalictrum*, *Hydraſtis*, *Anemone*, *Hamadryas* of Commerſon, *Adonis*, *Ranunculus*, *Ficaria*, and *Myoſurus*.

Sect. 2. *Capſules many-ſeeded, ſplitting at the inner edge. Petals irregular.*

The calyx in this ſection is often coloured, being what Linnæus terms corolla; that author conſidering the petals of Juſſieu as nectaries. The genera are *Trollius*, *Helleborus*, *Iſopyrum*, *Nigella*, *Garidella*, *Aquilegia*, *Delphinium*, and *Aconitum*. Some ſpecies of *Delphinium* have but a ſingle capſule.

Sect. 3. *Capſules many-ſeeded, ſplitting at the inner edge. Petals regular.*

Caltha, *Pæonia*, *Zanthorrhiza*, *Cimicifuga*.

Sect. 4. *Germen ſolitary. Berry of one cell, with many ſeeds, affixed to a ſingle lateral receptacle.*

The only genera are *Actæa* and *Podophyllum*, and theſe we feel diſpoſed to remove to Juſſieu's next order, PAPAVERACEÆ. See that article.

We cannot but remark that the *petals*, as Juſſieu terms them, in *Trollius* and *Helleborus* are by no means definite, and that they greatly exceed the number five. Neither are they irregular in *Trollius*. As to the other genera of his 2d ſection, the parts in queſtion are ſuch obvious nectaries, that they can have no other function to perform, except poſſibly in *Aquilegia*, where their limb partakes of the nature of petals.

RANUNCULOIDES, a genus of Vaillant's, founded on the *Ranunculus hederaceus* and *aquatilis* of Linnæus, and named from its reſemblance or affinity to RANUNCULUS; ſee that article. No one has followed Vaillant in this inſtance, nor is there any real mark of diſtinction for his ſuppoſed genus. *Ranunculoides* is, beſides, the ſpecific name of a rare Britiſh *Anemone*, but *ranunculina* would have been better Latin; as in *Helleborus ranunculinus*, Sm. Pl. Ic. faſc. 2. t. 37. Willd. Sp. Pl. v. 2. 1336. See HELLEBORUS.

RANUNCULUS, an ancient name, whoſe origin is as obvious as its ſenſe is obſcure. The word is, no doubt, derived from *rana*, and means a little frog. The Greeks call the ſame plant βατράχιον, which is nearly ſynonimous. Moſt etymologiſts ſuppoſe this name to allude to the native ſtation of the plant, in bogs and watery places, ſuch as frogs frequent. But the original βατράχιον of Dioſcorides is the beautiful *Ranunculus aſiaticus* of Linnæus, or Garden Ranunculus, which inhabits corn-fields, and does not grow in wet places; though indeed the other three ſpecies, deſcribed by that ancient writer, do; theſe are our *lanuginoſus*, *muricatus*, and *aquatilis*. It ſeems poſſible that the diviſions of the leaves in all theſe plants may have ſuggeſted the idea of a frog's foot, which ſuppoſition is confirmed by the Engliſh name, Crowfoot. Ambroſinus hints at a reſemblance between the root and the foot of a frog, which is not, to us, by any means apparent.—Linn. Gen. 281. Schreb. 377. Willd. Sp. Pl. v. 2. 1307. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 587. Prodr. Fl. Græc. Sibth. v. 1. 380. Ait. Hort. Kew. v. 3. 351. Purſh v. 2. 391. Juſſ. 233. Poiret in Lamarck Dict. v. 6. 97. Lamarck Illuſtr. t. 498. Gærtn. t. 74. (Ficaria; Dill. Gen. 108. t. 5. Hudſ. Angl. 244. Juſſ. 233. Ranunculoides; Vaill. Mem. de l'Acad. des Sciences for 1719, German edition, 321.)—Claſs and order, *Polyandria Polygynia*. Nat. Ord. *Multiſiliquæ*, Linn. *Ranunculaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of five ovate, concave, ſomewhat

what coloured, deciduous leaves. *Cor.* Petals five, obtufe, polifhed; with fmall claws. Nectary a cavity in each petal, juft above the claw. *Stam.* Filaments very numerous, half the length of the corolla; anthers firmly united therewith, erect, oblong, obtufe, of two feparate lobes. *Pift.* Germens numerous, collected into a head; ftyles none; ftigmas reflexed, very fmall. *Peric.* none. *Receptacle* befet with extremely minute ftalks, to which the feeds are attached. *Seeds* numerous, naked, irregular, uncertain in figure, with a reflexed point.

Obf. The effential mark of this genus confifts, as Linnæus remarks, in the nectary, the reft of the parts being uncertain; hence he takes occafion to point out the ufe of adverting to that organ, which before his time had been neglected, and which his opponents accufe him of fometimes making of too much importance. The great Juffieu will not, in this obvious cafe, ufe the language, though he adopts, unacknowledged, the idea of Linnæus; nor will he allow the manifeft nectaries of fome of his RANUNCULACEÆ (fee that article) to be other than petals. "Such," to ufe his own words, in his preface, p. 26, "is the love of undivided praife!"

The nectary in *Ranunculus*, fays Linnæus, is, in fome fpecies, a naked pore; in fome it is bordered with a cylindrical margin; in others clofed with a notched fcale. *Ficaria* of authors has only a three-leaved calyx, with a fuperabundance of petals. The feeds in fome fpecies are roundifh; in others depreffed, prickly, and fewer in number. *R. hederaceus* has but five ftamens; *falcatus* has a fword-fhaped point to each feed, and appendages to the bafe of the calyx; *fceleratus*, and a few befides, have an awl-fhaped receptacle, and confequently a fpiked fruit.

Eff. Ch. Calyx of five leaves. Petals from five to eight, with a honey-bearing pore in the claw of each. Seeds naked.

This extenfive genus is divided into two fections, by the form of the leaves. The fpecies are all herbaceous, generally of an acrid quality. The prevailing colour of the flowers is yellow; we know of none that are blue, except by accidental variation in *R. afiaticus*. They are plants of temperate or cold climates; fome of them alpine. Linnæus, in Sp. Pl. ed. 2, enumerates twenty-eight fpecies; the 14th edition of Syft. Veg. has forty-four, and Willdenow reckons up fixty-one. Fifteen are natives of Britain, as mentioned in Fl. Brit.; but the 11th fpecies in that work, *parvulus* of Linnæus, muft be expunged, as a mere variety of *hirfutus*, n. 8. The original number is, however, made up, by a new-difcovered Scottifh fpecies, the *alpeftris*, figured in Engl. Bot. v. 34. t. 2390.

So many additions have been made to this genus by the labours of Poiret in Lamarck's Dict. v. 6, and the difcoveries of Michaux and Purfh, that, with fome neceffary corrections, and a few communications of our own, the whole fubject requires to be detailed.

Sect. 1. *Leaves fimple and undivided.*

1. R. *Flammula*. Leffer Spear-wort. Linn. Sp. Pl. 772. Willd. n. 1. Ait. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 387. Curt. Lond. fafc. 6. t. 37. (R. flammeus minor; Ger. Em. 961, and R. flammeus ferratus; ibid. 962.)—Leaves ovato-lanceolate, bluntifh, ftalked. Stem declining.—Native of watery places throughout Europe, flowering moft part of the fummer. *Root* perennial, of long fimple fibres. *Herb* fhining, not quite fmooth, very various in fize and luxuriance. *Stems* fpreading in every direction, round, leafy, hollow. *Leaves* many-ribbed, either entire or varioufly ferrated. *Flowers* numerous, folitary, on long ftalks, of a bright golden yellow, half an inch or more in diameter. The whole plant is of an exceffively acrid burning quality, faid to produce inflammation in the vifcera of fheep, whence the name *flammula*, a little flame. Dr. Withering recommends the diftilled water, as preferable to all other medicines, for procuring inftantaneous vomiting in cafes of poifon.

2. R. *reptans*. Creeping Spear-wort. Linn. Sp. Pl. 773. Fl. Lapp. ed. 2. 198. t. 3. f. 5. Lightf. 289; fig. in frontifpiece to v. 1. Fl. Dan. t. 108.—Leaves linear-lanceolate. Stem creeping.—About the margins of alpine lakes, on a fandy foil; common in Scotland, flowering in June and July. We have always thought this a variety of the former, as mentioned in Fl. Brit.; but Willdenow contends for the contrary. He truly afferts that it differs in having a thread-fhaped creeping *ftem*; linear entire *leaves*, tapering down into their *footftalks*; *flower-ftalks* folitary, erect, fingle-flowered; and much fmaller *flowers*. Neverthelefs, we have feen fo many intermediate varieties, and fuch a difpofition in weak plants of the *Flammula* to take root at their joints, that we moft incline to our original opinion, fuggefted firft by Linnæus himfelf in his Sp. Pl.

3. R. *Lingua*. Great Spear-wort. Linn. Sp. Pl. 773. Willd. n. 3. Ait. n. 3. Fl. Brit. n. 2. Engl. Bot. t. 100. Fl. Dan. t. 755. (R. flammeus major; Ger. Em. 961. R. longifolius, lingua Plinii dictus, foliis ferratis; Ambrof. Phyt. 459.)—Leaves lanceolate, pointed. Stem erect, many-flowered. In marfhes and muddy ditches, chiefly in the northern parts of Europe; rare in England; flowering in July. Thrice the fize of *R. Flammula*, and quite erect. *Leaves* more nearly feffile, and taper-pointed; occafionally ferrated, as in the rude cut of Ambrofinus, but not commonly fo. *Calyx* hairy. The whole *herb* is more or lefs covered with clofe-preffed hairs, vifible alfo in *Flammula*. *Flowers* large and brilliant, very confpicuous.

4. R. *nodiflorus*. Knot-flowered Crowfoot. Linn. Sp. Pl. 773. Willd. n. 4. Ait. n. 4. Waldft. et Kitaib. Hung. v. 2. 192. t. 176. *Ait.* (R. parifienfis pumilus, plantaginellæ folio; Petiv. Gazoph. v. 1. 6. t. 25. f. 4. Vaill. Mem. de l'Acad. for 1719, Germ. ed. 324. t. 17. f. 4. R. ficulus, &c.; Petiv. Gaz. t. 24. f. 9, is a variety.) —Leaves ovate, ftalked. Flowers feffile.—In marfhy places about Paris; alfo in Sicily; flowering in fummer. A fmall, fmooth, annual plant, varying in luxuriance, and having much the appearance of *Limofella aquatica*. *Leaves* about an inch long, various in breadth, on very long ftalks. *Flowers* fmall, folitary, feffile, axillary. *Seeds* taper-pointed.

5. R. *filiformis*. Slender Creeping Crowfoot. Michaux Boreal-Amer. v. 1. 320. Purfh n. 4. Lamarck Dict. n. 4.—"Stem thread-fhaped, creeping, jointed, almoft naked. Leaves linear-awlfhaped, obtufe. Flowers axillary, folitary, ftalked."—In inundated places, on the banks of the river St. Lawrence; at Hudfon's bay and Labradore; flowering in June and July. This is defcribed as a very fmall, flender, fmooth fpecies, very much refembling *R. reptans*, n. 2. We have feen no fpecimen.

6. R. *pufillus*. Diminutive Crowfoot. Purfh n. 3. (R. Flammula; Walt. Carol. 159. Michaux Boreal-Amer. v. 1. 321; according to Purfh.)—"Smooth. Leaves ftalked; lower ones ovate, toothed; upper linear-lanceolate, toothed at the end; uppermoft linear, like bracteas. Stalks alternate, folitary, fingle-flowered."—Native of North America. Perennial, flowering from June to Auguft. A fmall fpecies, with exceeding fmall *flowers*. *Petals* pale yellow. *Purfh.* A fpecimen from Kalm, unnamed, in the Linnæan herbarium, anfwers nearly to the above characters, and yet feems a variety of *R. abortivus*, hereafter mentioned.

7. R.

7. R. *gramineus*. Graſſy Crowfoot. Linn. Sp. Pl. 773. Willd. n. 5. Ait. n. 5. Fl. Brit. n. 3. Engl. Bot. t. 2306. Curt. Mag. t. 164. Bulliard. t. 123.—Leaves linear-lanceolate, glaucous, many-ribbed, ſeſſile. Stem erect, very ſmooth throughout, with few flowers. Fruit globoſe.—Native of mountainous ſituations in the ſouth of France. *Gerard.* In Italy, Columm. Ecphr. 314. Withering ſays it was brought from North Wales by Mr. Pritchard. Willdenow mentions moiſt meadows in France as its native ſtation, for which we can find no authority. The plant thrives in England in rather dry gardens, flowering in May or June, and is perennial. The graſſy, broadiſh, glaucous *leaves*, and large golden *flowers*, readily diſtinguiſh this ſpecies. The *root* is tuberous and round. *Stem* twelve or eighteen inches high. *Calyx* very ſmooth, ſpreading, not deflexed. The *fruit* is deſcribed as globoſe. We have not ſeen it ripe.

8. R. *pyrenæus*. Pyrenean Crowfoot. Linn. Mant. 248. Willd. n. 6. Jacq. Miſc. v. 1. 154. t. 18. f. 1. (R. pumilus, gramineis foliis; Bauh. Hiſt. v. 3. append. 850. R. n. 1180; Hall. Hiſt. v. 2. 77.) β. R. plantagineus; Allion. Pedem. n. 1445. v. 2. 48. t. 76. f. 1.—Leaves linear-lanceolate, many-ribbed, ſtalked. Stem erect, with one or two flowers; woolly at the top. Fruit ſomewhat cylindrical. Seeds with recurved beaks.—Native of the Pyrenees, as well as of the Alps of Switzerland, Dauphiny, and Carinthia. Linnæus, for a long while, confounded this with the laſt, and many botaniſts have conſidered them as hardly to be diſtinguiſhed, but by the colour of the *flowers*. The *leaves* of the preſent vary greatly in breadth, being ſometimes quite narrow and linear; but in variety β they are elliptical, and an inch wide. They appear to be green, not glaucous. The upper part of the *ſtem*, quite ſmooth in *R. gramineus*, is always hairy, and under the flower is denſely woolly, in the preſent ſpecies. The *petals* are pure white. *Fruit* nearly cylindrical. *Seeds* with elongated, remarkably recurved, points. Few plants vary more in luxuriance.

A moſt remarkable variety, as Haller and Villars eſteem it, is the *R. lacerus*, Bellardi Append. ad Flo. Pedem. 27. t. 6, of which we have a ſpecimen from the author himſelf. In this the *ſtem* is branched, bearing thirteen or fourteen *flowers*, but its chief ſingularity conſiſts in the jagged, and partly almoſt palmate, *leaves*, which nevertheleſs bear all the marks of caſual luxuriance. We have a ſpecimen of Allioni's *plantagineus*, our variety β, which, by a tooth or two in ſome of the leaves, evinces an approach towards this *lacerus*; and we have another of the ſame with four flowers on one ſtem.

9. R. *parnaſſifolius*. Parnaſſia-leaved Crowfoot. Linn. Sp. Pl. 774. Willd. n. 7. Ait. n. 6. Curt. Mag. t. 386. Wulf. in Jacq. Coll. v. 1. 191. t. 9. f. 3, without leaves. (R. n. 1179; Hall. Hiſt. v. 2. 77. Herb. Davall.)—Leaves many-ribbed; radical ones roundiſh-ovate, ſomewhat heart-ſhaped, on long ſtalks; ſtem-leaves ovato-lanceolate, pointed, ſeſſile.—Native of the Alps of Switzerland, Dauphiny and Carinthia, as well as of the Pyrenees, from all which countries we have received ſpecimens. The plant is eſteemed very rare, and Wulfen regrets that he loſt the root and leaves of his only ſpecimen; ſo that Mr. Curtis has rendered a valuable ſervice to botaniſts by his excellent figure. This is a ſingularly elegant ſpecies, on account of its *leaves*, which reſemble our *Parnaſſia*, as well as for its large and brilliant white *flowers*, with their roſe-coloured *calyx*. Their *ſtalks* are woolly. *Fruit* ovate. *Seeds* obovate, obtuſe, with ſhort incurved beaks. The *root* is perennial, formed of copious, very long, pale fibres, as if it grew in watery places, but Haller ſays it inhabits ſtony alpine ſituations, being quite common in his own territory of Aigle.

10. R. *ophioglоſſoides*. Serpent's-tongue Crowfoot. Willd. n. 8. (R. ophioglоſſifolius; Villars Dauph. v. 3. 731. t. 49.)—Stem ſimple, erect, leafy. Lower leaves ovate, or heart-ſhaped, many-ribbed, on long ſtalks; upper linear-lanceolate, ſeſſile.—Found between Toulon and Hyeres in Provence, by M. Villars, who mentions having ſeen a drawing of the ſame plant, in the royal collection at Paris, marked R. leſbius paluſtris, ophiogloſſi folio; Tourn. Cor. 20. The *root* is deſcribed by Villars as ſomewhat bulbous, or tuberous, with many whorls of fibres. *Stem* erect, a foot high. *Leaves* ſmooth, rather fleſhy. *Flowers* ſmall, yellow, with ſhining *petals*. *Seeds* in a ſmall round head. He conceives it ſomewhat allied to *R. Flammula*. The reſemblance of the *leaves*, in his plate, to *parnaſſifolius*, ſeems to have induced Willdenow to range it here. We have ſeen no ſpecimen.

11. R. *amplexicaulis*. Plaintain-leaved Crowfoot. Linn. Sp. Pl. 774. Willd. n. 9. Ait. n. 7. Curt. Mag. t. 266. (R. folio plantaginis; Ger. Em. 963.)—Leaves ovate, pointed, glaucous, claſping the many-flowered ſtem. Root faſciculated.—Native of the Apennine and Pyrenæan mountains, but not, as far as we know, of the Swiſs Alps, Haller having miſtaken his n. 1179, which is *parnaſſifolius*, for this ſpecies. It is a hardy perennial in our gardens, not difficult of culture, yet not common, flowering in May. The *herbage* is glaucous. *Stem* erect, leafy, twelve or fifteen inches high, branched above. *Leaves* generally more or leſs fringed with ſoft hairs. *Calyx* green, ſmooth, concave, partly membranous and white at the edge. *Petals* of a pure and brilliant white. *Anthers* yellow, as in other ſpecies. We have never ſeen the ripe *ſeeds*.

12. R. *heterophyllus*. Various-leaved Slender Crowfoot. (R. bonarienſis; Lamarck Dict. n. 9.)—Leaves ſtalked, toothed, heart-ſhaped or ovato-lanceolate, with three central ribs. Stem erect. Flowers ſtalked, ſolitary, oppoſite to the leaves. Seeds obtuſe, granulated.—Gathered by Commerſon at Buenos Ayres, in marſhy places. *Root* fibrous. *Stem* erect, a foot or more in height, ſlender, ſmooth, ſtriated, branched, leafy. *Leaves* alternate, on long ſtalks; the lower ones ovate, or heart-ſhaped; the upper lanceolate, or ovate; all obtuſe, more or leſs crenate or toothed, about an inch long, ſmooth, furniſhed with three central ribs, and ſeveral lateral branching veins. *Footſtalks* bordered at their baſe; the lowermoſt much the longeſt. *Flowers* very ſmall, whitiſh, on ſolitary, ſtraight, ſimple, lateral ſtalks, an inch or an inch and half long, oppoſite to the leaves. *Fruit* ovate. *Seeds* obtuſe, or obovate, rough with minute points. The *calyx* is ſmooth and reflexed, often remaining till the ſeeds are ripe.

13. R. *flagelliformis*. Long-ſtalked Crowfoot.—Leaves on long ſtalks, heart or kidney-ſhaped, wavy or crenate. Stem creeping, thread-ſhaped. Flowers ſtalked, ſolitary, oppoſite to the leaves. Petals ovate. Seeds obtuſe, dotted.—Native of Chili and New Granada. We have ſpecimens from Mutis and Cavanilles, but this ſpecies does not ſeem to be any where deſcribed. The *ſtems* are long, thread-ſhaped, much branched, proſtrate, creeping or perhaps floating, ſending out from each joint long fibrous radicles, and one or more ſmooth, roundiſh, heart-ſhaped or kidney-ſhaped *leaves*, hardly an inch wide; their *footſtalks* meaſuring from two to three inches. *Flowers* very ſmall, white, ſolitary, oppoſite to the leaves, on ſlender *ſtalks*, rather ſhorter than thoſe of the foliage. *Stamens* few. *Fruit* rather oblong. *Seeds* obovate, obtuſe, compreſſed, minutely dotted. This *Ranunculus* is perhaps moſt nearly akin to our Britiſh *hederaceus*, hereafter deſcribed, though very certainly diſtinct, and as the ſpecies are at preſent arranged, they muſt remain

 at

at a diſtance. In habit and general reſemblance they cloſely accord.

14. R. *Cymbalaria.* Small Trailing Crowfoot. Purſh n. 5.—"Leaves heart or kidney-ſhaped, with five blunt teeth. Stem creeping, thread-ſhaped. Flower-ſtalks ſolitary, moſtly two-flowered. Petals linear. Fruit oblong."—In ſaline marſhes, near the ſalt works of Onondago, New York, flowering in June and July. Perennial, ſomewhat reſembling the following. *Flowers* ſmall, pale yellow, ſometimes white. *Purſh.*

15. R. *ſalſuginoſus.* Salt-marſh Crowfoot. "Pallas's Travels, ſmall edition, v. 3. 173." Willd. n. 11. (R. ruthenicus; Jacq. Hort. Vind. v. 3. 19. t. 31. R. repens, flore in caule ſingulari, foliis variè ſectis; Amm. Ruth. 81. t. 13. f. 2.)—Leaves ovate, ſomewhat heart-ſhaped; toothed at the extremity. Stem creeping, thread-ſhaped. Flower-ſtalks ſolitary, moſtly ſingle-flowered. Petals obovate. Fruit nearly globoſe.—Found by Gmelin, on the banks of the Neva; *Ammann;* by Pallas in the ſalt plains of Siberia, beyong the lake Baical. The *flowers* are yellow, as big as our common Crowfoots, being more than ten times the ſize of the laſt. Their *petals* are about ten, obovate. The *root* ſends out long runners, like a garden ſtrawberry. Gmelin's ſpecimen is much ſmaller than Jacquin's figure.

16. R. *bullatus.* Portugal Crowfoot. Linn. Sp. Pl. 774. Willd. n. 10. Ait. n. 8. (R. luſitanicus; Dod. Pempt. 429. R. autumnalis Cluſii; Ger. Em. 954. R. luſitanicus Cluſii; ib. 955.)—Leaves ovate, ſerrated. Flower-ſtalks radical, ſingle-flowered, hairy.—Native of Portugal and the north of Africa, cultivated in England before 1640, but now ſcarcely ſeen. It flowers in May and June, and has a perennial fibrous *root*, more like Gerarde's fig. 10 than 11. *Leaves* all radical, ſtalked, ovate, ribbed and veiny, ſomewhat hairy, ſtrongly and unequally ſerrated, an inch or an inch and half long; ſometimes, according to Cluſius, bliſtered. *Flowers* yellow, on ſimple, hairy, upright, radical *ſtalks*, three or four inches long. *Petals* more than five, narrow-obovate. The old authors delineate two kinds, generally ſuppoſed to be varieties, but which may poſſibly be ſpecies. We have not ſeen either, except in a dried ſtate.

17. R. *Ficaria.* Pilewort, or Leſſer Celandine. Linn. Sp. Pl. 774. Willd. n. 12. Ait. n. 9. Fl. Brit. n. 4. Engl. Bot. t. 584. Curt. Lond. faſc. 2. t. 39. Mart. Ruſt. t. 21. Bulliard t. 43. (Chelidonium minus; Matth. Valgr. v. 1. 578. Fuchſ. Hiſt. 867. Ger. Em. 816.)—Leaves heart-ſhaped, angular, ſmooth, ſtalked. Petals numerous.—Native of waſte ground throughout Europe, in moiſt, ſhady, or buſhy places, flowering in the early ſpring. Dr. Sibthorp found it common in Greece; and there can be no doubt of its being, as all botaniſts have judged, χελιδόνιον το μικρον, the Leſſer Celadine, of Dioſcorides. *Root* perennial, fibrous, with many fleſhy, pear-ſhaped, annual knobs, whoſe appearance gave riſe to the Latin, as well as Engliſh, name of this ſpecies, and to an idea that the plant might be ſerviceable in the piles, which thoſe who believe, may conſult Gerarde for the mode of application. The *ſtems* are leafy, and moſtly ſingle-flowered. *Leaves* ſmooth and ſhining. *Flowers* ſtalked; with three, ſometimes five, leaves to the *calyx;* and eight, occaſionally ten, elliptic-oblong, highly poliſhed *petals*, which fade to white in bright ſunſhine.

18. R. *frigidus.* Alpine Siberian Crowfoot. Willd. n. 13.—Radical leaves wedgeſhape-ovate, five-toothed at the extremity; thoſe of the ſtem ſeſſile, palmate.—Native of the alps of Siberia. Willdenow ſays he received this by the name of *gracilis*, meaning *glacialis*, "with which it agrees in the ſize, and perhaps colour, of the *flower*, but is abundantly diſtinct in the *leaves*." Several Siberian unnamed ſpecimens, in the Linnæan herbarium, anſwer exactly to Willdenow's deſcription. The radical leaves are ſeveral, ſtalked, between half an inch and an inch in length, ſmooth; rounded and entire at the baſe; abrupt and variouſly cut into broad blunt teeth, we might almoſt ſay lobes, at the ſummit. *Stem* erect, uſually ſingle-flowered, with two or three, alternate, ſeſſile, more deeply lobed, or palmate, *leaves*. *Calyx* brown, hairy. *Petals* five, inverſely heart-ſhaped, apparently white. The *flower* is ſo like *glacialis*, that we cannot but ſuſpect the difference of the *leaves*, however great, to be but caſual. At any rate, they are ſometimes ſo deeply cut, that this ſpecies might perhaps, without violence, have been placed in the following ſection, next to *glacialis*.

19. R. *Thora.* Kidney-leaved Crowfoot. Poiſon-root of the Swiſs. Linn. Sp. Pl. 775. Willd. n. 14. Ait. n. 10. Jacq. Auſtr. t. 442. Obſ. faſc. 1. 25. t. 13. (Thora major et minor; Camer. Epit. 825, 826. Th. valdenſis, et montis Baldi; Ger. Em. 966. Pſeudo aconitum pardalianches; Matth. Valgr. v. 2. 430.)—Leaves kidney-ſhaped, abrupt, crenate, reticulated; the radical ones on long ſtalks. Stems with one or two flowers. Bracteas lanceolate.—Native of the alps of Switzerland, Auſtria, and Greece, as well as of mount Baldus, near Verona, flowering rather early in ſummer. It is ſaid to have been formerly in the Engliſh gardens, but has never fallen under our obſervation. *Root* perennial, of thick, tapering, fleſhy fibres or rather knobs. *Stem* ſolitary, ſmooth, ſimple, near a ſpan high; terminating in one, rarely more, long-ſtalked golden *flowers*, about half an inch wide; its *calyx-leaves* lanceolate, coloured, ſmooth, like every other part of the plant. *Leaves* about two inches wide, and one long, rather coriaceous, ſtrongly reticulated with veins, neatly crenate, terminating either abruptly, with a notch, or elongated into three acute, entire, triangular, central lobes; the uppermoſt, or floral, ones, lanceolate and entire; the radical ones only on long ſlender ſtalks. *Fruit* globular, of a few, large, tumid, ovate *ſeeds*, with hooked points. The *root* of this plant is reported to be extremely acrid and poiſonous, its juice having been uſed formerly, by the Swiſs hunters of wild beaſts, to envenom their darts, whoſe wound by that means becomes ſpeedily fatal and incurable. Hence the name, from φθορα, *corruption*, or *venom*. We can ſee no poſſible reaſon for diſtinguiſhing the greater and ſmaller kinds, even as permanent, or well-marked, varieties.

Section 2. *Leaves diſſected and divided.*

20. R. *creticus.* Cretan Crowfoot. Linn. Sp. Pl. 775. Willd. n. 15. Ait. n. 11. (R. creticus latifolius; Cluſ. Hiſt. v. 1. 239. Ger. Em. 963.)—β. R. macrophyllus; Desfont. Atlant. v. 1. 437. Lamarck Dict. n. 19.—Radical leaves kidney-ſhaped, crenate, ſomewhat lobed; ſtem-leaves in three deep, lanceolate, entire ſegments. Stem many-flowered.—Native of Crete; cultivated in the Oxford garden in 1658, but perhaps now loſt. The *root* is perennial, of many thick, tapering, fleſhy fibres. *Stem* thick, moderately branched, eighteen inches, or more, in height, hairy as well as the reſt of the herbage. *Radical leaves* from two to four inches long, and more in breadth, kidney-ſhaped, reticulated with ſtrong veins, light green, downy, unequally divided into about ſeven three-cleft, or coarſely notched, ſhallow lobes: *ſtem-leaves* alternate, in three deep, oblong, obtuſe, entire lobes; the baſe tapering or wedge-ſhaped. *Flowers* ſeveral, yellow, nearly as large as *R. Lingua*, n. 3. *Calyx* reflexed, ovate, looſely hairy. β appears, by the account of M. Desfontaines, to differ merely in having the lower

lower *leaves* more deeply lobed than uſual, and ſomewhat leſs hairy.

21. R. *caſſubicus*. Caſſubian Crowfoot. Linn. Sp. Pl. 775. Willd. n. 16. Ait. n. 12. (R. aconitifolius, folio rotundo, ad radicem præſtolante; Loeſ. Pruſſ. 225. t. 72.)—Radical leaves roundiſh-heartſhaped, crenate, undivided; ſtem-leaves in ſeveral deep, lanceolate, toothed and jagged ſegments. Stem many-flowered.—Native of Pruſſia and Siberia, flowering in May. Meſſrs. Loddiges are ſaid to have introduced it into England, in 1794. Though the character of this approaches the laſt, the two plants are very different. The radical *leaves* of the preſent, though heart-ſhaped, are almoſt orbicular, their two lobes meeting each other; their margin ſharply crenate, but not at all divided; their ſurface minutely downy. *Stem* much branched; ſmooth below; downy above; bearing ſeveral fingered, veiny, ſmooth, ſeſſile *leaves*; the lower ones largeſt, many-lobed, and jagged; the upper with only three lanceolate, entire lobes. *Flowers* rather ſmall, deep yellow. *Calyx* hairy towards the baſe. *Fruit* ovate. *Seeds* hairy, roundiſh, ſlightly compreſſed, each with a ſtrongly revolute beak.

22. R. *auricomus*. Wood Crowfoot, or Goldilocks. Linn. Sp. Pl. 775. Willd. n. 17. Ait. n. 13. Purſh n. 9. Fl. Brit. n. 5. Engl. Bot. t. 624. Curt. Lond. faſc. 2. t. 41. Fl. Dan. t. 665. Ger. Em. 954. (R. prima ſpecies ſylveſtris; Fuchſ. Hiſt. 156. Dalech. Hiſt. v. 1. 1029.)—Radical leaves kidney-ſhaped, deeply three-cleft, crenate; ſtem-leaves divided to the baſe into linear ſegments. Stem many-flowered. Calyx coloured.—Native of woods and ſhady places, throughout Europe; alſo in Pennſylvania; flowering in April and May. *Root* fibrous, perennial. *Herb* of a pale pleaſant green, and deſtitute of the acrimony uſual in this genus. *Stems* a foot high, erect, branched, ſcarcely downy, except near the top. *Leaves* generally a little downy; the radical ones on long ſtalks, deeply divided into three or five, wedge-ſhaped, crenate, or cut lobes; the reſt in many linear, entire, or partially cut, ſpreading diviſions. *Flowers* terminal, erect, ſolitary at the top of each branch, of a bright golden hue. *Calyx* pale yellow, hairy, ſcarcely at all reflexed. *Nectary* a naked pore in each petal, not cloſed by any ſcale. In cold backward ſeaſons the *petals* are ſometimes wanting, or rather identified with the *calyx*, which is then dilated, and more coloured than uſual.

23. R. *abortivus*. Small-flowered Virginian Crowfoot. Linn. Sp. Pl. 776. Willd. n. 18. Ait. n. 14. Purſh n. 6.—Radical leaves heart-ſhaped, undivided, crenate; lower ſtem-leaves pedate; upper in three deep linear ſegments. Calyx reflexed, coloured. Petals obſolete.—In wet places, by the ſides of ponds and ditches, from New York to Carolina, flowering in July and Auguſt. *Purſh*. In ponds at Buenos Ayres. *Commerſon*. This ſpecies appears to have been cultivated in Chelſea garden 100 years ago, but it has, long ſince, diſappeared, nor has any author given a figure of the plant. Its habit is moſt like *ſceleratus*, n. 26. *Root* perennial, of many long fibres. *Herb* ſmooth. *Stem* from ſix to eighteen inches high, branched, leafy. *Radical leaves* like thoſe of a violet, not an inch long, crenate, ſmooth; their *ſtalks* two inches, or more, in length: lower *ſtem-leaves* ternate, their lateral leaflets deeply divided, all cut or crenate: uppermoſt *leaves* nearly ſeſſile, in three deep, lanceolate, entire diviſions. *Flowers* ſmall; yellow according to Purſh, but Commerſon, in his MSS. calls them fleſh-coloured; each ſtands on a ſimple ſolitary ſtalk, half an inch or an inch long, either from the forks of the branches, or at their ſummits. The *calyx* is reflexed, large, membranous and coloured. We find ſcarcely any certain traces of *petals*, but the plant may be variable in theſe parts, like *auricomus*. *Stamens* few. *Germen* large, globoſe.—Linnæus took his ſpecific character, *caule ſubtrifloro*, from ſpecimens not fully grown; yet he had an authentic one by him, with above thirty flowers. In Commerſon's the upper *leaves* are more ſtalked than uſual.

24. R. *nitidus*. Varniſhed American Crowfoot. Walt. Carol. 159. Lamarck n. 68. Purſh n. 7.—"Very ſmooth. Stems hollow. Radical leaves roundiſh-kidney-ſhaped, bluntly crenate; ſtem-leaves ſeſſile, digitate; their leaflets cut, with blunt ſegments. Seeds nearly globoſe, very ſmooth."—In inundated grounds, from New York to Carolina, flowering in July and Auguſt. *Root* perennial. *Flowers* ſmall. *Petals* white. This and the foregoing one are probably only varieties. *Purſh*.

25. R. *trilobus*. Three-lobed Barbary Crowfoot. Deſfont. Atlant. v. 1. 437. t. 113. Willd. n. 19.—Stem erect, much branched. Leaves ſmooth, deeply three-lobed, cut; uppermoſt linear, obtuſe, undivided. Flower-ſtalks ſtriated. Seeds compreſſed, tuberculated.—Gathered by Deſfontaines, in moiſt fields, near Mayane, in Barbary. He deſcribes it as akin to *R. parviflorus*, except in its upright growth, and ſmooth, deeply three-lobed *leaves*. The loweſt *leaf* of all is undivided and crenate. *Flowers* very ſmall, yellow, ſituated as in the two laſt. *Seeds* in a round head, ſmall, compreſſed, orbicular with a point, covered with tubercles on both ſides. To us this ſpecies ſeems, by its *ſeeds*, allied to *parvulus* of Linnæus, which is a variety of *hirſutus*, hereafter deſcribed.

26. R. *ſceleratus*. Celery-leaved Water Crowfoot. Linn. Sp. Pl. 776. Willd. n. 20. Ait. n. 15. Purſh n. 8. Fl. Brit. n. 6. Engl. Bot. t. 681. Curt. Lond. faſc. 2. t. 42. Fl. Dan. t. 571. (R. paluſtris rotundifolius; Ger. Em. 962.)—Stem erect, much branched. Lower leaves palmate, ſmooth; upper ones fingered. Fruit oblong. Seeds very numerous, minute.—Found about ditches and in watery places by road ſides, in moſt parts of Europe and North America, flowering in ſummer. *Root* annual. *Herb* various in ſize and luxuriance, of a pale ſhining green, juicy, very ſmooth, except occaſional hairineſs on the flower-ſtalks. *Stem* round, thick and hollow. Lower *leaves* larger, broader, leſs divided, and more ſtalked, than the upper; the floral ones moſtly lanceolate, ſimple, and entire. *Flowers* numerous, ſmall, yellow. *Calyx* deflexed, ſhaggy. *Nectary* ſomewhat tubular. *Stamens* few. *Seeds* very ſmall, but exceſſively numerous, making a denſe, oblong, obtuſely rounded head. This is one of the moſt acrid of its tribe, raiſing bliſters and dangerous ſores in the ſkin.

27. R. *aconitifolius*. Aconite-leaved White Crowfoot. Linn. Sp. Pl. 776. Willd. n. 21. Ait. n. 16. Curt. Mag. t. 204. (R. montanus quartus; alſo R. pleno flore albo; Cluſ. Hiſt. v. 1. 236. R. aconiti folio; Ger. Em. 954. R. albus multiflorus; ib. 957. R. albus, flore denſo; Bauh. Hiſt. v. 3. 844, not 860.)—Leaves veiny, ſmooth, in five deep, pointed, toothed lobes; the middle one three-cleft: floral leaves ſeſſile, fingered, lanceolate, cut. Stem branched, many-flowered.—Native of the alps of Switzerland, France, Auſtria, &c.; a hardy and long-eſtabliſhed perennial in our gardens, flowering in May and June; generally in a double ſtate, as figured by Curtis. He remarks that it requires moiſture, ſhade, and a pure air. The *ſtem* is one and a half or two feet high, partly purpliſh, ſmooth, with ſpreading branches. *Leaves* dark green, with a glaucous hue beneath; the radical ones on long ſtalks; the reſt nearly ſeſſile; all compoſed of more or leſs diſtinctly ſeparate, often ſtalked, leaflets, ſtrongly veined and coarſely toothed; the uppermoſt ſmaller, more ſimple, quite ſeſſile.

Flowers

Flowers white, three-quarters of an inch in diameter, not very ornamental in their single wild ftate, but much admired when double, and formerly called Fair Maids of France. Their pearly whitenefs is enhanced by the violet *calyx*.

28. R. *platanifolius*. Plane-tree-leaved White Crowfoot. Linn. Mant. 79. Willd. n. 22. Ait. n. 17. Fl. Dan. t. 111. (R. albus, flore fimplici; Lob. Ic. 668. R. alpinus albus; Ger. Em. 951.)—Leaves veiny, fmooth, deeply palmate, five-lobed, cut and toothed; the middle ones three-cleft: floral leaves feffile, fingered, linear-awlfhaped, entire. Stem branched, many-flowered.—Native of the Alps of Germany, Norway, Switzerland, Italy, and of the Pyrenees, in fhady places. Said to have been introduced into the Englifh gardens in 1769, by Meffrs. Kennedy and Lee. This is very diftinct from the laft, with which Linnæus originally confounded it. The *leaves* are larger, not divided quite to the bafe, though their lobes are more cut and jagged: the floral ones are remarkably long, flender, and entire. *Flowers* twice as large, and rather more abundant. The radical *leaves* of both have occafionally feven or nine lobes, inftead of five.

29. R. *fpicatus*. Spike-fruited Crowfoot. Desfont. Atlant. v. 1. 438. t. 115. Willd. n. 23.—Leaves radical, five-lobed, toothed. Stem nearly fimple, hairy. Fruit cylindrical, thrice as long as the calyx.—Gathered by Desfontaines in marfhes at Algiers. *Root* perennial, of numerous, oblong, flefhy, tapering knobs. *Stem* folitary, erect, a fpan high, hairy, fimple, except at the top, where it divides into two or three fimple fingle-flowered ftalks; fometimes accompanied by a few *bracteas*, in three or four deep linear fegments; fometimes naked. *Leaves* all radical, on hairy ftalks, heart-fhaped, rounded, five-lobed, ftrongly toothed, villous, about an inch and a half broad. *Calyx* of five ovate-oblong, coloured, hairy, fpreading leaves. *Petals* five, obovate, yellow, the fize of *R. acris*. *Fruit* cylindrical, flender, an inch and a half or two inches long. *Seeds* very numerous, ovate, compreffed, bordered each with a hooked, prominent beak.

30. R. *paludofus*. Marfh Crowfoot. Poiret Voy. en Barb. v. 2. 184. Lamarck n. 22. Desfont. Atlant. v. 1. 439.—"Downy. Lower leaves in three deep, many-cleft, fan-fhaped fegments; upper fimple, linear, entire. Stem branched, many-flowered. Calyx erect."—Gathered by Poiret, in the borders of extenfive marfhes, near la Calle, and in fome other parts of Barbary. *Root* fibrous, denfely fafciculated. *Herb* downy, with fhort, clofe-preffed hairs. *Stems* feveral, eight or ten inches high, with fpreading leafy branches, bearing abundance of widely-fpreading, deep-yellow *flowers*, the fize of the foregoing, on flender ftalks of various lengths. Radical *leaves* ftalked; the earlieft ones ovate, undivided, deeply toothed; the reft almoft pinnate, with three long, narrow, deeply cut, fan-fhaped fegments; thofe on the lower part of the ftem lefs compound: the uppermoft linear, undivided, acute, entire. *Fruit* oval, or almoft elliptical, obtufe. *Seeds* oblong, fmooth, compreffed, fcarcely pointed.

31. R. *illyricus*. Illyrian Silky Crowfoot. Linn. Sp. Pl. 776. Willd. n. 24. Ait. n. 18. Jacq. Auftr. t. 222. Ger. Dod. Pempt. 428. Em. 953. (R. grumofâ radice quartus; Cluf. Hift. v. 1. 240.)—Leaves fhaggy with filky hairs, linear-lanceolate, ternate, entire. Calyx filky, reflexed. Stem branched. Flower-ftalks woolly.—Native of Hungary, France, Italy, Auftria, Thrace, and of the Swedifh ifle of Oeland; cultivated here in Gerarde's time. Clufius received his fpecimens, from a phyfician of Ferrara, with the name of *R. illyricus*, which has been retained, abfurdly enough, for a plant found in fo many different countries, and for which fo many expreffive appellations might eafily have been contrived. The *root* is perennial, compofed of numerous, fmall, round granulations. Whole herb more or lefs clothed with fnow-white, filky, or partly cottony, down. *Stem* a foot high, or more, fomewhat branched, bearing feveral bright lemon-coloured *flowers*, nearly the fize of *R. Lingua*, their *calyx-leaves* ovate, reflexed, externally filky. *Leaves* all linear-lanceolate, entire, feldom divided; the radical ones on long ftalks, ternate or pinnate; thofe about the middle of the ftem ternate, almoft feffile; upper ones fimple: the ufual length of each leaf or leaflet is two or three inches.—Dodonæus takes this for the fecond Βατράχιον, or *Ranunculus*, of Diofcorides, with whofe defcription it in fome meafure accords. That fpecies is faid to be extremely acrid. Hence Dodonæus, who is copied by Gerarde, fuppofes our plant may be the *Gelotophyllis* of Pliny, which caufed thofe who took it to dye laughing. But this opinion depends on too many conjectures to deferve attention; even if any benefit could accrue from afcertaining the point. We muft obferve however that Dr. Sibthorp thought the above *Ranunculus* of Diofcorides to be our *lanuginofus*, which is a common Greek plant, and anfwers better to his defcription.

32. R. *flabellatus*. Fan-leaved Crowfoot. Desfont. Atlant. v. 1. 438. t. 114. Willd. n. 25. Sm. Fl. Græc. Sibth. t. 520, unpublifhed. (R. alter faxatilis, afphodeli radice; Columm. Ecphr. 312. t. 313.)—Radical leaves undivided or twice ternate, toothed or deeply cut, ftalked; upper ones ternate or fimple. Stem hairy, fimple below, few-flowered. Fruit elliptical.—Found by Desfontaines, near Algiers, on moift uncultivated hills, flowering in winter: by Sibthorp on the northern mountains of Greece. *Root* perennial, of many oblong, tapering, cluftered fibres, rather than knobs. *Stem* a fpan high, hairy, fomewhat divided above, and bearing two or three yellow *flowers*, the fize of our common *R. bulbofus*, accompanied by deeply two or three-cleft *bracteas*. *Leaves* chiefly radical, on longifh ftalks; feveral of the earlieft undivided, fan-fhaped, ftrongly toothed; the reft deeply three-cleft, and fubdivided.

33. R. *afiaticus*. Perfian Crowfoot, or common Garden Ranunculus. Linn. Sp. Pl. 777. Willd. n. 26. Ait. n. 19. Mill. Ic. t. 216. Sm. Fl. Græc. Sibth. t. 518, unpublifhed. (R. afiaticus, grumofâ radice; Cluf. Hift. v. 1. 240—243. Ranunculi varii; Ger. Em. 958—960. Βατράχιον; Diofc. book 2. chap. 206.)—Leaves once or twice ternate; leaflets three-cleft, cut. Stem hairy, branched. Petals thrice as long as the calyx. Fruit cylindrical.—Found by Dr. Sibthorp wild in various parts of Afia Minor, but moft plentifully in the ifle of Cyprus, where it ftill retains one of its ancient names, mentioned by Diofcorides, αγριο-σέλινον, or Wild Parfley. In the gardens of Europe it has been cultivated, ever fince the latter part of the fixteenth century, under the form of innumerable varieties, chiefly double, of every variegated hue. In a wild and fingle ftate the large and fplendid *petals* are of a moft vivid crimfon, occafionally varying to yellow. The *root* is perennial, of numerous, brown, flefhy, tapering knobs. *Stem* twelve or fifteen inches high, erect, round, downy, hoary, leafy, branched from the middle or lower part, and bearing from three to five large long-ftalked *flowers*, whofe *calyx* is brown, hairy, and reflexed, but one-third the length of the broad, obovate, concave *petals*. *Leaves* rather hairy, moftly ftalked, varioufly three-cleft and notched, more or lefs compound; the floral ones, as ufual, narrower and moft fimple. *Fruit* cylindrical. *Seeds* oblong, with recurved points.

34. R. *japonicus*. Japan Crowfoot or Ranunculus. Thunb. Tr. of Linn. Soc. v. 2. 337. Willd. n. 27. (R. afiaticus;

asiaticus; Thunb. Jap. 241.)—"Leaves deeply three-cleft, cut and toothed, hairy as well as the stem."—Common in ditches about Nagasaki, Jedo, and elsewhere in Japan, flowering from February to May. It is hairy in every part, except the *corolla*. The radical *leaves* are rounded; the uppermost divided into lanceolate segments; all three-cleft, their segments cut, toothed, acute, hairy on both sides. *Footstalks* from an inch to a foot in length. *Stems* striated, scarcely leafy, zigzag, branching into flower-stalks at the top. *Thunberg*. The above character and description are not sufficient to distinguish this species from the last, with which Thunberg originally confounded it. Something is necessary to be known respecting the *calyx*, and its relative proportion to the *petals*, as well as the form of the *fruit* and *seeds*.

35. R. *rutæfolius*. Rue-leaved Crowfoot. Linn. Sp. Pl. 777. Willd. n. 28. Ait. n. 20. Jacq. Coll. v. 1. 186. t. 6, 7. Allion. Pedem. v. 2. 49. t. 67. f. 1. (R. præcox rutaceo folio; Clus. Hist. v. 1. 232. Ger. Em. 965. Ranoncolo alpino, con foglia di Coriandro; Pon. Bald. 197.)—Leaves pinnate, ternate, many-cleft, glaucous, smooth; their segments elliptic-oblong. Stem nearly simple. Petals numerous. Calyx smooth. Seeds ovate, with straight points.—Native of the loftiest alps of Switzerland, Dauphiny, Austria, and the north of Italy, flowering early in July. The *root* is tuberous, with long, simple, stout fibres, perennial. *Herb* glaucous and smooth. *Stem* from two to five inches high, mostly simple and single-flowered, sometimes bearing two, rarely three, flowers. *Leaves* stalked, elegantly decompounded; their leaflets wedge-shaped, many-cleft; the ultimate segments oblong, slightly elliptical, bluntish. *Flowers* of a brilliant white, at first tinged with red, on long stalks. *Calyx* purplish, five-leaved, smooth. *Petals* eight or ten, very erroneously represented in the figure of Clusius and Gerarde, so as to look like a syngenesious flower. *Seeds* few, large, ovate, pitted, pointed, straight, spreading every way, stalked, in a round head.

36. R. *glacialis*. Alpine Hairy-cupped Crowfoot. Linn. Sp. Pl. 777. Fl. Lapp. ed. 196. t. 3. f. 1. Willd. n. 29. Ait. n. 21. Fl. Dan. t. 19. (R. montanus purpureus, calyce villoso, Felicis Platerii; Bauh. Hist. v. 3. b. 846. Scheuchz. Alp. v. 1. 399, and 139. t. 20. f. 1.)—Leaves ternate, three-cleft, cut; their segments elliptical. Stem nearly simple. Calyx very hairy.—Native of the highest alps of Lapland, Switzerland, Dauphiny, Germany, &c. in the neighbourhood or ice and snow, flowering in June and July. *Root* perennial, with very long strong fibres. *Stem* from three to six inches high; simple and naked in its lower part; leafy near the top, bearing one or two, very rarely three, *flowers*, on long, smooth stalks. *Leaves* green, scarcely hairy, rather fleshy; the radical ones more or less compound, on long stalks; their segments broader, more elliptical, and blunter than in the former. *Flowers* large and handsome, of five broad, roundish, white *petals*, rose-coloured or purple underneath; the *calyx* purplish-brown, singularly rough, with shining tawny hairs. When we contemplate the great diversity of subdivision in the foliage of this species, we are disposed to believe our *frigidus*, n. 18, may possibly be a mere variety. Their *flowers* precisely agree, as well as their general habit.

37. R. *Seguieri*. Sharp-leaved Alpine Crowfoot. Villars Dauph. v. 3. 737. t. 49. Willd. n. 30. (R. Columnæ; Allion. Pedem. v. 2. 50. t. 67. f. 3, 4. Wulf. in Jacq. Coll. v. 4. 345. R. alpinus apii folio, flore albo magno; Pont. Comp. 117. Seguier Veron. v. 1. 490. t. 12. f. 2, 3.)—Leaves ternate; segments wedge-shaped, subdivided, decurrent, acute. Stem branched, about three-flowered. Calyx smooth.—Native of mount Baldus, where it was first found by Pontedera; as well as of the mountains of Dauphiny, Piedmont, and Carniola; in stony situations. This resembles some of the most luxuriant varieties of *glacialis*, but differs in the acute and decurrent segments of its *leaves*, as well as its smooth pale *calyx*; for Villars is incorrect in describing that part "externally downy." It is quite smooth, in his own and Allioni's specimens; the hairiness being confined to the top of the *flower-stalk*, where it is very dense and conspicuous; while the same part in *glacialis* is smooth, up to the base of the hairy *calyx*. The *petals*, and even the *nectary*, are white. Villars is surely right in removing the synonym of Columna, cited by Allioni, which we refer, with hardly any scruple, to *flabellatus*, n. 32, a very different plant.

38. R. *nivalis*. Palmate Alpine Crowfoot. Linn. Sp. Pl. 778. Fl. Lapp. ed. 2. 195. t. 3. f. 2. Willd. n. 31. (Excluding the variety.)—Leaves palmate, five-lobed, spreading, entire; those of the stem sessile. Stem single-flowered, smooth. Calyx hairy, half the length of the petals.—Found by Linnæus in Lapland, by the alpine rivulets on the snowy mountains of that country. Martens had previously gathered it at Spitzbergen. The *root* is fibrous, and slender. *Stem* simple, erect or ascending, smooth, leafy, about six inches high. *Radical leaves* two or three, on long slender stalks, heart-shaped at the base, rather deeply palmate, in five broad, divaricated, obovate, entire lobes, veiny and quite smooth: *stem-leaves* one or two, sessile, with five deeper, longer, more lanceolate lobes; the uppermost only three-lobed, or occasionally quite undivided. *Flower* solitary, on a long, terminal, hairy stalk. *Calyx* of five ovate yellowish leaves, rough with blackish hairs. *Petals* yellow, obovate, twice the length of the calyx.

39. R. *pygmæus*. Dwarf Small-flowered Alpine Crowfoot. Pursh n. 10. (R. nivalis pygmæus; Linn. Fl. Lapp. ed. 2. 196. t. 3. f. 3. R. lapponicus; Fl. Dan. t. 144.)—Leaves palmate, somewhat pedate, five-lobed, spreading entire; the upper ones almost sessile. Stem single-flowered. Calyx nearly smooth, rather longer than the petals.—Native of Lapland and Labrador. Perennial, flowering in May and June. Much smaller than the foregoing. Middle lobe of the *radical leaves* very deeply separated. *Stem-leaves* less perfectly sessile, and with narrower segments, than in *nivalis*. *Flower* not a quarter the size of that species; its *petals* yellow, roundish, scarcely so long as the *calyx*, which is likewise small, and very slightly hairy.

40. R. *montanus*. Yellow Mountain Crowfoot. Willd. n. 32. Ait. n. 22. (R. nivalis; Jacq. Austr. t. 325, 326. Sibth. in Prodr. Fl. Græc. n. 1272? Villars Dauph. v. 3. 742. Crantz Austr. fasc. 2. 92. t. 4. f. 3, 4. R. n. 1168; Hall. Hist. v. 2. 71, excluding the references to Linnæus. R. minimus alpinus luteus; Bauh. Hist. v. 3. 845, two upper figures.)—Leaves five-lobed, rounded, cut; those of the stem sessile, with deep, lanceolate, entire segments. Stem single-flowered, rough with erect hairs. Calyx hairy.—Very abundant on the alps of Switzerland, Dauphiny, and Germany; not of Lapland. It was one of those many alpine plants, introduced into the English gardens in 1775, by a person sent on purpose to collect them, at the expence of Dr. Fothergill and Dr. Pitcairn. This species has been confounded with the Linnæan *nivalis*, by all writers previous to Willdenow; yet they are truly distinct. The *montanus* has remarkably long, subdivided, tuberous *roots*, with very long strong fibres. *Stem* hairy throughout, the hairs erect; sometimes quite leafless. Lobes of the radical *leaves* un-

equally

equally cut and toothed, not entire. *Calyx-leaves* narrower, and lefs hairy. *Petals* larger, and of a deeper yellow. This is the *nivalis* of moft botanifts, few having feen the true Linnæan Lapland plant. The variety of *montanus* with a leaflefs *ftem*, figured in Jacquin's t. 326, at the right hand, was taken for a new fpecies, and called *acaulis*, by Favrod and Reynier, as appears by their dried fpecimens.

41. R. *Gouani*. Gouan's Pyrenean Crowfoot. Willd. n. 33. (R. pyrenæus; Gouan Illuftr. 33. t. 17. f. 1, 2.)—Leaves five-lobed, rounded, cut; thofe of the ftem feffile, deeply palmate; the uppermoft with acute, entire lobes. Stem fingle-flowered, rough with deflexed hairs. Calyx hairy.—Gathered by Gouan on the Pyrenees, where it flowers foon after the melting of the fnow. We have a fpecimen from the late M. Brouffonet. This is a larger plant than the preceding, efpecially in its *flower*, and differs, as Willdenow remarks, in having the *ftem-leaf* toothed or cut; but that character applies only to the lower one. The upper *ftem-leaves*, if there be more than one, confift of entire, acute lobes. The moft decifive mark of diftinction appears to us in the hairs of the *ftem*, below the leaves, which in Gouan's plant are either widely extended or bent downwards; in the *montanus* the hairs of every part of the *ftem* are erect, or clofe-preffed. To this no perfon has hitherto adverted.

42. R. *alpeftris*. Alpine White Crowfoot. Linn. Sp. Pl. 778. Willd. n. 34. Ait. n. 23. Sm. Tr. of Linn. Soc. v. 10. 343. Engl. Bot. t. 2390. Jacq. Auftr. t. 110. (R. n. 1167; Hall. Hift. v. 2. 71. R. montani fpecies prima et fecunda; Cluf. Hift. v. 1. 234. R. montanus, flore minore, & majore; Ger. Em. 964. R. minimus alpinus albus; Bauh. Hift. v. 3. 845, two lower figures.)—Leaves very fmooth; radical ones fomewhat heart-fhaped, obtufe, in three deep, lobed fegments; ftem-leaf lanceolate, entire. Stem moftly fingle-flowered.—Native of the higheft alps of Auftria and Switzerland, and of the mountain of Clova, in Angusfhire, Scotland, in which laft place it was difcovered by the late Mr. George Don, by the fides of little rills, flowering, though fparingly, in the fpring of 1809. The *roots* are perennial, with long fibres. Whole *herb* very fmooth, and rather glaucous. *Stem* erect, from one to four inches high, almoft always fimple and fingle-flowered, naked, except one or two fimple, linear-lanceolate, obtufe, entire *leaves*, apparently of the nature of *bracteas*. Radical *leaves* feveral, ftalked, in three deep, fubdivided, acute lobes. *Calyx-leaves* oval, fmooth, edged with white. *Petals* of a pure and brilliant white. Haller fays this is one of the moft acrid of its tribe, bliftering the fkin; and yet the alpine hunters chew it, by way of refrefhment.

43. R. *lapponicus*. Long-ftalked Lapland Crowfoot. Linn. Sp. Pl. 778. Fl. Lapp. ed. 2. 194. t. 3. f. 4. Lapland Tour, v. 1. 156, 252.)—Leaves fmooth, in three very deep, dilated, blunty notched lobes. Flower-ftalks elongated, naked, fingle-flowered. Petals the length of the fmooth calyx.—This rare fpecies, not known out of the limits of Lapland, was difcovered by Linnæus in two or three different places, near the river Juchtan, flowering in June. Profeffor Swartz alfo gathered it, many years after, near Luloa. It grows in watery fituations, and is very different from all others of this genus. The afpect of the plant, at firft fight, recalls the idea of *Adoxa Mofchatellina*. The *root* is long, thread-fhaped, and creeping, throwing up here and there, from its joints, a little, fhort, fimple, folitary, fmooth *ftem*, fometimes an inch or two high, fometimes fcarcely diftinguifhable. *Leaves* one from the bafe, and another from the top, of the ftem, on flender, weak *foot-ftalks*, two or three inches in length; each *leaf* an inch or an inch and half wide, fmooth, veiny, rather flefhy, fomewhat kidney-fhaped, in three very deep, almoft diftinct, broad wedge-fhaped lobes, having a few broad and rounded, blunt notches, each tipped with a minute glandular point. *Flower-ftalks* from three to five or fix inches high, terminating the ftem, folitary, fimple, naked, fmooth, each bearing a fmall yellow *flower*, fcarcely half an inch in diameter. *Calyx* of three elliptical, concave, fmooth, pale, reflexed leaves. *Petals* five or fix, obovate, ribbed, about the length of the calyx; their nectary clofed by a fcale. *Stamens* from nine to twelve. *Piftils* from fix to twelve. *Seeds* in a round head, ovate, fmooth, with ftrongly recurved points.

44. R. *hyperboreus*. Arctic Crowfoot. Retz. Scand. ed. 2. 131. Willd. n. 36. "Rottb. in Copenh. Tranf. v. 10. 458. t. 4. f. 16." (R. Fl. Dan. t. 331, excluding the fynonym of Ammann, which belongs to *falfuginofus*, n. 15. R. n. 50; Gmel. Sib. v. 4. 204. t. 83, b, excluding the Linnæan fynonyms.)—Leaves fmooth, in three deep divaricated lobes; the lateral ones cloven. Stem creeping. Flower-ftalks the length of the leaves. Petals fcarcely longer than the fmooth calyx.—Native of Iceland, Greenland, Norway, and Siberia, in watery places. Gmelin and Linnæus confounded this with *hederaceus* hereafter mentioned; Gunner miftook it for *falfuginofus*, which he called *R. Ammanni*, Fl. Norv. n. 826. From both, as well as from *lapponicus*, it is very diftinct. The *ftems* are long and creeping, or floating, throwing out from each joint, feveral fimple, very long, fibrous *radicles*, with a ftalked *leaf*, not a quarter the fize of *lapponicus*, whofe lobes are by no means toothed or crenate, the lateral ones only being fimply cloven. The *flowers* are fmall, pale yellow, folitary, each on a lateral, but not axillary, *ftalk*, whofe length is about equal to the adjoining leaf with its footftalk. *Calyx-leaves* only three or four, fmooth, coloured. *Petals* about the fame number, and fcarcely longer, obovate. *Seeds* ovate, gibbous, with a hooked, but very fhort, beak.

45. R. *monfpeliacus*. Montpellier Crowfoot. Linn. Sp. Pl. 778. Willd. n. 37. (R. faxatilis, magno flore; Bauh. Prodr. 96. Sauv. Monfp. 181.)—"Leaves in three deep crenate fegments. Stem fimple, villous, nearly naked, fingle-flowered."—Native of rocky places about Montpellier, according to Bauhin, who thus defcribes his plant. "*Root* compofed of long capillary fibres. *Leaves* from the root feveral; on long, fomewhat woolly, ftalks, each leaf hardly fo broad as the nail, in three fmall fegments, which are again divided into two or three acute ones. The *ftem* is about three inches high, flender, woolly, bearing one large *flower*, of a brilliant golden yellow, compofed of five petals, with many reddifh *ftamens*." We know no authentic fpecimen nor figure of this plant. Linnæus has marked it as never feen by him; but a fpecimen fent him by Gouan, from the Pyrenees, marked *R. alpinus humilis, magno flore*, which we have been difpofed therefore to confider as *R. Gouani*, n. 41, anfwers very well to Bauhin's defcription, and it is not impoffible that thefe fuppofed two fpecies are one and the fame. Yet Poiret, who profeffes to have gathered *R. monfpeliacus* at Montpellier, and in Barbary, fpeaks of them as diftinct, though, it muft be confeffed, his defcription is hardly fufficient to eftablifh the point in difpute.

46. R. *penfylvanicus*. Penfylvanian Crowfoot. Linn. Suppl. 272. Willd. n. 38. Ait. n. 24. Purfh n. 11. (R. canadenfis; Jacq. Ic. Rar. t. 105. Mifc. v. 2. 343.)—Stem erect, hairy, branched. Leaves ternate; leaflets ftalked, deeply three-cleft, jagged, toothed; hairy beneath. Calyx reflexed, rather longer than the round petals. Fruit cylindrical.

cylindrical. Seeds compreffed, with ftraight beaks.—Native of low meadows, from Canada to Penfylvania, but rare, flowering in July and Auguft. This fpecies was fent by profeffor Thunberg, in 1785, to Kew garden, from whence we procured a fpecimen the fame year. Mr. Aiton makes it biennial; Jacquin and Purfh perennial. The *ftem*, like the *footftalks*, is very hairy. Whole *herb* of a light green, two feet or more in height, branched, many-flowered. *Leaflets* one and a half or two inches long, ftrongly veined, with fpreading fegments. *Flower-ftalks* terminal, longifh, furrowed, rough with clofe-preffed hairs. *Flowers* fmall, their little, round, yellow *petals* not fo long as the *calyx*, which is fmooth and bent downward. *Seeds* in a cylindrical head, numerous, ovate, gibbous, compreffed, fmooth, very minutely dotted, each tipped with a fhort, fharp, erect, or flightly inflexed, beak. *Receptacle* hairy. Mr. Purfh's defcription does not, in every circumftance, anfwer to the Linnæan plant; for the *flowers* are not near fo big as *R. acris*, nor are their *ftalks* round.

47. R. *ternatus*. Ternate-leaved Japanefe Crowfoot. Thunb. Jap. 241. Willd. n. 39.—"Calyx reflexed. Leaves all ternate; leaflets three-cleft. Stem many-flowered."—Native of the Japanefe ifland of Nipon, flowering in May. Nothing more is known of this fpecies, concerning whofe peculiar characters, or affinities, we can form no precife opinion.

48. R. *biternatus*. Twice-ternate Magellanic Crowfoot.—Leaves fmooth, twice ternate, cut; fegments ovate, acute. Stem creeping. Stalks fingle-flowered, the length of the leaves. Petals obovate, the length of the fmooth calyx.—Gathered by Commerfon, in the ftraits of Magellan. No author appears to have taken up this fpecies, of which a fpecimen, from Commerfon's herbarium, was given by Thouin to the younger Linnæus. The whole *plant* is fmooth. The *leaves* bear a confiderable refemblance to thofe of *R. Seguieri*, but are rather fmaller, and diftinctly twice ternate. The habit of the plant more accords with *lapponicus* and *hyperboreus*, however unlike at firft fight. The *ftem* is thread-fhaped and creeping, fending forth, from every joint, a few fibrous *radicles*, a pair of upright, ftalked *leaves*, two or three inches in height, and one *flower*, whofe fimple, naked *ftalk* is about as tall as the *leaves*. This *flower* appears to be extremely like that of *lapponicus*, though fcarcely more than half fo large. The dried *petals* have the fame opaque whitenefs as is obfervable in that fpecies, and others, on their upper furface, and are probably yellow when frefh.

49. R. *peduncularis*. Long-ftalked Magellanic Crowfoot.—Leaves ternate, deeply cut, fomewhat hairy. Stems hairy, taller than the leaves, two-flowered. Calyx reflexed, nearly fmooth. Seeds globofe, fmooth, with recurved, hooked beaks.—Gathered by Commerfon in the ftraits of Magellan, with the preceding. This has a general likenefs to feveral common European kinds, which we fhall next defcribe, but is effentially diftinct. The radical *leaves* are feveral, on hairy ftalks, four inches long, their circumfcription roundifh, meafuring an inch, or inch and half, acrofs; the leaflets almoft always quite diftinct, with fhort partial ftalks, their form wedge-like, or fan-fhaped, more or lefs deeply cut, feldom regularly three-cleft. *Stems* feveral, erect, ftriated, rough, with fpreading hairs; fimple and naked to the height of four or fix inches, then dividing into two upright, hairy, fimple *flower-ftalks*, greatly elongated, (from one to feven or eight inches), after flowering, and accompanied at their bafe by a folitary, ftalked, deeply divided, palmate or fingered, *leaf*, an inch long. The *flowers* are much like thofe of *bulbofus*, or *acris*. *Calyx-leaves* ovate, concave, reflexed, bearing a few external hairs. *Petals* yellow, wedge-fhaped, ftriated, nearly twice as long as the calyx. *Fruit* globofe. *Seeds* globofe, tumid, keeled, even and fmooth; their beaks rather fpreading, hooked at the tip.

50. R. *bulbofus*. Bulbous Crowfoot, or Butter-cups. Linn. Sp. Pl. 778. Willd. n. 40. Ait. n. 25. Fl. Brit. n. 7. Engl. Bot. t. 515. Purfh n. 12. Curt. Lond. fafc. 1. t. 38. Mart. Ruft. t. 28. Ger. Em. 953. Lob. Ic. 666.—Leaves hairy, ternate, three-cleft, cut. Stem many-flowered. Calyx reflexed. Seeds compreffed, fmooth. Root bulbous.—Very common in Europe, as well as North America, in meadows and paftures, flowering throughout the fummer. The *root* is a round, folid, perennial bulb, about an inch in diameter, increafing by offsets from the top, and fending out from its bafe many long ftout fibres. *Stems* feveral, erect, a foot high, branched, leafy, round, hairy, many-flowered, deftitute of trailing fhoots or runners. *Leaves* ftalked, varioufly cut, more or lefs hairy. *Flowers* terminal, folitary, on angular furrowed ftalks, rough with erect, briftly hairs. *Calyx* hairy, bent back to the ftalk. *Petals* nearly equal in fize to *R. Lingua*, of a deep fhining yellow. *Nectary* covered by a notched fcale. *Fruit* globofe. *Seeds* orbicular, greatly compreffed, bordered, fmooth, and even, tipped with a fhort blunt beak.—This is one of the moft acrid, and even cauftic, fpecies. Villars fays the root may be ufed as a blifter, inftead of cantharides, but not fo fafely. It is moft active in the fpring, and muft not then be left on the fkin more than four or fix hours, for fear of leaving a dangerous fpreading fore.

51. R. *hirfutus*. Pale Hairy Crowfoot. Curt. Lond. fafc. 2. t. 40. Fl. Brit. n. 8. Engl. Bot. t. 1504. Ait. n. 26. (R. Philonotis; Ehrh. Beitr. fafc. 2. 145. Herb. 116. Willd. n. 41. Lamarck Dict. n. 48. Purfh n. 13. R. fardous; Crantz Auftr. fafc. 2. 84. Lamarck Dict. n. 47. R. pallidior; Villars Dauph. v. 2. 751. R. bulbofus β; Hudf. Angl. 241. R. rectus foliis pallidioribus, hirfutis; Bauh. Hift. v. 3. p. 2. 417. R. fecundus; Matth. Valgr. v. 1. 559. R. paluftris, apii folio lanuginofus; Bauh. Pin. 180. Morif. fect. 4. t. 29. f. 27 and 28.)—β. R. parvulus; Linn. Mant. 79. Fl. Brit. n. 11. Willd. n. 50. Ait. n. 31. Lamarck Dict. n. 73. R. agrarius; ib. n. 46? R. minimus faxatilis hirfutus; Bauh. Prodr. 96. R. minimus apulus; Column. Ecphr. 314. t. 316. f. 1.—Leaves ternate, notched. Stem erect, branched. Calyx reflexed. Seeds orbicular, compreffed with a fhort afcending beak, bordered; tuberculated at the fides.—Native of moift ground, in various parts of Europe, from Britain to Greece, flowering from June to October. The *root* is fibrous and annual. *Stem* erect, generally much branched, leafy, fpreading, many-flowered, ftriated, clothed with foft, widely fpreading hairs; in variety β fmaller, fmoother and weaker, fometimes, in a very ftarved ftate, bearing but one or two flowers. *Leaves* on longifh, more or lefs hairy, *footftalks*, pale green, hairy, ternate, varying much in fize; their leaflets wedge-fhaped, fometimes deeply three-lobed, fometimes only bluntly notched; upper ones narrower and more fimple, nearly feffile. *Stipulas* membranous, hairy, fomewhat dilated, attached to the bafe of the footftalks. *Flowers* on long, terminal, furrowed, hairy ftalks, folitary, fmaller than in *bulbofus*. *Calyx* hairy, reflexed. *Petals* roundifh; of a bright fhining yellow above; paler and opaque beneath. *Nectary* clofed by an abrupt fcale. *Fruit* globofe. *Seeds* lenticular, compreffed, brown, with a triple-ribbed greenifh border; their beaks fhort, afcending, very obfcurely hooked; their fides ftudded with minute fharp tubercles, efpecially towards the margin, where they are often circularly arranged, as Poiret (or Lamarck)

Lamarck) defcribes them in his *R. agrarius*, cited above.—This fpecies has been very little underftood. It is remarkable that any botanift fhould confound it with *bulbofus*, or with *fceleratus*, and that Mr. Curtis, in labouring to diftinguifh it, did not advert to the decifive character of the tuberculated feeds, by which it approaches a very different tribe, hereafter defcribed, confifting of *parviflorus*, *muricatus*, &c. Even Ehrhart has not noticed this circumftance. We are obliged to Mr. Edward Forfter, F.L.S. for tracing out the identity of *R. parvulus* and *hirfutus*, and we cannot but prefer Curtis's original name for the fpecies, rather than Ehrhart's pedantic one of later date. On the account of priority *fardous* perhaps ought to have been retained; but this name is founded on a very dubious opinion, that the plant of which we are fpeaking caufed the Sardonic laugh. Valerius Cordus, indeed, fays it grows copioufly in Sardinia, and it has certainly the appearance of Smallage, *Apium;* fo far anfwering to the ancient hiftory. But the account of Cordus feems taken from Diofcorides, whofe "fecond *Ranunculus*" is more probably the Linnæan *lanuginofus*, a ftill more general plant of the fouth of Europe than that of which we are fpeaking. After all, the famous Sardinian herb, compared to Smallage, may be actually wild Smallage or Celery, *Apium graveolens*, which is fufficiently acrid and poifonous to warrant our fuppofition, though it becomes fweet and wholefome by culture. In this uncertainty it is furely beft to call our plant *R. hirfutus*.

52. R. *paluftris*. Oriental Marfh Crowfoot. Linn. MSS. (R. orientalis paluftris, apii folio, caule fubhirfuto; Tourn. Cor. 20.) Leaves hairy, in three or five deep fegments, bluntly notched, with rounded dilated finufes. Stem erect, branched, almoft leaflefs. Calyx fpreading. Seeds ovate, compreffed, very fmooth, with a fhort recurved beak.—Native of the Levant. An oriental fpecimen, with Tournefort's fynonym, is preferved in the Linnæan herbarium, and named *paluftris*, but we can find no mention of it elfewhere. This is certainly a moft diftinct fpecies, though not taken up by any recent author. The *root* confifts of many flefhy knobs, tapering into fibres, and refembling thofe of *R. afiaticus*, though not fo thick. *Stem* two feet or more in height; hairy below; much branched, and almoft leaflefs above; the branches ternate. *Leaves* chiefly radical, on long hairy ftalks; their outline fomewhat pentagonal; heart-fhaped at the bafe; hairy on both fides, about two inches wide; their three principal lobes fpreading, deeply feparated by wide rounded finufes, and notched unequally at the extremity with broad, rounded, abrupt teeth; the upper or floral leaves are fmall, fhort, linear, undivided. *Flowers*, as far as we can judge, yellow, not large. *Calyx* hairy, fpreading widely, but fcarcely reflexed. *Seeds* in a round head, brown, fhining, quite fmooth, compreffed, moft like thofe of *bulbofus*, but more ovate, and with a longer, more recurved, and fomewhat hooked, beak. Their edge is green, fimple, not triple-ribbed as in the laft.

53. R. *polyrhizos*. Many-rooted Siberian Crowfoot. Willd. n. 42. Lamarck Dict. n. 38.—Radical leaves palmate, with wedge-fhaped, three-toothed fegments; ftem-leaves feffile, fingered. Stems many-flowered. Root fafciculated. Calyx fpreading. Seeds ovate, compreffed, fmooth, with a blunt beak.—Native of Siberia. *Root* fafciculated, perennial. *Radical leaves* like *R. fceleratus*, three-lobed; their lateral lobes two-lobed, wedge-fhaped like the leaf itfelf, their fegments bluntly three-toothed. *Stems* a finger's length, fimple, erect or afcending, two or three from one root. *Stem-leaves* feffile, fingered, wedge-fhaped at the bafe; their fegments linear, bluntifh, entire. *Flower-ftalks* two, three, or four, long, fingle-flowered, round, not furrowed, very finely downy like the ftem. *Calyx-leaves* coloured, fmooth, obtufe, fpreading. *Petals* yellow, the fize of *R. Flammula*. *Fruit* roundifh. *Seeds* ovate, compreffed, fmooth, crowned with the permanent blunt *ftigma*. *Willdenow*. By the above defcription this fpecies appears related, in many points, to the laft, though they can hardly be the fame.

54. R. *repens*. Common Creeping Crowfoot. Linn. Sp. Pl. 779. Willd. n. 43. Ait. n. 27. Purfh n. 14. Fl. Brit. n. 9. Engl. Bot. t. 516. Curt. Lond. fafc. 4. t. 38. Mart. Ruft. t. 29. (R. pratenfis, etiamque hortenfis; Ger. Em. 951.)—Leaves ternate, three-cleft, cut, hairy. Stems afcending. Runners creeping. Flower-ftalks furrowed. Calyx hairy, fpreading. Seeds ovate, compreffed, even.—Very common in meadows, wafte ground, church-yards, neglected gardens and fields, throughout Europe. Mr. Purfh obferved it in fhady wet woods, particularly on the mountains, from Penfylvania to Virginia. It flowers from June to Auguft, and is perennial, being often a troublefome weed. *Root* fibrous. Befides the upright *ftems*, which are of humble growth, leafy, branched, bearing feveral flowers, the root fends forth long trailing creeping fhoots, whofe joints produce leaves, and fome fhorter fimpler ftems. The whole *herb* is rough and hairy, of a dark green. *Leaves* ftalked, ternate, more or lefs three-cleft, fharply cut or toothed; often marked with dark purple, or black, fometimes pale, fpots; the uppermoft linear-lanceolate and entire. *Calyx* hairy, fpreading, not reflexed. *Petals* deep yellow, generally emarginate. *Nectary* covered by a heart-fhaped fcale. *Fruit* globofe. *Seeds* ovate, compreffed, fmooth at the fides, often hairy at the edge, their beak fhort and blunt.

55. R. *proftratus*. Proftrate Crowfoot. Lamarck Dict. n. 35. Fl. Francoife, n. 3. 197.—Leaves ternate, three-cleft, very hairy. Stems entirely proftrate, creeping, zigzag. Calyx fmooth.—Native of dry hilly places about Paris. Lamarck and Poiret efteem this a diftinct fpecies from the laft, not only becaufe its herbage is much fmaller and more hairy, but becaufe the *ftems* are, even when in flower, entirely proftrate. We have never met with any thing anfwering to this defcription in England. The *flowers* are faid to refemble *repens*, having likewife a fmooth *calyx*. Our *repens* has hairs on that part.

56. Q. *intermedius*. Intermediate Crowfoot. Lamarck Dict. n. 44.—Lower leaves three-lobed, cut; upper fomewhat fingered. Flower-ftalks moftly folitary. Calyx reflexed. Seeds compreffed, fmooth. Root fibrous.—Found at the borders of ponds in France, about Paris and at Fontainebleau. This plant, according to Poiret, is, as it were, intermediate between *bulbofus* and *repens*, having, befides, many characters in common with *proftratus*. The *root* is fibrous, fafciculated. *Stems* feveral, low, fcarcely branched, almoft leaflefs except at the bottom, weak, ftriated, flightly downy, often forked above. *Radical leaves* on long ftalks, almoft fmooth, in three rounded, often cut, lobes; the *ftem-leaves* have three linear or lanceolate irregular lobes; the uppermoft are very narrow, almoft fingered. *Flowers* axillary, or terminal, two or three on each branch, on very long and flender, nearly fmooth, ftalks. *Calyx-leaves* reflexed at the time of flowering, as in *bulbofus*, coloured, concave, bearing fome very fine long hairs. *Petals* of a fine yellow, ftriated, middle-fized. *Fruit* oval or globofe. *Seeds* fmooth, compreffed, roundifh, with a green border. We know nothing of this fpecies but from the above defcription.

57. R. *lucidus*. Shining-leaved Crowfoot. Lamarck Dict. n. 36.—Leaves with three or five lobes, fomewhat pinnatifid, fhining, fmooth. Stem erect, many-flowered. Calyx reflexed.—Suppofed to be a native of the Levant; cultivated in

in the botanic garden at Paris. *Root* perennial. *Stems* one or two feet high, branched, leafy, very fmooth, tender, ftriated. *Leaves* alternate, ftalked, widely fpreading, fmooth, fhining as if varnifhed on their upper furface, divided into three or five diftant dilated lobes, the two lowermoft contracted at their bafe, unequally cut, obtufe. *Footftalks* long, fomewhat downy, dilated at their bafe into a broad membranous expanfion. *Flowers* numerous, fituated at the ends, as well as in the forks, of the *branches*, on long, fimple, cylindrical, rather downy *ftalks*. *Calyx-leaves* coloured, fmooth, concave, reflexed after the flower expands. *Petals* rather large, roundifh, of a fine fhining yellow. This plant has fome agreement with *R. repens*, from which it differs in having entirely upright *ftems* and a reflexed *calyx*, as well as fhorter more dilated lobes to the *leaves*. Such is Poiret's account. This furely cannot be our *paluftris*, n. 52, which has hairy *leaves*, and no refemblance or affinity to *repens*; neither could the intelligent author have overlooked Tournefort's fynonym for that plant.

58. R. *polyanthemos*. Many-flowered Crowfoot. Linn. Sp. Pl. 779. Fl. Suec. ed. 2. 196. Willd. n. 44. Ait. n. 28. Lamarck n. 41. Lob. Ic. 666. (R. fylveftris fecundus; Dod. Pempt. 427. R. furrectis cauliculis; Ger. Em. 951, as to the figure. R. fylveftris; Tabern. Kreuterb. 107. Ic. 42. R. napellifolius; Crantz fafc. 3. 90. t. 4. f. 1, 1?)—Leaves in five deep, repeatedly fubdivided lobes; fegments all linear. Stem erect, many-flowered. Flower-ftalks furrowed. Calyx fpreading. Seeds ovate, bordered, compreffed, fmooth.—Native of moift, elevated, rich meadows, in Upland, and elfewhere in Sweden, but rarely. *Linnæus*. In Germany, and perhaps in Switzerland, on the authority of various writers. *Root* perennial. *Stem* erect, two or three feet high, branched, many-flowered; leafy, clothed with upright, or fomewhat fpreading, hairs. *Radical* and lower *ftem-leaves* three inches wide, on long very hairy ftalks, divided to the very bafe into three lobes, the lateral lobes again divided almoft to the bafe, fo that the leaf may truly be called, in the firft inftance, five-lobed; each lobe is deeply, more or lefs repeatedly, cut, into three-cleft or alternate, linear, bluntifh, entire, fingle-ribbed, fpreading fegments, loofely hairy on both fides, paler beneath: the uppermoft leaves are nearly feffile, in about three deep, linear, entire divifions. *Flower-ftalks* long, terminal, angular or furrowed, rough with upright hairs. *Flowers* large, yellow, drooping, not clofing, in wet weather, according to Linnæus. *Calyx* fpreading, pale, externally hairy. *Fruit* globofe. *Seeds* ovate, fhort, compreffed, fmooth at the fides, bordered and roughifh at the edges, tipped with a broad, fhort, recurved beak. We have defcribed this from the authentic Linnæan fpecimen, which feems diftinct from the following, and anfwers extremely well to the figure of Tabernæmontanus more efpecially, nor does it ill accord with that of Dodonæus, reprinted in Gerarde's herbal. The laft-named author however certainly applies that figure to the common Englifh *R. acris*, which he fays he found double. Hence fome doubt may arife whether the true *polyanthemos* was ever cultivated in England, as it feems to depend on Gerarde's authority only for a place in Hort. Kew. We have never feen it alive. Poffibly it may be found in a double ftate in fome old garden. The above defcription of the *leaves*, and the greater fize of the whole plant, will diftinguifh it from *acris*. The *calyx* is hairy in both, notwithftanding Willdenow's remark to the contrary.

59. R. *acris*. Upright Meadow Crowfoot. Linn. Sp. Pl. 779. Willd. n. 45. Ait. n. 29. Purfh n. 15. Fl. Brit. n. 10. Engl. Bot. t. 652. Curt. Lond. fafc. 1. t. 39. Mart. Ruft. t. 30. Woodv. Suppl. t. 246. Bulliard. t. 109. Curt. Mag. t. 215. (R. hortenfis fecundus; Dod. Pempt. 426. R. pratenfis, furrectis cauliculis; Lob. Ic. 665. R. luteus; Trag. Hift. 94.)—Leaves in three deep, wedge-fhaped, many-cleft, jagged lobes; the lateral ones deeply divided. Stem erect, many-flowered. Flower-ftalks round. Calyx fpreading. Seeds ovate, bordered, compreffed, fmooth.—Native of meadows and paftures in all the more northern countries of Europe, very common in England, flowering in June and July. The double-flowered variety is frequent in gardens. The *root* is perennial, tuberous, with long fimple fibres. *Stem* erect, two feet high, round, ftriated, rough with fpreading hairs below, and with clofe-preffed ones above, branched, flightly leafy. *Leaves* hairy, far lefs divided than in the laft, and with broader, wedge-fhaped, by no means linear, fegments: the upper ones linear, either deeply three-cleft, or fimple. *Flower-ftalks* round, not furrowed. *Calyx* green, fpreading, hairy. *Petals* bright fhining yellow. *Fruit* globofe. *Seeds* much like the laft.

A dwarf alpine variety was brought by Mr. Dawfon Turner from wet rocks, near the fummit of Snowdon, whofe *ftem* is but three or four inches high, and bears but one or two *flowers*. This when cultivated in a garden gradually affumes the fize and habit of the common kind.

60. R. *Breyninus*. Woolly-fruited Alpine Crowfoot. Crantz Auftr. fafc. 2. 91. t. 4. f. 2. (R. Breynifius, by miftake; Lamarck Dict. n. 59. R. n. 1170; Hall. Hift. v. 2. 72.)—Leaves deeply three-lobed, cut and toothed, very hairy beneath. Stems fpreading, few-flowered. Calyx fpreading. Seeds fmooth. Receptacle woolly.—Native of the Auftrian and Swifs Alps. Haller fays it is the fmalleft of all the fpecies. The *ftems* are feveral, two or three inches high, oblique, fimple or fomewhat branched, hairy, bearing one or two *flowers*, which are of a varnifhed yellow. *Radical leaves* numerous, lefs deeply divided than in *acris*, very hairy beneath. *Fruit* globular. *Seeds* fmooth, hooked. *Receptacle* woolly, which Crantz fays he had not obferved in other fpecies, and by which we prefume this is moft effentially diftinguifhed, particularly from the above alpine variety of *acris*. We have not met with a fpecimen, nor was Mr. Davall acquainted with the plant of Haller.

61. R. *lappaceus*. Bur Crowfoot.—Leaves ternate; leaflets ftalked, three-lobed, fharply cut, hairy. Stem erect, many-flowered. Calyx fpreading. Seeds ovate, keeled, reticulated, with elongated, revolute-pointed beaks.—Native of Port Jackfon, New South Wales; communicated by Dr. White. This has much of the habit of *R. acris*, but is very diftinct. The *ftems* are a foot, or more, in height, branched, roundifh, rough with clofe-preffed hairs. *Radical leaves* numerous, on long hairy ftalks, very hairy, about the fize of *acris* or *repens*, but remarkable for the partial ftalks, fometimes an inch or two long, that fupport the leaflets, efpecially the terminal one; the *leaflets* are broad, wedge-fhaped, more or lefs deeply three-lobed, coarfely and fharply cut. The lower *ftem-leaves* are narrower and lefs cut; the upper entire and lanceolate; the uppermoft of all fimple and linear. *Flowers* larger than in *acris*, white in the dried fpecimen, but perhaps yellow when frefh, finely veined, on long, hairy, angular, terminal ftalks. *Calyx* fpreading, clothed with long hairs. *Nectary* covered with a wedge-fhaped fcale. *Fruit* globofe. *Seeds* ovate, turgid, keeled, reticulated with veins, fmooth, each tipped with a prominent angular beak, nearly its own length, whofe point is ftrongly recurved, and even revolute.

62. R. *cappadocicus*. Cappadocian Crowfoot. Willd. n. 46. Lamarck Dict. n. 39. (R. orientalis dulcis, doronici radice; Tourn. Cor. 20.)—"Calyx fpreading. Flower-

ftalk round. Stem fimple or divided. Leaves heart-fhaped, three-lobed, toothed."—Native of Cappadocia. *Root* perennial, hard, the thicknefs of a goofe-quill, and refembling the root of *Doronicum*. *Radical leaves* roundifh-heart-fhaped, with three very fhort lobes, all pointed, furnifhed with a few coarfe teeth, and clothed on both fides with fcattered clofe-preffed hairs. *Stem-leaf* folitary, ftalked as well as the radical ones; and in the middle of the flower-ftalk is a fmall, feffile, lanceolate, entire leaf. *Stem* a fpan high, clothed with clofe-preffed hairs, either fimple, or divided above the leaf, each ftalk fingle-flowered. *Corolla* yellow, the fize of *R. polyanthemos*. *Fruit* roundifh. *Seeds* compreffed, hooked. *Willdenow*, from a dried fpecimen.

63. R. *lanuginofus*. Broad-downy-leaved Crowfoot. Linn. Sp. Pl. 779. Willd. n. 47. Ait. n. 30. Purfh n. 16. Fl. Dan. t. 397. Sm. Fl. Græc. Sibth. t. 519, unpublifhed. (R. montanus fubhirfutus latifolius; Bauh. Prodr. 96. R. nemorofus hirfutus, foliis caryophyllatæ; Loef. Pruff. 220. t. 71. R. magnus valde hirfutus, flore luteo; Bauh. Hift. v. 3. 417. R. n. 1172; Hall. Hift. v. 2. 73. Βατράχιον ἕτερον; Diofc. book 2. chap. 206.) Leaves heart-fhaped, five-cleft, lobed, notched, filky. Stem erect, many-flowered, hairy. Flower-ftalks round. Calyx fpreading. Seeds ovate, compreffed, with elongated, revolute-pointed beaks.—Native of Germany, France, Switzerland, Carniola, Greece, and North America. Mr. Purfh obferved it in old fields and meadows, from Penfylvania to Carolina, flowering from June to October. Dr. Sibthorp found it in fhady watery fituations in the Peloponnefus, but moft plentifully in the north of Greece, and with great reafon concluded it to be the fecond *Ranunculus* of Diofcorides, with whofe defcription it fufficiently well agrees, except being mild, rather than very acrid, in fenfible qualities, if we may truft modern authors. Linnæus diftinguifhes two varieties, between which we can difcover no difference, and Haller unites them. The opinion of this great Swifs botanift however lofes fome of its weight, by the doubt he expreffes whether this plant be diftinct from *R. repens*, n. 54, to which it has indeed a flight general refemblance, though differing totally in its upright *ftem*, deftitute of runners; its very foft filky *leaves*, by which this plant is known at once from every other European *Ranunculus*; and the revolute taper points of its *feeds*, which nearly agree with *lappaceus* in that refpect; but the *feeds* themfelves are compreffed, and, as far as we can fee, deftitute of reticulated veins. The *root* is perennial, with many long, ftout, cylindrical, flefhy fibres, or perhaps flender knobs, intermixed with capillary branched radicles. *Stem* 12 or 18 inches high, branched, leafy, round, clothed with long, fpreading or deflexed, hairs; its bafe purplifh, as are alfo the long hairy *footftalks* of the radical *leaves*. Thefe and the lower *ftem-leaves* are three inches wide, divided about half way down into five or feven broad, fharply notched lobes, whofe clofe finufes have a pale fpot, with a purple ftain, adjoining to their termination. The upper *leaves* are deeply three-cleft, with ovate and toothed, or lanceolate and entire, lobes. *Flowers* yellow, much like thofe of *acris*. *Calyx* hairy, fpreading. *Fruit* globofe. *Seeds* with awl-fhaped, ftrongly revolute beaks, by which this fpecies is clearly diftinguifhable from *repens*, *polyanthemos*, *acris*, if fuch a mark were neceffary, and by which it forms a chain of affinity between thofe fpecies and our *lappaceus*. It is fomewhat remarkable that *R. lanuginofus* has not been found in Britain, and ftill more fo, that any obfcurity fhould envelope the botanical hiftory of fo diftinct a fpecies.

64. R. *fericeus*. Silky Crowfoot. Lamarck Dict. n. 26. —Leaves ternate, very filky; leaflets wedge-fhaped, deeply three-cleft, jagged and toothed. Stem erect, many-flowered, filky. Calyx fpreading. Seeds ovate, compreffed, with fhort erect beaks.—Gathered in the ifle of Bourbon by Commerfon, from whom we have fpecimens. *Root*, as well as the general habit and fize of the *plant*, like the laft, but the whole herb is much more denfely clothed with fhining filky hairs. The *leaves* are ternate, fome of them almoft twice ternate; their lobes deeply and repeatedly cut, in a radiant manner, with fharp teeth. *Flowers* like the laft. *Fruit* ovate. *Seeds* with broad ftraight beaks, longer, and not fo much curved or hooked, as even thofe of *acris*.

65. R. *tomentofus*. Shaggy Crowfoot. Lamarck Dict. n. 70. Purfh n. 17.—Leaves downy, three-lobed or notched; the uppermoft oval, entire. Stem reclining, fomewhat creeping, fhaggy, one or two-flowered. Calyx hifpid, flightly reflexed.—Gathered in North Carolina, by M. Bofc. A fmall, almoft creeping, very hairy plant, with fibrous *roots*. The *ftems* are very low, and nearly proftrate, afcending at their extremities, two or three inches long, tender, covered with whitifh tufted hairs, difpofed in two rows. *Leaves* ftalked, thick, downy, generally with three lobes, which are either diftinct or confluent; fome leaves are merely crenate and rounded. *Footftalks* long and hairy. The uppermoft *ftem-leaf* is feffile, oval, acute, entire. *Flowers* one or two, on terminal, unequal, fimple *ftalks*, clothed with two rows of hairs. *Calyx* hifpid, a little reflexed. *Petals* white or yellowifh, rounded at the end. *Poiret*. We have feen no fpecimen, nor did Mr. Purfh meet with the plant himfelf.

66. R. *marylandicus*. Maryland Crowfoot. Lamarck Dict. n. 69. Purfh n. 18.—Leaves ternate, three-lobed, acute, cut, pale and nearly fmooth beneath. Stem fimple, almoft naked, downy. Calyx fmooth, reflexed. Found in fhady woods, from Penfylvania to Virginia, flowering from May to July. *Purfh*. *Root* fibrous, perennial. *Stems* fimple, erect, downy, flender, about ten inches high; Poiret by miftake, as we prefume, fays ten feet. *Leaves* radical, on long downy ftalks, ternate; the two lateral ones oppofite, ftalked; all with three confluent, lanceolate, acute, cut lobes; their upper furface green; the under paler and whitifh, almoft fmooth. There are no other *ftem-leaves* than what ftand almoft feffile, at the bafe of the flower-ftalks, and either have three or five fhallow irregular lobes, or are fimply cut. *Flowers* two or three, terminal, on fhort, fcarcely downy, ftalks. *Calyx* fmooth, reflexed. *Petals* rather large, oval, rounded at the end, pale yellow. *Poiret*.

67. R. *recurvatus*. Recurved Crowfoot. Lamarck Dict. n. 65. Purfh n. 19.—Leaves in three deep, acute, cut, wedge-fhaped lobes. Stem many-flowered. Calyx and corolla reflexed. Petals nearly linear. Seeds compreffed, dotted, with revolute, awl-fhaped beaks.—Native of fhady woods, from New York to Carolina, flowering from June to Auguft. *Purfh*. We received fpecimens from the Rev. Dr. Muhlenberg, of Lancafter, Penfylvania. The *root* is perennial. *Stems* a fpan high, very hairy; branched and leafy at the upper part. *Leaves* two or three inches wide, rather hairy, on very hairy ftalks; their fide-lobes for the moft part deeply cloven. *Flowers* ftalked, fmall. *Calyx* pale-purplifh, ribbed, clothed with fine long hairs. *Petals* fmall, narrow, almoft white. *Fruit* globofe. *Seeds* ovate, lenticular, minutely dotted, fmooth, with flender, revolute-pointed beaks.

68. R. *feptentrionalis*. Smooth North-American Crowfoot. Lamarck Dict. n. 64. Purfh n. 20.—Leaves ternate, membranous, fmooth, deeply lobed, acute, cut. Stem two-flowered, hairy, like the bafe of the footftalks. Calyx reflexed.

reflexed.—Native of North America. Described by Poiret from Lamarck's herbarium, and adopted by Pursh. *Root* perennial, fibrous, fasciculated. *Stems* nearly simple, hollow, eight or ten inches high, almost leafless; downy in their lower part. *Leaves* stalked, thin, smooth, composed of three stalked leaflets, the central one having three deep spreading lobes, the others often but two; all sharp, cut and toothed. There is usually but one *stem-leaf*, which is nearly sessile, ternate, with narrower segments. *Footstalks* long, slender, most hairy towards their base. *Flower-stalks* two, terminal, unequal, very slender, smooth, each bearing, about half way up, one small linear leaf. *Calyx* reflexed, coloured, smooth, except a few terminal hairs, deciduous. *Petals* pale yellow, rounded. *Fruit* small, globular. *Seeds* nearly orbicular, lenticular, with sharp straight beaks. *Poiret.*

69. R. *hispidus.* Hispid American Crowfoot. Michaux Boreal-Amer. v. 1. 321. Lamarck Dict. n. 27. Pursh n. 21.—Very hairy, erect. Leaves ternate, sharply lobed. Stems few-flowered; leafless below. Calyx close-pressed. Seeds obovate, with awl-shaped, inflexed beaks.—Found in wet fields, and on the banks of ditches, from Virginia to Carolina, flowering from June to August. *Root* perennial. *Flowers* small, pale yellow. *Pursh.* A specimen sent by Gronovius to Linnæus, as akin to his *lanuginosus*, but distinct, answers very well to the characters of Michaux, and we have taken from that specimen the above account of the *seeds.* The *flower* is nearly as big as *acris.* Whole herbage, especially the *footstalks*, very hairy.

70. R. *pinnatus.* Pinnated Indian Crowfoot. Poiret in Lam. Dict. n. 66.—"Downy. Leaves pinnated; leaflets lobed and cut. Branches spreading. Seeds tuberculated."—Gathered in India by Sonnerat. *Stems* with lax, spreading, downy, striated, leafy *branches.* *Leaves* alternate, stalked, downy, of five or seven opposite *leaflets*, divided into irregular, sharp, cut, almost lanceolate, lobes. *Flowers* numerous, on long, downy, single-flowered stalks. *Calyx* coloured, not reflexed. *Petals* yellowish, of a middling size. *Seeds* orbicular, convex, moderately tuberculated on each side, and tipped with a small, thick, straightish beak. *Poiret.*

71. R. *multifidus.* Many-cleft Arabian Crowfoot.—Forsk. Ægypt-Arab. 102. Lamarck Dict. n. 67.—"Leaves many-cleft; the lower ones pinnated. Stem many-flowered. Calyx the length of the corolla. Seeds ovate, acute.—Gathered by Forskall, in ditches near the town of Taes. He describes the *stem* two feet high, erect; round in the lower part; striated above; hairy. *Fruit* oval. We have no other authority, than the authors quoted, for this species or the last.

72. R. *pedatifidus.* Radiating-leaved Crowfoot.—Leaves deeply pedatifid, with linear, obtuse, divided or three-cleft, radiating, entire segments. Stem one or two-flowered. Seeds ovate, hairy, with small recurved beaks.—Native of Siberia. Four specimens from that country are in the Linnæan herbarium, but the species, though very distinct, appears never to have been described. *Root* perennial, of many long, cylindrical, fleshy fibres, and crowned with numerous capillary remains of old footstalks. *Stem* a span high, erect, round, striated, leafy, simple or divided, clothed with long, soft, lax hairs. *Radical leaves* on long hairy stalks, deeply cut, in a pedate manner, into five, seven, or more, narrow, linear, obtuse, elegantly radiating segments, some of which are deeply three-cleft, and their lobes again cloven, others merely divided, and others undivided; all entire at the edges, and somewhat hairy on both sides, with long, lax, white hairs. The *stem-leaves* are mostly sessile, less divided; the uppermost in three, rarely more, deep, linear, simple segments. *Flowers* apparently yellow, the size of *R. acris.* *Calyx* woolly at the base; its segments partly dilated and coloured, all shorter than the *petals*, and closely pressed to their under side. *Fruit* ovate. *Seeds* not very numerous, ovate, tumid, hairy, with short, awl-shaped, reflexed beaks.

73. R. *chærophyllos.* Chervil Crowfoot. Linn. Sp. Pl. 780. Willd. n. 48. Lamarck Dict. n. 32. (R. tenuifolius luteus, grumosâ radice, foractensis seu italicus; Barrel. Ic. t. 581? bad.)—Leaves thrice compound, with linear segments. Stem silky, with few flowers. Calyx reflexed, hairy. Root with tapering fleshy fibres.—Native of the south of Europe. The only certain specimen of this plant, that has ever come under our observation, exists in the Linnæan herbarium. The *root* consists of numerous, long, fleshy, gradually tapering, downy fibres. *Stem* erect, about a span high, slender, silky, slightly leafy, branched, bearing three or four flowers. *Radical leaves* several, stalked, repeatedly ternate, with numerous linear, or somewhat lanceolate, entire segments, hairy beneath. *Footstalks* an inch and half long, hairy; dilated, membranous, and ribbed at the base. *Stem-leaves* few, much less compound, and often nearly sessile. *Flowers* solitary, on long, terminal, simple, hairy, quadrangular stalks. *Calyx* strongly reflexed, coloured; externally hairy. *Petals* yellow. *Fruit* not sufficiently advanced to be described. At the back of this specimen Linnæus has written *Ranunculus lybicus, pulsatillæ folio, T. Cor.;* but there is no such passage in Tournefort's *Corolla*, nor any thing to which it can refer, except *R. lesbius, pulsatillæ folio, flore parvo*, a species unknown to us. A very different plant from the true *R. chærophyllos*, was given by the abbè Pourret to the younger Linnæus, under that name. It seems rather to be *flabellatus*, n. 32, a species allied, in many points, to what we are describing.

74. R. *millefoliatus.* Milfoil Crowfoot. Vahl. Symb. v. 2. 63. t. 37. Desfont. Atlant. v. 1. 441. t. 116. Willd. n. 49. Lamarck Dict. n. 33. Sm. Fl. Græc. Sibth. t. 521, unpublished. (R. montanus leptophyllon, asphodeli radice; Column. Ecphr. 312. t. 311.)—Leaves thrice compound, with elliptic-linear segments. Stem silky, with few flowers. Calyx erect, somewhat hairy. Root with ovate knobs.—Native of Italy, Greece, Syria, and Barbary. The *root*, in Dr. Sibthorp's specimens, consists of many oval fleshy knobs, scarcely half an inch long, intermixed with fibres. Columna describes and delineates the fibres as terminating the knobs; a very material difference. The *stems*, in the Greek and Italian specimens, are simple and single-flowered; in the more luxuriant ones from Aleppo and Tunis, somewhat branched, bearing two or three flowers. The *stem-leaves* are more numerous, as well as more compound, than in the last. *Flowers* large. *Calyx* closely pressed to the corolla; sometimes nearly smooth. *Fruit* oblong. *Seeds* with small recurved beaks. We can scarcely doubt, notwithstanding the above-mentioned diversity respecting the *root*, that the synonym of Columna belongs to the present, rather than the foregoing, species.

75. R. *oxyspermus.* Sharp-seeded Crowfoot. Willd. n. 51. Lamarck Dict. n. 37.—"Radical leaves oblong, obtuse, deeply and unequally toothed; stem-leaves sessile, fingered, cut. Seeds awned."—Native of Siberia, near the river Tereck. *Root* apparently annual. *Radical leaves* stalked, ovate, obtuse, with unequal deep teeth; hairy, like their *footstalks*, on both sides. *Stem* erect, branched, hairy, a foot or more in height. *Stem-leaves* digitate; the segments of the lower ones unequally pinnatifid; of the upper linear and entire. *Calyx* reflexed. *Corolla* yellow, the size of *R. bulbosus.* *Fruit* elliptical. *Seeds* rather compressed, acute,

acute, with upright, awl-ſhaped, briſtly points. *Willdenow.*

76. R. *arvenſis.* Corn Crowfoot. Linn. Sp. Pl. 780. Willd. n. 52. Ait. n. 32. Fl. Brit. n. 12. Engl. Bot. t. 135. Curt. Lond. faſc. 6. t. 36. Mart. Ruſt. t. 56. Fl. Dan. t. 219. Bulliard. t. 117. Brugnon Mem. de l'Acad. de Turin, v. 4. 108. t. 3. (R. arvorum; Ger. Em. 951.)—Leaves ternate, three-cleft, with linear ſegments. Seeds prickly at each ſide. Stem erect.—Frequent in corn-fields throughout Europe, flowering in the middle of ſummer. *Root* fibrous, annual. *Stem* one or two feet high, much branched, many-flowered, leafy, nearly ſmooth. *Leaves* of a light green, ſlightly hairy, ſtalked, once or twice ternate, as well as deeply three-cleft; the ultimate ſegments almoſt linear, entire, or rarely notched. *Flowers* ſmall, lemon-coloured, ſtalked, lateral and terminal. *Calyx* ſpreading, hairy. *Petals* obovate, veined. *Fruit* depreſſed. *Seeds* very large, compreſſed, with erect, awl-ſhaped, hooked beaks; their ſides armed with numerous, prominent, awl-ſhaped prickles, largeſt towards the margin. From the obſervations of M. Brugnon, this appears to be one of the moſt virulent of its genus, eſpecially when young, cauſing ſpeedy inflammation and gangrene in the ſtomachs of ſheep and oxen; who nevertheleſs eat it with avidity. Vinegar much diluted with water, poured down their throats, proved a quick and certain remedy. The expreſſed juice of the plant, given to dogs, is no leſs fatal.

77. R. *muricatus.* Spreading Prickly-ſeeded Crowfoot. Linn. Sp. Pl. 780. Willd. n. 53. Lamarck Dict. n. 75. Ait. n. 33. Purſh n. 24. Sm. Fl. Græc. Sibth. t. 522, unpubliſhed. (R. creticus echinatus latifolius; Alpin. Exot. 263. t. 262. R. Apulei quibuſdam; Cluſ. Hiſt. v. 1. 233. R. parvus echinatus; Ger. Em. 965. R. paluſtris echinatus; Bauh. Hiſt. v. 3. 846. Feuill. Peruv. 58. t. 18. f. 1.)—Leaves ſimple, three-lobed, notched, bluntiſh, ſmooth. Stipulas diſtantly fringed. Seeds prickly at each ſide. Stem diffuſe.—Native of watery places in various parts of the ſouth of Europe; frequent in Greece. It occurs alſo in North America, in old fields, from Virginia to Carolina, flowering in June and July, according to Mr. Purſh. The *root* is annual, conſiſting of numerous long fibres. *Herb* ſmooth and ſucculent, bright green. *Stems* ſeveral, various in length, ſpreading, and moſtly procumbent, leafy, round, ſhining; purpliſh in the lower part. *Leaves* an inch and a half to three inches wide, veiny, in three rather deep lobes, broadly and irregularly notched. *Footſtalks* from one to four inches, or more, in length, with a concave ſheathing baſe, bordered with a membranous *ſtipula*, whoſe edges are regularly fringed with diſtant hairs. *Flowers* the ſize of the laſt, yellow, ſolitary, on axillary ſtalks, rather ſhorter than the leaves. *Calyx* reflexed, nearly, or quite, ſmooth. *Petals* obovate, almoſt twice as long as the calyx, at leaſt in the European ſpecimens, though they appear to be but of the ſame length in American ones. *Fruit* capitate. *Seeds* large, ovate, compreſſed, with broad, awl-ſhaped, angular, ſomewhat recurved beaks; their ſides covered with ſmaller, more uniform prickles, than in *R. arvenſis*. Commerſon gathered, by the ſea-ſhore at Monte Video, a variety of this with more luxuriant herbage, and ſmaller flowers, of which Ventenat makes a ſpecies of the name of *ventricoſus*, founding its character on the inflated baſes of the *footſtalks*, of which, however, we can ſee nothing, in our original ſpecimens from Thouin's herbarium. Its *ſtipulas* are fringed preciſely as in our European *muricatus*, to which we agree with Poiret in referring it, though we can ſcarcely do the ſame by the following.

78. R. *echinatus.* Dwarf Prickly-ſeeded Crowfoot. Venten. Jard. de Cels t. 73. Purſh n. 25. (R. muricatus γ; Lamarck Dict. n. 75.)—Leaves ſimple, three-lobed, notched, ſmooth. Stipulas bearded at the ſummit. Seeds prickly at each ſide. Stem erect, branched.—Found by M. Boſc, near Charleſtown, South Carolina. This ſeems to differ from the laſt, in its ſimple, ſhort, upright *ſtem*; but more eſpecially, if Ventenat's plate and deſcription be correct, which we cannot doubt, in having each *ſtipula* crowned with a tuft of hairs, inſtead of being diſtantly fringed throughout. The *petals* are ſaid to be larger than thoſe of the American variety, at leaſt, of *muricatus*; but that circumſtance is of ſmall moment here, as to a ſpecific diſtinction.

79. R. *parviflorus.* Small-flowered Crowfoot. Linn. Sp. Pl. 780. Willd. n. 54. Ait. n. 34. Fl. Brit. n. 13. Engl. Bot. t. 120. (R. hirſutus annuus, flore minimo; Raii Syn. 248. t. 12. f. 1. Pluk. Phyt. t. 55. f. 1.)—Leaves ſimple, three-lobed, notched, hairy. Seeds covered, at each ſide, with hooked prickles; their beaks recurved. Stem diffuſe.—Native of the more temperate parts of Europe. Found on banks, and in waſte as well as cultivated ground, in England, where the ſoil is gravelly; as alſo in Greece, flowering in the early part of ſummer. The *root* is annual. *Stems* proſtrate. Whole herb hairy, ſmaller in every part than *R. muricatus*. *Flower-ſtalks* oppoſite to the leaves. *Petals* pale yellow, ſcarcely longer than the ſpreading *calyx*, fugacious, and often imperfect. *Fruit* capitate. *Seeds* ovate, with a broad, ſhort, hooked beak, their flat brown ſides denſely covered with ſhort, hooked prickles. *R. trilobus*, Desfont. Atlant. v. 1. 437. t. 113. Lamarck Dict. n. 77, ſeems a variety, not of this, but of our *hirſutus*, n. 51.

80. R. *orientalis.* Spinous Oriental Crowfoot. Linn. Sp. Pl. 781. Willd. n. 55. Lamarck Dict. n. 71. (R. leſbius, pulſatillæ folio, flore magno; Tourn. Cor. 20.)—Leaves deeply laciniated, acute; all ſtalked. Stem branched. Calyx reflexed. Fruit cylindrical. Seeds dotted; their beaks recurved and ſpinous.—Native of the Levant. *Root* annual. *Stem* various in luxuriance, ſilky, leafy; in the Linnæan ſpecimen much branched and divaricated, with many flowers. *Leaves* ſtalked, compoſed in general of three deeply laciniated, often pinnatifid, acute, hairy leaflets. *Flowers* large, pale yellow, on long, ſtout, ſimple, lateral or terminal, ſolitary, ſpreading ſtalks. *Calyx* rather ſpreading than decidedly reflexed, nearly ſmooth. *Fruit* three quarters of an inch long, ſlightly elliptical, obtuſe. *Seeds* in many rows, compreſſed, minutely dotted at each ſide, gibbous at the baſe, each terminating in a very broad, rather ſhort, compreſſed, recurved, ſpinous-pointed beak. We know of no figure of this or the following.

81. R. *grandiflorus.* Large-flowered Oriental Crowfoot. Linn. Sp. Pl. 781. Willd. n. 56. Lamarck Dict. n. 63. (R. orientalis, aconiti folio, flore luteo maximo; Tourn. Cor. 20.)—"Stem erect, two-leaved. Leaves many-cleft; thoſe of the ſtem alternate, ſeſſile."—Gathered by Tournefort in the Levant. We have ſeen no ſpecimen. Willdenow marks this as a perennial ſpecies, and indicates his having ſeen it in a dried ſtate. We regret that he did not ſubjoin a deſcription of the plant, the Linnæan ſpecific character being very inſufficient. What Poiret has given is evidently compiled from the ſhort materials furniſhed by Linnæus and Tournefort. The Abbè Seſtini is ſaid to have gathered *R. grandiflorus* near Conſtantinople; on whoſe authority it finds a place in Prodr. Fl. Græc. v. 1. 385.

82. R. *falcatus.* Sickle-ſeeded Crowfoot. Linn. Sp. Pl.

Pl. 781. Willd. n. 57. Ait. n. 35. Jacq. Auftr. t. 48. (Melampyrum luteum; Ger. Em. 90. Lob. Ic. 37.)—Leaves linear-wedge-fhaped, in three deep many-cleft lobes. Seeds with fickle-fhaped beaks. Stalks radical, fingle-flowered.—Native of corn-fields in the fouth of Europe, and the Levant; cultivated by Miller at Chelfea in 1739. A fmall annual, flowering in the early part of fummer. *Root* thread-fhaped, with a few fibres. *Stem* none. *Leaves* feveral, pale green, downy, about two inches long; their fegments narrow and entire. *Stalks* fimple, downy, taller than the leaves, each bearing a fmall yellow *flower*, whofe *calyx* is erect. *Fruit* large, ovate, or nearly cylindrical, befet on all fides with the long, prominent, afcending, incurved, compreffed, downy, fpinous-pointed beaks of the feeds.

83. R. *polyphyllus*. Many-leaved Water Crowfoot. "Waldft. et Kitaibel Hung." Willd. n. 58.—"Leaves under water oblong, ftalked, capillary; floating ones wedge-fhaped, three-lobed; thofe above the water elliptical. Stem erect."—Native of the waters of Hungary. Annual. *Stem* nine inches high, erect; branched in the upper part. *Leaves* that are under water very numerous, entirely covering that part of the ftem, oblong, the length of the nail, each fupported by a capillary *footftalk* an inch long: the floating leaves fmall, wedge-fhaped, three-lobed, entire, as long as the former, their *footftalks* thicker and fhorter. *Branches* an inch long, erect, rifing above the water, and bearing elliptical obtufe leaves, tapering each way, from four to fix lines long, on fhort *footftalks*. *Flowers* extremely fmall, yellow. *Willdenow.*

84. R. *hederaceus*. Ivy Crowfoot. Linn. Sp. Pl. 781. Willd. n. 59. Ait. n. 36. Fl. Brit. n. 14. Engl. Bot. t. 2003. Curt. Lond. fafc. 4. t. 39. Fl. Dan. t. 321. Dalech. Hift. 1031. (R. hederaceus rivulorum fe extendens, atrâ maculâ notatus; Bauh. Hift. v. 3. 774.)—Leaves fmooth, roundifh, kidney-fhaped, with three or five entire lobes. Stem creeping. Stamens from five to ten. Seeds corrugated.—Native of watery places, on a fandy or gravelly foil, in England, Germany, France, &c. flowering from May to Auguft. *Roots* fibrous, perennial. *Stems* either creeping or floating, proftrate, branched, round, fmooth, and fucculent. *Leaves* ftalked, fmooth, and fhining, nearly uniform; often blackifh in the difk. *Flowers* very fmall, on fimple, axillary or lateral, ftalks. *Petals* linear-oblong, rather exceeding the calyx in length, white, with yellow claws. *Stamens* fcarcely ever more than ten. *Fruit* globofe. *Seeds* ovate, incurved, fomewhat compreffed, with a very fmall inflexed beak, and numerous, lateral, corrugated or reticulated veins.

85. R. *aquatilis*. White Floating Crowfoot. Linn. Sp. Pl. 781. Willd. n. 60. Ait. n. 37. Fl. Brit. n. 15. Engl. Bot. t. 101. Ger. Em. 829.—Leaves capillary under water; above fomewhat peltate. Stamens numerous. Seeds corrugated.—Native of pools, ditches, and rivers, throughout Europe, mantling the furface with its copious white bloffoms, in the early part of fummer. The *roots* are long, fibrous, and perennial. *Stems* floating under water, long, round, branched, leafy. *Leaves* ftalked, fmooth; the uppermoft floating, ufually peltate, with various blunt notches; the next deeply three-lobed, or even ternate; the lowermoft immerfed, repeatedly three-cleft, with innumerable capillary fegments. *Flowers* floating on long fimple ftalks, oppofite to the leaves. *Petals* obovate, much longer than the calyx, white, with yellow claws. *Nectary* tubular. *Stamens* thirty or more. *Fruit* like the laft, but the *feeds* more numerous, and generally briftly, fomewhat obovate.

Varieties, as we deem them, of this fpecies are, 1ft, that whofe *leaves* are all immerfed, and entirely capillary, figured in Ger. Em. 827. f. 3: 2dly, the *circinatus* of Sibth. Oxon. 175, figured in Pluk. Phyt. t. 55. f. 2, whofe leaves are all likewife in capillary divifions, but finer and fmaller than the former: 3dly, the *fluviatilis* of Willdenow, n. 61, *peucedanoides* of Desfont. Atlant. v. 1. 444, figured in Fl. Dan. t. 376, whofe leaves are not only in capillary fegments, but confiderably elongated, by the influence, as we conceive, of the running water, in which this fort is always found. The *feeds* indeed are not briftly, in our fpecimens of this laft variety, but naked, as in *hederaceus*, which fpecies agrees with every variety of *aquatilis*, in the corrugations of the feeds, as above defcribed.

We have thus added twenty-four fpecies to Willdenow's number, following his arrangement, for the prefent at leaft; not only for the convenience of our readers, but becaufe it would be very difficult to make a perfect one on any known principles; the feveral fpecies being allied by fo many characters, and fo diffimilar in others, that nothing could be more precarious than to feek the clue of nature through fuch a labyrinth. The *feeds* perhaps ought to form the bafis of a fpecific arrangement, if they might not even lead to generic diftinctions.

No fmall curiofity in the hiftory of this genus is the *R. alatus*, of Poiret in Lamarck's Dict. n. 72, which, by his defcription, proves to be no other than *Gymnoftyles pterofperma* of Juffieu. (See GYMNOSTYLES.) The *pumilus* of Poiret, n. 82, appears to us a variety of *aquatilis*, growing in fhallow, and perhaps fluctuating, waters; whence, though its *leaves* are all deeply cut, their fegments are not quite capilllary, but linear and obtufe. We have Swifs fpecimens anfwering to this author's defcription.

RANUNCULUS, in *Gardening*, contains plants of the hardy, herbaceous, perennial kind, of which the fpecies cultivated are, the Perfian crowfoot, or garden ranunculus, (R. afiaticus); the aconite-leaved crowfoot (R. aconitifolius); the upright meadow crowfoot (R. acris); the creeping crowfoot (R. repens); and the embracing-leaved crowfoot (R. amplexicaulis). But there are other fpecies that may be cultivated for variety.

Of the firft fpecies the varieties are exceedingly numerous, being fometimes divided into two claffes, as the old Turkey kinds, and the Perfian kinds, the varieties of the latter amounting to many hundreds, and being confiderably more various, rich, and beautiful in colour than thofe of the others.

But in the former of thefe forts they rife with a ftrong generally unbranching ftalk a foot high, terminated by one large double flower, fometimes emitting one or two fmaller ones from its fides, and of which there are red-flowered, fcarlet-flowered, yellow-flowered, and fcarlet turban-flowered, &c.; but being feldom tinged with different colours, as in the Perfian kinds.

And in the latter kind the plants rife eight or nine inches high, generally branching from the bottom, producing from five or ten to twenty or more flowers on each root, and of which there are fingle-flowered, femi-double-flowered, full-double-flowered, large and full like a double rofe, being generally filled with petals to the very centre, forming a regular globular body, of admirable elegance, of all forts of the moft beautiful colours in different varieties, and of numerous degrees of deeper and lighter fhades, ftripes, and tinges in the feveral colours. Indeed Martyn obferves, that the varieties produced of late years from the feeds of femi-double flowers are unbounded; and that Mr. Maddock remarks that they are more numerous than of any other

other flower. Accordingly his catalogue, he fays, boafts nearly eight hundred, all with their proper names: ranged under the heads of—dark and dark purple; light purple and grey, &c.; crimfon, &c.; reds, &c.; rofy, &c.; orange, &c.; yellow and yellow fpotted, &c.; white and white fpotted, &c.; olive, &c.; purple and coffee-ftriped, &c.; red and yellow-ftriped; red and white ftriped.

And according to the above flower gardener a fine ranunculus fhould have a ftrong ftraight ftem from eight to twelve inches high. The flower fhould be of an hemifpherical form, at leaft two inches in diameter, confifting of numerous petals gradually diminifhing in fize to the centre, lying over each other, fo as neither to be too clofe nor too much feparated, but having more of a perpendicular than horizontal direction, in order to difplay the colours with better effect. The petals fhould be broad, with entire well-rounded edges; their colours dark, clear, rich or brilliant, either of one colour or varioufly diverfified, on an afh, white, fulphur or fire-coloured ground, or elfe regularly ftriped, fpotted or mottled, in an elegant manner.

In the fecond fpecies there is a variety with double flowers, which has been obtained by feeds, and is preferved in many curious gardens for the beauty of its flowers. It is by fome gardeners called the *Fair Maid of France*. The root is perennial, and compofed of many ftrong fibres: the leaves are divided into fine lanceolate lobes: the four fide-lobes are upon footftalks coming from the fide of the principal ftalk, and the middle one terminates it; they are deeply ferrate, and have feveral longitudinal veins. The ftalks rife a foot and half high, and branch out at the top into three or four divifions, at each of which there is one leaf, of the fame fhape with the lower, but fmaller. The flowers are pure white, and very double, each ftanding upon a fhort footftalk. The flowers come forth in May.

In the third fort there is alfo a variety with double flowers, which is the fort moft generally cultivated in the garden. It is frequently among other herbaceous perennials, under the name of *Yellow Bachelor's Buttons*.

And in the fourth fpecies there is a variety with double flowers, which is the fort cultivated in the gardens for its ornamental effects.

Method of Culture.—The firft fort and different varieties may be readily increafed by the off-fets taken from the root, and new varieties may be raifed from feed. In the firft of thefe methods the off-fets fhould be feparated from the roots in dry weather, in the latter end of fummer, when the flowering is over, and the ftems and leaves are declining, being placed in bags or boxes, in a dry place, till the autumn, when they fhould be planted out in rows fix or eight inches apart, and fix of them to each, in feparate beds, prepared with light fandy earthy compoft, to the depth of two or three feet; taking care to protect them carefully from the froft during the winter. When the buds begin to break through the ground they fhould be kept perfectly clear from weeds, protecting them from frofts; and when they have flowered and the ftems are decayed, the root fhould be taken up; cleared from dirt, and placed in bags or boxes till the autumn, when they muft be planted again.

But in the fecond mode, the feed fhould be collected from the beft plants of the femi-double kinds, and be fown in flat pans or boxes, filled with light rich earth, in Auguft, covering it in about a quarter of an inch thick with the fame fort of earth, placing them in a fhady fituation, fo as to have a little of the morning fun. The pots fhould remain here till the beginning of October, when the plants fometimes appear, though it is often later before this happens, when they fhould have a more open expofure with the full fun; but when froft is apprehended, they fhould be removed under a common hot-bed frame, being only covered in the nights and bad weather with the glaffes, guarding them well againft rains and froft. In the fpring following they fhould be expofed to the open air, being very flightly refrefhed with water, having a fituation to enjoy the morning fun; and when their leaves and ftems begin to decay, the roots may be taken up, dried in a proper place, and then put up in bags to be planted out in the fame manner as the old roots in October.

In the following fummer they will produce flowers; when fuch as are good fhould be marked, and the others removed from them. The plants intended to flower fhould not be fuffered to run to feed, as roots which have produced feeds feldom furnifh fine flowers afterwards. The difappointments experienced in purchafing thefe roots, chiefly depend upon this circumftance.

It may be noticed that the roots intended for the borders fhould be planted towards the fpring in little clumps or patches, three, four, or five roots in each, putting them in either with a dibble or trowel, about two inches deep, and three or four afunder in each patch, and the patches from about three to five or ten feet diftance, placing them in a varied manner in the borders.

And in regard to their general culture after planting, fuch of the forward autumnal-planted roots of the choice forts in beds as have fhot above ground, fhould in winter, where convenient, have occafional fhelter from hard frofts, by mats fupported on low hoop arches; or in very fevere weather be covered clofe with dry long litter, removing all covering in open weather: and in the fpring, when the flower-buds begin firft to advance, fhelter them in frofty nights with fupported mats, fuffering them, however, to be open to the full air every day; but the latter plantings, that do not come up in winter, or very early in fpring, whilft frofty nights prevail, will not require any protection, and all thofe diftributed in patches about the borders muft alfo take their chance in all weathers: thofe of the different feafons of planting will fucceed one another in flowering from the beginning of April until the middle of June, though the May blow generally fhews to the greateft perfection. After the blow is paft, and the leaves and ftalks withered, the roots fhould be taken up and dried in the fhade, then cleared from all off-fets and adhering mould, putting them up in bags or boxes till next planting feafon, when they muft be planted again, as directed above.

But in each feafon of planting, it is highly neceffary, in the principal fine varieties, to put them either in entire new beds, or the old ones refrefhed with fome frefh rich earth or compoft, working the old and new well together, in order to invigorate the growth of the plants.

All the other fpecies are capable of being eafily raifed by the roots, which fhould be flipped or parted in autumn when paft flowering, or in the fpring before they begin to fhoot, and the flips be either planted at once, where they are to remain, or in nurfery-rows for a feafon, then planted out finally. They fucceed in any common foil and fituation, and may be difperfed about the different flower-borders and clumps, where they conftantly remain, only trimming them occafionally; and once in a year or two, or when they have increafed into large bunches, taking them up in autumn or fpring, to divide them for further increafe, replanting them again directly.

In faving feed for raifing new varieties, it muft be fuffered to continue on the plant till it becomes brown and dry,

dry, then be cut off, with the heads, and ſpread upon paper, in a dry room, expoſed to the ſun, and when quite dry, be put into a bag, and hung in a dry place till it is wanted.

All theſe plants are highly ornamental; the firſt ſort in beds and pots, and the other in the borders, clumps, and other parts of pleaſure-grounds.

RANUNCULUS, *Globe*, in *Botany*. See HELLEBORE.

RANUNCULUS *Viridis*, in *Zoology*, the name of an animal common in many parts of the world, and uſually known by the name of the *tree-frog*, or *rana arborea*.

The creature is eaſily diſtinguiſhed from the common frog, by its being much ſmaller, and of a green colour. It uſually ſits upon the leaves of trees and ſhrubs, and makes a great noiſe in an evening; but that is rather like the ſinging of a ſmall bird than the croaking of a frog.

Theſe creatures have been kept alive many years together in glaſs veſſels, giving them flies and other ſmall inſects: and in winter, when theſe are ſcarce, they uſually become very lean and feeble; but in ſummer, when they are plentiful, they will grow fat again, as if at their liberty. This is eſteemed a poiſonous creature. Ray. See RANA.

RANZ *des Vaches*, a celebrated air among the Swiſs, played upon the bagpipe by the young cow-keepers on the mountains. The air will be found on our muſic-plates. In the article MUSIC, the powerful effects of this tune are mentioned, from Rouſſeau's Dict. de Muſique.

RAOLCONDA, in *Geography*, the ſeite of a diamond-mine in Hindooſtan, placed in Mr. Montreſor's map about 15 geographical miles to the weſt of Ralicotte, and 12 from the north bank of the Kiſtnah, but Mr. Rennell does not know what authority he has for this poſition. Tavernier, who viſited Raolconda, gives its diſtance from Golconda at 17 gos, of 4 French leagues each. He croſſed a river that formed the common boundary of Golconda and Viſiapour, about four gos, or more, before he came to Raolconda; and this river can be no other than the Beemah, which to this day forms the eaſtern boundary of Viſiapour, and paſſes about 80 or 82 miles to the weſt of Golconda, croſſing the road from it to Ralicotte. If we reckon the 82 miles at 13 gos, that is, forming a ſcale from the diſtance between Golconda and the river Beemah, each gos will be 6.3 geographical miles in horizontal diſtance (or nearer three than four French leagues); and Raolconda will be placed about 25 geographical miles on the W. of the Beemah, or 11 E. of Ralicotte.

RAON L'ETAPE, a town of France, in the department of the Voſges, and chief place of a canton, in the diſtrict of St. Dié, on the Meurte; 7 miles N. of St. Dié. The place contains 2528, and the canton 5300 inhabitants, on a territory of 70 kiliometres, in 5 communes.

RAOUDA, or ROUDDA, denoting *gardens*, an iſland of Egypt, in the Nile, in front of Old Cairo, about 500 yards in breadth, where is built the *Mekkias*, ſignifying meaſure, or Nilometer, a pillar, by the gradations on which the riſe of the Nile is meaſured.

This iſland is called Roudd, or gardens, becauſe it is laid out in gardens, and inhabited only by gardeners.

RAOUTTY, a town of Hindooſtan, in Malwa; 20 miles N.N.E. of Tandla.

RAPA, in *Botany*, (an ancient name, of whoſe etymology no plauſible account has come to our knowledge,) the Turnip. See BRASSICA, ſpecies 7.

RAPAAPO, in *Geography*, a town of America, in New Jerſey; 30 miles S. of Woodbury.

RAPACIOUS ANIMALS, in the general, are ſuch as live upon prey.

Naturaliſts divide birds into *rapacious*, *carnivorous*, and *frugivorous*.

The characteriſtic notes of rapacious birds, which are the Accipitres of Linnæus, are, that they have a great head, and a ſhort neck; hooked, ſtrong, and ſharp-pointed beak and talons, fitted for tearing of fleſh; ſtrong and brawny thighs, for ſtriking down their prey; a broad thick fleſhy tongue, like that of man; twelve feathers in their train; and twenty-four flag-feathers in each wing, and the two appendices, or blind guts, are always very ſhort.

Rapacious birds have a membranous ſtomach; and not a muſculous one, or a gizzard, ſuch as birds have which live on grain.

They are very ſharp-ſighted, and gather not in flocks; but, generally ſpeaking, are ſolitary; though vultures will fly fifty or ſixty in a company.

RAPAKIVI, in *Mineralogy*, a name given to the aggregate of felſpar and mica: its colour is brown, or browniſh-red; it moulders by expoſure to the air, but that is only when the mica is in exceſs. When the felſpar exceeds, it forms a durable ſtone, called in Italy "Granitone." Kirwan.

RAPALLO, in *Geography*, a town of the Ligurian republic, ſituated on a bay to which it gives name; 12 miles E.S.E. of Genoa.

RAPANEA, in *Botany*, according to De Theis, its vernacular name in Guiana; though Aublet ſays nothing to that effect.—Aubl. Guian. v. 1. 121. Juſſ. 288. Lamarck Illuſtr. t. 122.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Berberides*, or rather perhaps *Rhamni*, or *Sapotæ*; Juſſ.

Gen. Ch. *Cal.* Perianth inferior, minute, of one leaf, with five or ſix teeth, permanent. *Cor.* of one petal; tube very ſhort; limb in five or ſix deep roundiſh ſegments. *Stam.* Filaments five or ſix, inſerted into the tube at the baſe of each lobe of the limb; anthers oblong, quadrangular, of two cells. *Piſt.* Germen ſuperior, roundiſh, of five or ſix cells; ſtyle very ſhort; ſtigma obtuſe. *Peric.* Drupa globular, of one cell. *Seed* ſolitary, globoſe.

Eſſ. Ch. Corolla in five or ſix deep ſegments, oppoſite to the ſtamens. Anthers quadrangular. Drupa ſuperior. Seed ſolitary, globoſe.

1. R. *guianenſis*. Aubl. Guian. t. 46. (Samara floribunda; Willd. Sp. Pl. v. 1. 665.)—Native of thickets, in the ſkirts of meadows, in Cayenne and Guiana, bearing flowers and fruit in December. A ſmall tree, whoſe *trunk* is five or ſix feet high, and four or five inches thick, crowned with branches; the wood white, not very compact. *Leaves* alternate, on ſhort ſtalks, obovate, bluntiſh, entire, ſmooth, two or three inches long, with one rib, and many tranſverſe veins ſcarcely viſible when freſh. *Flowers* copious, ſmall, white, in denſe lateral tufts. *Fruit* violet-coloured.—Mr. Brown, in his Prodromus Nov. Holl. v. 1. 533, ſpeaks of this ſhrub as belonging to the genus MYRSINE, ſee that article; conſequently Juſſieu was moſt correct in hinting its affinity to his *Sapotæ*, an order from which Ventenat and Brown have ſeparated their more recent one of MYRSINEÆ, to which we refer the reader.

RAPATEA, apparently a vernacular name of the plant in Guiana, Aubl. Guian. v. 1. 305. t. 118. Juſſ. 44. Lamarck Illuſtr. t. 226. See MNASIUM.

RAPAX, in *Ichthyology*, a name given by Schoneveldt to the *corvus piſcis* of ſome writers, a ſpecies of chub or cyprinus, called *rappe* by the Germans, and by Geſner and others *capito fluviatilis rapax*.

RAPE, RAPTUS, in *Law*, a *raviſhing*; or the having carnal knowledge of a woman by force, and againſt her will.

will. If the woman conceived, the law formerly efteemed it no rape; from an opinion, that fhe cannot conceive, unlefs fhe confented. But this opinion has been fince queftioned. Coke on Litt. lib. ii. cap. 11.

This crime, by the Jewifh law, Deut. xxii. 25. was punifhed with death, in cafe the damfel was betrothed to another man; and in cafe fhe was not betrothed, then a heavy fine of fifty fhekels was to be paid to the damfel's father, and fhe was to be the wife of the ravifher all the days of his life; without that power of divorce, which was in general permitted by the Mofaic law.

The civil law (cod. 9. tit. 13.) punifhes the crime of ravifhment with death and confifcation of goods; including under this crime both the offence of forcible abduction, and alfo that of forcibly difhonouring; either of which, without the other, is in that law fufficient to conftitute a capital crime. And the ftealing away a woman from her parents or guardians, and debauching her, is equally penal by the emperor's edict, whether fhe confent, or is forced.

Rape was punifhed by the Saxon laws, particularly thofe of king Athelftan, with death; which was alfo agreeable to the old Gothic or Scandinavian conftitution. Inftead of this, another punifhment was inftituted by William the Conqueror, *viz.* caftration and lofs of eyes, which continued till after Bracton wrote in the reign of Henry III. But it was then the law, and ftill continues in appeals of rape, that the woman fhould immediately after go to the next town, and there make difcovery to fome credible perfons of the injury fhe has fuffered; and afterwards fhould acquaint the high conftable of the hundred, the coroners and the fheriff, with the outrage; the time of limitation for this purpofe was by ftat. Weftm. 1. cap. 13. extended to forty days. But there is now no time fixed; for as it is now ufually punifhed by indictment at the fuit of the king, the maxim of law takes place, *nullum tempus occurrit regi:* however, the jury will rarely give credit to a ftale complaint. During the former period it was alfo held for law, that the woman (by confent of the judge and her parents) might redeem the offender from the execution of his fentence, by accepting him for her hufband, if he alfo was willing to agree to the exchange, but not otherwife.

In the 3 Edw. I. by the ftat. Weftm. 1. cap. 13. the punifhment of rape was much mitigated: the offence being reduced to a trefpafs; if not profecuted by the woman within forty days; and fubjecting the offender only to two years imprifonment, and a fine at the king's will. But in the 13 Edw. I. it was found neceffary to make the offence of rape felony, by ftat. Weftm. 2. cap. 34. And by 18 Eliz. cap. 7. it was made felony without benefit of clergy; as is alfo the abominable wickednefs of carnally knowing or abufing any woman-child, under the age of ten years; in which cafe the confent or non-confent is immaterial, as, by reafon of her tender years, fhe is incapable of judgment and difcretion. Sir Matthew Hale is indeed of opinion, that fuch profligate actions committed on an infant under the age of twelve years, the age of female difcretion by the common law, either with or without confent, amount to rape and felony, as well fince, as before the ftatute of queen Elizabeth; but the law has in general been held only to extend to infants under ten. A male infant, under the age of fourteen years, is prefumed by law incapable of committing a rape; and, therefore, cannot be found guilty of it.

The civil law feems to fuppofe a proftitute incapable of any injuries of this kind; not allowing any punifhment for violating the chaftity of her who hath indeed no chaftity at all, or at leaft hath no regard to it. But the law of England holds it to be felony to force even a concubine or harlot; becaufe the woman may have forfaken that unlawful courfe of life.

As to the material facts requifite to be given in evidence and proved upon an indictment of rape, we fhall here only obferve, that the party ravifhed may give evidence upon oath, and is in law a competent witnefs; but the credibility of her teftimony muft be left to the jury, upon the circumftances of fact that concur in that teftimony: *e. gr.* if the witnefs be of good fame; if fhe prefently difcovered the offence and made fearch for the offender; if the party accufed fled for it: thefe and the like are concurring circumftances, which give greater probability to her evidence. But, on the other fide, if fhe be of evil fame, and ftands unfupported by others; if fhe concealed the injury for any confiderable time after fhe had opportunity to complain; if the place, where the fact was alleged to be committed, was where it was poffible fhe might have been heard, and fhe made no outcry; thefe and the like circumftances carry a ftrong, but not conclufive, prefumption, that her teftimony is falfe or feigned. Moreover, if the rape be charged to be committed on an infant under twelve years of age, fhe may ftill be a competent witnefs, if fhe hath fenfe and underftanding to know the nature and obligation of an oath; and, even if fhe hath not, it is thought by fir Matthew Hale that fhe ought to be heard, without oath, to give the court information; though that alone will not be fufficient to convict the offender. And, indeed, it is now fettled, that infants of any age are to be heard; and if they have any idea of an oath, to be alfo fworn: it being found by experience, that infants of very tender years often give the cleareft and trueft teftimony. Blackft. Com. book iv.

The civilians make another kind of rape, called *fubornatio*, *rape of fubornation*, or *feduction;* which is, when a perfon feduces or entices a maid to uncleannefs, or even marriage, and that by gentle means; provided there be a confiderable difparity in age or condition between the parties. In this cafe, the father and mother intend their action reciprocally for the *crimen raptus*, or *fubornationis*.

The French laws make no difference between the rape of violence and that of folicitation, or fubornation; they make both capital. This kind of rape our laws call *Ravifhment;* which fee.

Rape *of the Foreft*, is a trefpafs committed in the foreft by violence.

This is mentioned in the laws of Henry I. as one of the crimes cognizable alone by the king.

Rape is alfo a name given to the wood or ftalks of the clufters of grapes, when dried, and freed from the fruit.

The rape is ufed in making vinegar, ferving to heat and four the wine: but it is firft put into a place to four itfelf, before it be caft into the vinegar veffel; to which end, prefently after the vintage, it is carefully put up in barrels, left it take air, otherwife it would heat itfelf and be fpoiled. There is no other way of keeping rape hitherto difcovered, but to fill the veffel, in which it is contained, with wine or vinegar.

Rape, *Rapa*, is alfo ufed for a part or divifion of a county; fignifying as much as a *hundred*.

Though fometimes rape is taken for a divifion containing feveral hundreds. Thus Suffex is divided into fix rapes, *viz.* thofe of Chichefter, Arundel, Bramber, Lewes, Pevenfey, and Haftings: every one of which, befides its hundreds, has a caftle, a river, and foreft belonging to it.

The like parts in other counties are called *tithings*, *lathes*, or *wapentakes*.

Rape, in *Botany*. See Napus.

Rape, *Broom*. (See Orobanche.) It frequently grows to to the roots of genifta or broom, whence it is called *rapum geniftæ*, or broom rape: it is alfo found among corn. The herb preferved, or its fyrup, is faid to be of excellent ufe in fplenetic or hypochondriac diforders, and an ointment prepared of it with fwine's fat, is good for hard and fcirrhous tumours.

Rape, *Wild*. See Mustard.

Rape, in *Gardening*, the common name of a plant of the cabbage kind. The variety called the French turnip, or *Braffica napus*, has been long cultivated upon the continent, and preferred to the common turnip as a culinary vegetable. And it has been lately noticed in the "Tranfactions of the Horticultural Society," that it has been brought to the principal London markets for more than twelve years paft by one perfon only, and fold chiefly to foreigners, though, when once fully known, it will be found a very ufeful and acceptable root in moft families, as being more delicate in its flavour than the common turnip. It is ufed in much the fame manner. It enriches foups, and there is not any neceffity for cutting away the outer fkin or rind, but only to fcrape it, as it is a great deal thinner than that of the turnip. When ftewed with gravy it forms an excellent difh, and being white and fhaped like the carrot, when laid alternately with thofe on a difh, they become very ornamental. The French drefs them fomewhat in this manner.

The roots are to be wafhed quite clean by means of a brufh; then fcraped, cutting a thin flice away from the top and bottom parts, fo as to make them all of equal lengths: after which boil them in water, with a little falt, until they are tender; then put them into a ftew-pan, with a gill of veal gravy, two fpoonsful of lemon pickle, one of mufhroom ketchup, a little mace, and falt, letting them juft fimmer, but by no means boil, for a quarter of an hour; afterwards thicken the gravy with flour and butter, ferving the whole up quite hot. Some add a few fpoonfuls of cream mixed with yolk of egg to this, juft before difhing up; and others drefs them in a fimilar manner to the above, fliced rather thinly, with Madeira, or other wines, after they have been fried to a brownifh colour. See Brassica.

Rape, in *Agriculture*, the name of a plant much cultivated for its feed, and alfo as a green food for cattle and fheep. The methods of culture and management that are neceffary in raifing crops of this fort, have been already defcribed and explained. (See Cole.) It may, however, be here neceffary to detail a few of the experiments that were made under the direction of the Dublin Society, by Mr. Whyn Baker, about the years 1769 and 1770, as they tend to throw additional light on the nature of the plant, as well as its cultivation, though the foil was not the moft fuitable for it. It was a fhallow foil, of a ftrong adhefive nature when wet, and when perfectly dry, in lumps, almoft impregnable; but between wet and dry, reducible. It lies upon a bed of lime-ftone quarry, and has a natural declivity to the north-weft; naturally very poor, and, he believes, never received any manure until he dreffed it. Three acres of this land were, in 1768, under potatoes, in the ordinary method of the country, in feven-feet beds, and four-feet trenches. In 1769 they were under drilled turnips.

The froft, fnow, hail, and rain which they had this year in the months of March and April, rendered it impoffible to get the grouud in any tolerable condition for the rape-feed before the 28th day of April. On that day twenty broad fets were fown, with twelve ounces of rape-feed to each fet or ridge. He intended to have fown it earlier, but the event will fhew, that, as it was, he fowed it too early, at leaft upon this ground.

It was flow in coming up, and made but a poor figure until July. After which it fhot forward; but inftead of affording a plentiful mowing crop for the purpofe of foddering cattle, it foon began to run up very faft, broke out into branches, with few and fmall leaves, like rape in bloffom from the autumn fowing, but with ftrong branches and few leaves; and, in a fhort time after, began to grow hard, pipey, and the feed to form.

It September he began to mow it for cattle, and they ate it with great eagernefs, but every day it became worfe, by growing harder; infomuch, that before it was exhaufted there was very great wafte, as to the object of fodder, but it wonderfully raifed the dung-hill, which, in his mind, is of the firft moment to the farmer: for if he has manure in plenty, and difpofes of it judicioufly, there is hardly any thing he need to fear, except climate.

It was pretty far in October before all his rape was cut, (and the feed coming forward very faft,) although it was brought home in great profufion. It was fo ftrong, that the mowing of it could not be accomplifhed with a common fcythe; it would have broken an hundred; but he had by him a fhort ftrong fcythe, with a thick back, intended to mow bufhes and other rubbifh; with this inftrument he got it mowed, but not fo clofe to the ground as he wifhed, it being next to impoffible to mow fuch ftrong plants as thefe were clofe to the ground; and he became the lefs folicitous about it, as from the ftrength of the rape ftumps and roots, and the weeds which were upon the ground, owing to the rape fhooting up in tall ftems, he gave up his intention of fowing the ground with wheat, as was originally intended. Hence he concludes, that the rape was fown much too early.

On the 16th of July he tranfplanted fome of this rape in rows upon ridges four feet wide; thefe plants flourifhed much better than the former, and were at leaft four times the fize of any of thofe left in the ground where they were fown. Neverthelefs, thefe alfo ran to feed; but the cold nights coming on prevented their forming their feed like the former. They were vaftly more fappy, and much better food for cattle.

On the 24th of July, he drilled rape-feed upon the fame ground.

N° 1. Six ridges four feet wide, and thirty-two perches long in fingle rows.

N° 2. Six ridges the fame length and breadth, in double rows, ten inches afunder.

It is obferved, that the double and fingle rows were drilled alternately on the fame ground, on the 18th day of July.

N° 3. Six ridges four feet wide, and thirty-two perches long, drilled in fingle rows.

N° 4. Six ridges the fame length and breadth, in double rows, ten inches afunder.

He remarks, that thefe were fown in alternate rows, on the fame ground, on the 24th of July. And that the feveral rows were thinned the latter end of Auguft, and twice horfe-hoed during the fummer. On the third of April 1771, he had a row of each of thefe cut and weighed, and the produce was as follows:

Rows.	Weight. ton.	cwt.	qr.	lb.		Prod. p. Plant. acre. t n.	cwt.	qr.	lb.
N° 1. Single row produced	1	2	1	11	Sown July 18th	29	6	1	16
2. Double row ditto	1	4	3	13		32	12	2	23
3. Single row ditto	1	5	2	22	Sown July 24th	33	14	1	26
4. Double row ditto	1	6	3	25		34	18	0	6

On the whole, it is ftated, that the laft fowing in July afforded confiderably greater produce than the firft, for the plaineft reafon, that the earlier we fow this feed, the fooner it runs; and confequently affords the lefs produce for the purpofe of foddering cattle in the yards for making dung, and feems to account very ftrongly for the ftate of the firft experiment.

And the double rows produced uniformly more than the fingle rows; and indicate that the double are to be preferred in drilling rape for foddering cattle.

The following trials are on fowing rape-feed broad-caft. On the 24th of July two acres were fown broad-caft, with ten pounds of feed to each acre, in the fame field where the other experiments were carried on; but the foil not fo ftiff by a good deal, has abundantly fewer loofe ftones in it, is very fhallow, and poor, to an incapability of producing any thing to profit, without great affiftance of manure.

In July he manured it with the dung of his yard, confifting of that of horned cattle, horfes, and fwine. The dreffing was indeed very high; about two fmart one-horfe cart-loads to a perch. He having ever found that one acre, highly improved, is much more valuable than five imperfectly handled, was the reafon why he gave this poor piece fo liberal a dreffing.

The rape came up but flowly for a time, as he finds to be the nature of the plant, but at length it fhot forward, and flourifhed away: but in winter it met with a fate which he was not aware of, nor did he expect. The wood-pigeons lay upon it prodigioufly, and did it great damage. Some plants he obferved in the froft to appear as if they had been finged: whether that was owing to the wounds given by the birds, and thereby giving the froft the greater force, or whether it was owing entirely to the feverity of the froft, is not in his power to determine. However, very early in the fpring this rape fhot forward, and as the days lengthened the vifits of the pigeons were lefs frequent, until they totally left it.

From this rape breaking out into bloffom fooner than he expected, he is inclined to believe that the 24th of July is too early to fow it for the purpofe of foddering cattle in the yard.

However, early in April he began to mow this rape for the horned cattle, fuch as cows, plough bullocks, young cattle, calves, and fwine. They all ate it with the greateft eagernefs, and were foddered with it every evening, until the 19th of May inclufive, and wheat ftraw in a morning, fave four calves of the preceding year; and they were foddered twice a day with rape, and had ftraw before them alfo, and throve upon it vaftly better than the other cattle; for no other reafon, he believes, than becaufe they were allowed more than the others: in fhort, they were in fuch order, that he dares believe the butchers would have been glad to have had them for killing.

He obferves, that he need not tell the farmer how neceffary it is to be frugal of provender in an harfh dry fpring, as the laft was, when he was like to be hard run with forty head of cattle, many of which he fhould actually have been obliged to fell at fo improper a feafon, had he not been poffeffed of thefe two acres of rape. He adds, that there is yet another circumftance which renders this a truly valuable fodder. The milk of the cows increafed prodigioufly; and the milk and butter were as good, fweet, and well-flavoured, he thinks, in every particular, as ever he tafted in June. Even the cream for the tea appeared to be perfectly free from any foreign flavour. The cows got hay every day, in the fame manner as he has in former years mentioned them to have, when feeding upon cabbages.

The fimplicity of the culture for rape, for the purpofe of feeding cattle, he cannot but think a particular recommendation to the farmer, and the cheapnefs of the feed in purchafe, or the eafe with which he may raife it, are objects which cannot fail, he thinks, of being perfuafive to him. And all perfons, who have annexed to their farms any bog, or other wafte ground, the improvement of which can be executed by burning, might furely raife fuch quantities of rape for the purpofe of mowing pafture, as would enable them to keep almoft any number of cattle; by which they would not only be bringing in the wafte land, but making that the foundation of improvement to their found land, by the immenfe quantities of dung they might raife by this means from the wafte land. Here the advantage to the cultivator would be double.

On the firft day of May he had four perches of this rape meafured out for weighing. It was mowed, immediately drawn home, and weighed. The four perches afforded feven hundred and two quarters: multiplying this by forty, fhews the acreable produce to be fifteen tons. The quantity indeed but fmall. However, the feafon in which it is to be had renders it more than ordinarily valuable, and, he thinks, bids fair to make it an object of hufbandry, as a pafture for cattle.

This year, 1770, Mr. Baker ploughed up fix acres of wheat ftubble, as foon as the wheat came off, harrowed it down the 12th, 13th, 14th, and 15th of September, then fowed rape-feed over the whole field, and gave it a light bufh harrowing. The rape came up very thin, and made fo poor an appearance in the fpring, that he ploughed up the field, and fowed fpring corn. This is a ftrong indication that but little is to be expected from fowing rape upon wheat ftubble; becaufe after the wheat comes off it feems to be too late in the year to fow rape. But fomething may be charged, as he obferves, to the natural moifture of the foil. See Cole.

The following is the recapitulation of his experiments on rape, as pafture for cattle.

				Produce.			
				Ton.	cwt.	qr.	lb.
Exp. I.	April fowing.		Ran, not anfwering the purpofe.				
II.	Ditto tranfplanted.		Ran, but not fo foon as the other.				
III.	July 18, fowing.	Single rows produced *per* acre		29	6	1	16
		Double rows ditto		32	12	2	23
	July 24.	Single rows ditto		34	14	1	26
		Double		35	18	0	9
IV.	Ditto	Broad-caft ditto		15	0	0	0
V.	September fowing on wheat ftubble ditto			0	0	0	0

Rape is a great deal cultivated in fome diftricts in the county of Effex for the feed. The fyftem is very profitable, but this fort of crop is found to draw or exhauft the land a good deal. It is thought by fome to prepare well for wheat, efpecially when fed off upon the land. In fome places they, however, confider it more beneficial to till, after this crop has been feeded for fpring corn, than to put in wheat, which, however, is ftill the moft common practice. Clover would certainly be better than either method.

In other places they conceive that feeding rape is much on the decline, from the general experience, that it leaves the beft prepared land in an unfavourable ftate for oats and clover,

clover, and is consequently prejudicial to the next succeeding winter crop. Other districts think very differently on this point. In feeding the crop, the produce is here considered to be in general from twenty-nine to thirty-four bushels the acre. In the greatest crops and best seasons, in particular parts it is supposed to rise even so high as five and six quarters the acre.

In Berkshire this sort of crop is not so much cultivated as it should be, as it will succeed well on soil where turnips will not, and with equally beneficial effects to the future crops, when fed off on the ground. When employed it is usually sown and managed so as to come into a high state of perfection in the early spring months, when sheep feed is mostly scarce. It is grown by some to supply the deficiency, and found remarkably useful, one acre of it affording more feed than two of turnips.

This sort of crop is still less grown in Oxfordshire, though occasionally had recourse to, especially on the rich red land about Banbury. Some sow it in mixture with the tankard turnip seed, for the purpose of weaning lambs upon: they begin with the rape, and it teaches them to eat the turnips: it is found to be a very good food for this sort of stock.

In the county of Sussex, the South Down sheep farmers hold it in great estimation, sowing it either alone or in mixture with tares as a food for their sheep; very rarely for the purpose of feeding. The ewes and lambs are wattled upon it in the spring, and it is very generally allowed to be most efficacious, and highly nutritious to the young lambs. Some, at the lambing season, hardly allow their ewes any other food but this, as the rape is found to produce a larger supply of milk than turnips; which, it is supposed, has the effect of extending the udder, without affording any considerable flow of milk. This crop is conjectured, however, in some cases, to have the effect of causing the slipping of the lambs, where the ewes are fed upon it. But such an effect is very improbable to arise in this way; other causes may have been overlooked. In some cases on Down land ray-grass is sown with the rape for sheep feed, one gallon of rape-seed and two of ray-grass to the acre. The rape is first fed off; and after that the ray-grass rises and affords a bite for the spring season. The rape crop is usually put in about June, or the following month, one gallon to the acre. When folded off, a rood and a half is a sufficient daily consumption for a flock of six hundred sheep, or rather more.

As it has been found in the improving of peat boggy morassy lands, that what is principally wanted is a crop which can be sown and reaped in the summer months; and which may require neither labour nor attendance during the moist seasons of autumn, winter, and spring; the writer of the "Treatise on Landed Property" has suggested that fortunately, such a crop is natural to, and has long been inured to the climate of this island, as well as one of the most profitable in the agriculture of it; and that this is rape: which is not only sown, but reaped, in the very height of summer; and which is known to delight in a soil of this nature. It has, however, only lately been found capable of being raised with advantage on crude mossy ground, as a first crop after draining, from some recent trials made in the north, after the above operation, levelling, paring and burning, and turning the ashes in. The result of which was, though the crop was too late in being put in, and the land laid in an improper manner, such as to prove clearly that rape-seed may be raised with profit as a first crop on drained moory soils. And it is thought highly probable that many extensive tracts of land, which now lie entirely waste, and as nusances in their neighbourhoods, may through this means be improved with immense profit to their proprietors. The experiment may be tried at a small expence. The cost of the labour and seed required for a sufficient trial are inconsiderable. The proof, it is supposed, is not whether rape will thrive as herbage, but whether it will mature its seed, on the given soil, in the given situation.

After being recompensed for the previous expences, in one or more rape crops, as there is here no danger of the exhaustion of the soil,—of impoverishing, perhaps, ten feet depth of vegetable mould, it remains to lay the foundation of more permanent profits, which is to be done by sowing grass seeds either with or over the rape crop, or by light cautious stocking after removing the stalks, as may be necessary, until there is a firmness of surface and a fitness for mixed cultivation, which may be much hastened by the use of heavy calcareous and earthy substances at any time during the process of improvement.

RAPE *Cake*, the refuse or cake remaining after the oil has been expressed from rape-seed. It is said to be useful as a manure. See MANURE.

This substance is found by chemical trials to contain a large quantity of mucilage, some albuminous matter, and a small quantity of oil. It should be kept as dry as possible before it is applied to the soil, and be employed in that way while it is in a fresh state. It is successfully applied in several ways and intentions, and affords an excellent dressing for turnips. See the next article.

RAPE *Dust*, the small reduced parts of the dried refuse of rape-seed, or the rape cake, after the oil has been obtained from it. This substance has been found useful as a top-dressing for crops of different kinds.

The rape cake, when reduced into powder or dust by means of a machine, has been extensively used in Norfolk; and when for turnip crops, it has been the custom to sow it some weeks before the seed of that root is put into the ground. In the practice of Mr. Coke of that district, it has, however, been found, that by having it brought into a fine powder it may be drilled from the same machine, at the same time with the turnip seed; and that, by thus delivering the manure and the seed from the same pipes and shares of the drill machine, a ton of dust does six acres in the place of three. See TURNIP.

In Lancashire some farmers use it with great advantage as a manure for potatoes, putting it in with the sets in the proportion of about thirty-two bushels to the statute acre; but if the ground were well prepared, and the dust carefully deposited for the reception of the sets, it is supposed, a much smaller quantity would be sufficient. It produces much luxuriance in the crops, and a very fine produce.

RAPE *Oil*, the oil obtained by means of expression from the seeds of this plant, in mills constructed for the purpose. The refuse oily substance of this kind may be employed as manure in mixture with rich earthy matters, with great advantage, wherever it can be procured in any quantity at a reasonable price.

RAPEL, in *Geography*, a river of Chili, which runs into the Pacific ocean, S. lat. 34° 8'.—Also, a town of Chili, on the forementioned river; 70 miles S. of Valparayso.

RAPERLAH, a town of Hindoostan, in the Carnatic; 13 miles N.E. of Ongole.

RAPHA, in *Anatomy*. See RAPHE.

RAPHAEL, one of the seven archangels, who are said to be continually before the throne of God, and ready to perform his commands. We have no such name in the Old or or New Teftament; but his hiftory occurs in the book of Tobit, c. xii.

If the ftory of Tobit be true, it is not improbable that the angels, both good and bad, whofe names do not appear to have been known before the Babylonifh captivity, are figurative perfonages; and Raphael might only denote the falutary protecting agency of divine providence, fo difpofing events as to produce a happy iffue.

Raphael Sanzio, da Urbino, in *Biography*, during whofe life, and by the exertion of whofe talents, in conjunction with thofe of Lionardo da Vinci, Titian, Michael Angelo, and fome few others, the art of painting reached its acme in modern times, was born in the city of Urbino, on the morning of Good Friday, in the year 1483. He was defcended from a refpectable family, and many of his anceftors had been painters; as was his father Giovanni Sanzio, whofe talents, however, did not elevate him to the firft rank. He cultivated with care the inclination which his fon Raphael exhibited, at an early age, for painting; and was foon repaid by the affiftance he acquired from him, in feveral of the pictures he was employed to paint in his native city of Urbino. But finding that the tafte of Raphael merited more fkilful guidance than he was able to give it, he placed him under the tuition of Corradini, better known by the name of Carnevale, for a fhort time, till he could be received as a pupil by Pietro Perugino, at Perugia.

This mafter was then in very high efteem, though his ftyle was dry and meagre, in comparifon with that of Mafaccio, and others of the Florentine fchool. It is not furprifing that Raphael, endowed as he was by nature, and trained as he had been in art, fhould foon become the rival, rather than the pupil, of fuch an artift. Accordingly we find, that his aptitude for the practice of art enabled him quickly to acquire his mafter's manner, and that in fo perfect a degree, that connoiffeurs were puzzled in their judgments upon the works which proceeded from Perugino's ftudio; and ordinary obfervers completely deceived. Vafari fpeaks of an Affumption of the Virgin, crowned by her Son, and the twelve apoftles below, round her tomb, contemplating the celeftial glories; with three fmall pictures in the fame frame below it, of the Annunciation, the Adoration of the Magi, and Simon embracing the Saviour, painted at this period by Raphael, as being wrought with extreme beauty, and precifely like the work of Perugino.

We have to lament that we are left ignorant of the time when Raphael went as a pupil to Pietro, how long he remained with him, or when he left him, or rather was left by him; as that mafter returned to Florence, to finifh fome pictures he had begun there fome time before. He muft certainly have been very young, from the number of pictures which he fubfequently executed, previous to his going to Rome in his 25th year, and probably not more than 16 or 17, when he acquired his liberty by the departure of Perugino.

From Perugia he went to Citta di Caftello, where he painted a St. Nicola crowned by the Virgin and St. Auguftin, for the church of St. Auguftine; and for that of St. Dominico, a picture of the Crucifixion of Chrift, accompanied by angels, the Virgin, St. John, &c.; which would certainly have been confidered as Perugino's, if Raphael had not fet his name to them. But he was confidered to have much furpaffed him in another work, reprefenting the marriage of the Virgin and St. Francifco, for the church of St. Francifco, in the fame city. He acquired by thefe productions a great and deferved extent of fame, and thus early entered with fuccefs that courfe, which conducted him to the higheft pinnacle of renown as an artift.

Attached to his perfon by friendfhip, and attracted by his fkill as a defigner, Pinturiccio, then employed by pope Pius II. to adorn the library of the Duomo at Sienna, fought the affiftance of Raphael, and engaged him to compofe defigns for his work. This he undertook, but proceeded only to the preparation of fome of the cartoons, when his ambition and his curiofity were ftimulated, and his work interrupted, by the renown fpread through the country of the cartoons painted by thofe great rivals, Lionardo da Vinci and M. Angelo, for the council-hall at Florence. He immediately determined, in conjunction with almoft all his brother artifts of the day, upon going to fee and form his judgment upon them for himfelf; and confequently left his engagement with Pinturiccio, and proceeded to Florence.

In this city he found fo many attractive beauties, both of nature and art, that he refolved to fix his refidence there for fome time. His agreeable perfon and manners, combined with the extraordinary talents he had manifefted, infured him friends; and he became intimate with feveral artifts of celebrity, among whom were Ghirtandaio, St. Gallo, and Taddeo Taddi; the latter of them, a learned man, and friend of cardinal Bembo, took the youthful painter to his houfe and table, and thus afforded him the beft introduction to the world, while he purfued his more immediate ftudies. This kindnefs the gentle heart of Raphael accepted with grateful emotion; and as he painted feveral pictures during his refidence in that city, he prefented two of them to Taddi. One of thefe pictures, a Madonna with the Child, and St. John bringing a little bird to him, the heirs of Taddi fold to the archduke Ferdinand Charles of Auftria at a great price: the other is loft fight of. He alfo prefented a picture to his friend Lorenzo Nafi, which afterwards found a place in the Medicean gallery, and a duplicate in that of the monaftery of Valombrofa.

From Florence Raphael was recalled to Urbino, by the death of both his father and mother; and there, when he had arranged his private affairs, he was engaged by Giudobaldo de Montefeltro, and feveral others, to paint religious fubjects for the altars of their chapels: and among thofe he painted at this time, were the two little St. Georges, now in the gallery of the Louvre. Thefe commiffions he executed with great tafte and delicacy; and Vafari, who enumerates them, more particularly fpeaks of one of Chrift praying in the garden, painted for Francefco Maria, duke of Urbino, as being finifhed with all the neatnefs of a miniature. What is become of moft of thefe pictures, it is not eafy to afcertain; but it is a curious fact, that not one of them remains at this time to adorn the native city of this great artift.

Thence he returned to Perugia, and painted feveral pictures. For the church of the Frati de Servi, one of the Virgin, with St. John Baptift, and St. Nicholas. For that of St. Stevens, in the chapel of our Lady, he painted in frefco a picture of Chrift in glory, with God the Father, furrounded by angels and fix faints, three on each fide. Upon this picture he wrote his name in large letters of gold, and very confpicuoufly, as if he himfelf was pleafed with the performance of it. He alfo painted here a picture for the nuns of St. Antonio da Padua, of our Lady with the Infant upon her lap clothed, and near her St. Peter, St. Paul, Sta. Cecilia, and Sta. Catherina. The airs and attire of the two female heads were regarded as the moft tafteful work of the time, wrought with the greateft degree of beauty and grace. Above the picture, in a femicircle, was reprefented

reprefented the Almighty Father; and at the foot of it, in three compartments, were the fcenes of our Lord's fufferings, *viz.* his agony in the garden, carrying his crofs, and dead upon the lap of the Virgin. It is not known what is become of the centre picture, or the uppermoft compartment; the lower ones formed a part of the Orleans collection. The execution of thefe works was performed in a ftyle much improved upon that of Perugino; with more breadth, more foftnefs, and more freedom and variety of action; proving that he had not ill fpent the time he had devoted at Florence to the ftudy of the works of other painters. Hence we may date the commencement of what is termed his fecond manner, from his firft vifit to that city.

Soon after he had produced thefe works at Perugia, that zeal for cultivation, which always accompanies true genius, led him to determine upon again vifiting Florence, at that time the emporium of fcience and of art. Though the native ftrength and purity of his mind were fuch as to conduct him, under favourable circumftances, to his future prominent ftation; yet he does not appear to have been fo extraordinary and original an inventor in the art itfelf as M. Angelo, or his great predeceffor and rival, Lionardo da Vinci. He knew how to take a hint of what was offered to his view, and to cultivate and improve it to his purpofe; but it yet remains a problem, whether Raphael, alone, and without the leading aid of thofe great and original artifts, would have ever feen the fublime of painting. His power may rather be faid to have confifted in ability to employ the materials furnifhed by their invention, *viz.* the ftyle of Michael Angelo, in form; and of Lionardo da Vinci, in chiaro-fcuro and colour; in beautiful conceptions, illuftrative of the character and paffions of man; and in an admirable felection of fubject, and mode of conveying it.

He himfelf appears to have been confcious of this; for we find him in the midft of honourable employment, leaving the profecution of it, to ftudy and improve himfelf by a conftant obfervation of the works of other renowned artifts, and again repairing to Florence, where alone he could find the true fource of found cultivation, and in which he made fo good ufe of his time, as to fit him in great meafure for the glorious field of exertion which awaited him.

On his return to the renowned abode of thefe great artifts, from whofe works he fought improvement, he had a letter of recommendation and introduction from the duchefs of Urbino to Pietro Soderini Gonfaloniere of the city; and was thus introduced to the beft circle of improvement and information.

It would have been highly gratifying to have been enabled to trace the fteps of a man fo diftinguifhed in the art, from the earlieft commencement of his ftudies; but the neglect of dates, by his hiftorians, counteracts every wifh to follow them more clofely; and the record of facts leaves us only the means of conjecture. That he began to paint original pictures very foon after he was placed with Perugino is evident, and he muft then have been very young, for it is on record, that the pictures by Pinturiccio, for which he made the cartoons at Sienna, were completed in 1503, at which time he was 20. If we allow, as we reafonably may, two years for their execution, it will place his firft vifit to Florence in 1501, at the age of 18; and it certainly cannot have been far from that period. In every part of his life, modefty, ingenuity, and the ardour of a mind entirely devoted to his art, characterized his conduct. His induftry and ingenuity feem to have kept equal pace; and the rapidity and certainty with which he muft have painted, to produce fo many pictures in fo fhort a fpace of time as he lived, are not the leaft extraordinary part of his hiftory.

On this, his fecond abode at Florence, he ftudied deeply the works of Mafaccio, and the cartoons of Angelo and Da Vinci; and attached himfelf in friendfhip to Baccio della Porta, better known by the name of Fra. Bartolomeo; than whom no one was better qualified to direct him rightly in whatever was grand and dignified, and from whofe judicious information in the art of cafting draperies and of colouring, Raphael evidently improved exceedingly; while he had the pleafure, in return, of communicating to his friend the principles of perfpective. Yet notwithftanding thefe helps, he did not entirely free himfelf from the formal and dry manner of his mafter, though he painted affiduoufly both in portrait and hiftory. In the former he produced the portraits of Angelo Doni and his lady Maddalena Strozzi; and in the latter he painted for Dominico Caneggiani, a Madonna, with the Infant playing with St. John brought by Elizabeth, who regards St. Jofeph as he ftands near, leaning both his hands upon a ftick, and inclining his head towards her. This picture appears to have been re-touched, or poffibly completed only in 1516, as the name of Raphael, with that date, in letters of gold, is written upon the drapery of the Virgin. He alfo made a cartoon during his refidence in Florence for a picture which he had previoufly engaged to paint for the Baglioni family at Perugia, and left the city to go and paint it in the church of St. Francefco in that place. The fubject of it was our Saviour carried to the fepulchre, accompanied by the Virgin, St. John, &c.; and it was exceedingly admired for the beauty and expreffion of the figures, and the fkill and perfection of the draperies. This picture was removed from Perugia by pope Paul V., and a copy, by Cefare d'Arpino, placed in its ftead: it afterwards found a ftation in the Borghefe palace at Rome.

When Raphael had completed this work, he returned to renew his ftudies at Florence, and was employed by the family of Dei, to paint a picture for their altar in Santo Spirito, which he began, and conducted through the preparatory parts; and in the mean time painted another for the city of Sienna, of the Madonna in an open country, with the Child ftanding by her, and St. John kneeling before him, but was interrupted, in its execution, by a fummons from pope Julius II. to Rome, and left it in the hands of his friend Ghirlandaio, to finifh a piece of blue drapery which it wanted. This picture was afterwards fold to Francis, king of France, and is at prefent in the French collection, known by the name of the Belle Jardinière. The unfinifhed fketch of the picture begun for the Dei family, was bought, after the death of Raphael, from his heirs, by Baldaffare Turini, and placed by him, in its original ftate, at the altar of his country church; it afterwards came into poffeffion of the houfe of Buonvicini di Pefcia, and was fold, by that family, to the grand duke Ferdinand, who, on removing it, placed a copy by Carlo Sacconi in its ftead. This was done at night, and with the utmoft fecrecy, for fear of a difturbance among the populace, by whom it was highly prized.

Raphael was indebted for the high patronage of the pope, which placed him in the proper fphere for the exercife of talents fuch as he poffeffed, to the friendfhip of his relation Bramante d'Urbino the architect; and never was recommendation better fupported by ability. Upon his arrival in Rome, in 1508, he was received with great courtefy by Julius, and the Camera della Segnatura, in the Vatican, affigned to him. He immediately began the preparation for his firft picture, which was the School of Theology, better known by the name of the Difpute of the Sacrament, and in obferving which, it is worthy of remark how his mind enlarged, in regard to ftyle in the art, as he became accuftomed to confider largely of his work; and according to the field of employment which he found before him. The difference in ftyle between one part of the picture, and that of the other, evidently points out where he began it; *viz.* on the right of the upper part, where the remains of the fchool of Perugino appears, and is fpread through the centre, where the glory which furrounds our Saviour is reprefented in the Gothic manner, by rays of gold. As he proceeded, his ftyle enlarged, and the lower part of the picture exhibits an immenfe improvement, and is almoft equal to any of his fubfequent productions.

In the fame room are the pictures of the School of Athens, the Parnaffus, painted in 1512, (where, furrounding Apollo and the Mufes, he has introduced portraits of the great poets, both of antiquity and of his own time,) and the Jurifprudence, comprizing two fubjects, one of the emperor Juftinian delivering the digeft of his code of laws to Tribonius, and another of pope Gregory IV. giving the decretal to a member of the confiftory. Over each of thefe fubjects, refpectively, are painted circular ones of fingle figures, reprefenting Theology, Philofophy, Poetry, and Juftice.

When pope Julius faw the fuperior tafte and talent with which Raphael produced the former of thefe works, he immediately ordered the whole of the ftanze, or chambers, which it was intended to decorate, to be entrufted to him; and all that had previoufly been done by Perugino, Pietro del Borgo, Il Soddoma, and Bramante di Milano, to be removed. But of this order Raphael made only a partial ufe; preferving entire the work of his firft mafter, and, partially, the ornamental labours of Il Soddoma.

While he was engaged upon thefe great works, he was not altogether indifferent to the more agreeable exercife of the pencil, and he painted for the church of the Auguftines, the pictures of the prophet Ifaiah, and the Sibyls who are fuppofed to have predicted the coming of Chrift. He alfo painted the portrait of his great patron, Julius, now in the Louvre, and feveral fmaller eafel pictures of Madonnas, and other religious fubjects. By thefe labours he acquired the renown they fo well merited, and his manners appear to have been in perfect accordance with the beauties of his mind. His perfon alfo was handfome, and he was beloved, efteemed, and admired. Yet he continued to ftudy, and to improve his talents, employing perfons to collect fpecimens and make drawings from Grecian remains. Full of tafte and feeling, he fpared no pains to perfect his powers by a thorough knowledge of all that had been done in art, both ancient and modern. In confequence, however, the fact, related by Vafari, may be doubted, of his being admitted, while Michael Angelo was abfent, to fee the work of that great artift in the chapel of Sixtus IV.; the tafte in which he wrought became aggrandized, and fimilar to that introduced by M. Angelo. About this time he painted the Galatea for Agoftini Ghigi, and the Madonna di Foligno, at the defire of Sigifmondo Conti, fecretary of pope Julius II., for the great altar of the church at Araceli, and which is now at the Louvre.

In another chamber of the Vatican he painted four other large pictures, the fubjects of which are, the miracle of Bolfenna, when the officiating prieft, who doubted of the real prefence in the Euchariſt, is offering up the hoft, and perceiving, with aftonifhment, that it diftils drops of blood; the releafe of St. Peter from prifon; the Heliodorus; and Attila arrefted, in his journey to Rome, by a vifion of St. Peter and St. Paul; thefe were completed in 1512, 13, and 14.

In thefe pictures his great improvement in colouring and ftyle is moft evident, and he continued to carry it ftill further into practice in another room, for which alfo he had compofed four other fubjects, known as the Incendio del Borgo; the coronation of Charlemagne by Leo III.; the fame pope defending his conduct to the fame emperor; and the defcent of the Saracens at the port of Oftia.

Whilft Raphael was engaged on the Heliodorus, his firft great patron, Julius II., died; but fortunately for the arts, if not for the tiara, he was fucceeded by another, Leo X., who was even more attached to them, and more fond of the renown arifing from the cultivation of whatever adorns fociety. By him, therefore, Raphael was ardently encouraged to proceed with his labours, and he continued to make defigns for other apartments, particularly for the great hall of Conftantine, as it is now called; but he did not live to execute them. The Incendio del Borgo was the laft upon which he himfelf wrought; the reft were completed by Julio Romano. He was alfo employed by Leo to make the cartoons now at Hampton Court, as exemplars for works in tapeftry, to be executed in Flanders, and which were completed at the expence of 70,000 crowns. Fortunately for us the originals were never returned to Rome, and were purchafed afterwards by Charles I.

Upon the death of Bramante, in 1514, the fuperintendance of the architectural concerns of the Vatican was entrufted to Raphael, who had already exhibited his knowledge and tafte in that art, by the introduction he had made of it in his pictures. He invented and began a palace for himfelf, and made feveral defigns for others.

Notwithftanding the immenfe application neceffary for the invention and completion of thefe important labours, together with the defigns he compofed for the ornamental parts, and the fcriptural fubjects on the ceilings and the covings of the loggia and ftanze of the Vatican, he found time to execute in frefco the defigns which adorn the palace of Agoftino Ghigi; the capital portrait of his great friend Leo X., with the cardinals de Medici and Roffi, now in the Louvre; the St. Michael, and the vifion of Ezekiel, both in the fame grand depôt; a Madonna, Child, and St. Anne, for Florence; and a large picture of Chrift bearing his Crofs, for the monaftery of St. Maria della Spafimo, at Palermo. Of this picture it is reported, that being fent on fhipboard to go to Sicily, the veffel was beaten from its courfe by a tempeft, and the mariners loft; when it drifted to Genoa, and of courfe its prefervation was attributed to the divine influence of this great work. The Genoefe chofe alfo to fuppofe that the hand of God had thus pointed out their city as the proper place for its refidence; and would not relinquifh it for a length of time, till the papal influence interfered, when it was configned to its original deftination. He alfo painted the picture of St. John, which adorned the Orleans collection; and laft of all, the Transfiguration; which indeed he had not quite finifhed when the unrelenting hand of death fet a period to his labours, and deprived the world of further benefit from his talents, when he had only attained an age at which moft other men are but beginning to be ufeful.

The immediate caufe of his death is allowed to have been brought on by too great an indulgence in gallantry, and, Vafari adds, by mifmanagement of his phyficians, who bled him when they ought to have adminiftered reftoratives. On his death bed he made his will, leaving his favourite pupils, Julio Romano and Il Fattore, his heirs, and ordering his

burial

burial to take place in the Pantheon (the church of Santa Maria Rotunda), where a monument still remains to his honour. He died on the same day of the year on which he was born, Good Friday, in 1520, at the age of 37, deeply lamented by all who knew his value. His body lay for a while in state, in one of the rooms wherein he had displayed the powers of his mind, and he was honoured by a public funeral; his last produce, the Transfiguration, being carried before him in the procession: and, that Rome might not be deprived of so noble a memorial of this extraordinary man, it was placed by the cardinal de Medici in the church of St. Pietro à Montorio, instead of being sent to France, as was originally intended.

Mr. Fuseli, in his edition of Pilkington, has given so discriminating and just an idea of the peculiar excellencies of Raphael, that we shall conclude our history of him by quoting it. "The general opinion has placed Raphael at the head of his art, not because he possessed a decided superiority over every other painter in every branch, but because no other artist ever arrived at uniting with his own peculiar excellence all the other parts of the art in an equal degree with him.

"The drama, or in other words the representation of character in conflict with passion, was his sphere; to represent this, his invention in the choice of the moment, his composition in the arrangement of his actors, and his expression in the delineation of their emotions, were, and are, and perhaps will be unrivalled. And to this he added a style of design dictated by the subject itself, a colour suited to the subject, all the grace which propriety permitted, or sentiment suggested, and as much chiaro-scuro as was compatible with his supreme desire of perspicuity and evidence. It is therefore only when he forsook the drama, to make excursions into the pure epic or sublime, that his forms become inadequate, and were inferior to those of M. Angelo: it is only in subjects where colour from a vehicle becomes the ruling principle, that he is excelled by Titian; he yields to Correggio only in that grace and that chiaro-scuro which is less the minister of propriety and sentiment, than its charming abuse, or voluptuous excess; and which sacrifices to the eye what was claimed in vain by the mind.

"Michael Angelo appears to have had no infancy: if he had, we are not acquainted with it: his earliest works equal in principle and elements of style the vigorous offsprings of his virility: Raphael we see in his cradle, we hear him stammer: but propriety rocked the cradle, and character formed his lips. Even the trammels of Pietro Perugino, dry and servile in his style of design, formal and gothic in his composition, he traced what was essential, and separated it from what was accidental, in figure and subject. The works of Lionardo, and the cartoon of Pisa, invigorated his eye, but it was the antique that completed the system which he had begun to establish on nature. From the antique he learned discrimination and propriety of form. He found that in the construction of the body, the articulation of the bones was the true cause of ease and grace in the action of the limbs, and that the knowledge of this was the true cause of the superiority of the antients. He discovered that certain features were fitted for certain expressions, and peculiar to certain characters: that such a head, such hands, and such feet, are the stamen or the growth of such a body, and on physiognomy established uniformity of parts. When he designed, his attention was immediately directed to the primary intention and motive of his figure, next to its general measure, then to the bones and their articulation, from them to the principal muscles or those eminently wanted, to their attendant nerves, and at last to the more or less essential minutiæ; but the character part of the subject is infallibly the characteristic part of his design, whether it be a rapid sketch, or a more finished drawing. The strokes of his pen or pencil themselves are characteristic: they follow the direction and texture of the part; flesh in their rounding, tendons in straight, bones in angular lines.

"Such was the felicity aud propriety of Raphael, when employed in the dramatic evolutions of character! both suffered when he attempted to abstract the forms of sublimity and beauty; the painter of humanity, not often wielded with success super-human weapons. His gods never rose above prophetic or patriarchal forms; if the finger of Michael Angelo impressed the divine countenance oftener with sternness than awe, the gods of Raphael are sometimes too affable or mild, like him who speaks to Jacob, in a ceiling of the Vatican; or too violent, like him who separates light from darkness, in the loggia of the same place. But though, to speak with things, he was chiefly made to walk with dignity on earth, he soared above it in the conception of Christ on Tabor, and still more in the frown of the angelic countenance that withers the strength of Heliodorus.

"Of ideal female beauty, though he himself, in his letter to count Castiglione, tells us, that from its scarcity in life, he made attempts to reach it by an idea formed in his own mind, he certainly wanted that standard which guided him in character: his goddesses and mythologic females are no more than aggravations of the generic forms of Michael Angelo. When the drama inspired Raphael, his women became definitions of grace and pathos at once. Such is the exquisite line and turn of the half-averted kneeling female with two children, among the spectators of the punishment inflicted on Heliodorus; her attitude, the turn of her neck, supplies all face, and intimates more than he ever expressed by features."

Raphael, in *Geography*, a fertile and healthy district, being the westernmost in the Spanish part of St. Domingo. Its northern boundary is found in part of the French parish Gonsalves. The air round St. Raphael in very salubrious, but the town, which is in a hollow, is very hot; 10 leagues S. of Cape François.

Raphael, *St.*, *Cape*, lies at the S. end of St. Domingo, and is the S.E. limit of Samana bay.

RAPHANEA, in *Ancient Geography*, a city of Syria, between which and Arca, or Arac, a city of Judea belonging to the kingdom of Agrippa, the Sabbatical river flowed. Joseph. de Bell. l. vii. c. 24. Raphanea is, perhaps, the Arpal of scripture. 2 Kings, xviii. 34. xix. 13. If. x. 9. xxxvi. 19. xxxvii. 13. Jerem. xlix. 23.

RAPHANIA, in *Medicine*, an appellation given by Linnæus, and afterwards by Dr. Cullen and others, to a severe and fatal disease, which has been described as epidemic in Sweden at particular seasons, and imputed to the use of the *raphanus* raphanistrum of Linnæus as food.

It is not necessary to describe the symptoms of this disease in this place; since it is, in fact, the same malady which has been epidemic in various other countries of Europe, during seasons of scarcity; and has been attributed to various other species of unwholesome grain, but more especially to diseased rye, affected with the *ergot*, to the *lolium temulentum*, to charlock, &c. We have already entered at great length into the history of the symptoms and imputed causes of this formidable malady, which has been more commonly denominated *ergot*, from one of its supposed sources. (See Ergot.) We have endeavoured also to shew, that it constituted one of the varieties of epidemic disease, described by the ancients, under the appellation of Ignis *Sacer* (which see); and that, instead of being properly imputed to the admixture

admixture of any of these substances with the corn used for food, the disease is to be ascribed with more probability to the insufficient nourishment afforded by damaged corn, or the actual dearth of it, which usually occur together; especially as these diseases have commonly been epidemic in years of scarcity, which is the only circumstance that can be observed in common to all the epidemics described by authors. In addition to the works on ergot and ignis facer, formerly referred to, consult, for an account of raphania, Pulteney's View of the Writings of Linnæus; Rothman's Paper, in the Amœnitates Academ. of Sweden; Tissot. Epistolæ Med. Pract.

RAPHANIS, in *Botany*, the name by which the Attics, among the Greeks, called the radish; for the word *raphanos*, or *raphanus*, with them, does not express the radish, but the cabbage. The Greek of all other places concurred in calling the radish *raphanos*, and the cabbage *crambe*; and it is owing to this that we have many authors who confound together these two plants, though so very unlike one another in appearance and use. It is generally to be understood, that wherever Theophrastus mentions the word *raphanos*, he means by it the cabbage; and the same being observed, in regard to all the other Attic writers, the whole danger of confusion and error will cease.

RAPHANISTRUM, a name given by botanists to the wild radish, and designed to express its affinity to the cultivated one. See RAPHANUS.

RAPHANUS, an ancient name for the Radish, a species of this genus, derived from ῥα, *easily*, or *quickly*, and φαινομαι, *to appear*, or *come forth*, in allusion to the quickness of its vegetation.—Linn. Gen. 343. Schreb. 445. Willd. Sp. Pl. v. 3. 560. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 4. 129. Sm. Fl. Brit. 723. Prodr. Fl. Græc. Sibth. v. 2. 32. Juss. 238. Tourn. t. 114. Lamarck Illustr. t. 566. Gærtn. t. 143. (Raphanistrum; Tourn. t. 115. Gærtn. t. 143.)—Class and order, *Tetradynamia Siliquosa*. Nat. Ord. *Siliquosæ*, Linn. *Cruciferæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, erect, of four oblong, parallel, converging, deciduous leaves, gibbous at the base. *Cor.* cruciform, of four inversely heart-shaped, spreading petals, whose claws are rather longer than the calyx. Nectariferous glands four; one at each side, between the shorter stamen and the pistil; and one at each of the opposite sides between the longer stamens and the calyx. *Stam.* Filaments six, awl-shaped, erect; two opposite ones the length of the calyx; the rest as long as the claws of the corolla; anthers simple. *Pist.* Germen oblong, tumid, tapering, the length of the stamens; style scarcely any; stigma capitate, undivided. *Peric.* Pod oblong, pointed, swelling here and there, imperfectly jointed, without valves. *Seeds* roundish, smooth.

Obs. *Raphanus* of Tournefort and Gærtner has a spongy fruit, of two cells, not bursting. *Raphanistrum* of the same authors has a jointed fruit, separating at the joints.

Ess. Ch. Calyx closed. Nectariferous glands four. Pod swelling out into knobs, imperfectly jointed, without valves.

1. R. *sativus*. Common Garden Radish. Linn. Sp. Pl. 935. Willd. n. 1. Ait. n. 1. Ger. Em. 237. (R. primus; Matth. Valgr. v. 1. 399.)—Leaves lyrate. Pod roundish, tumid, of two cells.—The native country of this well-known plant, so commonly cultivated in gardens, is not ascertained. Linnæus mentions China; but his authority does not appear. Its chief value with us consists in the root, esteemed for its grateful pungency, mixed with a watery coolness. The shape of this part varies, from its natural spindle-like figure, to a globular one, and the colour of the skin from purple to white. We doubt much whether the *R. niger* of Bauhin, commonly called the Black Spanish Radish, which Linnæus marks β, can belong to this species. Its firmness, and black rugged coat, seem to indicate more than a mere variety. We have not examined the herbage. The *leaves* of *R. sativus* are lyrate, notched, and rough, especially the lower ones; the upper part of the herb is smoother, and somewhat glaucous. *Stem* branched. *Flowers* purple, corymbose; soon racemose. *Pods* erect, tumid, juicy, pale, glaucous, smooth, slightly striated, various in length and thickness, tipped with an awl-shaped beak. Linnæus cultivated at Upsal a Chinese variety, or possibly species, whose *leaves* are broader and smoother, and its whole habit more lax. The oil of the *seeds* is said to be used in China.

2. R. *caudatus*. Long-tailed Radish. Linn. Mant. 95. Linn. fil. Plant. Rar. fasc. 1. 19. t. 10. Willd. n. 2.—Leaves lyrate. Pod compressed, of one cell, wavy, longer than the whole plant.—Native of Java, where, according to the younger Linnæus, it is cultivated, and the pickled pods known by the name of Mougri. In Sweden, as well as in England, it may be treated as a hardy annual, like the foregoing; but the present species does not occur in Hort. Kew., though Mr. Lambert met with it last year in a country garden in Wiltshire. The appearance of the plant, weighed down to the ground by its immoderately long serpentine *pods*, is altogether extraordinary. The lobes and indentations of the *leaves* are sharper than in the Common Radish, but the *flowers* and other parts, except the *pods*, scarcely betray any difference.

3. R. *Raphanistrum*. Wild Radish, or Jointed Charlock. Linn. Sp. Pl. 935. Willd. n. 3 Ait. n. 2. Fl. Brit. n. 1, α, β. Eng. Bot. t. 856. Curt. Lond. fasc. 4. t. 46. Mart. Rust. t. 71. Fl. Dan. t. 678. (R. sylvestris; Ger. Em. 240.)—Leaves simply lyrate. Pod round, jointed, even, of one cell.—A troublesome weed in the cornfields of Europe, flowering in June and July. The *root* is annual, small, and tapering. *Stem* branched, round, glaucous, rough with prominent bristles, leafy. *Leaves* rough, lyrate; the upper ones oblong, simply toothed. *Flowers* numerous, lemon-coloured, changing to white in decay, with purple veins; sometimes the petals are white from the first. *Pods* cylindrical, or rather tapering, beaked, knobbed or imperfectly jointed, smooth, becoming striated as they ripen. In a young state they are divided into two cells, but the partition is obliterated, and confounded in one spungy mass, as they ripen. Linnæus was of opinion that the seeds of this plant caused a convulsive disease, thence termed by him *Raphania*, of which he has given a history in Amœn. Acad. v. 6. 430, with a figure, and elaborate synonymy of the plant. We have never met with any circumstance to corroborate this hypothesis.

4. R. *maritimus*. Sea Radish. Sm. Engl. Bot. t. 1643. Ait. n. 3. (R. Raphanistrum γ; Fl. Brit. 723. R. maritimus, flore luteo, siliquis articulatis, secundum longitudinem eminenter striatis; Raii Syn. 296. Raphanistrum siliquâ articulatâ striatâ maximâ; Moris. v. 2. 266. Raii Hist. v. 1. 806.)—Radical leaves interruptedly lyrate. Pod round, jointed, smooth, deeply furrowed, of one cell.—Found on the sea-shore in various parts of Britain, flowering in May. The late Rev. Dr. Walker, and Mr. J. Mackay, observed it on the western coasts of Scotland; and the former cultivated this plant, till his death, as an esculent root, preferable to horse radish; he also found that cattle were very fond of the leaves. Mr. Turner and Mr. W. Borrer gathered the same on rocks, near Beachy Head, Sussex. The *root* is large and succulent, lasting two or three

three years. *Stems* three or four feet high, round, roughest at the base. *Leaves* all rough, and rather sharply toothed; the radical ones interruptedly lyrate, which we have never observed in the last described species. *Flowers* of a deeper yellow, and less veiny. *Pods* strongly jointed, and very deeply furrowed longitudinally, destitute of hairs or other roughness. There can be no doubt of this being a distinct species from the former, though generally confounded therewith.

5. R. *sibiricus.* Siberian Radish. Linn. Sp. Pl. 935. Murray Comment. Gott. for 1775. 48. t. 11. (R. n. 28; Gmel. Sib. v. 3. 266.)—Leaves pinnatifid, somewhat toothed. Pod round, beaded, downy, of one cell.—Native of Siberia. The seeds were sent by Professor Pallas to the Goettingen garden, where the plant flowered in June. *Root* annual, long, and slender. *Stems* from three to six inches high; or more, as the seeds ripen, ascending, leafy, hairy, simple or branched. *Leaves* sometimes elegantly and neatly pinnatifid, almost pectinate, either in a simple or interrupted manner, roughish at the edge only, sometimes more dilated, with distant and broader lobes. *Flowers* large, yellow, sweet-scented in an evening, their *petals* strongly emarginate. *Pods* inflexed, copiously and neatly beaded in appearance, rather than distinctly jointed, downy, each with a sharp taper beak.

6. R. *tenellus.* Slender Purple Radish. Pallas Trav. v. 3. append. 741. t. L. f. 3. Willd. n. 5. Ehrh. Sel. n. 38. (Chorispermum tenellum; Brown in Ait. H. Kew. v. 4. 129.)—Leaves smooth, oblong, toothed; the lowermost pinnatifid. Pod awl-shaped, jointed, smooth, of two cells.—Native of deserts near the Caspian sea. A hardy annual in our gardens, flowering in June and July. *Root* long, simple, tapering, and slender. *Herb* smooth, scarcely branched, leafy. *Leaves* elliptic-oblong, toothed or pinnatifid, tapering down into longish footstalks. *Flowers* small, purple. Beak of the *pod* very long and slender. The ingenious Mr. Brown separates this from *Raphanus* chiefly, as it seems, because the cotyledons are flat, not folded.

7. R. *arcuatus.* Curve-podded Radish. Willd. n. 6.—"Leaves oblong-lanceolate, toothed. Pod awl-shaped, curved, two-celled, smooth."—Native country unknown. Willdenow cultivated the plant, which he describes as annual, with an erect branched *stem*, hardly a span high. *Leaves* stalked, oblong-lanceolate, very smooth, with broad shallow teeth. *Flowers* small, violet. *Pods* round, of two cells, jointed, curved, smooth, striated, with an awl-shaped beak. The figure of *Hesperis arenaria*, Desfont. Atlant. v. 2. t. 162, answers exactly to this plant, except the pods. *Willdenow.*

8. R. *lanceolatus.* Lanceolate Radish. Willd. n. 7.—"Leaves oblong-lanceolate, somewhat toothed at the apex. Pod tumid, smooth, two-celled, with a squarish beak."—Native of the West Indies. *Stem* a foot and half high, erect, zigzag, with short branches, smooth like every other part of the plant. *Leaves* stalked, oblong-lanceolate; the uppermost lanceolate, narrow, entire; the lower ones bluntly toothed at the extremity. *Flowers* of a middling size, yellow, in a terminal cluster, six inches long. *Pods* half an inch long, with a long, obtuse, obscurely quadrangular beak. *Willdenow.*

9. R. *pilosus.* Hairy-stalked Radish. Willd. n. 8.—"Leaves lanceolate-linear, pinnatifid at the base. Stem rough with bristly hairs. Pod round, smooth, jointed, of one cell."—Native of Guinea. *Stem* two feet, or perhaps more, in height, branched, divaricated. *Leaves* three inches long, narrow, smooth, pointed; pinnatifid at the base; toothed in the middle; entire at the extremity. *Cluster* axillary from every leaf, of few flowers. *Pods* an inch and half long, round, jointed, of one cell, with a short beak, all of them turned one way. *Willdenow.*

R. *erucoides*, Linn. Suppl. 299, is rightly referred by Mr. Brown, in Ait. H. Kew. v. 4. 126, to *Sinapis Allionii*, Jacq. Hort. Vind. v. 2. t. 168. Willd. Sp. Pl. v. 3. 557. (See Sinapis.) Willdenow cites it, doubtingly, under *Brassica Cheiranthus* of Villars, a very different plant; for which he also by mistake quotes Barrel. Ic. t. 1016, a synonym properly belonging to *Sisymbrium Barrelieri.*

Linnæus once referred *Bunias Cakile* to this genus of *Raphanus.*

Raphanus, in *Gardening*, contains plants of the herbaceous, annual, esculent kind, of which the species cultivated is, the common garden radish (R. sativus).

There are several varieties; some of which have the appearance of distinct species, from their shape, size, and colour of the roots; as the *long-rooted*, which is that commonly cultivated in kitchen-gardens for its roots. Of this there are several subordinate variations: as the small-topped, and the long-topped striped radish. The small-topped is most commonly preferred by the gardeners near London, as they require much less room than those with large tops; for as forward radishes are what produce the greatest profit to the gardener, and these are commonly sown upon borders near hedges, walls, or pales, the large-topped sorts would be apt to grow mostly at top, and not swell so much in the root as the other, especially if the plants should be left pretty close.

The *small round-rooted*, which is not very common here, but in many parts of Italy it is the only one cultivated; the roots of this are very white, round, small, and very sweet. It is now frequently brought to the London markets in the spring, generally in bunches, and is sometimes mistaken there for young turnips: when eaten young, it is crisp, mild, and pleasant.

The large *turnip-rooted*, or *white Spanish*, which has a moderately large, spheroidal white root, and is esteemed chiefly for eating in autumn and the early part of winter. Both these sorts are commonly called indiscriminately turnip radishes.

The *black turnip-rooted Spanish*, which has a root like the preceding, white within, but with a black skin; and is greatly esteemed by many for autumn and winter eating.

There are likewise some other subvarieties of the radish noticed by gardeners, as the common *salmon radish*, and the short-topped early *salmon radish*. Also the small red *turnip-rooted radish*. Gardeners, too, often call the long-topped sort the *sallad radish*.

Method of Culture.—These are raised from seed by different sowings from the end of October till April, or the following month. They should have a light fine mould, and the more early sowings be made on borders, under warm walls, or other similar places, and in frames covered by glasses. The common spindle-rooted, short-topped sorts are mostly made use of in these early sowings, the seed being sown broadcast over the beds after they have been prepared by digging over and raking the surface even, being covered in with a slight raking. Some sow carrots with the early crops of radishes.

It is usual to protect the early sown crops in the borders, during frosty nights and bad weather, by mats or dry wheat straw, which should be carefully removed every mild day. By this means they are brought more forward, as well as form better roots. When mats are used, and supported by pegs or hoops, they are readily applied and removed.

 A second

A ſecond more general ſowing ſhould be made in January or February. When the crops have got their rough leaf, they ſhould be thinned out, where they are too thick, to the diſtance of two inches, as there will be conſtantly more thinning by the daily drawing of the young radiſhes.

When the weather is dry in March, or the following month, the crops ſhould be occaſionally well watered, which not only forwards the growth of the crops, but increaſes the ſize of the roots, and renders them more mild and criſp in eating.

And the ſowings ſhould be continued at the diſtance of a fortnight, till the latter end of March, when they ſhould be performed every ten days, until the end of April or beginning of the following month. In ſowing theſe later crops, it is the practice of ſome gardeners to ſow coſs-lettuces and ſpinach with them, in order to have the two crops coming forward at the ſame time, but the practice is not to be much recommended, where there is ſufficient room.

But in ſowing the main general crops in the open quarters, the market-gardeners generally put them in on the ſame ground where they plant out their main crops of cauliflowers and cabbages, mixing ſpinach with the radiſh-ſeed as above, ſowing the ſeeds firſt, and raking them in, then planting the cauliflowers or cabbages; the radiſhes and ſpinach come in for uſe before the other plants begin to ſpread much, and as ſoon as thoſe ſmall crops are all cleared off for uſe, hoe the ground all over to kill weeds and looſen the ſoil, drawing earth about the ſtems of the cauliflowers and cabbages.

The turnip radiſh ſhould not be ſown till the beginning of March, the plants being allowed a greater diſtance than for the common ſpindle-rooted ſort. The ſeeds of this ſort are apt to degenerate, unleſs they are ſet at a diſtance from that kind.

The white and black Spaniſh radiſhes are uſually ſown about the middle of July, or a little earlier, and are fit for the table by the end of Auguſt, or the beginning of September, continuing good till froſt ſpoils them. Theſe ſhould be thinned to a greater diſtance than the common ſort, as their roots grow as large as turnips, and ſhould not be left nearer than ſix inches.

To have theſe roots in winter, they ſhould be drawn before hard froſt comes on, and laid in dry ſand, as practiſed for carrots, carefully guarding them from wet and froſt; as in this way they may be kept till the ſpring.

In regard to the culture of the general crops, they require very little, except occaſional thinning where they are too thick, when the plants are come into the rough leaf, either by hoeing or drawing them out by hand: though for large quantities, ſmall hoeing is the moſt expeditious mode of thinning, as well as moſt beneficial to the crop by looſening the ground; in either method thinning the plants to about two or three inches diſtance, clearing out the weakeſt, and leaving the ſtrongeſt to form the crop.

In order to ſave the ſeed, about the beginning of May ſome ground ſhould be prepared by digging and levelling; then drawing ſome of the ſtraighteſt and beſt-coloured radiſhes, plant them in rows three feet diſtant, and two feet aſunder in the rows; obſerving, if the ſeaſon be dry, to water them until they have taken root: after which they will only require to have the weeds hoed down between them, until they are advanced ſo high as to overſpread the ground.

When the ſeed begins to ripen, it ſhould be carefully guarded againſt the birds. When it is ripe, the pods will turn brown: then it muſt be cut, and ſpread in the ſun to dry; after which it muſt be thraſhed, and laid up for uſe where no mice can come at it.

Method of Culture on Hot-beds.—This method is ſometimes practiſed in order to have the roots early, as in January or the following month. They ſhould have eighteen inches depth of dung to bring them up, and ſix or ſeven inches depth of light rich mould. The ſeed ſhould be ſown moderately thick, covering it in half an inch thick, and putting on the lights: the plants uſually come up in a week or leſs; and when they appear, the lights ſhould be lifted or taken off occaſionally, according to the weather; and in a fortnight thin the plants to the diſtance of an inch and half or two inches, when in ſix weeks they will be fit to draw. Where there are no frames to ſpare, the beds may be covered with mats over hoops, and the ſides ſecured by boards and ſtraw-bands. And when in want of dung, if the beds be covered with frames, and the lights put on at night and in bad weather, the plants may be raiſed for uſe a fortnight ſooner than in the open borders.

RAPHE, in *Anatomy*, a Greek term, ſignifying future, applied to ſome parts of the body; thus we have the raphe corporis calloſi in the brain (ſee BRAIN); raphe perinei, ſcroti, and penis. See GENERATION.

RAPHELENGIUS, ſometimes called RAULENGHIEN, FRANCIS, in *Biography*, a learned orientaliſt, was born in 1539 at Lanoy, near Lille, in Flanders. He had the early part of his education at Ghent, but on the death of his father, it was intended to bring him up to trade, and for that purpoſe he was ſent to Nuremberg. Here he had acceſs to books, reſumed his ſtudies, and took an opportunity of going to Paris, where he made great progreſs in the Greek and Hebrew languages. The civil wars obliged him to quit France, and he came to England, where, for ſome time, he taught Greek in the univerſity of Cambridge. After this he returned to the Low Countries, and became a corrector of the preſs to the celebrated printer Plantin, whoſe daughter he married in the year 1565. He made himſelf very ſerviceable in the printing office, eſpecially with reſpect to the famous Antwerp Polyglot Bible, printed in 1571 by order of Philip II. of Spain. When Plantin removed to Leyden, he left his buſineſs at Antwerp under the care of Raphelengius, and upon his return the latter went to Leyden. The curators of the univerſity of that place conferred upon him the profeſſorſhip of Hebrew, to which was added that of Arabic. He died in 1597. His literary works were "Variæ Lectiones et Emendationes in Chaldaicam Bibliorum Paraphraſin;" "Grammatica Hebræa;" "Dictionarium Chaldaicum;" and "Lexicon Arabicum." He had a ſon of the ſame name, a man of talents and learning, who publiſhed "Notes upon Seneca's Tragedies," and "Eulogies, in Verſe, of fifty Perſons, with their Portraits."

RAPHIA, in *Botany*, from ῥαφὶς, *a point* or *needle*, ſo that it ought to have been *Rhaphia*, a genus of Palms, with a very pointed fruit, eſtabliſhed by Paliſot Beauvois, in his *Flore d'Oware et de Benin*, faſc. 8.

RAPHIA, in *Ancient Geography*, a famous city in the Mediterranean, between Gaza and Rhinocorura. This was perhaps Gath of the Rephiam. Raphia is famous for the victory of Philopator, king of Egypt, over Antiochus the Great, king of Syria. (3 Maccab. i. 11.) Joſephus ſays (Antiq. l. xiii. c. 21.) that Raphia was taken by Alexander Jannæus, and after being ruined in the wars, was repaired by Gabinius. There are extant ſome ancient medals ſtruck at Raphia, and ſome biſhops of this city are found in the liſts of the eaſtern councils.

RAPHIDIA, in *Entomology*, a genus of inſects of the order Neuroptera, of which there are two ſpecies. The generic character is as follows; Mouth with a curved toothed

toothed horny mandible; the thorax is long and cylindrical; it has three ſtemmata; the wings are deflected; the antennæ filiform, as long as the thorax, the anterior part is elongated and cylindrical: it has four feelers, which are ſhort and filiform; the tail of the female is terminated by a large recurved briſtle.

* Ophiosus. The wings of this ſpecies are immaculate. It inhabits divers parts of Europe in woods, and preys on other inſects.

* Notata. Wings with a brown marginal ſpot. It inhabits England, and has been thought to be only a variety of the former. The body is black; the head is alſo black with a teſtaceous ſpot; the legs are teſtaceous; the appendage of the female is as long as the body.

RAPHOE, in *Geography*, a biſhopric of Ireland, in the eccleſiaſtical province of Armagh, which comprifes the greater part of the county of Donegal, being 44 miles in length from north to ſouth, and 32 in breadth, comprehending 515,250 Iriſh acres. It contains 31 pariſhes, in which are 32 churches. The dean, archdeacon, and four prebendaries, compoſe the chapter. The patronage of 6 pariſhes, which form the corps of the deanery, is in the crown; of 15 others, in the biſhop; of 7, in the univerſity of Dublin; and of 3, in lay hands. It is not preciſely known at what time this ſee was founded, but it muſt have been as early as the ninth century, ſince biſhops of Raphoe are mentioned at that time. Beaufort.

Raphoe, a ſmall poſt-town of Ireland, the pariſh church of which ſerves as a cathedral, where is the biſhop's palace. It is 107 miles N. by W. from Dublin.

Raphoe, a townſhip in Lancaſter county, Pennſylvania, containing 2814 inhabitants.

RAPHON, in *Ancient Geography*, a city beyond Jordan, on a brook, not far from Carnaim.

RAPICIO, Grovita, in *Biography*, an Italian man of letters, was born about the year 1480, at Chiari, in the territory of Breſcia. Devoting himſelf to the inſtruction of youth in literature, he firſt opened a ſchool at Bergamo, where he wrote a Latin treatiſe on the education of youth, which was afterwards printed at Venice. He next taught at Vicenza, and various other cities in Italy, and was for many years employed at Venice in inſtructing, in polite literature, the youths deſtined for public life, and among others, the care and inſtruction of the ſons of cardinal Bembo were devolved upon him. Cardinal Pole, in one of his letters, ſpeaks of Rapicio in high terms of commendation. He died at Venice in 1553. He was author of various harangues, poems, and epiſtles, but his chief work was entitled "De numero Oratorio," in five books, printed at Venice in 1544. "In this," ſays his biographer, "he minutely inveſtigates the principles of writing the Latin language with ſweetneſs and harmony, and he replies to Melancthon's aſſertion, that rules of this kind are rendered uſeleſs by our ignorance of the ancient pronunciation. Moreri."

RAPID Ann, in *Geography*, a ſmall river of Virginia, which runs into the Rappahanock, about 10 miles above Fredericksburg.

Rapid *Plat*, *Iſle au*, a ſmall iſland of Upper Canada, in the river St. Lawrence, in front of the townſhip of Matilda, containing about 200 acres.

Rapid *River*, a river which runs into Hudſon's Bay.

RAPIDES, a county of the territory of Orleans, containing three pariſhes, *viz*. Rapides, including 2200 inhabitants, Catahula 1164, and Avoyelles 1209.

RAPIER, properly denotes a long, ordinary, old-faſhioned cutting ſword, ſuch as thoſe worn by the common ſoldiers.

The word is formed from the French *rapiere*, of the Greek ῥαπίζειν, *cædere*, *to ſmite*, or *ſtrike*.

In this ſenſe do the French ſtill uſe the term; ſo that among them, to *take the rapier*, is to enter in the army.

Rapier, in a modern ſenſe among us, uſually denotes a ſmall ſword, as contradiſtinguiſhed from a back-ſword, or cutting-ſword.

RAPILLO, in *Mineralogy*, the name given by the Italians to the ſand or powders (improperly called aſhes) thrown from the craters of volcanoes in immenſe quantities, towards the concluſion of an eruption. See Volcano, and Volcanic *Products*.

RAPIN, René, in *Biography*, a Jeſuit, was born at Tours in 1621. He entered the ſociety in 1639, and was a teacher of the belles lettres in it during nine years. He became eminent by ſeveral publications in the Latin and French, and obtained a high rank among the literary characters of his time. It is, however, as a Latin poet that he is chiefly known: his didactic poem on *Gardens*, entitled "Hortorum, lib. iv." firſt printed in 1665, has paſſed through many editions, and has been regarded as one of the moſt elegant and claſſical pieces of modern Latin verſe. By others it has been thought a work of art and ſtudy, rather than an effuſion of poetical feeling and fancy, and treats on gardening more as a branch of rural economy than as one of the fine arts. His other Latin poems are ſacred eclogues, heroic, elegiac, and lyric poems. Father Rapin died at Paris in 1687. He was no leſs eſteemed for his virtues and amiable qualities, than admired for his talents; and he poſſeſſed all that poliſh and fitneſs for the ſociety of the great world, which have diſtinguiſhed this order from other religious communities. His works were collected and publiſhed, in 3 vols. 12mo. 1681. There is a fine edition of his "Hortorum," publiſhed by Brotier at Paris, in 1780. Rapin was great as a critic, in which line he is known by his "Reflexions ſur l'Eloquence, ſur la Poeſie, ſur l'Hiſtoire, et ſur la Philoſophie;" and alſo by his "Comparaiſons de Virgile et d'Homere," printed in 2 vols. 4to. Bayle. Moreri.

Rapin de Thoyras, Paul, well known as the hiſtorian of England, was born at Caſtres, in Languedoc, in 1661. He was deſcended from a noble family of Savoy, which came into France in the reign of Francis I. for the ſake of profeſſing the reformed religion. The ſubject of this article, after having received his education, went to his father, who was an advocate in the chamber of the edict at Nantes, for the purpoſe of ſtudying the law. He was in due time admitted an advocate, but the chamber being ſuppreſſed in the ſame year, he went with his father to Toulouſe. On the revocation of the edict of Nantes, in 1685, he withdrew to England, after which he went to Holland, and entered into a company of French cadets at Utrecht. In 1689 he followed the prince of Orange into England, and obtained an enſigncy in lord Kingſton's regiment, which went to Ireland. He was engaged in ſeveral battles, particularly at the ſieges of Carrickfergus and Limerick, and at the battle of the Boyne, and ſo much diſtinguiſhed himſelf, that he obtained a captain's commiſſion. In 1693 he was nominated governor to the ſon of the earl of Portland, reſigned his commiſſion to a younger brother, and received from the crown, for his paſt ſervices, 100*l*. a-year. He travelled to different countries in company with his pupil, and reſided with him ſome time at the Hague. By the death of king William he was deprived of his penſion, and his engagement as private tutor being over, he retired, in 1707, to Weſel, in the duchy of of Cleves, where he devoted himfelf to the compofition of the hiftory of England. Here he died in 1725. He had, previoufly to his deceafe, publifhed in the year 1717, "Differtation fur les Whigs et Torys," which was tranflated into Englifh. His great work, "L'Hiftoire de Angleterre," was printed at the Hague in 9 vols. 4to. in the years 1725—6. It commences with the remoteft periods, and is brought down to the proclamation of William and Mary. It has been twice tranflated into our own language, and was, till the appearance of Hume, the moft popular hiftory of England, and Tindal's, or rather Birch's, and other continuations, have been adapted to it. It is written in a prolix and unanimated ftyle, but deferves the praife of much folid information. "His work," fays an excellent writer, "is of great authority, on account of his perpetual references to original documents, and the ample quotations which he frequently makes from important ftate papers, confer upon it additional value. He has fo copioufly detailed the matters which were agitated in the turbulent, but prudent parliament of Charles I., as to give a clear view of the rife of thofe parties which to this day divide the people of England. On the dark and horrible tranfactions of the reign of Charles II. he perhaps throws as much light as it is now poffible to obtain. In reference to that important period, he has ftated hiftorical difficulties with candour, and in difcuffing the merits and demerits of parties, he has weighed evidence with laudable fcrupulofity." (See Shepherd's Syftematic Education.) Rapin, during the collection of his materials, undertook the ufeful labour of making an "Abridgment of Rymer's Foedera," which was publifhed in Le Clerc's "Bibliotheque Choifie;" and tranflated into the Englifh by Mr. Stephen Whatley, and publifhed in 1733, under the title of "Acta Regia," and in folio.

RAPINE, Rapina, in *Law*. To take a thing in private, againft the owner's will, is properly *theft*; but to take it openly or by violence, is *rapine*, or *robbery*.

RAPINIA, in *Botany*, was fo called by Loureiro, Fl. Cochinch. 127, after father René Rapin, a French Jefuit, author of an elegant Latin poem on gardens, who died in 1687, aged 66. If this writer contributed nothing to improve the fcience of botany, he has, doubtlefs, helped to promote a love of plants, and may therefore claim a botanic wreath. A Jefuit of his day is doubly entitled to refpect, for having, like the good Loureiro, turned his mind to an elegant and improving purfuit, from thofe two corruptors of the human heart and underftanding, political intrigue, and fcholaftic divinity; in which moft of his brethren fought their temporal, and oftenfibly their eternal, good. The *Rapinia* of Loureiro however, proved, on the examination of his fpecimens by the late Mr. Dryander, to be the Sphenoclea of other authors; and this laft-mentioned name is now generally adopted. See that article.

RAPINO, in *Geography*, a town of Naples, in Abruzzo Citra; nine miles S. of Civita di Chieti.

RAPISTRUM, in *Botany*, originally the wild turnip, fo called from its affinity to *Rapa*, the cultivated one. Tournefort, however, ufes the word generically, for fome fpecies referred by other botanifts to *Myagrum*. In this he is followed, as far as concerns *M. paniculatum*, by Gærtner, and by the writer of the prefent article, in the Prodr. Fl. Græc.—Tourn. t. 99. Gærtn. v. 1. 285. t. 141. Sm. Prodr. Fl. Græc. Sibth. v. 2. 1. Brown in Ait. Hort. Kew. v. 4. 74.—Clafs and order, *Tetradynamia Siliculofa*. Nat. Ord. *Siliquofæ*, Linn. *Cruciferæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of four oblong, fpreading, deciduous leaves, gibbous at the bafe. *Cor.* cruciform, of four obovate, entire, fpreading petals, whofe claws are fhorter than the calyx. *Stam.* Filaments fix, about the length of the calyx, the four oppofite ones rather the longeft; anthers fimple. *Pift.* Germen oblong; ftyle awl-fhaped, the length of the calyx; ftigma obtufe. *Peric.* Pouch lenticular, pointed, corrugated, of two cells, and two cohering, not fpontaneoufly feparating, coriaceous valves; partition membranous. *Seeds* roundifh, folitary in each cell; cotyledons flat.

Eff. Ch. Calyx fpreading. Pouch of two cells, and two convex valves, not burfting.

1. R. *paniculatum*. Panicled Rapiftrum. Ait. n. 2. (R. arvenfe, folio auriculato acuto; Tourn. Inft. 211. Myagrum paniculatum; Linn. Sp. Pl. 894. Willd. Sp. Pl. v. 3. 409. Fl. Dan. t. 204. Myagro fimilis, filiquâ rotundâ; Bauh. Prodr. 52.)—Native of cultivated fields in various parts of Europe, from Sweden to Greece, but not, as yet, obferved in Britain. *Root* annual, tapering. *Stem* about two feet high, erect, round, roughifh, leafy, branched. *Leaves* oblong, acute, undivided, rough, fomewhat toothed, clafping the ftem with their arrow-fhaped bafe. *Flowers* fmall, yellow, in numerous clufters, which become greatly elongated when in fruit. *Pouch* fcarcely bigger than muftard-feed, a little abrupt, finely reticulated. One of the *feeds* is often, but not always, abortive. Mr. Brown refers to this genus the *Bunias ægyptiaca* of Linnæus, which agrees with our *R. paniculatum* in having flat, not fpiral, cotyledons, but has otherwife the characters of *Bunias*.

Rapistrum is alfo a fpecies of the *fea-cabbage*, or *crambe*.

RAPOLLA, in *Geography*, a town of Naples, in Bafilicata, the fee of a bifhop, united to Melfi; fix miles W. of Venofa. N. lat. 40° 58′. E. long. 15° 44′.

RAPORE, a town of Naples, in Principato Ultra; 9 miles E. of Conza.

RAPOSO, a town of South America, in the country of Popayan.—Alfo, a river of Popayan, which runs into the Pacific ocean, N. lat. 3° 48′.—Alfo, a fmall ifland in the Pacific ocean, near the coaft of Popayan. N. lat. 4°.

RAPPAHANOCK, a large navigable river of Virginia, which rifes in the Blue Ridge, and runs about 130 miles from N.W. to S.E., and ente[illegible] Chefapeak bay, between Windmill and Stingr[illegible]. It waters, in its courfe, the towns of Falmo[illegible]ericksburg, Port-Royal, Leeds, Tappahannock, and Urbanne.

RAPPE, in *Commerce*, a money of account in Switzerland, 10 of which are equal to a good batze; and 6 are equal to a plappert, fhilling, or efcalin. This is the cafe at Bafil, but at Lucern the plappert is only 3 rappen, and the Zurich efcalin = $3\frac{3}{4}$ rappen.

Rappe, in *Ichthyology*, a name given by fome to the *capito fluviatilis rapax* of Gefner, more frequently known by the name of the *corvus pifcis*.

RAPPERSCHWEIT, in *Geography*, a town of Switzerland, and capital of a diftrict to which it gives name; fituated on the N. fide of the lake of Zurich, over which there is a bridge, 1852 paces in length, built in 1358 by the counts of Habfburg. The town was founded in 1091, and formerly had its own counts. In 1358 it was fold to the fons of Albert, archduke of Auftria. In 1464 it put itfelf under the cantons of Uri, Schweitz, Unterwalden, and Glarus, with a referve of its liberties; but the cantons gradually made themfelves mafters of it. At the peace of Arau in 1712, its liberties were reftored, though the country remains fubject to the fovereignty of Zurich and Berne; 15 miles S.E. of Zurich.

RAPPIN, a town of Anterior Pomerania; 7 miles N. of Bergen.

RAPPO RAPPO, a bay on the coaſt of Mowee, one of the Sandwich iſlands.

RAPPOLTSKIRCHEN, a town of Auſtria; five miles S. of Tuln.

RAPPORT, Fr. in *Muſic*, is ſometimes uſed for proportion, and ſometimes for relation, words which will be explained in their places.

RAPPS, in *Geography*, a town of Auſtria, on the river Taya; four miles S.W. of Droſendorf.

RAPSO, a town of Iſtria; 52 miles S.E. of Capo d'Iſtria.

RAPTEC, a river of Hindooſtan, which runs into the Dewah, five miles S.W. of Sellimpour.

RAPTU HÆREDIS, in *Law*, an ancient writ which lies for taking away an heir, holding in ſocage; of which there are two ſorts; one when the heir is married, the other when not. See RAVISHMENT.

RAPTURE, RAPTURA, an extaſy, or tranſport of mind. See EXTASY, ENTHUSIASM, RHAPSODY, &c.

RAPUNCULUS, in *Botany*, the Rampion, owes its name to a reſemblance in the root to a Rape, or oblong Turnip. This root, *Campanula Rapunculus* of Linnæus, is biennial, ſcarcely larger than a radiſh, which it reſembles alſo in ſhape, but the colour is white. Its flavour is ſweet and mild, notwithſtanding ſome degree of milkineſs in the juices, in which it accords with other, uſually bitter and acrid, ſpecies of its genus. The Rampion is now much leſs cultivated than formerly, and almoſt a ſtranger at our tables.

RAPUNTIUM, a name uſed by Tournefort and Moriſon for ſome plants referred to *Lobelia* by Linnæus. See LOBELIA.) Gærtner, having adopted Plumier's *Lobelia*, the Linnæan *Scævola*, reſtores *Rapuntium;* but ſuch a meaſure could now lead to inconvenience only.

RAPUTIA, ſo called by Aublet, becauſe the plant grows in the foreſts of *Orapu* in Guiana. Juſſieu and Lamarck have retained this curious name. Schreber has changed it for SCIURIS; ſee that article hereafter.

RARAKIT, in *Geography*, a town of the iſland of Ceram, at the foot of a mountain covered with trees, which ſerves as a harbour for pirates.

RARE, in *Phyſics*, denotes a body that is very porous, whoſe parts are at a great diſtance from one another, and which contains but little matter under a great deal of bulk.

In this ſenſe *rare* ſtands oppoſed to *denſe*.

The corpuſcular philoſophers, *viz.* the Epicureans, Gaſſendiſts, Newtonians, &c. aſſert that bodies are rarer ſome than others, in virtue of a greater quantity of vacuity included between their pores. The Carteſians hold, that a greater rarity only conſiſts in a greater quantity of materia ſubtilis included in the pores. Laſtly, the Peripatetics contend, that rarity is a new quality ſuperinduced upon a body without any dependence, either on vacuity, or ſubtile matter.

RARECOURT, in *Geography*, a town of France, in the department of the Meuſe; 10 miles S.W. of Verdun.

RAREE, a town of Hindooſtan, in Concan; 20 miles N.N.W. of Goa.—Alſo, a town of Hindooſtan, in Bahar; 11 miles N.N.W. of Durbungah.

RAREFACTION, RAREFACTIO, in *Phyſics*, the act by which a body is rendered *rare;* that is, is brought to poſſeſs more room, or appear under a larger bulk, without acceſſion of any new matter.

Rarefaction is oppoſed to *condenſation*.

Our more accurate writers reſtrain rarefaction to that expanſion of a maſs into a larger bulk, which is effected by means of heat. All expanſion from other cauſes they call *dilatation*.

The Carteſians deny any ſuch thing as abſolute rarefaction: extenſion, with them, conſtituting the eſſence of matter, they are obliged to hold all extenſion equally full.

Hence, they make rarefaction to be no other than an acceſſion of freſh, ſubtile, and inſenſible matter, which, entering the parts of the body, ſenſibly diſtends them. See this diſproved under VACUUM.

It is by rarefaction that gunpowder has its effect; and to the ſame principle alſo we owe our æolipiles, thermometers, &c.

The degree to which the air is rarefiable exceeds all imagination: Merſennus, long ago, by means of an intenſe heat, found that air might be rarefied ſo as to poſſeſs more than ſeventy times its former ſpace.

Mr. Boyle afterwards found, that air, by its own elaſticity, and without the help of any heat, would dilate itſelf ſo as to take up nine times its former ſpace; then 31 times; then 60; then 150: at length, by many degrees, he found it would reach to 8000 times, then 10,000, and finally to 13,679.

Such is the rarefaction of common air, from its own principle of elaſticicity, and without any previous condenſation; but if it be compreſſed, the ſame author found its greateſt ſpace when moſt rarefied, is to its leaſt when moſt condenſed, as 55,000 to 1.

Such an immenſe rarefaction, ſir Iſaac Newton ſhews, is inconceivable on any other principle than that of a repelling force inherent in the air, by which its particles mutually fly from one another.

This repelling force, he obſerves, is much more conſiderable in air than in other bodies, as being generated from the moſt fixt bodies, and that with much difficulty, and ſcarcely without fermentation; thoſe particles being always found to fly from each other with the moſt force, which, when in contact, cohere the moſt firmly. See AIR.

The members of the French Royal Academy have beſtowed much attention on the different rarefactions, or rather the different rarities of the air at different heights. M. Mariotte eſtabliſhed this as a principle, from experiments, that the different rarefactions, or condenſations, of the air, follow the proportion of the weights with which it is preſſed.

Hence, ſuppoſing the mercury in the level of the ſea ſuſpended to twenty-eight inches, which is the weight of the whole atmoſphere; and that ſixty feet height of air are equivalent to a line, or one-twelfth of an inch of mercury; ſo that the barometer, at the height of ſixty feet from the ſea, would fall a line; it is eaſy finding what height of air would be equal to a ſecond, or any other line of mercury: for as twenty-eight inches of mercury one-twelfth are to twenty-eight inches, ſo is the height of ſixty feet of air to a fourth term, which is the height of air correſponding to a ſecond line of mercury.

And after the ſame manner may the height of air correſponding to each line be found; which will make a geometrical progreſſion, the ſum of which will be the whole *height of the* ATMOSPHERE (which ſee); and, of conſequence, a certain part of that ſum will be the height of a mountain, at whoſe top the barometer ſhall have ſunk a certain quantity.

Meſſrs. Caſſini and Maraldi, upon meaſuring the heights of ſeveral mountains, found, that this progreſſion of M. Mariotte was defective; that it always gave the height of the mountains, and conſequently the rarefactions, leſs than they really were; and from ſome farther experiments, M. Amon-

M. Amontons found, that the principle will only hold in the mean rarefactions, not in the extremes. See BAROMETER.

RAREN, or RARON, in *Geography*, a town of the Valais, and capital of a tithing; 21 miles E. of Sion.

RARGIARA, a town of Hindooltan, in Bahar; 32 miles S.W. of Bahar.

RARITON, a river of America, in New Jersey, formed by two considerable streams, called the north and south branches; the one rises in Morris county and the other in the county of Hunterdon. This river passes by Brunswick and Amboy, and, uniting with the waters of the Arthur Kull sound, helps to form the fine harbour of Amboy. At Rariton hills, through which this river passes, is a small cascade, with a fall of water from fifteen to twenty feet, romantically situated between two rocks. Copper ore has been found upon the upper part of this river.

RARITON, a town of New Jersey, situated between the mouth of the N. branch of the above river and Boundbrook; 12 miles N.W. of Brunswick.

RARO, a town of Hungary; 8 miles E.S.E. of Altenburg.

RARONGHAKON, a large lake of Thibet. N. lat. 31° 4′. E. long 85° 52′.

RARUM, *Non-Spissum*, in the *Ancient Music*. See APYCNON.

RAS, in *Geography*, a town of Syria, anciently called "Conna," situated near the source of the Orontes; 24 miles N. of Balbec.

RAS *Abad*, or *Baba*, a cape on the coast of Arabia, in the Red sea; 10 miles S.S.W. of Jiddah.

RAS-*Acon-natter*. See CAXINES.

RAS *Adder*. See *Cape* BON.

RAS *Ahabaz*, a cape on the coast of Arabia, in the Red sea. N. lat. 18° 19′. E. long. 37° 48′.

RAS *Ain*, or *Ain Verdeh*, a town of Asiatic Turkey, in the province of Diarbekir; 80 miles S. of Diarbekir. N. lat. 36° 34′. E. long. 39° 48′.

RAS *el Amoushe*, a cape of Africa, on the coast of Algiers; 42 miles E. of cape Tennes. N. lat. 36° 41′. E. long. 2° 48′.

RAS *Assah*, a cape on the coast of Abyssinia, in the Red sea. N. lat. 13° 8′. E. long. 43° 10′.

RAS *el Camir* or *Kansir*, or cape of the wild boar, a town of Syria, in the pachalic of Aleppo, near a cape on the sea-coast; 16 miles W. of Alexandretta.

RAS *el Doar*, a cape on the coast of Nubia, in the Red sea. N. lat. 21° 21′. E. long. 36° 9′.

RAS *el Anf* or *Enf*, *i. e.* cape of the Rose, a cape on the coast of Egypt, in the Red sea; without tree or herb; in the front of the point are the remains of a large temple. N. lat. 23° 57′.

RAS *Fartach*. See FARTACH.

RAS *Fillam*, a cape on the E. coast of Arabia; 18 miles S.E. of cape Mozendum. N. lat. 29° 59′.

RAS *Ibrahim*, a cape of Arabia, in the Red sea; 6 miles S. Ghunfude.

RAS *Iggidid*, or *Ras el Jidid*, a cape of Nubia, in the Red sea; near which is a harbour, resembling a cauldron, and round as the arch of a circle; the entrance is formed by two points, N. and S. of each other, with 18 fathoms of water, and in the harbour 13. This port is subject to no inconvenience, except from the east. N. lat. 22° 15′. E. long. 36°.

RAS *al Mahbees*, a cape of Africa, on the coast of Tripoli. N. lat. 32° 18′. E. long. 11° 49′.

RAS *Mohammed*, a cape on the coast of Arabia, in the Red sea. N. lat. 27° 54′.

RAS *al Mar*, a town of Persia, in the province of Segestan; 200 miles S.W. of Zareng.

RAS *al Nashef*, a cape of Egypt, in the Red sea. N. lat. 23° 16′.

RAS *Rouzé*, a cape on the E. coast of Arabia. N. lat. 21° 55′.

RAS *Viré*, a cape on the coast of Arabia, forming the S. point of the gulf of Curia Muria. N. lat. 17° 25′.

RAS *Zafrane*, a cape on the coast of Egypt, in the Red sea; 32 miles S.S.E. of Suez. N. lat. 29° 14′.

RASA, a small island in the Indian sea, near the coast of Africa. S. lat. 17° 8′.

RASAIN, a town of Persia, in the province of Fars or Farsistan; 110 miles N.W. of Schiras or Shirauz.

RASAL, or RASAL-SEM, *Cape*, a cape of Africa, on the coast of Tripoli. N. lat. 32° 36′. E. long. 21° 10′.

RASALEMA, a river of Africa, which waters the city of Fez.

RASALGATA, CAPE, or *Ras Rouse*, a cape on the E. coast of Arabia. N. lat. 22° 25′. E. long. 58° 15′.

RASANT, or RAZANT *flank*, in *Fortification*. See FLANK.

The defence of the bastion is rasant.

RASANT *Fire*. See FIRE.

RASCA, in *Geography*, a river of Servia, which joins the Ibar; 16 miles N.E. of Jenibasar.

RASCETA, a word used by the Arabian physicians to express the wrist or ankle.

RASCH, in *Geography*, a town of Bavaria, in the territory of Nuremberg; two miles S.S.E. of Altorf.

RASCHNA, or RIZANA, a town of Servia; eight miles S. of Parakin.

RASCHOWITZ, a town of Bohemia, in the circle of Leitmeritz; four miles E. of Ausche.

RASCIA, a port of Servia, watered by the Rasca.

RASCINES, a town of Spain, in the province of Biscay; 21 miles S.E. of Santander.

RASE, RASARIUM, in our *Old Writers*, seems to have been a measure of corn now disused; toll shall be taken by the rase, and not by the heap or cantel.

RASE, in the *Manege*. *To rase*, or glance upon the ground, called in French *razer le tapis*, is to gallop near the ground, as our English horses do.

RASEB, AL, in *Geography*, a fortified pass in the mountains of Grand Bucharia; 60 miles N. of Vashgberd.

RASEBORG, a sea-port town of Sweden, in the gulf of Finland; 30 miles S.E. of Abo.

RASEC, a town of Persia, in the province of Segestan; 60 miles S.W. of Zareng.

RASGRAD, or RASGRAT. See HRASGRAD.

RASH, in *Clock-Work*. See RATCH.

RASH, in *Medicine*, an eruption or efflorescence upon the skin, thrown out in fevers, or surfeits.

RASHAUA, in *Geography*. See RASSAGU.

RASHED, a town of Nubia, in Sennaar; 15 miles N. of Giessim.

RASICULMO, CAPE, a cape on the N. coast of Sicily. N. lat. 38° 18′. E. long. 12° 49′.

RASIERE, or RAZIERE, in *Commerce*, a measure of corn in Dunkirk and Flanders. At Dunkirk, they have the sea rasiere, and the land rasiere; 8 of the former being = 9 of the latter; 54 sea rasieres or 60¾ land rasieres answer to 31 English quarters. Each sea rasiere contains 9884 inches, and each land rasiere contains 8786 inches; 17.40 of the former, and 19.57 of the latter, are equal (each) to 10 English

Engliſh quarters. At Dixmude 29.51 raſieres are equal to 10 Engliſh quarters, and each raſiere contains 5821 inches. At Gravelines 21.29 raſieres are equal to 10 Engliſh quarters, and each contains 8080 inches. At Nieuport 16.93 raſieres are equal to 10 Engliſh quarters, and each raſiere contains 10157 cubic inches. At Oſtend 16.02 raſieres are equal to 10 Engliſh quarters, and each of them contains 10733 inches. At St. Omer 21.77 raſieres = 10 Engliſh quarters, and each contains 7900 cubic inches. At Liſle or Lille, the raſiere is divided into 8 parts; of theſe there are two ſorts, one, uſed for wheat or rye, the other, called raſiere de Mars, for oats or beans; 38 of the former, and 40 of the latter, are reckoned for one laſt. The raſiere of wheat weighs about 128lbs., and 41 of theſe are equal to 19 ſetiers, Paris meaſure, or about $10\frac{1}{3}$ Engliſh quarters; 39.64 raſieres of Liſle are equal to 10 Engliſh quarters, and each contains 4339 cubic inches.

RASILIS ÆRUGO, in the *Materia Medica of the Ancients*, one of their kinds of verdigris. It was prepared in the following manner; they ſet ſome ſharp vinegar over the fire in a ſtrong earthen veſſel, and covered it with a braſs pot inverted, well cleaned, and without any vent-hole. And after ſome time the veſſels were to be ſeparated; and the verdigris, which was found concreted on the inſide of the braſs pot, was ſcraped off, and put up for uſe.

RASILITA, in *Geography*, a town of Italy, in Friuli; 26 miles S.S.E. of Friuli.

RASIN, a town of Hindooſtan, in Dowlatabad; 18 miles W.S.W. of Carmullah.

RASINTA, a town of Italy, in Friuli; 14 miles N. of Udina.

RASKOW, a town of Poland, in the palatinate of Braclaw; 54 miles S. of Braclaw.

RASMAN, an iſland in the Red ſea. N. lat. 13° 58′.

RASMEND, a mountain of Perſia, in the province of Irak; 60 miles N.E. of Nehavend.

RASNO, an iſland in the Adriatic. N. lat. 44° 6′. E. long. 15° 25′.

RASO, or Ell of Turin, in *Commerce*, is equal to $2\frac{2}{5}$ Genoeſe palmi, or $23\frac{1}{5}$ Engliſh inches; the foot 143.2 French lines, or $3\frac{4}{11}$ Engliſh inches; hence 180 Piedmonteſe raſi are equal to 119 Engliſh yards, and 33 Piedmonteſe feet = 35 Engliſh feet. At Cagliari, 166.7 raſi = 100 Engliſh yards, and each of them equal to 21.6 Engliſh inches. At Chamberry 158.5 raſi = 100 Engliſh yards, and each = 22.7 Engliſh inches. At Nice, 166.7 raſi = 100 Engliſh yards, and each = 21.6 Engliſh inches; 154.5 raſi of Turin = 100 Engliſh yards, and each = 23.3 Engliſh inches.

RASP, a coarſe ſort of file.

RASPACH, in *Geography*, a town of Auſtria; eight miles E. of Zwetl.

RASPATORIUM, (from *rado*, to ſcrape,) a ſurgical inſtrument with which the perioſteum was, by the old practitioners, ſcraped from the bones, and the bones themſelves ſometimes raſped.

RASPBERRY BUSH, in *Botany*. See RUBUS.

For the dietetic and medicinal uſe of raſpberries, ſee SUMMER *Fruits*.

RASPECON, in *Ichthyology*, a name given by ſome to the uranoſcope, or ſtar-gazer.

RASPENBURG, in *Geography*, a town of Germany, in the principality of Weimar, near which are ſome medicinal ſprings; 12 miles N. of Weimar. N. lat. 51° 13′. E. long. 11° 35′.

RASPHUYS, or *Raſp-houſe*, a celebrated work-houſe, or houſe of correction, at Amſterdam. See WORK-*houſe*.

RASPUGLY, in *Geography*, a town of Bengal; four miles S. of Calcutta.

RASSADES, a cluſter of ſmall iſlands, in the river St. Lawrence. N. lat. 48° 15′. W. long. 68° 48′.

RASSAGU, one of the Kurile or Kurilſkoy iſlands, lying 40 verſts from Mutova, and in extent about 30 verſts meaſured either way. It has lofty mountains and ſteep rocky ſhores, with very few ſandy bogs. On the mountains, here and there, is a good foreſt of birch, alders, and the nut-bearing pine; the vales and flats abound in herbs. On the land is no other animal beſides the fox, but the cliffs of the rock afford neſting-places for all kinds of ſea-birds; and the beavers and ſeals lie ſcattered on ſeveral parts of the ſtrand. Here are no ſtreams that yield fiſh. The Kurils on this iſland are not numerous, and ſome of them are baptized. N. lat. 48° 20′. E. long. 154° 14′.

RASSE CORONDE, in *Natural Hiſtory*, a name given by the Ceyloneſe to a peculiarly fine kind of cinnamon, which is the bark of a tree, growing no where but in that iſland. The name they give it ſignifies *ſharp* or *biting cinnamon.* This choice kind was formerly exported annually, in conſiderable quantity, by the Dutch Eaſt India company, who prohibited the mixing any other kind of cinnamon with it, under a very ſevere penalty. Phil. Tranſ. N° 409.

RASSOOLPOUR, in *Geography*, a town of Hindooſtan, in the circar of Nagore; 22 miles N.W. of Didwana.—Alſo, a town of Hindooſtan, in the circar of Gohud, on the Jumnah; 40 miles E. of Gohud.

RASSOVAT, or AXIOPOLI, a town of European Turkey, in Bulgaria; 24 miles N. of Driſtra. N. lat. 44° 25′. E. long. 27° 37′.

RASTADT, a town of the duchy of Baden, ſituated on a large plain on the river Merg; the town is new, and regularly built, and the principal ſtreet is broad and handſome; 16 miles S.W. of Durlach. N. lat. 48° 52′. E. long. 8° 15′.—Alſo, a town of Bavaria, in the biſhopric of Bamberg; five miles N.W. of Bamberg.—Alſo, a town of the duchy of Wurzburg; three miles S. of Melrichſtadt.

RASTAGARA, a town of Egypt; 90 miles E. of Cairo.

RASTEDE, a town of Germany, in the country of Oldenburg; 11 miles N. of Oldenburg.

RASTENBURG, a town of Pruſſia, in the province of Natangen, founded in 1329, and after having been deſtroyed by the Lithuanians in 1348, was rebuilt, together with its caſtle, and put into a better ſtate of defence; it is encloſed by a wall, and, in 1669, ſurrounded by a rampart. The burghers, moſt of whom are Lutherans, are about 200. The inhabitants derive their ſubſiſtence from a little commerce, brewing, agriculture, and mechanic trades; 46 miles S.E. of Königſberg. N. lat. 53° 58′. E. long. 21° 27′.

RASTICO HARBOUR, *Grand*, a bay in the gulf of St. Lawrence, on the N. coaſt of the iſland of St. John. N. lat. 46° 25′. W. long. 62° 50′.

RASTORFF, a town of Auſtria; ſeven miles E. of Ehrnſprunn.

RASTOWICA, a river of Poland, which runs into the Drieper, on the borders of Ruſſia.

RASURA, a word uſed by the pharmaceutic writers to expreſs the ſhavings of woods, or other hard ſubſtances, to make them readily yield their virtues by decoction. Phyſicians alſo uſe it to expreſs the corroſion of acrid humours.

RASURE *in a Deed*, in *Law*. See DEED.

RASZNA, in *Geography*, a town of Servia; 24 miles N. of Niſſa.

RAT, in *Zoology*. See MUS.

It has been obferved that this country was formerly infefted with two kinds of rats, the *houfe*-rat and the *water*-rat; but that it is believed that the latter, within this laft half century, has deftroyed the former. This is probably, however, only imaginary, fince it is well known that the houfe-rats are frequently brought, in great abundance, into the different fea-ports of the kingdom, in corn, and other veffels. It feems not improbable, but that thefe different varieties of rats may intercopulate, and by that means the latter become houfe-rats, as there is confiderable diverfity in the colours of the houfe-rats, fome approaching to nearly black, which is the natural colour of the water-rat, while the genuine houfe-rat is always of a darkifh or dapple brown. In their habits they have fome circumftances in which they agree, as in that of making burrows in the ground; but the water-rat is capable of living much in the water, and of feeding on fifh and other aquatic animals, while the houfe-rat moftly lives upon grain, and other produce of that kind. The water-rats are alfo faid, by Dr. Darwin, to eat the foliage as well as the feeds and fruits of vegetables, as he has feen a young rat of this kind devour a large leaf of the water-plantain (alifma plantago). They likewife, as well as the houfe-rats, are deftructive of young animals, fuch as ducklings, goflings, chickens, and rabbits. But the great mifchief which the water-rats produce, is in feeding on, and deftroying, the roots of a great variety of vegetables, in their innumerable burrows. The above writer remembers to have feen fome new-planted apple-trees taken out of the ground with nearly the whole of their fmaller roots eaten, and the larger ones peeled by them. With the houfe kind, they are, likewife, extremely deftructive of the food of poultry, and fwine, and of courfe are highly detrimental near waters. It is remarked by the above able writer, that as thefe animals, like the dog, are of a lafcivious nature, and, as fome materials have a ftrong fcent, refembling, perhaps, that of their venereal orgafm, they are liable to be attracted by fuch fmells, as dogs are, on the fame account, he fuppofes, inclined to roll themfelves in putrid carrion; and male cats to eat marum valerian, and cat-mint. It is of this principle that rat-catchers avail themfelves, and by indulging the propenfity, deceive them to their deftruction, by blending with their favourite foods different ftrong-fcented fubftances, fuch as the effential oil of rhodium, or mufk, with the poifonous powders of ftrychnos nux vomica, or of delphinium ftavifagria, or perhaps of arfenic.

The firft ftep taken by rat-catchers, in order to clear a houfe, &c. of thofe vermin, is to allure them all together, to one proper place, before they attempt to deftroy them; for there is fuch an inftinctive caution in thefe animals, accompanied with a furprifing fagacity in difcovering any caufe of danger, that if any of them be hurt, or purfued, in an unufual manner, the reft take the alarm, and become fo fhy and wary, that they elude all the devices and ftratagems of their purfuers for fome time after. The place where the rats are to be affembled, fhould be fome clofet, or fmall room, into which all the openings, but one or two, may be fecured; and this place fhould be, as near as may be, in the middle of the houfe, or buildings. It is the practice, therefore, to attempt to bring them all together in fome fuch place before any attempt be made to take them; and even then to avoid any violence, hurt, or fright to them, before the whole be in the power of the operator. In refpect to the means ufed to allure them to one place, they are various; one of thofe moft eafily and efficacioufly practifed is the trailing fome piece of their moft favourite food, which fhould be of the kind that has the ftrongeft fcent, fuch as toafted cheefe, or broiled red-herring, from the holes or entrances to their acceffes in every part of the houfe, or contiguous buildings, whence it is intended to allure them. At the extremities, and in different parts of the courfe of this trailed tract, fmall quantities of meal, or any other kind of their food, fhould be laid, to bring the greater number into the tracks, and to encourage them to purfue it to the centre place, where they are intended to be taken; at that place, where time admits of it, a more plentiful repaft is laid for them, and the trailing repeated for two or three nights. But befides this trailing, and way-baiting, fome of the moft expert of the rat-catchers have a fhorter, and, perhaps, more effectual method of bringing them together, which is, the calling them, by making fuch a kind of whiftling noife as refembles their own call, and by this means, with the affiftance of the way-baits, they call them out of their holes, and lead them to the repaft prepared for them at the place defigned for taking them. But this is much more difficult to be practifed than the art of trailing; for the learning the exact notes, or cries, of any kind of beafts or birds, fo as to deceive them, is a peculiar talent, not eafily attained to in other cafes.

And in practifing either of thefe methods great caution muft be ufed by the operator to fupprefs, and prevent, the fcent of his feet and body from being perceived; which is done by overpowering that fcent by others of a ftronger nature. In order to this the feet are to be covered with cloths rubbed over with affafœtida, or other ftrong fmelling fubftances; and even oil of rhodium is fometimes ufed for this purpofe, but fparingly, on account of its dearnefs, though it has a very alluring, as well as difguifing effect. If this caution of avoiding the fcent of the operator's feet, near the track, and in the place where the rats are propofed to be collected, be not properly obferved, it will very much obftruct the fuccefs of the attempt to take them; for they are very fhy of coming where the fcent of human feet lies very frefh, and intimates, to their fagacious inftinct, the prefence of human creatures, whom they naturally dread. To the above-mentioned means of alluring by trailing, way-baiting, and calling, is added another of very material efficacy, which is the ufe of oil of rhodium, which, like the marum fyriacum in the cafe of cats, has a very extraordinary fafcinating power on thefe animals. The oil is extremely dear, and therefore very fparingly ufed. It is exhaled in a fmall quantity in the place, and at the entrance of it, where the rats are intended to be taken, particularly at the time when they are to be laft brought together in order to their deftruction; and it is ufed alfo, by fmearing it on the furface of fome of the implements ufed in taking them, by the method before defcribed, and the effect it has in taking off their caution and dread, by the delight they appear to have in it, is very extraordinary.

It is ufual, likewife, for the operator to difguife his figure as well as fcent, which is done by putting on a fort of gown or cloak, of one colour, that hides the natural form, and makes him appear like a poft, or fuch inanimate thing; which habit muft likewife be fcented as above, to overpower the fmell of his perfon; and befides this he is to avoid all motion, till he has fecured his point of having all the rats in his power. When the rats are thus enticed and collected, where time is afforded, and the whole in any houfe or out-buildings are intended to be cleared away, they are fuffered to regale on what they moft like, which is ready prepared for them; and then to go away quietly for two or three nights; by which means thofe which are not allured the firft night are brought afterwards, either by their fellows, or the effects of the trailing, &c. and will not fail to come duly again, if they are not disturbed or molested. But many of the rat-catchers make shorter work, and content themselves with what can be brought together in one night or two; but this is never effectual, unless where the building is small and entire, and the rats but few in number.

With respect to the means of taking them when they are brought together, they are various. Some entice them into a very large bag, the mouth of which is sufficiently capacious to cover nearly the whole floor of the place where they are collected; which is done by smearing some vessel, placed in the middle of the bag, with oil of rhodium, and laying in the bag baits of proper food. This bag, which before laid flat on the ground, with the mouth spread open, is to be suddenly closed when the rats are all in it. Others drive or frighten them, by slight noises or motions, into a bag of a long form, the mouth of which, after all the rats are come in, is drawn up to the opening of the place by which they entered, all other ways of retreat being secured. Others, again, intoxicate or poison them, by mixing with the repast prepared for them the cocculus indicus, or the nux vomica. A receipt for this purpose has appeared, which directs four ounces of cocculus indicus, with twelve ounces of oatmeal, and two ounces of treacle or honey, to be made up into a moist paste with strong beer; but if the nux vomica be used, a much less proportion will serve than is here given of the cocculus. Any similar composition of these drugs, with that kind of food the rats are most fond of, and which has a strong flavour, to hide that of the drugs, will equally well answer the end. If, indeed, the cocculus indicus be well powdered, and infused in strong beer for some time, at least, half the quantity here directed will serve as well as the quantity before mentioned. When the rats appear to be thoroughly intoxicated with the cocculus, or sick with the nux vomica, they may be taken with the hand, and put into a bag or cage, the door of the place being first drawn to, lest those which have strength and sense remaining should escape. By these methods, when well conducted, a very considerable part of the rats in a farm, or other house, and the contiguous buildings, may be taken and destroyed. But various other methods have been practised.

In the Transactions of the Bath Agricultural Society, the following compositions are advised for destroying these mischievous creatures, and which are stated to have been attended with great success. First, to a quart of oatmeal, add six drops of oil of rhodium, one grain of musk, and two or three of the nuts of nux vomica finely powdered; make them into pellets, and put them into the rat-holes. This, it is said, was at first greedily eaten, and did great execution; but the wise animals, after a time, ceased to eat it. Secondly; this consisted of three parts of oatmeal and one of stave's-acre, mixed well into a paste with honey. Pieces of this paste were laid in their holes, and again did great execution. Thirdly; this is a method of destroying them by laying a large box down on its front side, with the lid supported open by a string over a pulley; and by trailing toasted cheese and a red-herring from their holes to this box, and placing oatmeal and other food in it, which they are for a few nights to be permitted to eat unmolested; and finally to watch them by moon-light, the inside of the box being painted white; and, when many of them are seen, to let down the lid; by which contrivance sixty of them are stated to have been taken at one time.

But though the usual ways of destroying rats are by traps and poison, Mr. Forsyth advises never to use arsenic, or corrosive sublimate, for that purpose, except under particular circumstances, as they are deadly poisons: nux vomica will, he thinks, generally answer the end as well, without the danger. He suggests it as a very good plan, to prevent accidents, to enclose the traps in cases, having holes in the ends of them large enough to admit rats, but small enough to exclude dogs, cats, &c. And that, as a bait for rat-traps, the following composition may be made use of with advantage. Take a pound of good flour, three ounces of treacle, and six drops of the oil of carraways: put them all in a dish; and rub them well together till they are properly mixed: then add a pound of crumb of bread. The traps baited with this mixture should be set as near their haunts as possible; but, for two or three days, so as not to fall or strike on the rats going in, but letting them have free liberty to go in and out at pleasure, as this makes them fearless. Some of the bait should also, he thinks, be laid at the rat-holes, and a little of it scattered quite up to the traps, and so on to the bridge of each trap, where a handful may be placed. It may also, he thinks, be proper to scent the traps with the following mixture, for the purpose of enticing the rats into them. Take twenty drops of the oil of rhodium, six or seven grains of musk, and half an ounce of oil of aniseed; put them in a small phial, and shake it well before using; then dip a piece of twisted paper or rag in the mixture, and rub each end of the trap with it, if a box trap, and put two or three drops on the bridge, leaving the paper or rag in the trap. Of whatever kind the trap is, it should be scented; but once in a twelvemonth will be sufficient. Then throw some chaff mixed with a little wheat about the bottom of the trap, in order to deceive the rats; for they are very sagacious, and will not enter a suspicious place. This will be necessary to be done only at the first time of setting the traps; for, after some rats have been caught and have watered and dunged in them, rats will enter boldly when they find others have been there before them: do not, therefore, wash or clean out the trap, as some people do before they set it again, but let the dung and urine remain in it. Keep the places where the traps are set as private as possible; and when they are set for catching, mix no bread with the bait, as the rats will, in that case be apt, to carry it away.

And it is useful, this writer remarks, when the holes are found quiet, and that no rats use them, to stop them up with the following composition. Take a pint of common tar, half an ounce of pearl-ashes, an ounce of oil of vitriol, and a good handful of common salt, mix them all well together in an old pan or pot. Take some pieces of paper, and lay some of the above mixture very thick on them; then stop the holes well up with them, and build up the mouth of the holes with brick or stone, and mortar; if this be properly done, rats will, he asserts, no more approach these while either smell or taste remains in the composition.

But with a view to destroy rats in places where traps cannot be set, it is recommended to take a quart of the above bait, then to rasp into it three nuts of nux vomica, and add a quarter of a pound of crumb of bread, if there was none before; mix them all well together, and lay it into the mouth of their holes, and in different places where they frequent; but first give them of the bait without nux vomica, for three or four succeeding nights; and when they find it agrees with them, they will eat that mixed with the nut with greediness.

However, as it is frequently found that rats are very troublesome in sewers and drains, in such cases arsenic may be used with success in the following manner. Take some dead rats, and having put some white arsenic, finely powdered, into an old pepper-box, shake a quantity of it

 on

on the fore-parts of the dead rats, and put them down the holes, or avenues, by the fides of the fewers at which they come in; this puts a ftop to the live ones coming any further: for when they perceive the arfenic, they will retire immediately; whereas, if they were put down without the arfenic, the live ones would eat them.

It is by means of arfenic, notwithftanding the above obfervations, that the moft certain method of deftroying thefe troublefome vermin, (provided they can be made to eat it,) takes place; which we have found to anfwer beft, when it is prepared by being finely levigated, and mixed up with very ftrong old cheefe and oatmeal.

In a note in the Agricultural Survey of Lancafhire, it is ftated, that it is greatly to be lamented that Mr. Heathcote's method of deftroying rats and mice is not generally known and practifed; if it were, there would be a total extirpation of thofe obnoxious and deftructive animals; for in one night he totally deftroys them (where he is employed), be they ever fo numerous, as can be well attefted by hundreds in the neighbourhood of Ormfkirk, who have employed him. And it is added, that the compofition he makes ufe of he puts in their holes and burrows, and from the fmall quantity he ufes, it is aftonifhing it fhould have fuch an effect: it will keep good two years. It is alfo ftated, that a farmer recommends, for the deftruction of rats, one ounce of pounded quick-lime to four ounces of tallow cake, to be beaten together and made into balls, and placed in their runs, which has cleared many buildings. But it has been proved by experience, is is faid, that an ounce of aerated barytes finely powdered, mixed with the tallow, in place of lime, is more effectual. And it has been remarked by the author of Phytologia, with the view of deftroying the water-rats, that they poffefs fome kind of ingenuity fimilar to the beaver in the conftruction of their houfes near the brinks of rivers and pools; which have two apertures, one above ground amongft the grafs, and the other beneath the furface of the water; and unlefs they can hide their upper opening amid weeds, or grafs, they forfake the fituation. Thus, if a rim, three or four feet in breadth, round a fifh-pond be kept fo low as to rife only two, three, or four inches above the level of the water; and if this be kept clean from high grafs or weeds, the rats will defert the pond.

But after all, it is probable that this highly deftructive animal, and great peft to the farmer, might be moft readily exterminated by parifhes uniting for the purpofe, and raifing certain fums of money to be applied in this way, under the direction of a proper perfon who is fully acquainted with the bufinefs.

In many grain and other diftricts in the kingdom thefe animals prevail very much, efpecially the grey kind, particularly in all thofe where there are no regular raifed ftaddles or ftands for the grain ftacks to reft upon, which is the cafe in a great number. The mifchief, injury, and deftruction of grain which is produced in this way, is fcarcely to be calculated; and they are befides very mifchievous, troublefome, and inconvenient in feveral others; fo that they fhould be every where extirpated as much as poffible. And in corn tracts, ftands or ftaddles fhould every where be provided in order to prevent mifchief being done by them. See Vermin, and Stand, *Corn*.

Rat, *Beaver*. See Mus *Coypus*.

Rat, *Black*. See Mus *Rattus*.

Rat, *Blind*. See Mus *Typhlus*.

Rat, *Field*. See Mus *Silvaticus*.

Rat *Mole*. See Mus.

Rat, *Mountain*. See Marmot *Talpinus*, &c.

Rat, *Mufk*. See Mus *Zibethicus*.

Rat, *Norway* or *brown*, *mus Norwegicus*, (*Mus decumanus*) is a rat whofe head, back, and fides are of a light brown colour, mixed with tawny and afh-colour; the breaft and belly are of a dirty white; the feet naked, and of a dirty flefh-colour; the fore-feet are furnifhed with four toes, and a claw inftead of the fifth: the length from the nofe to the tail is nine inches, and the tail is of the fame length. This animal is more ftrongly made than the common black rat, or *mus rattus*.

This fpecies of rat, which is the fame animal that is called in the Eaft Indies a *bondicote*, now inhabits moft parts of Europe; whither it is fuppofed to have been brought within the laft century, in fome of the India fhips. It came into Great Britain about 70 or 80 years ago, but has not been known in the neighbourhood of Paris above half that time. They fwarm in Peterfburg, and are known in Pruffia; but have not yet reached the oppofite fide of the Baltic, as Linnæus takes no notice of this fpecies. Thefe were probably the *mures Cafpii* of Ælian, which made periodical vifits in great multitudes to the countries bordering on the Cafpian fea, fwimming boldly over the rivers, holding by one another's tail. (Ælian. Hift. An. 17. cap. 17.) They burrow, like the water rat, on the fides of ponds and ditches; fwim and dive well; live on grain and fruits, but will deftroy poultry and game; increafe faft, producing from fourteen to eighteen young at a time; are very bold and fierce; will turn, when clofely purfued, and faften on the ftick or hand that offers to ftrike them: they have deftroyed the common black rat in moft places: they inhabit the fields part of the year, but migrate in great numbers into houfes, and do much mifchief. The bite of thefe rats is not only fevere but dangerous; the wound being immediately attended with a great fwelling, and healing very flowly. Pennant. See Mus *Decumanus*.

Rat, *Norway*, is alfo a name given by fome writers to the lemming, or fable moufe. See Mus *Lemmus*, and *Sable* Mouse.

Rat, *Water*. See Mus *Amphibius*.

Rat, in the *Sea Language*, is ufed to exprefs a part of the fea, where there are rapid and dangerous currents, or counter-currents.

Rat-*Goofe*, in *Ornithology*, the name of a fmall fpecies of wild goofe, common in fome of the northern counties of England.

Rat-*Tails*, in the *Manege*. See Arrets.

Rat-*Tailed*. A horfe is thus called that has no hair upon his tail.

Rat-*Tailed Worms*, in *Natural Hiftory*, a fpecies of flyworms with long tails, refembling thofe of rats, whence they have their name. They are of feveral fizes, and found alfo in different places, but all change into two-winged flies, having very much the refemblance of bees, and commonly called *bee-flies*. See Drone-*Fly*.

Rat, *Cape*, in *Geography*, a cape of Africa, in the Red fea. N. lat. 14° 55'.

Rat *Ifland*, a fmall ifland in Milford Haven.—Alfo, an ifland in the Red fea. N. lat. 14° 55'.—Alfo, a fmall ifland in the Eaft Indian fea, near the W. coaft of Sumatra. S. lat. 3° 57'. E. long. 101° 55'.—Alfo, a fmall ifland in the Mergui Archipelago, S.W. of Olive ifland.

RATA *pro* Rata. See Pro *rata*.

Onerando pro Rata portionis. See Onerando.

RATAFIA, a fine fpirituous liquor, prepared from the kernels, &c. of feveral kinds of fruits, particularly of cherries and apricots.

Ratafia of cherries is prepared by bruifing the cherries, and putting them into a veffel in which brandy has been long kept;

kept; then adding to them the kernels of cherries, with ſtrawberries, ſugar, cinnamon, white pepper, nutmegs, cloves; and to twenty pounds of cherries, ten quarts of brandy. The veſſel is left open ten or twelve days, and then ſtopped cloſe for two months before it be tapped.

Ratafia of apricots is prepared two ways; *viz.* either by boiling the apricots in white wine, adding to the liquor an equal quantity of brandy, with ſugar, cinnamon, mace, and the kernels of apricots; infuſing the whole for eight or ten days; then ſtraining the liquor, and putting it up for uſe: or elſe by infuſing the apricots, cut in pieces, in brandy, for a day or two; paſſing it through a ſtraining-bag, and then putting in the uſual ingredients.

RATAN, in *Geography*, a ſmall iſland on the W. ſide of the gulf of Bothnia. N. lat. 63° 58′. E. long 20° 39′.

RATCH, or RASH, in *Clock Work*, a ſort of wheel having twelve fangs, which ſerve to lift up the detents every hour, to make the clock ſtrike.

RATCHETS, in a *Watch*, are the ſmall teeth at the bottom of the fuſee, or barrel, which ſtop it in winding up.

RATCHIN LOPA, in *Geography*, a large lake of Thibet. N. lat. 30° 43′. E. long. 82° 27′.

RATCLIFF, a town of America, in Maryland; 22 miles S. of Saliſbury.

RATE, a ſtandard or proportion, by which either the quantity or value of a thing is adjuſted.

The rates of bread, &c. in London, are fixed by authority. See *Aſſiſe of* BREAD.

The rate of intereſt, as now eſtabliſhed by law in England, is five *per cent.* The rate of intereſt in Italy, is three *per cent.*; in Sweden, ſix; in France, five; in Spain, ten; in Barbadoes, ten; in Ireland, twelve; in Turkey, twenty. Low rates of intereſt advance the prices of land.

The rates or fares of hackney-coachmen, chairmen, and watermen, are fixed by act of parliament. See *Hackney* COACHES, &c.

The rates of exchange, factorſhip, &c. are different. See EXCHANGE, FACTORAGE, &c.

RATE *of a Ship of War*, is its order, degree, or diſtinction, as to magnitude, burden, force, &c.

The Britiſh fleet is accordingly diſtributed into ſix rates, excluſive of the inferior veſſels that uſually attend on naval armaments; as ſloops of war, armed ſhips, bomb-ketches, fire-ſhips, and cutters or ſchooners, commanded by lieutenants.

Ships of the *firſt* rate mount a hundred cannon, and ſome more, having forty-two-pounders on the lower deck, twenty-four-pounders on the middle deck, twelve-pounders on the upper deck, and ſix-pounders on the quarter-deck and forecaſtle. They are manned with eight hundred and fifty men, including their officers, ſeamen, marines, and ſervants.

In general, the ſhips of every rate, beſides the captain, have the maſter, the boatſwain, the gunner, the chaplain, the purſer, the ſurgeon, and the carpenter; all of whom, except the chaplain, have their mates or aſſiſtants, in which are comprehended the ſail-maker, the maſter at arms, the armourer, the captain's clerk, the gunſmith, &c. The number of other officers is always in proportion to the rate of the ſhip. Thus, a firſt rate has ſix lieutenants, ſix maſter's mates, twenty-four midſhipmen, and five ſurgeon's mates, who are conſidered as gentlemen; beſides the following petty officers: quarter-maſters, and their mates, fourteen; boatſwain's mates, and yeomen, eight; gunner's mates and aſſiſtants, ſix; quarter-gunners, twenty-five; carpenter's mates, two, beſides fourteen aſſiſtants; with one ſteward, and ſteward's mate to the purſer.

Ships of the *ſecond* rate carry ninety-eight and ninety guns upon three decks; of which thoſe on the lower battery are thirty-two-pounders; thoſe on the middle, eighteen-pounders; on the upper deck, twelve-pounders; and thoſe on the quarter-deck, ſix-pounders, which uſually amount to four or ſix. Their complement of men is ſeven hundred and fifty, in which there are ſix lieutenants, four maſter's mates, twenty-four midſhipmen, and four ſurgeon's mates, fourteen quarter-maſters and their mates, eight boatſwain's mates and yeomen, ſix gunner's mates and yeomen, with twenty-two quarter-gunners, two carpenter's mates, with ten aſſiſtants, and one ſteward and ſteward's mate.

Ships of the *third* rate carry from ſixty-four to eighty cannon, which are thirty-two, eighteen, and nine-pounders. The eighty-gun ſhips, however, begin to loſe their repute, and give way to thoſe of ſeventy-four, ſeventy, &c. which have only two whole batteries; whereas the former have three, with twenty-eight guns planted on each; the cannon of their upper deck being the ſame as thoſe on the quarter-deck and forecaſtle of the latter, which are nine-pounders. The complement in a ſeventy-four is ſix hundred and fifty; and in a ſixty-four, five hundred men: having in peace, four lieutenants, but in war, five, and when an admiral is aboard, ſix. They have three maſter's mates, ſixteen midſhipmen, three ſurgeon's mates, ten quarter-maſters and their mates, ſix boatſwain's mates and yeomen, four gunner's mates and yeomen, with eighteen quarter-gunners, one carpenter's mate with eight aſſiſtants, and one ſteward and ſteward's mate under the purſer.

Ships of the *fourth* rate mount from ſixty to fifty guns, upon two decks and the quarter-deck. The lower tier is compoſed of twenty-four-pounders; the upper tier, of twelve-pounders; and the cannon on the quarter-deck and forecaſtle are ſix-pounders. The complement of a fifty-gun ſhip is three hundred and fifty men, in which there are three lieutenants, two maſter's mates, ten midſhipmen, two ſurgeon's mates, eight quarter-maſters and their mates, four boatſwain's mates and yeomen, one gunner's mate and one yeoman, with twelve quarter-gunners, one carpenter's mate and ſix aſſiſtants, and a ſteward and ſteward's mate.

All veſſels of war under the fourth rate, are uſually comprehended under the general name of frigates, and never appear in the line of battle. They are divided into the *fifth* and *ſixth* rates, the former mounting from forty to thirty-two guns, and the latter from twenty-eight to twenty. The largeſt of the fifth rate have two decks of cannon, the lower battery being of eighteen-pounders, and that of the upper deck of nine-pounders; but thoſe of thirty-ſix and thirty-two guns have only one complete deck of guns, mounting twelve-pounders, beſides the quarter-deck and forecaſtle, which carry ſix-pounders. The complement of a ſhip of forty-four guns is two hundred and eighty men; that of a frigate of thirty-ſix guns, two hundred and forty men. The firſt has three, and the ſecond two lieutenants; and both have two maſter's mates, ſix midſhipmen, two ſurgeon's mates, ſix quarter-maſters and their mates, two boatſwain's mates and one yeoman, one gunner's mate and one yeoman, with ten or eleven quarter-gunners, and one purſer's ſteward.

Frigates of the ſixth rate carry nine-pounders; thoſe of twenty-eight guns having three-pounders on their quarter-deck, with two hundred men for their complement; and thoſe of twenty-four, one hundred and ſixty men: the former has two lieutenants; the latter, one; and both have two maſter's mates, four midſhipmen, one ſurgeon's mate, four quarter-maſters and their mates, one boatſwain's mate and one yeoman, one gunner's mate and one yeoman, with ſix or ſeven quarter-gunners, and one purſer's ſteward.

The

The floops of war carry from eighteen to eight cannon: the largeft of which have fix-pounders; and the fmalleft, *viz.* thofe of eight or ten guns, four-pounders. Their officers are generally the fame as in the fixth rates, with little variation; and their complements of men are from one hundred and twenty to fixty, in proportion to their force or magnitude.

Bomb-veffels are on the fame eftablifhment as floops; but fire-fhips and hofpital-fhips are on that of fifth rates. If the dimenfions of all fhips of the fame rate were equal, it would be eafy to collect them into one point of view in a table; but as there is no invariable rule for the general dimenfions, we fhall felect thofe of fome of a late conftruction in each rate.

		Guns.	Length of the keel.		Length of the lower deck.		Extreme breadth.		Depth in the hold.		Burthen in tons.
Rates.			Ft.	In.	Ft.	In.	Ft.	In.	Ft.	In.

Sloop	Nautilus	16	80	$7\frac{5}{8}$	98	0	27	2	12	8	316

Ships of one hundred guns, and above, and downwards to fixty-four, are termed fhips of the line.

Ships of the line, fifties, frigates, and royal yatchs, are commanded by poft-captains; floops of war, bombs, fire-fhips, armed fhips, ftore-fhips, and armed *en flute*, under fifty guns, by commanders; fchooners, cutters, &c. by lieutenants; flop-fhips occafionally by mafters; and fmall craft by midfhipmen, who have paffed for lieutenants.

Ships of the fecond rate, and thofe of the third, which have three decks, carry their fails remarkably well, and labour very little at fea. They are excellent in a general action, or in cannonading a fortrefs. Thofe of the third rate, which have two tiers, are fit for the line of battle, to lead the convoys and fquadrons of fhips of war in action; and, in general, to fuit the different exigencies of the naval fervice. The fourth rates may be employed on the fame occafions as the third rates; and may be alfo deftined for fervice among the foreign colonies, or on expeditions of great diftance; fince thefe veffels are ufually excellent for keeping and fuftaining the fea. Veffels of the fifth rate are too weak to fuffer the fhock of a line of battle; but they may be deftined to lead the convoys of merchant fhips, to protect the commerce in the colonies, to cruife in different ftations, to accompany fquadrons, or be fent exprefs with neceffary intelligence and orders. The fame may be obferved of the fixth rates.

The frigates which mount from twenty-eight to thirty-eight guns upon one deck, with the quarter-deck, are extremely proper for cruifing againft privateers, or for fhort expeditions, being light, long, and ufually excellent failers. Falconer.

Rates, *Books of.* See Book and Customs.

Rate, *Poor.* See Poor.

Rate-*Tythe.* When fheep, or other cattle, are kept in a parifh for lefs time than a year, the owner muft pay tythe for them *pro rata*, according to the cuftom of the place.

Rate, in *Geography*, a town of Hindooftan, in Myfore; 25 miles E. of Rattinghery.

RATEEN, or Ratten, in *Commerce*, a thick woollen ftuff, quilled, woven on a loom with four treddles, like ferges, and other ftuffs that have the whale or quilling.

There are fome rateens dreffed and prepared like cloths; others left fimply in the hair; and others where the hair, or knap, is frized.

Rateens are chiefly manufactured in France, Holland, and Italy; and moftly ufed in linings.

The frize is a fort of coarfe rateen; and the drugget is a rateen half linen, half woollen.

RATEL, in *Zoology*, a name given by the Hottentots to an animal inhabiting the Cape of Good Hope, which lives on honey, and is a great enemy to bees: hence called the Viverra *Mellivora:* which fee. It has a blunt black nofe; no external ears, but a fmall rim round the orifice; a rough tongue, fhort legs, very long claws, which are ftraight like thofe of a badger, and guttered beneath: the colour of the forehead, crown, and whole upper part of the body, is a cinereous grey; the cheeks, and fpace round the ears, throat, breaft, belly, and limbs, black; from each ear to the tail extends along the fides a dufky line, leaving beneath another of grey. Its length from the nofe to the tail is forty inches, and the tail twelve.

This animal preys in the evening, and afcends to the higheft parts of the defert to look about; and will then put one foot before its eyes, to prevent the dazzling of the fun. The reafon of its going to an eminence is for the fake of feeing or hearing the honey-guide cuckoo, or cuculus indicator, which lives on bees, and, as it were, conducts it to their haunts. Pennant.

RATENSTADT, in *Geography*, a town of Hungary; 16 miles S.E. of Baes.

RATESPONTE *de Mulher*, a town of Portugal, in the province of Entre Duero e Minho; 15 miles N.E. of Villa de Conde.

RATH, a word ufed in the compofition of names of places in Ireland, as Rathdrum, &c. It fignifies an intrenchment, or fort.

Rath, *ripe*, in *Agriculture*, a term applied to fome early ripe corn crops, and which have a degree of rednefs in the ftraw; fuch as fome varieties of barley, &c.

RATHANGAN, in *Geography*, a poft-town of the county of Kildare, Ireland, fituated on the Athy branch of the Grand Canal; $28\frac{1}{2}$ miles W. from Dublin, and 5 miles N.N.W. from Kildare.

RATHCONRATH, a fmall town of the county of Weftmeath, Ireland, which gives name to a barony. It is 44 miles N. by W. from Dublin, on the road to Lanefborough, and 6 miles W. from Mullingar.

RATHCOOLE, a fmall poft-town of the county of Dublin, Ireland, where fairs are holden for cattle and pedlars' wares. It is on the great fouthern road, $7\frac{3}{4}$ miles S.W. from Dublin.

RATHCORMUCK, a poft-town of the county of Cork, Ireland, which returned two members to the Irifh parliament, before the union. It has gone much to decay, in confequence of the profperity of Fermoy, which is little more than three miles diftant. It is near the river Bride, 111 miles S.W. from Dublin, and $13\frac{1}{2}$ N.E. from Cork.

RATHDOWNY, a poft-town of the Queen's county, Ireland; 59 miles S.W. from Dublin.

RATHDRUM, a poft-town of the county of Wicklow, Ireland, fituated on the river Ovoca. It has a monthly fair

fair for flannels, of which there is a confiderable manufacture. The adjoining country is very interefting, and the Wicklow copper-mines are not far diftant. Rathdrum is 29 miles S. from Dublin.

RATHENAU, or RATEMAO, a town of the middle mark of Brandenburg, on the Havel; 38 miles W. of Berlin. N. lat. 52° 38′. E. long. 12° 30′.

RATHER, or NEITHER, a river of England, which runs into the Lune, four miles N. of Kirkby Lonfdale, in the county of Weftmoreland.

RATHERIUS, in *Biography*, a very learned prelate in the tenth century, commenced his ecclefiaftical career by embracing a monaftic life at the abbey of Lobbes, or Laubes, in Flanders. Here he diftinguifhed himfelf by his abilities and acquirements. In the year 928, after Hilduin had been driven out of the fee of Liege, he accompanied him into Italy; and in 931 he was, by the exprefs order of the pope, put in poffeffion of the fee of Verona. As, however, this was in direct hoftility to the king of the country, he was expofed to much perfecution, and at length banifhed from Italy. After fpending five years in exile, he returned with the hope of regaining his bifhopric: but he was unfuccefsful, and was ordered to withdraw. He obeyed, and retired into Provence: from this place he went to the abbey of Lobbes, where the recollection of the honour, which he had formerly reflected on that eftablifhment, fecured him a welcome reception. Shortly after this, he was fent for by the emperor Otho, who placed him near the perfon of his brother Bruno. This prince, having been made archbifhop of Cologne in the year 953, prefented Ratherius to the bifhopric of Liege; from which, however, he was driven in about two years. As the emperor Otho was at this time in Italy, our prelate made an effort to recover his former fee of Verona. Accordingly he laid his cafe before a fynod affembled at Pavia, which paffed a decree that he fhould be re-eftablifhed in that bifhopric. His peace was foon interrupted by controverfies with the clergy, who could not endure his reproofs of their irregularities and corruptions; till at length they became fo irkfome to him, that he determined to take his final leave of Italy. He accordingly went to France, where he purchafed fome eftates, and obtained the abbies of St. Amand, Aumont, and of Aunay. He died at Namur, about the year 973. His works are numerous, fome of which are inferted in father d'Achery's "Spicilegium." They are faid to afford evident proofs of great fagacity and judgment, while they breathe throughout an ardent love of virtue. They alfo fhew, that he was moft zealous and intrepid in expofing the irregularities and vices of the times, and particularly the corrupt morals of ecclefiaftics. Moreri. Mofheim.

RATHFRILAND, in *Geography*, a poft-town of the county of Down, Ireland. It is fituated on a rifing ground, and has four great ftraight roads leading up to it, and centering in the town. It is on the road to Downpatrick, and much frequented. The neighbourhood abounds with granite of a clofe texture, and fit for building. On the fummit of the hill are the ruins of a caftle, formerly one of the refidences of the Magennifes, lords Iveach. Rathfriland is $57\frac{1}{2}$ miles N. from Dublin, and $7\frac{1}{2}$ miles N.E. from Newry.

RATHKEALE, a poft-town of Ireland, in the county of Limerick. It is fituated on the river Deel, and was formerly a corporation town, and of much more confequence than at prefent. It has feveral fairs, one of which for horfes is much frequented, as are alfo its races. In the reign of queen Elizabeth, it fuftained an attack of the Englifh army. The ruins of a priory, founded by a perfon of the name of Harvey, are ftill remaining. Rathkeale is 108 miles S.W. from Dublin, and 14 miles W.S.W. from Limerick.

RATHLACKEN, a poft-town of the county of Mayo, Ireland, on the fea-coaft, nor far from Rathlacken or Relakin head, and weft of the entrance to Killala bay. It is 132 miles W.N.W. from Dublin, and 5 miles N. from Killala.

RATHLIN, RAGHLIN, or *Raghery*, an ifland fituated between the north coaft of Antrim, in Ireland, and Scotland, and confidered as belonging to the former. It is about five miles in length, and three quarters of a mile in breadth, being bent in an angle towards the middle. This angle lies oppofite to Ballycaftle, and forms a tolerable bay, called Church bay; but in a wefterly wind, though the anchorage is good, few veffels can ride it out, from the fwell along the coaft. The number of plantation acres is about 2000, which fupport a population of about 130 or 140 families, amounting to about 1100 perfons. The cultivated land is kindly enough, and produces excellent barley. But kelp is the great fource of wealth to this ifland, 100 tons of which have been exported from it in one year. The horfes, as well as the fheep, are fmall, but ferviceable; and the black cattle are not large, though they do well when brought to the main land, and better foil. The inhabitants are a fimple, laborious, and honeft race of people, much attached to their own ifland, and regarding Ireland as a foreign country. The monuments of antiquity are fmall tumuli, in one of which, when opened, a ftone coffin was found, befide which an earthen veffel ftood. Within the tumuli lay a confiderable number of human bones, which might have been the remains of more ignoble men than the perfon whofe remains the coffin covered. Brazen fwords and fpear-heads have alfo been found. The remains of a fortrefs are vifible, where Robert Bruce is faid to have defended himfelf for fome time, when obliged to fly from his country. N. lat. 55° 20′. W. long. 6° 6′.

RATHMANSDORF, a town of Silefia, in the principality of Neifs; 4 miles N.N.W. of Weidenau.

RATHOWEN, a poft-town of the county of Weftmeath, Ireland, near the borders of Longford; 48 miles W.N.W. from Dublin.

RATHSCHACH, or RADESCHE, a town of the duchy of Carniola, on the Save; 9 miles W.N.W. of Gurckfeld.

RATHSPRÆSENTGERS, in *Commerce*, filver coins of Aix-la-Chapelle, being double, fingle, or half pieces of 22, 16, and 8 marks. By the affay, the rathfpræfentger is worfe than the Englifh ftandard of 11 oz. 2 dwts., by 4 oz. 2 dwts. Its weight is 4 dwts. $1\frac{1}{2}$ gr.; its content in pure filver 56.9 grs.; and its value in fterling 8*d*. The double of the fame is worfe by 2 oz. 15 dwts.; its weight 6 dwts. $23\frac{1}{4}$ grs.; its content in pure filver 116.3 grs.; and its value in fterling 1 *s*. $4\frac{1}{4}$*d*. This coin bears on one fide an eagle within a circle, marked 16 on his breaft, (32 on the double piece,) and within another circle the legend, REGUM CURIA PRINCIPALIS PRIMA; and next the edge, URBS AQUENSIS. URBS REGALIS. REGNI SEDES: on the other fide, or reverfe, an altar, with two fwords and a crown over it, on the double piece; but on the fingle, a crown and the date within a circle: the legend on both is LOCUS CÆSAREA CORONATIONIS; Cæfar being a general title for the emperor. Kelly's Un. Cambift.

RATI, in *Geography*, a fmall ifland in the Grecian Archipelago, near the S. coaft of Nicaria.

RATIBOR, a town of Silefia, in a principality of its name, on the Oder, which here becomes navigable; 70 miles

miles S.E. of Breflau. N. lat. 50°. E. long. 18° 5′. The principality is bounded N. by the principality of Oppeln, on the E. by Poland, on the S. by Tefchen, and on the W. by the principality of Jagendorf. Its foil is better than that of Oppeln, as it produces a fufficient fupply of wheat, rye, and barley, with fruits; and befides, it has alfo good pafture grounds. Its only river is the Oder, which paffes through its weftern part; but it is abundantly watered in all its parts with ftreams, ponds, and lakes. It contains only three cities, and the inhabitants are univerfally Polifh. It became a principality in 1288, and about 200 years afterward it was united to Oppeln, from which it has never been feparated.

RATIFICATION, Ratificatio, an act, approving of, and confirming, fomething done by another, in our name.

A treaty of peace is never fecure till the princes have ratified it.

All procuration imports a promife of ratifying and approving what is done by the proxy, or procurator: after treating with a procurator, agent, factor, &c. a ratification is frequently neceffary on the part of his principal.

Ratification is particularly ufed, in our *Laws*, for the confirmation of a clerk in a benefice, prebend, &c. formerly given him by the bifhop, &c. where the right of patronage is doubted to be in the king.

Ratification is alfo ufed for an act confirming fomething we ourfelves have done in our own name.

An execution, by a major, of an act paffed in his minority, is equivalent to a ratification.

RATING. See Raiting.

RATINGEN, or Rattingen, in *Geography*, a town of the duchy of Berg; 4 miles N.E. of Duffeldorp. N. lat. 51° 15′. E. long. 6° 47′.

RATINO, a town of Naples, in the county of Molife; 6 miles S.E. of Molife.

RATIO, in *Arithmetic* and *Geometry*, that relation of homogeneous things, which determines the quantity of one from the quantity of another, without the intervention of any third.

The homogeneous things, thus compared, we call *the terms of the ratio;* particularly that referred to the other, we call the *antecedent;* and that to which the other is referred, the *confequent.*

Thus, when we confider one quantity by comparing it with another, to fee what magnitude it has in comparifon of that other; the magnitude this quantity is found to have in comparifon with it, is called the *ratio* of this quantity to that: which fome think would be better expreffed by the word *comparifon.*

Euclid defines ratio by *a mutual relation of two magnitudes of the fame kind in refpect of quantity.* But this definition is found defective; there being other relations of magnitudes which are conftant, yet are not included in the number of ratios: fuch as that of the right fine, to the fine of the complement in trigonometry.

Hobbes endeavoured to improve Euclid's definition of ratio, but without fuccefs: for in defining it, as he does, by *the relation of magnitude to magnitude,* his definition has not only the fame defect with Euclid's, in not determining the particular kind of relation; but it has this farther, that it does not exprefs the kind of magnitudes which may have a ratio to one another.

Ratio is frequently confounded, though very improperly, with *proportion.* Proportion, in effect, is an identity or fimilitude of two ratios.

Thus, if the quantity A be triple the quantity B; the relation of A to B, *i. e.* of 3 to 1, is called the ratio of A to B. If two other quantities, C, D, have the fame ratio to one another that A and B have, *i. e.* be triple one another, this equality of ratio conftitutes *proportion;* and the four quantities A : B :: C : D, are in proportion, or proportional to one another.

So that ratio exifts between two terms; proportion requires more.

There is a twofold comparifon of numbers: by the firft, we find how much they differ, *i. e.* by how many units the antecedent exceeds, or comes fhort of, the confequent.

This difference is called the *arithmetical* ratio, or exponent of the arithmetical relation or habitude of the two numbers. Thus, if 5 and 7 be compared, their arithmetical ratio is 2.

By the fecond comparifon, we find how oft the antecedent contains, or is contained in, the confequent; *i. e.* as before, what part of the greater is equal to the lefs.

This ratio, being common to all quantity, may be called ratio in the general, or by way of eminence: but is ufually called *geometrical* ratio; becaufe expreffed, in geometry, by a line, though it cannot be expreffed by any number.

Modern authors diftinguifh ratio, with regard to quantity in the general, into *rational* and *irrational.*

Ratio, *Rational,* is that which is as one rational number to another; *e. gr.* as 3 to 4.

Ratio, *Irrational,* is that which cannot be expreffed by rational numbers.

Suppofe, for an illuftration, two quantities, A and B; and let A be lefs than B. If A be fubtracted as often as it can be from B, *e. gr.* five times, there will either be left nothing, or fomething. In the former cafe, A will be to B, as 1 to 5; that is, A is contained in B five times; or $A = \frac{1}{5} B$. The ratio here, therefore, is *rational.*

In the latter cafe, either there is fome part, which, being fubtracted certain times from A, *e. gr.* 3 times, and likewife from B, *e. gr.* 7 times, leaves nothing; or there is no fuch part: if the former, A will be to B as 3 to 7, or $A = \frac{3}{7} B$; and therefore the ratio, *rational.* If the latter, the ratio of A to B, *i. e.* what part A is of B, cannot be expreffed by rational numbers; nor any other way than either by lines, or by infinite approaching feries.

The *exponent of a geometrical ratio* is the quotient arifing from the divifion of the antecedent by the confequent. Thus, the exponent of the ratio of 3 to 2, is $1\frac{1}{2}$; that of the ratio of 2 to 3, is $\frac{2}{3}$: for when the lefs term is the antecedent, the ratio, or rather the exponent, is a proper fraction. Hence the fraction $\frac{3}{4} = 3 \div 4$. If the confequent be unity, the antecedent itfelf is the exponent of the ratio: thus, the exponent of 4 to 1, is 4. See Exponent.

If two quantities be compared, without the intervention of a third; either the one is equal to the other, or unequal: hence, the ratio is either of *equality* or *inequality.* If the terms of the ratio be unequal, either the lefs is referred to the greater, or the greater to the lefs: that is, either the lefs to the greater, as a part to the whole, or the greater to the lefs, as the whole to a part. The ratio, therefore, determines how often the lefs is contained in the greater, or how often the greater contains the lefs; *i. e.* to what part of the greater the lefs is equal.

The following diftinctions of ratios are fometimes found in early authors.

The ratio which the greater term has to the lefs, *e. gr.* 6 to 3, is called the *ratio of the greater inequality:* the ratio which the lefs term has to the greater, *e. gr.* 3 to 6, is called the *ratio of the leffer inequality.*

This ratio correfponds to quantity in the general, or is admitted

admitted of by all kinds of quantities, discrete or continued, commensurable or incommensurable: but discrete quantity, or number, does likewise admit of another ratio.

If the less term of a ratio be an aliquot part of the greater, the ratio of the greater inequality is said to be *multiplex*, multiple; and the ratio of the less inequality, *submultiple*.

Particularly, in the first case, if the exponent be 2, the ratio is called *duple*; if 3, *triple*, &c. In the second case, if the exponent be $\frac{1}{2}$, the ratio is called *subduple*; if $\frac{1}{3}$, *subtriple*, &c.

E. gr. 6 to 2 is in a triple ratio; because 6 contains two thrice. On the contrary, 2 to 6 is a subtriple ratio; because 2 is the third part of 6.

If the greater term contains the less once, and over and above an aliquot part of the same; the ratio of the greater inequality is called *superparticularis*, and the ratio of the less *sub-superparticularis*.

Particularly, in the first case, if the exponent be $1\frac{1}{2}$, it is called *sesquialterate*; if $3\frac{1}{3}$, *sesquitertial*, &c. In the other, if the exponent be $\frac{2}{3}$, the ratio is called *subsesquialterate*; if $\frac{3}{4}$, *subsesquitertial*, &c.

E. gr. 3 to 2 is in a sesquialterate ratio; 2 to 3 in a subsesquialterate.

If the greater term contains the less once, and over and above several aliquot parts; the ratio of the greater inequality is called *superpartiens*; that of the less inequality is *subsuperpartiens*.

Particularly, in the former case, if the exponent be $1\frac{2}{3}$, the ratio is called *superbipartiens tertias*; if the exponent be $1\frac{3}{4}$, *supertripartiens quartas*; if $1\frac{4}{7}$, *superquadripartiens septimas*, &c. In the latter case, if the exponent be $\frac{3}{5}$, the ratio is called *subsuperbipartiens tertias*; if $\frac{4}{7}$, *subsupertripartiens quartas*; if $\frac{7}{11}$, *subsuperquadripartiens septimas*.

E. gr. the ratio of 5 to 3 is *superbipartiens tertias*; that of 3 to 5, *subsuperbipartiens tertias*.

If the greater term contains the less several times, and, besides, some quota part of the same; the ratio of the greater inequality is called *multiplex superparticularis*; and the ratio of the less inequality, *submultiplex subsuperparticularis*.

Particularly, in the former case, if the exponent be $2\frac{1}{2}$, the ratio is called *dupla sesquialtera*; if $3\frac{1}{4}$, *tripla sesquiquarta*, &c. In the latter case, if the exponent be $\frac{2}{3}$, the ratio is called *subdupla subsesquialtera*; if $\frac{4}{13}$, *subtripla subsesquiquarta*, &c.

E. gr. the ratio of 16 to 5 is *tripla sesquiquinta*; that of 4 to 9, *subdupla subsesquiquarta*.

Lastly, if the greater term contains the less several times, and several aliquot parts of it besides; the ratio of the greater inequality is called *multiplex superpartiens*; that of the less inequality, *submultiplex subsuperpartiens*.

Particularly, in the former case, if the exponent be $\frac{2}{3}$, the ratio is called *dupla superbipartiens tertias*; if $3\frac{4}{7}$, *tripla superbiquadrapartiens septimas*, &c. In the latter case, if the exponent be $\frac{3}{8}$, the ratio is called *subdupla subsuperbipartiens tertias*; if $\frac{7}{25}$, *subtripla subsuperquadripartiens septimas*, &c.

E. gr. the ratio of 25 to 7 is *tripla superquadripartiens septimas*; that of 3 to 8, *subdupla subsuperbipartiens tertias*.

These are the various kinds of *rational* ratios; the names of which, though they occur but rarely among the modern writers (for in lieu of them they use the smallest terms of the ratios, *e. gr.* for *duple* 2 : 1, for *sesquialterate* 3 : 2); yet are they absolutely necessary to such as converse with the ancient authors.

Clavius observes, that the exponents denominate the ratios of the greater inequality, both in deed and name; but the ratios of the less inequality, only in deed, not in name: but it is easy finding the name in these, if you divide the denominator of the exponent by the numerator.

E. gr. if the exponent be $\frac{5}{8}$, then $5 : 8 = 1\frac{3}{5}$; whence it appears, the ratio is called *subsupertripartiens quintas*. As to the names of irrational ratios, nobody ever attempted them.

Same, or *identic* ratios, are those whose antecedents have an equal respect to their consequents, *i. e.* whose antecedents divided by their consequents, give equal exponents. And hence may the identity of irrational ratios be conceived.

Hence, first, as oft as the antecedent of one ratio contains its consequent, or whatever part it contains of its consequent, so oft, or such part of the other consequent does the antecedent of the other ratio contain: or, as oft as the antecedent of the one is contained in its consequent, so oft is the antecedent of the other contained in its consequent.

Secondly, if A be to B as C to D; then will A : B :: C : D; or A : B = C : D. The former of which is the usual manner of representing the identity of ratios, the latter is that of the excellent Wolfius; which has the advantage of the former, in that the middle character, =, which denotes the sameness, is scientifical; *i. e.* it expresses the relation of the thing represented, which the other, ::, does not. See CHARACTER.

Two *equal* ratios, *e. gr.* B : C = D : E, we have already observed, constitute a proportion: of two *unequal* ratios, *e. gr.* A : B and C : D, we call A : B the *greater*, if A : B > C : D; on the contrary, we call C : D the *lesser*, if C : D > A : B.

Hence, we express a greater and less ratio thus: *e. gr.* 6 to 3 has a greater ratio than 5 to 4; for, 6 : 3 (= 2) > 5 : 4 (= $1\frac{1}{4}$). But 3 to 6 has a less ratio than 4 to 5; for $\frac{3}{6} = \frac{1}{2} > \frac{4}{5}$. Compound ratio is that made up of two or more other ratios, which the factum of the antecedents of two or more ratios has to the factum of their consequents. Thus, 6 to 72 is in a ratio compounded of 2 to 6, and 3 to 12.

Particularly if it be compounded of two, it is called a *duplicate* ratio; if of three, a *triplicate*; if of four, *quadruplicate*; and, in the general, *multiplicate*, if it be composed of several similar ratios. Thus 48 : 3 is a duplicate ratio of 4 : 1 and 12 : 3.

RATIO, *Additive*. See ADDITIVE.

RATIO, *Alternate*. See ALTERNATE.

RATIO, *Ordinate*. See ORDINATE.

RATIO *Modularis* and *Modulus*, were terms introduced into use by Cotes, but more modern authors do not use them always in the same sense: according to Cotes, the modulus in logarithms is that number which connects any system of logarithms with the hyperbolic system, or that number by which the hyperbolic number of a logarithm must be multiplied, or by the reciprocal of which it must be divided, in order to transform it to another system; and this modulus is, therefore, always the reciprocal of the hyperbolic logarithm of the radix of that system to which the modulus belongs.

This is what Cotes calls the modulus, to whom we owe the introduction of the term; and the reciprocal of it he calls the *ratio modularis*: but some modern authors, as Lagrange, &c. use the term modulus to denote the ratio modularis of Cotes.

The modulus of the hyperbolic system is 1, this being the reciprocal of the hyperbolic logarithm of 2.71828182, the radix of this system; and the modulus of the common logarithmic

logarithmic fyftem is .43429448, which is the reciprocal of 2.3025809, the hyperbolic logarithm of 10, the radix of this fyftem.

It is fhewn under the article LOGARITHMS, that

$$\log. a = \frac{(a-1) - \frac{1}{2}(a-1)^2 + \frac{1}{3}(a-1)^3, \&c.}{(r-1) - \frac{1}{2}(r-1)^2 + \frac{1}{3}(r-1)^3, \&c.}$$

where r is the radix, and may be affumed at pleafure, and the reciprocal of this whole denominator is called the modulus. In the hyperbolic fyftem the whole denominator is affumed 1, which makes $r = 2.71828182$; and in the common fyftem r is affumed 10, and the whole feries becomes $= 2.3025809$, which is the reciprocal of the modulus; and fince, in the former cafe, we have

$$\text{hyp. log. } a = (a-1) - \tfrac{1}{2}(a-1)^2 + \tfrac{1}{3}(a-1)^3, \&c.$$

it follows alfo that in any other

$$\text{hyp. log. } r = (r-1) - \tfrac{1}{2}(r-1)^2 + \tfrac{1}{3}(r-1)^3, \&c.$$

whatever be the value of r; therefore, in every fyftem, the modulus is the reciprocal of hyp. log. of the radix. See LOGARITHMS.

RATIO, *Denominator of a.* See DENOMINATOR.

RATIO, *Properties of.*—1. Ratios fimilar to the fame third are alfo fimilar to one another; and thofe fimilar to fimilar, are alfo fimilar to one another.

2. If A : B :: C : D; then, inverfely, B : A :: D : C.

3. Similar parts P and p have the fame ratio to the wholes T and t; and if the wholes have the fame ratio, the parts are fimilar.

4. If A : B :: C : D; then, alternately, A : C :: B : D. And hence, if B = D, A = C; hence, alfo, if A : B :: C : D; and A : F :: C : G; we fhall have B : F :: D : G. Hence, again, if A : B :: C : D; and F : A :: G : C; we fhall have F : B :: G : D.

5. Thofe things which have the fame ratio to the fame, or equal things, are equal; and *vice verfâ.*

6. If you multiply any quantities, as A and B, by the fame, or equal quantities; their products D and E will be to each other as A and B.

7. If you divide any quantities, as A and B, by the fame or equal quantities, the quotients F and G will be to each other as A and B.

8. The exponent of a compound ratio is equal to the factum of the exponents of the fimple ratios.

9. If you divide either the antecedents or the confequents of fimilar ratios, A : B, and C : D, by the fame E; in the former cafe, the quotients F and G will have the fame ratio to the confequents B and D; in the latter, the antecedents A and B will have the fame ratio to the quotients H and K.

10. If there be feveral quantities in the fame continued ratio A, B, C, D, E, &c. the firft A is to the third C, in a *duplicate* ratio; to the fourth D, in a *triplicate;* to the fifth E, in a *quadruplicate,* &c. ratio of the ratio of the firft A, to the fecond B.

11. If there be any feries of quantities in the fame ratio, A, B, C, D, E, F, &c. the ratio of the firft A to the laft F is compounded of the intermediate ratios A : B, B : C, C : D, D : E, E : F, &c.

12. Ratios compounded of ratios, of which each is equal to each other, are equal among themfelves. Thus the ratios 90 : 3 :: 960 : 32, compounded of 6 : 3 :: 4 : 2, and 3 : 1.:: 12 : 4; and 5 : 1 :: 20 : 4.

For other properties of fimilar or equal ratios, fee PROPORTION.

RATIOS, *Reduction of.*—It is obvious that there is a variety of cafes in which the real ratio of two quantities may be expreffed in terms too great to be applied to any ufeful purpofe; of which we have an example in the conftruction of planetariums, and fimilar aftronomical inftruments. The ratios of the times in which the feveral planets perform their fidereal revolutions, are expreffed in very large numbers, far exceeding the number of teeth that can be introduced into the machinery of a planetarium; and it, therefore, becomes neceffary to find fmaller numbers, which, though they do not exprefs the true ratio, may approximate as near to the truth as the ftate of the cafe will admit. Another inftance, in which a reduction of the ratio of large numbers to others expreffed in lower terms becomes neceffary, occurs in the calendar; for, according to the common reckoning, the year is fuppofed to be 365 days, whereas it is known to be nearly 365 days 6 hours; it, therefore, becomes neceffary to have fome means of expreffing the ratio between the true and the affumed length of the years, in order that, by a proper intercalation, we may preferve an uniformity in the feafons, with reference to the months, as we fhould otherwife find the fhorteft day transferred to the middle of June, and the longeft to the month of December.

This reduction of ratios is beft performed by means of *continued* FRACTIONS, of which a fketch is given under that article, as alfo under the article INDETERMINATE *Analyfis,* but which we fhall probably treat at greater length in a fupplement to the prefent work, on which account it is not our intention to enter much into the rationale of the theory in this place, but merely to ftate the rules by which the required reduction is to be performed.

To reduce a ratio expreffed in large numbers, to others nearly equivalent, but reprefented in fimpler terms.

Rule 1.—Divide the greater of the two numbers by the lefs; then the divifor by the remainder, and fo on, as in finding the greateft common meafure of two numbers, and referve the feveral quotients, which may be denoted by $a, b, c, d,$ &c.

2. Write down the feveral quotients, thus; $a, b, c, d, e,$ &c. from which the feries of converging fractions or ratios will be derived as follows; *viz.* the firft fraction will have unity for its numerator, and the firft quotient, a, for its denominator; the fecond will have the fecond term, b, for its numerator, and for its denominator $a b + 1$; and the numerators of all the fucceeding fractions will be found, by multiplying the numerator laft obtained, by the fucceeding quotient in the above feries, and adding to the product the preceding numerator. And the denominators are obtained by precifely the fame rule, merely changing the word numerator into denominator.

In this rule we have fuppofed the ratio to be lefs than 1, or the numerator lefs than the denominator; if the denominator be lefs than the numerator, it muft be reverfed, making the numerator what we have called the denominator, and the denominator the numerator.

The laft fraction of this feries will be the fame as the original fraction propofed, and the others will be fo many approximate or converging fractions, each of which will approach nearer to the original fraction than the preceding one, and nearer than any other fraction whofe terms are not expreffed by greater numbers. This rule may be exhibited analytically as follows:

Let $\frac{A}{B}$ be the propofed fraction, and $a, b, c,$ &c. the quotients obtained by the divifions as above, then the converging

verging fractions will be $\frac{1}{a}$, $\frac{b}{ab+1}$, $\frac{bc+1}{(ab+1)c+a}$, $\frac{(bc+1)d+b}{[(ab+1)c+a].d+ab+1}$, &c. which will be found to agree with the preceding rule; and these fractions will be alternately greater and less than that proposed, which will be the last of the series.

Let us illustrate this rule by an example. Required a series of converging fractions towards $\frac{314159}{100000}$, which is the fraction commonly employed for expressing the ratio of the diameter to the circumference of a circle.

Operation by Division.

$$
\begin{array}{l}
100000)314159(3 = a \\
\quad 300000 \\
\quad\quad 14159)100000(7 = b \\
\quad\quad\quad 99113 \\
\quad\quad\quad\quad 887)14159(15 = c \\
\quad\quad\quad\quad\quad 13305 \\
\quad\quad\quad\quad\quad\quad 854)887(1 = d \\
\quad\quad\quad\quad\quad\quad\quad 854 \\
\quad\quad\quad\quad\quad\quad\quad\quad 33)854(25 = e \\
\quad\quad\quad\quad\quad\quad\quad\quad\quad 825 \\
\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad 29)33(1 = f \\
\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad 29 \\
\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad 4)29(7 = g \\
\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad 28 \\
\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad 1)4(4 = h \\
\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad 4 \\
\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad\quad 0
\end{array}
$$

Having thus obtained our quotients, the several fractions will be easily formed by the preceding rule; thus,

$$
\begin{array}{cccccccc}
3 & 7 & 15 & 1 & 25 & 1 & 7 & 4 \\
\frac{3}{1}, & \frac{22}{7}, & \frac{333}{106}, & \frac{355}{113}, & \frac{9208}{2931}, & \frac{9563}{3044}, & \frac{76149}{2423}, & \frac{314159}{100000};
\end{array}
$$

the last of which is the same as the original fraction. These fractions are formed according to the preceding rule, which will be understood from one example; thus, the fifth fraction is formed from the two preceding fractions as follows:

$$355 \times 25 + 333 = 9208 \text{ numerator,}$$
$$113 \times 25 + 106 = 2931 \text{ denominator,}$$

and all the others are obtained in the same manner.

Each of these fractions represents an approximate ratio towards the original one, and each of them nearer than any preceding fraction in the series, and nearer than any fraction expressed in less numbers, or than any fraction having a less denominator than the succeeding fractions. Thus, $\frac{3}{1}$ is a nearer approximation than any fraction whose denominator is less than 3, and $\frac{355}{113}$ nearer than any fraction whose denominator is less than 2931; &c.

Our original fraction exhibited the ratio usually employed to denote the ratio of the diameter to the circumference of a circle, and amongst our approximations we find some of those commonly employed by former writers; as 7 to 22, being that given by Archimedes; 106 to 333, which is another ratio formerly used; also 113 to 355, being that invented by Peter Metius. Each of these ratios is alternately too small and too great, to express the ratio of the diameter to the circumference of the circle. Thus, 1 to 3 is too small a ratio, 7 to 22 too great, 106 to 333 too small, and 113 to 355 too great; and so on.

We may therefore divide the above series into two distinct classes, one of which shall exhibit the ratios all in excess, and the other all in defect, which will stand as follows: *viz.*

Ratios in defect.

$$\frac{3}{1},\ \frac{333}{106},\ \frac{9208}{2931},\ \frac{76149}{24239}.$$

Ratios in excess.

$$\frac{22}{7},\ \frac{355}{113},\ \frac{9563}{3044},\ \frac{314159}{100000}.$$

And between every two consecutive fractions we may now interpolate as many fractions of the same kind, as is one less than the number of units in the quotients from which it was formed. If we write the first of the above series, with the corresponding quotients above their terms, we shall have

$$
\begin{array}{cccc}
 & 15 & 25 & 7 \\
\frac{3}{1}, & \frac{333}{106}, & \frac{9208}{2931}, & \frac{79149}{24239}.
\end{array}
$$

We may therefore interpolate, between the two first fractions, fourteen others, which will possess the same property as the principal fractions above, *viz.* of approximating nearer to the true ratio than any other fractions expressed in less terms, but all in defect. Between the second and third we may interpolate twenty-four fractions: and between the third and fourth, six: all of them less than the proposed ratio. But if we take the second series and their corresponding quotients, they will stand thus:

$$
\begin{array}{cccc}
1 & 1 & 1 & 4 \\
\frac{22}{7}, & \frac{355}{113}, & \frac{9563}{3044}, & \frac{314159}{100000},
\end{array}
$$

which shews, that no fraction can here be interpolated either between the first and second, or between the second and third; but there may be three interpolated between the third and fourth, which will, of course, be all in excess. This interpolation is performed as follows: to the numerator and denominator of the less fraction add, once, twice, three times, &c. the numerator and denominator of the principal fraction which interposes between the two, which will form the interpolated fractions required. Thus, because $\frac{76149}{24239}$ is the principal fraction interposed between $\frac{9563}{3044}$ and $\frac{314159}{100000}$, the intermediate or interpolated fractions will be

$$\frac{9563 + 76149}{3044 + 24239} = \frac{85712}{27283}$$
$$\frac{9563 + 2.76149}{3044 + 2.24239} = \frac{161861}{51522}$$
$$\frac{9563 + 3.76149}{3044 + 3.24239} = \frac{238010}{75761}$$

And

And in the ſame manner we may interpolate fourteen fractions between $\frac{3}{1}$ and $\frac{333}{106}$; twenty-four between $\frac{333}{106}$ and $\frac{9208}{2931}$; and ſix between $\frac{9208}{2931}$ and $\frac{16149}{24339}$.

Having thus explained the nature of the operation, we ſhall enter leſs into detail in the following example.

Example 2.—According to M de la Caille, the ſolar year is $365^d\ 5^h\ 48^m\ 49^s$, and conſequently longer by $5^h\ 48^m\ 49^s$ than the common year of 365 days. If this difference were exactly 6 hours, it would make one day at the end of four common years: but if we wiſh to know exactly at the end of how many years this difference will produce a certain number of days, we muſt ſeek the ratio between 24^h and $5^h\ 48^m\ 49^s$, which we find to be $\frac{86400}{20929}$, ſo that at the end of 86400 common years, we muſt intercalate 20929 days, in order to reduce them to tropical years.

Now as the ratio of 86400 to 20929 is expreſſed in very high terms, let it be required to find ratios in lower terms, as near this as poſſible.

For this purpoſe, we muſt perform upon theſe numbers the ſame operations as in the preceding caſe; thus:

```
20929)86400(4 = a
      83716
      -----
       2684)20929(7 = b
            18788
            -----
             2141)2684(1 = c
                  2141
                  ----
                   543)2141(3 = d
                       1629
                       ----
                        512)543(1 = e
                            512
                            ---
                             31)512(16 = f
                                496
                                ---
                                 16)31(1 = g
                                    16
                                    --
                                    15)16(1 = h
                                       15
                                       --
                                        1)15(15
                                          15
                                          --
```

From which quotients we derive the following converging fractions, *viz.*

$$\begin{array}{ccccccccc} 4 & 7 & 1 & 3 & 1 & 16 & 1 & 1 & 15 \\ \frac{4}{1}, & \frac{29}{7}, & \frac{33}{8}, & \frac{128}{31}, & \frac{161}{39}, & \frac{2704}{655}, & \frac{2865}{694}, & \frac{5569}{1349}, & \frac{86400}{20929}. \end{array}$$

Now we ſee from the above fractions, that the ſimpleſt intercalation is that of one day in four common years, which is the foundation of the Julian calendar; but that we ſhould approximate with more exactneſs, by intercalating only 7 days in the ſpace of 29 common years, or 8 in the ſpace of 33 years, and ſo on.

It appears farther, that as the fractions $\frac{4}{1}$, $\frac{29}{7}$, $\frac{33}{8}$, &c. are alternately leſs and greater than the fraction $\frac{86400}{20929}$, or $\frac{24^h}{5^h\ 48^m\ 49^s}$, the intercalation of 1 day in 4 years would be too much, of 7 days in 29 years too little, of 8 days in 33 years too much again, and ſo on; but each of theſe intercalations will be the moſt exact, that it is poſſible to make in the ſame ſpace of time.

Now if we arrange in two ſeparate ſeries, the fractions that are leſs, and thoſe that are greater, than the given fractions, we may inſert or interpolate between certain of thoſe fractions, as in the preceding examples.

Taking firſt thoſe fractions that are leſs than the given one, and their correſponding quotients, we ſhall have,

$$\begin{array}{cccc} & 1 & 1 & 15 \\ \frac{4}{1}, & \frac{33}{8}, & \frac{2865}{694}, & \frac{86400}{20929}. \end{array}$$

Hence it appears, that the only interpolation that can be performed is between the two fractions $\frac{2865}{694}$ and $\frac{86400}{20929}$; which will admit of 14 intermediate fractions; which being ſupplied, as in the former example, gives the following ſeries of converging fractions, each leſs than the fraction originally propoſed, *viz.*

$$\frac{4}{1},\ \frac{33}{8},\ \frac{161}{39},\ \frac{2865}{694},\ \frac{8434}{2043},\ \frac{14003}{3392},$$
$$\frac{19572}{4741},\ \frac{25141}{6090},\ \frac{30710}{7439},\ \frac{36279}{8788},$$
$$\frac{41848}{10137},\ \frac{52986}{12835},\ \frac{58555}{14184},\ \frac{64124}{15533},$$
$$\frac{69633}{16882},\ \frac{75262}{18231},\ \frac{80831}{19580},\ \frac{86400}{20929}.$$

And as the laſt fraction is the ſame as the given fraction, it is evident that this ſeries cannot be carried farther: hence, if we chooſe to admit theſe intercalations only in which the error is too much, the ſimpleſt and moſt exact will be thoſe of 1 day in 4 years, or of 8 days in 33 years, or of 39 in 161 years, and ſo on.

Let us now conſider the decreaſing fractions:

$$\begin{array}{cccc} 7 & 3 & 16 & 1 \\ \frac{29}{7}, & \frac{128}{31}, & \frac{2704}{655}, & \frac{5569}{1349}. \end{array}$$

Here it appears, that we may place 6 fractions before the firſt, 2 between the firſt and ſecond, 15 between the ſecond and third; but between the third and fourth no ſuch fraction can be inſerted.

Theſe interpolations being made, we ſhall have the following ſeries of decreaſing fractions, *viz.*

$$\frac{5}{1},\ \frac{9}{2},\ \frac{13}{3},\ \frac{17}{4},\ \frac{21}{5},\ \frac{25}{6},$$
$$\frac{29}{7},\ \frac{62}{15},\ \frac{95}{23},\ \frac{128}{31},\ \frac{289}{70},\ \frac{450}{109},$$
$$\frac{611}{148},\ \frac{772}{187},\ \frac{933}{226},\ \frac{1094}{265},\ \frac{1255}{304},$$

$$\frac{1416}{343},\ \frac{1577}{382},\ \frac{1738}{421},\ \frac{1899}{460},\ \frac{2060}{499},$$
$$\frac{2221}{538},\ \frac{2382}{577},\ \frac{2543}{616},\ \frac{2704}{655},\ \frac{5569}{1349},$$

which are all lefs than the propofed fraction, and expreffed in lefs terms; and each of which is nearer than any other fraction that can be expreffed in lefs terms.

Hence we conclude, that if we only attend to the intercalations in which the error is too fmall, the fimpleft and moft exact are thofe of 1 day in 5 years, of 2 days in 9 years, of 3 days in 13 years, of 4 days in 17 years, and fo on.

In the Gregorian calendar, only 97 days are intercalated in 400 years; but it is evident, from the preceding table, that it would be much more exact to intercalate 109 days in 450 years.

But it muft be obferved, that in the Gregorian reformation, the determination of the year given by Copernicus was made ufe of, which is $365^d\ 5^h\ 49'\ 20''$; and fubftituting this inftead of the fraction $\frac{86400}{20929}$, we fhall have $\frac{86400}{29060}$, or rather $\frac{540}{131}$; whence we may find, by the preceding method, the quotients 4, 8, 5, 3; and from them the principal fractions

$$\begin{array}{cccc} 4 & 8 & 5 & 3 \\ \frac{4}{1}, & \frac{33}{8}, & \frac{169}{41}, & \frac{540}{131}; \end{array}$$

which, except the two firft, are quite different from thofe before determined. However, we do not find amongft thefe fractions $\frac{400}{97}$, which is that adopted in the Gregorian calendar; and this fraction cannot even be found among the interpolated fractions, which might be inferted in the two feries, $\frac{4}{1}$, $\frac{169}{41}$, and $\frac{33}{8}$, $\frac{540}{131}$: for it is evident that it could only be between the laft two fractions, between which, becaufe of the number 3, (the correfponding quotient,) there can be but two fractions interpolated, which are $\frac{202}{49}$, and $\frac{371}{90}$: whence it appears, that it would have been more exact, if, in the Gregorian reformation, they had only intercalated 90 days in the fpace of 371 years.

If we reduce the fraction $\frac{400}{37}$, fo as to have for its numerator the number 86400, it will become $\frac{86400}{20952}$, which eftimates the tropical year at $365^d\ 5^h\ 49'\ 12''$.

In this cafe, the Gregorian intercalation would be quite exact; but as obfervations fhew that the year is fhorter than this by more than 20″, it is evident that, at the end of a certain period of time, we muft introduce a new intercalation.

If we adopt the determination of de la Caille, it follows, as the denominator 97 of the above fraction, *viz.* $\frac{400}{97}$, lies between the denominators of the fifth and fixth principal fractions already found, that, from what has been ftated above, the fraction $\frac{161}{39}$ will be nearer the truth than $\frac{400}{97}$. But as aftronomers are ftill divided with regard to the exact length of the year, we fhall refrain from giving a decifive opinion on this fubject. For more on the reduction of ratios, fee Lagrange's Additions to Euler's Elements of Algebra.

RATIOS, *Prime and Ultimate*, is a fpecies of computation, which we owe to the fertile genius of Newton. The ancients, in order to extend the geometry of right lines to curvilinear figures, had recourfe to the method of *exhauftions*, in which they made ufe of what is called the *reductio ad abfurdum* method, which, though logical, is extremely tedious, and to avoid which, Cavalerius propofed his method of *indivifibles*, publifhed in 1635 under the title of "Geometria Indivifibilibus," in which he was followed by Dr. Wallis and others of the 17th and 18th centuries. In this method every line was fuppofed to confift of a number of other lines indefinitely fmall; every curve was confidered as a polygon of an indefinite number of fides, each fide being indefinitely fmall; a folid was fuppofed to confift of an infinite number of plane fections, or of indefinitely thin laminæ, and fo on; fuppofitions which in many inftances led thofe, who adopted them, into errors and inconfiftencies, which indeed it was very difficult to avoid.

To obviate both the tedioufnefs of the ancients, and the inaccuracy of the moderns, Newton introduced his method of *prime* and *ultimate* ratios, the foundation of which is contained in the firft lemma of the firft book of his "Principia." Many difficulties have been ftarted, and much controverfy concerning the proof of it; all of which would have been avoided, had either the author or his readers obferved, that he is in reality laying down the definition of a term, *viz. being ultimately equal*, and not proving a propofition. Taking, therefore, this firft lemma for a definition, it may be illuftrated as follows.

Let there be two quantities, one fixed and the other varying, fo related to each other, that, 1ft, the varying quantity continually approaches to the fixed quantity; and, 2dly, that the varying quantity never reaches or paffes beyond that which is fixed: 3dly, that the varying quantity approaches nearer to the fixed quantity than by any affigned difference. Then is fuch a fixed quantity called the *limit* of the varying quantity; or, in other words, the varying quantity may be faid to be *ultimately equal* to the fixed quantity. Thefe three conditions may be expreffed more diftinctly thus. 1. The difference between the varying quantity and the fixed quantity muft continually decreafe. 2. This difference muft never become either nothing or negative. 3. This difference muft become lefs, in refpect of the fixed quantity, than by any affigned ratio; or the difference between the two quantities muft become a lefs part of the fixed quantity than any fractional part that is affigned, however fmall the fraction expreffing fuch part may be. Wherever thefe properties are found, the fixed quantity is called the *limit* of the varying quantity, or the varying quantity is faid to be *ultimately equal* to the fixed quantity. The laft expreffion, however, muft not be underftood in its ftrict literal fenfe, there being no *ultimate ftate*, no particular magnitude, that is the *ultimate magnitude* of fuch a varying quantity. Under the word quantity in this definition, muft be included not only numbers, lines, &c., but more efpecially ratios confidered as a peculiar fpecies of quantity; but as the con-

fideration

ſideration of ratios which have limits is difficult, we ſhall begin with examples of other quantities.

1ſt. Let there be formed a ſeries, whoſe firſt term is 1; ſecond, $\frac{1}{2}$; third, $\frac{1}{4}$; fourth, $\frac{1}{8}$, and ſo on; every term being half the preceding one, *viz.*

$$1,\ \frac{1}{2},\ \frac{1}{4},\ \frac{1}{8},\ \frac{1}{16},\ \frac{1}{32},\ \&c.$$

and let the ſum of an indefinite number of terms in this ſeries be conſidered as continually increaſed by the acceſſion of a new term; thus, the ſum of the two firſt is $1\frac{1}{2}$, of three terms is $1\frac{3}{4}$, of four terms is $1\frac{7}{8}$, &c. I ſay then, that the varying ſum of the terms of this ſeries continually approximates to the fixed number 2, as its limit. For the difference between 1, 2, 3, &c. terms and the number 2, will be the numbers $1,\ \frac{1}{2},\ \frac{1}{4},\ \frac{1}{8},\ \frac{1}{16}$, &c. ſucceſſively, *in infinitum.* Here it is evident, that the terms in this laſt ſeries, which expreſs the ſucceſſive differences between the increaſing ſum of the former ſeries and the number 2, *firſt*, continually decreaſe; and *ſecondly*, no term in this ſeries of differences can become either nothing or negative; and *thirdly*, we may continue this ſeries of ſucceſſive differences, till we arrive at a term which ſhall be a leſs part of the fixed number 2, than any fractional part of it that can be aſſigned; or ſo that this difference ſhall be leſs, when compared with the number 2, than any ratio aſſigned. The number 2, therefore, having the conditions laid down in the definition, is to be called the limit of the ſum of the terms of the infinite ſeries $1,\ \frac{1}{2},\ \frac{1}{4},\ \frac{1}{8},\ \frac{1}{16}$, &c.

And the ſame is to be underſtood of any other infinite ſeries; *viz.* if a number can be ſound having the above conditions, that ſeries is ſaid to have a limit; and the finding of this limit, is what is to be underſtood when mathematicians ſpeak of finding the ſum of ſuch an infinite ſeries.

No number leſs than 2, for inſtance $1\frac{7}{8}$, can be taken for the limit; for, in this caſe, it will not anſwer the ſecond condition of the definition. In the above example, the ſum of four terms of the ſeries is equal to $1\frac{7}{8}$, and the ſum of five terms exceeds it; therefore, the difference between this ſum and the number $1\frac{7}{8}$ propoſed as a limit is, in the former caſe zero, and in the latter negative. Neither can any number greater than 2, as for example 3, be taken for the limit, becauſe here the laſt condition will be wanting; for if the ſum of any aſſigned number of terms be leſs than 2, that ſum muſt always want more than unity of the number 3, and conſequently cannot approach nearer to 3, than any aſſigned quantity, as 1.

In like manner the ſum of the ſeries $1,\ \frac{1}{3},\ \frac{1}{9},\ \frac{1}{27}$, &c. continued *in infinitum*, will be $1\frac{1}{2}$; the ſeries of ſucceſſive differences being $\frac{1}{2},\ \frac{1}{6},\ \frac{1}{18},\ \frac{1}{54}$, &c. *in infinitum.*

Now, in order to make the preceding example general, let $a:b$ expreſs the common ratio of any ſeries of numbers in continual proportion, whoſe firſt term is unity, I ſay then, if a be greater than b, ſuch a ſeries will have for its limit the quantity $\frac{a}{a-b}$; or, in other words, the ſum of all the terms of ſuch an infinite ſeries will be $\frac{a}{a-b}$.

For the terms of this ſeries will be $1,\ \frac{b}{a},\ \frac{b^2}{a^2},\ \frac{b^3}{a^3},\ \frac{b^4}{a^4}$, &c.

Whence the ſum of 1 term is - - - 1

of 2 terms - - - $\frac{a+b}{a}$

of 3 terms - - $\frac{a^2+ab+b^2}{a^2}$

of 4 terms - $\frac{a^3+a^2b+ab^2+b^3}{a^3}$

Let each of theſe ſums be ſubtracted from the limit $\frac{a}{a-b}$, and we have the ſucceſſive differences $\left(\frac{b}{a-b}\right)$, $\left(\frac{b}{a-b}\cdot\frac{b}{a}\right)$, $\left(\frac{b}{a-b}\cdot\frac{b^2}{a^2}\right)$, $\left(\frac{b}{a-b}\cdot\frac{b^3}{a^3}\right)$, &c. or if n be any aſſigned number of terms, the difference between the ſum of that number of terms and the limit $\frac{a}{a-b}$, will be $\frac{b}{a-b}\cdot\frac{b^{n-1}}{a^{n-1}}$. Whence we may obſerve, 1ſt, that as the number of terms whoſe ſum is required increaſes, this difference continually decreaſes, becauſe $\frac{b}{a}$, being a fraction leſs than unity, its powers continually decreaſe. 2dly. This difference can never become nothing or negative; the powers of a fraction, though they decreaſe, being always real and affirmative. 3dly. This difference may become leſs in reſpect of $\frac{a}{a-b}$, than by any aſſigned ratio. For $\frac{a}{a-b} : \frac{b}{a-b}\cdot\frac{b^{n-1}}{a^{n-1}}$ as $a^n : b^n$; or as $\frac{a^n}{b^n}$ to 1; or as $\left(\frac{a}{b}\right)^n$ to 1: and ſince $\frac{a}{b}$ is greater than 1, and n indeterminate, the former term of the ratio may become greater than any aſſigned quantity, and therefore the ratio itſelf leſs than any ratio aſſigned.

The quantity $\frac{a}{a-b}$, having, therefore, the required conditions, is the limit of the above ſeries, or is equal to the ſum of all the terms continued *in infinitum.*

What has been proved above may be ſhewn more conciſely by dividing a by $a-b$, in the manner of diviſion in algebra, for the quotients will be the very ſeries propoſed in the example: for inſtance,

$$
\begin{array}{l}
a-b)\ a\ \left(1+\frac{b}{a}+\frac{b^2}{a^2}+\frac{b^3}{a^3}+\&c.\right.\\
\quad\ \ a-b\\
\hline
\qquad\quad b\\
\qquad\quad b-\frac{b^2}{a}\\
\hline
\qquad\qquad \frac{b^2}{a}\\
\qquad\qquad \frac{b^2}{a}-\frac{b^3}{a^2}\\
\hline
\qquad\qquad\qquad \frac{b^3}{a^2}
\end{array}
$$

And

And it may be further confirmed by multiplying the propofed feries by $a - b$, for the product will be a, all the terms except the firft deftroying each other.

We may alfo obferve, that if every term of the foregoing feries be multiplied by any number c, it will become $c + \frac{bc}{a} + \frac{b^2 c}{a^2} + \frac{b^3 c}{a^3} +$ &c.; a feries having the fame ratio, but whofe firft term is c; and it is therefore evident, that, in this cafe, to find the fum of all the terms, we muft multiply the former limit by c, whence it will become $\frac{ac}{a-b}$.

Before we begin to confider ratios, it may not be amifs to caution the reader againft confounding the terms of a ratio with the ratio itfelf: the terms of a ratio may vary in fome cafes through all degrees of magnitude, and yet the ratio remain conftant or invariable. In other inftances, varying the terms *in infinitum*, likewife varies the ratio *in infinitum;* while in others, though varying the terms may alfo vary the ratio, yet the laft ratio can never exceed certain limits.

Let x be any varying quantity; make $4x^2 + 3x = A$, and $2x^2 + x = B$, then will A and B alfo be varying quantities, as depending upon x; when x vanifhes, A and B will both vanifh; when x is infinite, they will be both infinite. I fay then the ratio of A to B, while x decreafes *in infinitum*, approximates to the ratio of 3 to 1.

For, firft, A is to B, as $4x^2 + 3x$ is to $2x^2 + x$, or as $4x + 3$ to $2x + 1$; where it is obvious, that as x decreafes, the quantities $4x$ and $2x$ alfo decreafe, and confequently the ratio of $4x + 3$ to $2x + 1$, or of A to B, approaches to that of 3 to 1. Secondly, the ratio of A to B can never exceed 3 to 1. For $6x^2 + 3x$ is to $2x^2 + x$, as 3 to 1; but $4x^2 + 3x$ is a lefs quantity than $6x^2 + 3x$, therefore $4x^2 + 3x$ is to $2x^2 + x$, or A is to B in a lefs ratio than $6x^2 + 3x$ to $2x^2 + x$; that is, lefs than the ratio of 3 to 1. Laftly, the ratio of A to B will approach nearer to the ratio of 3 to 1, than any affigned difference. For in the terms of this ratio, $4x + 3$ to $2x + 1$, the varying parts $4x$ and $2x$, by diminifhing x, may become lefs than any affigned quantity, while the other parts, 3 and 1, remain the fame; therefore the ratio of A to B will approach nearer to the ratio of 3 to 1, than by any affigned difference.

In like manner the ratio of A to B, while x increafes *in infinitum*, approximates to the ratio of 2 to 1, as its limit. For fince A is to B as $4x + 3$ to $2x + 1$, or as $4x + \frac{3}{x}$ to $2 + \frac{1}{x}$, it is obvious, that as x increafes, the quantities $\frac{3}{x}$ and $\frac{1}{x}$ decreafe, and confequently the ratio of $4 + \frac{3}{x}$ to $2 + \frac{1}{x}$, or of A to B, approaches to the ratio of 4 to 2, or of 2 to 1. For $4x^2 + 2x$ is to $2x^2 + x$, as 2 is to 1; but $4x^2 + 3x$, is a greater quantity than $4x^2 + 2x$, therefore $4x^2 + 3x$ is to $2x^2 + x$, or A is to B always in a greater ratio than 2 to 1. Laftly, the ratio of A to B will approach nearer to that of 2 to 1, than by any affigned difference. For in the terms of this ratio, $4 + \frac{3}{x}$ and $2 + \frac{1}{x}$, the variable parts $\frac{3}{x}$ and $\frac{1}{x}$, by increafing x, may become lefs than any affigned fraction, while the parts 4 and 2 remain the fame; therefore the ratio of A to B will approach nearer to the ratio of 4 to 2, or 2 to 1, than the affigned difference. Hence then we fee that though diminifhing x, and confequently diminifhing the terms A and B, we increafe their ratio, and on the contrary increafing thefe terms, by increafing the quantity x, we decreafe their ratio, yet there is a limit both to the increafe and decreafe of this ratio, although there be none to the terms themfelves which compofe it.

The ratio of 3 to 1, which limits the ratio of A to B, when thefe terms decreafe *in infinitum*, is called the *ultimate ratio* of the evanefcent quantities A and B. The ratio of 2 to 1, which is their other limit, is called the *ultimate ratio* of the quantities A and B increafing *in infinitum.*

Another example of a fimilar kind we have as follows. Let x be a varying quantity, and d a conftant one, then will $x + d$ and x be two varying quantities capable of all degrees of magnitude, I fay that the ratio of $x + d$ to x, while x increafes, will continually decreafe, but not beyond a certain limit, which is the limit of equality. On the contrary, if x decreafe, the ratio of $x + d$ to x will continually decreafe more and more *ad infinitum*, and never come to a limit. For $x + d$ is to x, as $1 + \frac{d}{x}$ to 1; now as x increafes, the fraction $\frac{d}{x}$ decreafes, and may become lefs than any affigned fraction; but the number 1, which is the other part of the antecedent of this ratio, remains the fame, as does likewife the confequent, therefore the ratio of $1 + \frac{d}{x}$ to 1, continually approximates to a ratio of equality. Secondly, it can never reach that ratio, becaufe $\frac{d}{x}$ has always fome magnitude, and confequently $1 + \frac{d}{x}$ always greater than 1. It therefore can never reach the ratio of equality, and much lefs can it pafs it, fo as to become a ratio *minoris inæqualitatis*, or a ratio in which the antecedent is lefs than the confequent. Laftly, the varying fraction $\frac{d}{x}$, as x increafes, will become lefs than any affigned fraction, while the other part of the antecedent, and likewife the confequent of this ratio, remain the fame. Therefore the ratio of $1 + \frac{d}{x}$ to 1, will approach nearer to the ratio of equality, than by any ratio that can be affigned, however fmall fuch ratio may be; therefore the ratio of equality is the limit of the ratio of $1 + \frac{d}{x}$ to 1, and confequently the limit of the ratio of $x + d$ to x, which continually decreafes, while the terms which compofe this ratio continually increafe *in infinitum.*

If x decreafe then $\frac{d}{x}$ will increafe, and may become greater than any affigned number, while the other part of the antecedent, and likewife the confequent, remain invariable; therefore the ratio of $1 + \frac{d}{x}$ to 1, and confequently the ratio of $x + d$ to x, as x decreafes, will become greater than any affigned ratio whatever, having no limit to its increafe.

We

We may farther obferve, that though the terms of this ratio, *viz.* $x + d$ to x, never approximate nearer to each other, their conftant difference being d, yet the ratio of the terms approximates to the ratio of equality; that is, though the terms get no nearer in their difference, yet, if we may be allowed the expreffion, they get nearer in their ratio. The difference of the terms, and the ratio of the terms, are ideas very diftinct from each other, and in no wife to be fo connected, but that one may vary whilft the other is conftant. Although the ratio of equality may ftrictly be called the *limit of the varying ratio* of the quantities $x + d$ and x, yet the terms of this ratio can never be ftrictly faid to be equal, nor *ultimately equal*, as that fuppofes an ultimate ftate in which they are equal; nor equal when they *vanifh into infinity*, or, when they pafs out of finity into infinity. There is no finite quantity next to infinity, no number, for inftance, which is the next number to infinity. Nor is there any ftep from a ftate of *nothingnefs* into finite exiftence; there is no fraction fo fmall as to be the very next fraction to nothing; no fraction can be affigned fo fmall, but another fraction may be affigned that is fmaller. Neither can we fay, in ftrictnefs, that two infinitely great numbers with a finite difference are equal, it being a propofition obvioufly abfurd and contradictory. There is no fuch thing in nature as an infinitely great number; and it is contradictory to fay of any two numbers, both that they have a difference, and that they are equal. Whoever confiders that the idea of infinity is a general or abftract idea, that the idea of number is always particular, that infinity is a *property* of numbers, a *property* of extenfion, &c. itfelf, will readily perceive that thefe and fuch like expreffions have no literal meaning. (See Locke, b. ii. ch. 16. and ch. 17.) As to the metaphorical ufe of them, to avoid circumlocution, or the introduction of new terms, it may be allowed, when once the literal meaning has been explained, in this, as well as on various other occafions both in fcience and in common life.

When the difference between any two quantities decreafes, fo as to become a lefs fractional part of the one of them than any affigned fractional part whatever; or when the difference between the terms of a ratio becomes lefs in refpect of one of them (the greater for example) than any affigned ratio, this may be expreffed by faying, that fuch difference *vanifhes* in refpect of that *greater* quantity.

But if the difference between two terms vanifh in refpect to one of them, it will alfo vanifh in refpect of the other. It is true that at any affigned time, when the terms have a particular magnitude, the difference between the terms will always be a lefs fractional part of the greater term than it is of the lefs term; but as this difference continually decreafes, it will become the fame fractional part of the lefs term that it was before of the greater, however fmall that fractional part of the greater term may be; therefore, if the difference vanifh with regard to one of them, it will vanifh alfo with regard to the other. We may, therefore, inftead of the third condition of our definition, fay, that "the difference muft vanifh in refpect either of the fixed or of the varying quantity, fince one of thefe implies the other."

The above is true as well for the cafe of two variables, as for one fixed and one variable, though both of fuch variables increafe or decreafe without limit. Thus, in the example above given, in which the terms were $x + d$ and x, and where x is continually increafing, the terms themfelves both continually increafe; for in this inftance it is obvious, that if the difference vanifh with refpect to one of the terms, it will alfo vanifh with refpect to the other. Let x be to d, at any affigned point of time, as n is to 1, and d at that inftant of time will be the $\frac{1}{n+1}$th part of the greater term, and the $\frac{1}{n}$th part of the lefs term: now, though the contemporary value of thefe fractions can never be equal, yet in fucceffion the value of the latter fraction will become whatever the former has been; therefore, if $\frac{1}{n+1}$ become lefs than any affigned fraction, fo will $\frac{1}{n}$ likewife; and thus, if the difference vanifhes with refpect to one of the terms, $x + d$, fo will it alfo vanifh with refpect of the other, x. And the fame would be true if the terms were x and $x - d$, all things elfe being as before.

Again, if x by decreafing vanifh with refpect to fome fixed quantity a, then will x, multiplied by a given number n, or $n\,x$, vanifh in refpect of a; or, which is the fame, if x vanifh in refpect of a, fo likewife will the quantity $n\,x$; bearing to x the affigned ratio of n to 1. For though at any particular point of time x is a fmaller fractional part of a than $n\,x$, yet x can be no affigned fractional part of a whatever; but by farther diminifhing x, the quantity $n\,x$ may become the fame fractional part of a that x was before. If, then, x may become equal to, or lefs than, any affigned fractional part of a, fo likewife may $n\,x$; that is, if x vanifh in refpect of a, fo likewife will $n\,x$.

For a like reafon, if x vanifh in refpect of any quantity, it will likewife vanifh in refpect to that quantity multiplied or divided by any number; or it will vanifh in refpect of a quantity, bearing to a any affigned ratio, as that of m to 1. Thus, if x vanifh in refpect of a, it will alfo vanifh in refpect of $3\,a$, $2\,a$, $\frac{1}{2}\,a$, &c. Or, if any fraction vanifh in refpect to the diameter of a circle, it will likewife vanifh in refpect of the radius. For whatever part of the diameter the line x may be at any affigned point of time, let x farther decreafe, till it be half what it was at that affigned time, and it will now be the fame part of the radius that it was before of the diameter; and the fame with various other lines and quantities. We have fhewn, in the preceding part of this article, that the ratio which two quantities bear to each other may have a limit, although the terms themfelves may increafe or decreafe perpetually without limit. 1. If the terms approximate towards each other; 2, if the lefs never pafs the greater; and, laftly, if their difference vanifh in refpect of either term, then the limit of their varying ratio is that of equality: and this, whether the terms themfelves are fuch, as by increafing they both become greater than any affigned quantity, or, which is more common, fuch as by decreafing become lefs than any affigned quantity, or as it is called, *infinitely fmall*. Becaufe the idea of the terms of a ratio is lefs abftract than that of the ratio itfelf, it is more ufual to fay that the terms themfelves in this cafe are ultimately equal, though, ftrictly, it is the ratio only of the terms that comes to a limit, for the terms themfelves are fuppofed to increafe or decreafe without limit, or as we commonly fay, *ad infinitum*.

Prop.—In a circle whofe centre is C, (*Plate* XIII. *Analyfis*, *fig.* 9.) radius C A, diameter A a, let A B be the chord, F B the fine, and A D the tangent of the arc A B. I fay, that while the arc A B continually decreafes without limit; 1ft, the fine continually approximates to the tangent; 2dly, the fine never exceeds the tangent; 3dly, their difference will vanifh in refpect of either fine or tangent.

Firft; B F : D A :: C F : C A, but while the arc decreafes, C F approximates to C A; B F approximates to D A.

D A. 2dly. C F can never exceed C A; therefore B F can never exceed D A. 3dly. The arc continually decreasing without limit, vanishes in respect of the diameter, which is fixed; therefore the chord A B, which is less than the arc, likewise vanishes in respect of the diameter A *a*. But A *a* : A B :: A B : A F; therefore, if A B vanishes in respect of A *a*, A F will vanish in respect of A B; and much more will A F vanish in respect of A *a*; but if A F vanish in respect of A *a*, it will also vanish in respect of $\frac{1}{2}$ A *a*, or C A.

Now C A : C F :: A D : F B, and by division of proportion C A : A F :: A D : A D − F B. Therefore, as A F vanishes in respect of C A, so does A D − F B (the difference of the sine and tangent) vanish in respect to A D the tangent, and consequently in respect of F B the sine. Whence we see, that while the arc continually decreases without limit, the sine approximates to the tangent; 2dly, the sine never exceeds the tangent; 3dly, although the sine and tangent both vanish in respect of the radius, yet their difference vanish in respect of these quantities themselves. Therefore the ratio of equality is the limit of the varying ratio which the sine and tangent have to each other, while they both decrease perpetually without limit, or it is their *ultimate ratio*, or, as we may say, they are *ultimately equal.* The sine is less than the chord; for in the right-angled triangle A F B, the side B F is less than the hypothenuse A B; the chord is less than the arc; this is self-evident, the chord being a straight line, and the arc a curve, both terminated by the same points A and B. The arc is less than the tangent; for from the point D draw another tangent to the circle in H; and the lines A B H, A D H, will be terminated by the same points A and H; and will have the concavities turned the same way; therefore the included arc A B H will be less than the sum of the two equal tangents D A and D H; consequently half that arc, or A B, will be less than half the sum of the tangents A D.

Cor. 1.—Hence the sine, chord, arc, and tangent, are all ultimately in a ratio of equality. This may appear because the chord and arc are included between the sine and tangent, but perhaps more plainly thus. Of these four quantities, *viz.* the sine, chord, arc, and tangent, the sine is the least, and the tangent the greatest; therefore, the difference between the sine and the tangent is greater than the difference between any other two of these four quantities. If, therefore, the greatest of all those differences vanish in respect of the least of all those quantities, much more will the difference between any other two of these four quantities vanish in respect of the quantities themselves.

Cor. 2.—Join B *a*, and in the right-angled triangle B F *a*, the hypothenuse B *a* is greater than the side F *a*; therefore A *a* − B *a* is less than A *a* − F *a*, or than A F; but while the arc A B decreases continually without limit, A F vanishes in respect of A *a*; much more then does A *a* − B *a*, the difference A *a* and B *a*, vanish in respect of A *a*; therefore the ultimate ratio of A *a* to B *a* is that of equality; and the ultimate ratio of $\frac{1}{2}$ A *a*, or B C to B A, is that of 2 to 1. See other applications of these principles in Ludlam's "Rudiments of Mathematics," from which the preceding article has been abstracted; Newton's "Principia," lib. i.; Smith's "Fluxions;" and Saunderson's "Algebra."

RATIO, in our *Law Writers,* is used for a judgment given in a cause.

Hence, *ponere ad rationem* is to cite one to appear in judgment. Walsingh. 88.

RATIO *Status*, *Ragione di stato.* See REASON *of State.*

RATIO *Victus*. See VICTUS.

RATIOCINATION, the act of reasoning.

RATION, or RATIAN, in the *Army*, a pittance or proportion of ammunition, bread, drink, or forage, distributed to each soldier for his daily subsistence.

Some write the word *racion*, and borrow it from the Spanish *racion;* but they both come from the Latin *ratio.* In some parts they call it a *reason.*

The horse have rations of hay and oats, when they cannot go out to forrage. See FORRAGE.

The rations of bread are regulated by weight. The ordinary ration of a foot soldier is a pound and a half of bread *per* day. The officers have several rations, according to their quality, and the number of attendants that they are obliged to keep.

When the ration is augmented on occasions of rejoicing, it is called a *double* ration.

The ships' crews have also their rations or allowances of biscuit, water, &c. proportioned according to their stock. The usual ration at sea, particularly among the Portuguese, &c. is a pound and half of biscuit, a pint of wine, and a quart of fresh water *per* day; and each month an arrobe, or thirty-one pounds of salt meat, with some dried fish and onions.

RATIONABILES EXPENSÆ, *Reasonable Expences.* The commons in parliament, as well as the proctors of the clergy in convocation, were anciently allowed *rationabiles expensas;* that is, such allowance as the king, considering the prices of all things, shall judge meet to impose on the people to pay for the subsistence of their representatives.

This in the 17th of Edward II. was settled at ten groats *per* day for knights, and five for burgesses: afterwards, four shillings a day for knights, and two shillings for burgesses; which was then deemed an ample retribution, both for expences, for labour, attendance, neglect of their own affairs, &c. See BURGESS, and KNIGHTS *of the Shire.*

RATIONABILI *Parte Bonorum*, a writ which lies for the wife, against the executors of her husband, denying her the third part of her husband's goods, after debts and funeral expences paid.

Fitzherbert quotes Magna Charta, and Glanville, to prove, that, by the common law of England, the goods of the deceased, his debts first paid, should be divided into three parts; of which his wife is to have one, his children a second, and the executors a third; adding, that this writ lies as well for the children, &c. as the wife. Such is the general law of Scotland at this day. And whatever may have been the custom of late years, in many parts of the kingdom, or however it was introduced in derogation of the old common law, the ancient method continued in use in the province of York, the principality of Wales, and the city of London, till very modern times; when in order to favour the power of bequeathing, and to reduce the whole kingdom to the same standard, three statutes have been provided; the one 4 & 5 W. & M. c. 2. explained by 2 & 3 Ann. c. 5, for the province of York; another, 7 & 8 W. III. c. 38. for Wales; and a third, 11 Geo. I. c. 18. for London (see CUSTOM *of London*); whereby it is enacted, that persons within those districts, and liable to those customs, may, if they think proper, dispose of all their personal estates by will; and the claims of the widow, children, and other relations, to the contrary, are totally barred. Thus is the old common law now utterly abolished throughout all the kingdom of England, and a man may devise the whole of his chattels as freely as he formerly could his third part or moiety. Blackst. Com. b. ii.

Recto de RATIONABILI *Parte.* See RECTO.

RATIONABILIBUS Divisis, is a writ that lies where two lords have fignories joining together, for him that finds his wafte encroached upon, within the memory of man, againft the encroacher, thereby to rectify the bounds of the fignories: in which refpect, Fitzherbert fays, it is of the nature of a writ of right.

RATIONABILIS Dos, a third part of fuch lands and tenements as the hufband was feifed of at the time of the efpoufals, with which his wife was formerly endowed by the common law, if no fpecific dotation was made at the church porch. See Dower and Jointure.

RATIONAL, Reasonable. See Reason.

Rational *Fable*. See Fable.

Rational *Fractions*, in *Arithmetic* and *Analyfis*, are thofe fractions into which no furd or radical quantity enters; as $\frac{7}{8}$, $\frac{19}{27}$, $\frac{x^2+1}{x^3+1}$, $\frac{x^3+x^2+ax}{x^4+bx^3+cx}$, &c.

The decompofition of rational fractions into fimple fractions, that is, the decompofition of them into other fractions whofe fum is equal to that propofed, is an important problem, as connected with the integral calculus, or inverfe method of fluxions, which was firft inveftigated by Leibnitz, but has fince been much extended and fimplified by the refearches of Euler, La Grange, La Croix, and other eminent analyfts.

The decompofition of numeral fractions into their partial fractions, is, perhaps, rather a fubject of curiofity than utility, yet as connected with, and leading to, the decompofition of rational algebraic fractions, it may not be amifs to give here a fketch of the procefs by which it is accomplifhed, previous to entering upon the latter fubject.

On the decompofition of rational numeral fractions, into others having prime denominators.

It is to be obferved, that this can only be effected in the cafe of a compofite denominator, or rather, there will be no difficulty in any other cafe, as it will require only a feparation of the numerator into any parts at pleafure, the fum of which is obvioufly equal to the fraction propofed; we fhall therefore only confider thofe fractions having compofite denominators, which are to be refolved into others having prime denominators; and even in this cafe there may be fractions that will not admit of decompofition, as will appear from what follows. This decompofition is effected, when poffible, by means of the indeterminate analyfis; *viz.* let $\frac{m}{n}$ be the given fraction, and fuppofe, in the firft inftance, that its denominator confifts of two prime factors, or $n = ab$, it will then be to find $\frac{m}{ab} = \frac{p}{a} + \frac{q}{b}$, or $aq + bp = m$; p and q being the required numerators of the two partial fractions, and which values of p and q are eafily found from the above equation $aq + bp = m$, on the principles explained under the article Indeterminate *Analyfis*, fubject however to the fame limitation there mentioned; *viz.* the above equation is always poffible, provided $m > ab - a - b$, but in other cafes it may or may not admit of folution.

If the given fraction be $\frac{m}{abc}$, then we may firft refolve it into two fractions, and one of thefe into two others; thus, let $\frac{m}{abc} = \frac{p}{ab} + \frac{q}{c}$, then we have $abq + cp = m$, from which equation p and q may be found. Again, let $\frac{p}{ab} = \frac{r}{a} + \frac{s}{b}$, which gives $as + rb = p$, whence r and s may be determined, and we fhall thus obtain $\frac{m}{abc} = \frac{r}{a} + \frac{s}{b} + \frac{q}{c}$, as required. In all thefe cafes it is obvious, that the fraction may be decompofed into partial fractions, in as many different ways as the indeterminate equation on which it depends admits of different anfwers.

Example.—Find two fractions, having prime denominators, whofe fum fhall be equal to $\frac{19}{35}$, or to $\frac{19}{7 \cdot 5}$.

Let the required fractions be $\frac{p}{7} + \frac{q}{5}$, then $\frac{5p+7q}{35} = \frac{19}{35}$; therefore $5p + 7q = 19$, whence $p = 1$, and $q = 2$ (fee Indeterminate *Analyfis*); and confequently the required partial fractions are $\frac{1}{7}$ and $\frac{2}{5}$.

Example 2.—Find three fractions, whofe fum is equal to $\frac{401}{315}$.

The three factors of 315 are 5, 7, 9, which are of neceffity the denominators of the required fractions. Suppofe then firft, that $\frac{401}{315} = \frac{p}{35} + \frac{q}{9}$, whence we have $9p + 35q = 401$, which gives $p = 29$, and $q = 4$; therefore $\frac{401}{315} = \frac{29}{35} + \frac{4}{9}$. Again, let $\frac{29}{35} = \frac{r}{7} + \frac{s}{5}$, or $5r + 7s = 29$; this gives $r = 3$ and $s = 2$, fo that $\frac{29}{35} = \frac{3}{7} + \frac{2}{5}$, and confequently $\frac{401}{315} = \frac{2}{5} + \frac{3}{7} + \frac{4}{9}$, as required. And in the fame manner the decompofition may be obtained in any other cafe, which falls within the limits above ftated.

On the decompofition of rational algebraic fractions, and its application to the integral calculus.

$$\text{Let } \frac{\text{N}}{\text{D}} = \frac{a + bx + cx^2 + dx^3 + \&\text{c.} \ldots px^{m-1}}{a' + b'x + c'x^2 + d'x^3 + \ldots . p'x^{m-1} + q'x^m}$$

be any rational fraction, whofe decompofition into fimple fractions is required, and whofe numerator is at leaft one degree lower than its denominator, to which form it may always be reduced by divifion, if it fhould prefent itfelf under a different form.

The denominator of this fraction, from the known theory of equations, may be fuppofed to be made up of as many fimple factors as is equal to the higheft power of x contained in it, and which factors may be found by determining the roots of the equation formed by putting the whole denominator equal to zero. Let therefore $a' + b'x + c'x^2 + d'x + \ldots . x^m = 0$, and fuppofe the roots of this equation to be r, r', r'', r''', r'''', &c., and we fhall have $a' + b'x + c'x^2 + d'x^3 + \ldots . x^m = (x - r)(x - r')(x - r'')(x - r''')$, &c.

And therefore our propofed fraction $\frac{\text{N}}{\text{D}}$ may now be put under the form

$$\frac{\text{N}}{\text{D}} = \frac{a + bx + cx^2 + dx^3 + \ldots . px^{m-1}}{(x-r)(x-r')(x-r'')(x-r''')}, \text{ \&c.}$$

and thefe factors are now to form the denominators of the

the simple fractions sought. Let A, A′, A″, A‴, &c. represent their numerators, so that

$$\frac{N}{D} = \frac{A}{x-r} + \frac{A'}{x-r'} + \frac{A''}{x-r''} + \&c. \frac{A^{(n-1)}}{x-r^{(n-1)}}$$

Reduce now these several simple fractions to a common denominator by the usual rule, and add their several numerators together; then comparing the co-efficients of the like powers of x in the numerator of this new fraction, with those in the numerator proposed, we shall obtain sufficient equations for determining the proper values of A, A′, A″, A‴, &c. and the decomposition will be effected as proposed. This will be better understood from a partial example.

Let us therefore assume the fraction $\frac{6x^2-4x-6}{x^3-6x^2+11x-6}$, which it is required to resolve into its simple fractions.

Here the roots of the denominator, by making it equal to zero, are 1, 2, and -3, whence the proposed equation may be put under the form $\frac{x^2-4x-6}{(x-1)(x-2)(x+3)}$.

Make now this fraction $\frac{x^2-4x-6}{(x-1)(x-2)(x+3)} = \frac{A}{x-1} + \frac{A'}{x-2} + \frac{A''}{x+3}$, which being reduced to a common denominator, and added together, give $\frac{x^2-4x-6}{x^3-6x^2+11x-6}$ $= \frac{A(x-2)(x+3)+A'(x-1)(x+3)+A''(x-1)(x-2)}{x^3-6x^2+11x-6}$ $= (A+A'+A'')x^2 + (A+2A'-3A'')x - (6A + 3A' - 2A'')$ whence

$$\begin{aligned} A + A' + A'' &= 6 \\ A + 2A' - 3A'' &= -4 \\ 6A + 3A' - 2A'' &= 6 \end{aligned}$$

from which we readily draw $A = 1$, $A' = 2$, $A'' = 3$; so that the required fractions are $\frac{1}{x-1} + \frac{2}{x-2} + \frac{3}{x+3}$.

If therefore the fluent of $\frac{(6x^2-4x-6)\dot{x}}{x^3-6x^2+11x-6}$ were required, we might immediately reduce the problem to finding the fluents of $\frac{\dot{x}}{x-1} + \frac{2\dot{x}}{x-2} + \frac{3\dot{x}}{x+3}$, which are known, being hyp. log. $(x-1)$ + 2 hyp. log. $(x-2)$ + 3 hyp. log. $(x+3)$ = hyp. log. $[(x-1)(x-2)^2(x+3)^3]$

The same method may be employed for all rational fractions, whose denominators are resolvable into unequal simple factors, but as this cannot be generally effected when the highest power of the variable quantity exceeds the fourth degree, we are necessarily limited in our application of the rule, in consequence of the imperfection which still attends the general solution of equations. In the case, however, of equal factors in the denominator, a different process is required, which we will explain, after illustrating the above rule by two or three examples.

Required the fluent of $\frac{(1+x)\dot{x}}{x-x^2}$ by resolving it into its simple fractions.

Here the factors of the denominator being x and $1-x$, we make

$$\frac{(1+x)\dot{x}}{x-x^2} = \frac{A\dot{x}}{x} + \frac{A'\dot{x}}{1-x} = \frac{(A+(A'-A)x)\dot{x}}{x-x^2},$$

whence $A = 1$, and $A' - A = 1$, or $A' = 2$, therefore

$$\text{fluent } \frac{(1+x)\dot{x}}{x-x^2} + \text{flu.} \frac{\dot{x}}{x} + \text{flu.} \frac{2\dot{x}}{1-x}$$

which are known.

Required the fluent of $\frac{(x-1)\dot{x}}{1-4x+2x^2}$, or of $\frac{\frac{1}{2}(x-1)\dot{x}}{\frac{1}{2}-2x+x^2}$.

Here, by making $x^2 - 2x + \frac{1}{2} = 0$, we have $x = 1 \pm \frac{1}{2}\sqrt{2}$; make, therefore,

$$\frac{(\frac{1}{2}x-\frac{1}{2})\dot{x}}{\frac{1}{2}-2x+x^2} = \frac{A\dot{x}}{x-1-\frac{1}{2}\sqrt{2}} + \frac{A'\dot{x}}{x-1+\frac{1}{2}\sqrt{2}}$$

$$= \frac{A(x-1+\frac{1}{2}\sqrt{2})\dot{x} + A'(x-1-\frac{1}{2}\sqrt{2})\dot{x}}{\frac{1}{2}-2x+x^2}$$

Here we have $A + A' = -\frac{1}{2}(1-\frac{1}{2}\sqrt{2})A + (1+\frac{1}{2}\sqrt{2})A' = -\frac{1}{2}$, whence we have $A = -\frac{1}{4}$, and $A' = -\frac{1}{4}$, therefore fluent of $\frac{(x-1)\dot{x}}{x-x^2}$ = flu. $\frac{-\frac{1}{4}\dot{x}}{x-1+\frac{1}{2}\sqrt{2}}$ $+ \frac{-\frac{1}{4}\dot{x}}{x-1-\frac{1}{2}\sqrt{2}}$, which are known.

We have hitherto considered the factors of the denominators of the proposed fractions to be all unequal; when any number of them are equal, a little difference in the operation is then required; for it is obvious that if two of our fractions were of the same form, for example $\frac{A}{x-r} + \frac{A'}{x-r}$, these two would form, in fact, but one fraction $\frac{A+A'}{x-r}$, which leads us to no useful result.

In case of equal factors, therefore, we must proceed as follows: let the proposed fraction be

$$\frac{a+bx+cx^2+dx^3+\ldots.qx^{m-1}}{(x-p)^n(x-r)(x-r')(x-r'')} \&c.$$

Assume it equal to

$$\frac{B}{(x-p)^n} + \frac{B'}{(x-p)^{n-1}} + \frac{B''}{(x-p)^{n-2}} + \ldots. \frac{B^{(n-1)}}{x-p} +$$

$$\frac{A}{x-r} + \frac{A'}{x-r'} + \frac{A''}{x-r''} + \&c.$$

Where the upper line represents the fractions due to the n equal factors, and the lower those due to the $\frac{m}{n}$ unequal factors.

Let now these fractions be reduced to a common denominator, and the co-efficients equated as before, which will give us the required values of the several numerators sought.

Example.—It is required to convert $\frac{1-5x}{(1-x)(1+x)^2}$ into its equivalent simple fractions.

$$\text{Assume } \frac{1-5x}{(1+x)^2(1-x)} = \frac{B}{(1+x)^2} + \frac{B'}{(1+x)} + \frac{A}{(1-x)}$$

$$= \frac{B+(1+x)B'}{(1+x)^2} + \frac{A}{1-x} =$$

$$\frac{B(1-x)+B'(1-x^2)+A(1+2x+x^2)}{(1+x)^2(1-x)} =$$

$$\frac{B+B'+A+(2A-B)x+(A-B')x^2}{(1+x)^2(1-x)}$$

whence

whence $B + B' + A = 1$
$2A - B = -5$
$A - B' = 0$
therefore $B = 3$, $B' = -1$, and $A = -1$,
consequently

$$\frac{1-5x}{(1+x)^2(1-x)} = \frac{3}{1+x^2} - \frac{1}{1+x} - \frac{1}{1-x}$$

We have in both the preceding cases extended the calculation to a greater length than it is necessary to observe in practical cases, in order that the reader might see distinctly the principles on which the decomposition depends. We shall now furnish him with an easier practical method, which we have extracted from Bonnycastle's Algebra, vol. i.

1. When the factors of the denominator of the given fraction are all unequal, or of the form

$$\frac{N}{D} = \frac{A}{x-r}, \frac{A'}{x-r'}, + \frac{A''}{x-r''} + \frac{A'''}{x-r'''} + \&c.$$

take that which constitutes the denominator of the simple fraction which is to be found, and let S denote the product of all the remaining fractions; then if the root or value of x, in that factor, be substituted for x in the formula $\frac{N}{S}$, it will give the numerator of the fraction required.

2. If some of the factors are equal and others unequal, or of the form

$$\frac{N}{D} = \frac{A}{x-r}, \frac{A'}{x-r'}, \&c. \ldots + \frac{B}{(x-p)^n} + \frac{B'}{(x-p)^{n-1}} + \&c.$$

let S denote the product of all the factors in the denominator, except one, as before; then find the simple fractions due to the unequal fractions as above, and for those of the equal factors proceed as follows:

1. $B = \frac{N}{S}$, taking x in N, and $S = p$.

Let $Q = \frac{N - BS}{x-p}$, then

2. $B' = \frac{Q}{S}$, taking x in Q, and $S = p$.

Let $Q' = \frac{Q - B'S}{x-p}$, then

3. $B'' = \frac{Q'}{S}$, taking x in Q', and $S = p$.

Let $Q'' = \frac{Q' - B''S}{x-p}$, then

4. $B''' = \frac{Q''}{S}$, taking x in Q'', and $S = p$.

&c. &c.

Which operation being performed, the sum of the fractions thus obtained, together with the former, will give all the simple fractions into which the given fraction is resolvable.

Example 1.—It is required to convert the rational fraction $\frac{1+x^2}{x-x^3}$ into its equivalent simple fractions.

Here $\frac{1+x^2}{x-x^3} = \frac{A}{0+x} + \frac{A'}{1-x} + \frac{A''}{1+x}$; whence, by the preceding rule,

$$A = \frac{N}{S} = \frac{1+x^2}{1-x^2} = 1; \text{ being } 0 = x$$

$$A' = \frac{N}{S} = \frac{1+x^2}{x+x^2} = 1; \text{ being } 1 = x$$

$$A'' = \frac{N}{S} = \frac{1+x^2}{x-x^2} = -1; \text{ being } 1 = -x.$$

The required fractions are therefore

$$\frac{1}{x} + \frac{1}{1-x} - \frac{1}{1+x} = \frac{1+x^2}{x-x^3}.$$

Example 2.—It is required to convert the rational fraction $\frac{N}{D} = \frac{1}{x^3(1-x)^2(1+x)}$ into its equivalent simple fractions. Here

$$\frac{N}{D} = \frac{A}{1+x} + \frac{B}{x^3} + \frac{B'}{x^2} + \frac{B''}{x} + \frac{C}{(1-x)^2} + \frac{C'}{1-x};$$

whence for $1+x$, the first factor, we have

$$A = \frac{N}{S} = \frac{1}{x^3 - 2x^4 + x^5} = \frac{1}{4}, \ x \text{ being} = -1$$

$$B = \frac{N}{S} = \frac{1}{1 - x - x^2 + x^3} = 1, \ x \text{ being} = 0.$$

$$\text{Let now } Q = \frac{N - BS}{x+p} = \frac{x + x^2 - x^3}{x} = 1 + x - n^2$$

$$B' = \frac{Q}{S} = \frac{1 + x - x^2}{1 - x - x^2 + x^3} = 1, \ x \text{ being} = 0.$$

$$\text{Let } Q' = \frac{Q - B'S}{x-p} = \frac{2x - x^3}{x} = 2 - x^2$$

$$B'' = \frac{Q'}{S} = \frac{2 - x^2}{1 - x - x^2 + x^3} = 2, \ x \text{ being} = 0.$$

Again, for $(1-x)^2$

$$C = \frac{N}{S} = \frac{1}{x^3 + x^4} = \frac{1}{2}, \ x = \text{being} = 1.$$

$$\text{Let now } R = \frac{N - CS}{x-p} = \frac{1 - \frac{1}{2}x^3 - \frac{1}{2}x^4}{x-1} = 1 + x + x^2 + \tfrac{1}{2}x^3$$

$$C' = \frac{R}{S} = \frac{1 + x + x^2 + \frac{1}{2}x^3}{x^3 + x^4} = \tfrac{7}{4}, \ x \text{ being} = 1.$$

$$\text{Therefore } \frac{1}{x^3(1-x)^2(1+x)} = \frac{1}{x^3} + \frac{1}{x^2} + \frac{2}{x} + \frac{1}{2(1-x)^2} + \frac{1}{4(1-x)} - \frac{1}{3(0+x)}, \text{ as required.}$$

It is obvious, as we have before stated, that this decomposition of rational fractions must necessarily be affected as to its general application, by the imperfection of the theory of equations, which will not admit of a practical resolution of the denominator into its simple factors in all cases. It will also further appear, that, in case of any of the roots being imaginary, the same will necessarily enter into the numerators of the simple fractions. But this difficulty may be avoided: for since the imaginary roots of equations always enter in pairs, and the product of such pairs of roots being always real, being of the form

$$x^2 + 2\alpha x + \alpha^2 + \beta^2,$$

we may, instead of resolving the fractions into the simple fractions $\frac{A}{x-r}$, $\frac{A'}{x-r'}$, $\frac{A''}{x-r''}$, &c. resolve it into as many of these fractions as it has rational simple factors, and into as many fractions of the form $\frac{Bx + C}{x^2 + \alpha x + \alpha^2 + \beta^2}$, as it has pairs of imaginary factors, and then proceed as before.

We

We cannot extend our remarks to a greater length in this article; we muſt, therefore, refer the reader who wiſhes to ſee theſe principles more completely developed, to Euler's Analyſis Infinitorum, vol. i. ch. 2 and 11; to La Croix's Algebra, and his Calcul Differentiel et Calcul Integral. See alſo Bonnycaſtle's Algebra, and Simpſon's Fluxions.

RATIONAL or *true horizon*, is that whoſe plane is conceived to paſs through the centre of the earth; and which therefore divides the globe into two equal portions, or hemiſpheres. See HORIZON.

It is called the *rational* horizon, becauſe only conceived by the underſtanding; in oppoſition to the *ſenſible* or apparent horizon, which is viſible to the eye.

RATIONAL *integer*, or *whole number*, is that of which unity is an aliquot part. See NUMBER, and ALIQUOT *part*.

RATIONAL *mixt number* is that conſiſting of an integer, and a fraction; or of unity, and a broken number.

Commenſurable quantities are defined by being one to another as one rational number to another.

For unity is an aliquot part of a rational number; and a fraction has ſome aliquot part common with unity; in things, therefore, that are as a rational to a rational number, either the one is an aliquot part of the other, or there is ſome common aliquet part of both; therefore they are commenſurable.

Hence, if a rational number be divided by a rational, the quotient is always a rational.

RATIONAL *Phyſicians*, in ancient medical hiſtory, the phyſicians of the *dogmatic* ſect, who ſtood in oppoſition to the *empiric* ſect; the former appealing to certain theoretical principles in the application of remedies, while the latter reſted entirely upon experience, and diſclaimed all knowledge of firſt principles. The tenets of both theſe ſects have been handed down to us by a claſſic author, Celſus, and have been given at length under a former article. See EMPIRIC.

RATIONAL *Quantity*, or *number*, a quantity or number commenſurable to unity.

Suppoſing any quantity to be 1, there are infinite other quantities, ſome of which are commenſurable to it, either ſimply, or in power: theſe Euclid calls *rational quantities*. The reſt, that are incommenſurable to 1, he calls *irrational quantities*, or *ſurds*.

RATIONAL *Ratio*. See RATIO.

RATIONAL *Soul*. See SOUL.

RATIONALE, a ſolution or account of the principles of ſome opinion, action, hypotheſis, phenomenon, or the like. Hence,

RATIONALE is alſo the title of ſeveral books. The moſt conſiderable is the "Rationale of Divine Offices," by Guil. Durandus, a celebrated ſchool-divine, biſhop of Mende, finiſhed in 1286, as he himſelf tells us. See PRINTING.

RATIONALE alſo denotes an ancient ſacerdotal veſtment, worn by the high-prieſt under the old law; and called by the Hebrews, חשן, *hhoſchen*; by the Greeks, λογιον; by the Latins, *rationale* and *pectorale*; and by the Engliſh tranſlators, *breaſt-plate*.

The rationale was a piece of embroidered ſtuff worn on the breaſt, about a ſpan ſquare. Du-Cange deſcribes it as a double ſquare of four colours, interwoven with gold, and ſet with twelve precious ſtones in four rows, on which were engraven the names of the twelve tribes, and faſtened to the ſhoulder by two chains and two hooks of gold. The form of the rationale was preſcribed by God himſelf, Exod. xxviii. 15—29.

A rationale appears alſo to have been anciently worn by the biſhops under the new law. But authors are in doubt about its form; ſome will have it reſemble that of the Jews; others take it to be only the pallium.

RATIONALIS, an officer mentioned in ſeveral ancient inſcriptions.

Lampridius, in the life of Alex. Severus, uſes rationalis as ſynonimous with procurator.

The rationales were intendants or ſurveyors under the emperors; and though Lampridius pretends they were firſt eſtabliſhed by Severus, it is evident there were ſome under Auguſtus.

RATIONARIUM, among the Romans, a book which contained the accounts of the empire. It was otherwiſe called *breviarium*. See BREVIARY.

RATIONIS ENS. See ENS.

RATIONIS *Diſtinctio*. See DISTINCTIO.

RATIONIS *Os*, in *Anatomy*, the bone of the forehead, otherwiſe called os frontis.

RATISBON, or REGENSPERG, in *Geography*, an imperial city of Germany, in the circle of Bavaria, and capital of a biſhopric of the ſame name, ſituated at the conflux of the Regen and of the Danube. The town is large, populous, and fortified; and was anciently the capital of Bavaria, and the reſidence of its dukes. The emperor Frederic I. annexed it to the empire. This town is a ſtaple, but neither its manufactures nor trade are very conſiderable; corn, wood, and proviſions, are ſent by the Danube to Vienna. The number of inhabitants is about 24,000; 62 miles N.E. of Augſburg. N. lat. 48° 55′. E. long. 12° 50′.

The biſhopric of Ratiſbon comprehends about 1383 pariſhes; and was founded, as it has been ſuppoſed, by St. Boniface, in the year 736. The ſeat of the biſhop is at Ratiſbon, where, however, he has no juriſdiction.

RATISKA, a town of Immeritia; 35 miles N.E. of Cotatis.

RATKAI, GEORGE, in *Biography*, born in 1613, of a noble family, in Hungary, entered into holy orders, and was made canon of the church of Zagrab. He obtained the eſteem of the viceroy of Croatia, John Draſkovitz, who engaged him to compoſe the hiſtory of that province, and gave him free acceſs to its archives. He accordingly publiſhed, in 1652, a very learned work, entitled "Memoria Regum et Banorum regnorum Dalmatiæ, Crotiæ, Slavoniæ, inchoata ab origine ſua uſque ad annum." Gen. Biog.

RATLINES, or, as the ſeamen call them, *Rutlins*, or *Rattlings*, are certain ſmall lines which traverſe the ſhrouds of a ſhip horizontally, at regular diſtances above the dead-eyes upwards, and forming a variety of ladders, whereby to climb to any of the maſt-heads, or deſcend from them. Hence the term ſeems to be derived from *rath*, an obſolete word, ſignifying *a hill*. In order to prevent the rattling from ſlipping down by the weight of the ſailors, they are firmly attached by a knot, called a *clove-hitch*, to all the ſhrouds, except the foremoſt or aftmoſt; where one of the ends, being fitted with an eye-ſplice, is previouſly faſtened with twine-thread or pack-thread. Falconer.

RATNO, in *Geography*, a town of Lithuania, in the palatinate of Brzeſc; 50 miles S.E. of Brzeſc.

RATOATH, a poor village of the county of Meath, Ireland, which, before the union, had its repreſentatives in parliament. It gave name to a barony, and is $12\frac{1}{2}$ miles N.W. by N. from Dublin.

RATOLY, a town of Hindooſtan, in the circar of Gohud; 25 miles S.E. of Raat.

RATONES, a ſmall iſland in the river La Plata, near Monte Video.

RATSCHA, or Retzka, a fortrefs of Sclavonia, on the N. fide of the Save, oppofite to the mouth of the Drin; 35 miles S.W. of Peterwardein.

RATSCHITZ, a town of Moravia, in the circle of Brunn; 10 miles N.E. of Brunn.

RATSUR, a town of Hindooftan, in the circar of Aurungabad; 65 miles E. of Aurungabad.

RATTAK, a town of Bengal; 14 miles S.S.E. of Curruckpour.

RATTAN. See Ruatan.

Rattan *Canes*. See Canes.

RATTELSDORF, in *Geography*, a town of Bavaria, in the bifhopric of Bamberg; 9 miles N. of Bamberg.

RATTEN. See Rateen.

Ratten, in *Rural Economy*, a provincial word, ufed to fignify a rat.

RATTENBERG, in *Geography*, a town of the county of Tyrol, with a citadel on the Inn; 16 miles E.N.E. of Infpruck.

RATTKOW, a town of the duchy of Holftein; 6 miles N.N.E. of Lubeck.

RATTLE, among the *Ancients*, a mufical inftrument called by the Romans *crepitaculum*.

Mr. Malcolm takes the tintinnabulum, crotalum, and fiftrum, to have been only fo many different kinds of rattles. The invention of the rattle is afcribed to the famous mathematician Archytas; whence Ariftotle calls it Αρχυτα πλαταγη, Archytas's rattle. Diogenianus adds the occafion of the invention; *viz.* that Archytas, having children, he contrived this inftrument to prevent their tumbling over things about the houfe. So that how much foever fome inftruments have changed their ufes, the rattle, we are fure, has preferved its original application.

Rattle, or *Rattel*, in *Commerce*, a weight in Arabia; a rattle of coffee contains, at Betelfagui, $14\frac{1}{2}$ vakias, and a farcel, or frazil, of 10 maunds, or 20 rattles, contains 290 vakias; a farcel weighs 20lb. 6 oz. 4 dr. avoirdupois, and a bahar of 40 farcels $= 815\frac{1}{4}$lb. avoirdupois; 10 farcels in Betelfagui are equal to 7 in Mocha; 16 vakias of dates, candles, and iron, are reckoned to a rattle; but of all other forts of goods 15 vakias make a rattle. The rattle is ufed in the bazar, or market, only. At Jiddah, another fea-port of Arabia, in the Red fea, the bahar contains 10 frazils, 100 maunds, or 500 rattles, and the rattle 15 vakias. The bahar weighs $222\frac{1}{2}$lb. Englifh troy, or 183lb. avoirdupois; and the maund 29 oz. $4\frac{1}{2}$ dr. avoirdupois. Kelly's Un. Cambift.

Rattle-*Grafs*. See Rhinanthus.

Rattle-*Net*. See Wolf *Net*.

Rattle, *Red*. See Pedicularis.

Rattle, *Yellow*. See Rhinanthus.

RATTLE-SNAKE. See Snake.

Rattle-snake *Root*, *Senegaw*. See Milk-*wort*.

Rattle-snake *Root*, Dr. Witt's, a fpecies of *Prenanthes*; which fee.

Rattle-snake *Weed*, a fpecies of *Eryngium*; which fee.

Rattle-snake *Iflands*, in *Geography*, a clufter of fmall iflands at the weftern extremity of lake Erie.

Rattle-snake *Mountains*, mountains of New Hampfhire; 38 miles N. of Concord.

RATTLING in horfes, a term applied to a difagreeable noife produced in them by the entrance of the air between the internal parts of the fheath and the prepuce or covering, principally taking place in trotting or going faft.

RATTONNEAU, in *Geography*, a fmall ifland at the entrance of the harbour of Marfeilles, which has a fortrefs erected in the 17th century by the duke of Guife.

RATTRAY Head, a cape of Scotland, on the N.E. coaft of the county of Aberdeen; 7 miles N. of Peterhead. N. lat. 57° 12'. W. long. 1° 44'.

RATULAH, a town of Hindooftan, in Oude; 15 miles N.E. of Fyzabad.

RATWAH, a town of Hindooftan, in the circar of Gohud; 27 miles E. of Gwalior.

RATZE, in *Commerce*, the name of a fmall coin, ftruck at Friburgh, &c. nearly of the fame value with the *blare*, which, in France, is worth two fols and a denier.

RATZEBUR, in *Geography*, a town of Hinder Pomerania; 14 miles S. of New Stettin. N. lat. 53° 30'. E. long. 16° 14'.

RATZEBURG, a town of Germany, which gives name to a principality, fituated on an ifland in a large lake; the lake is 30 miles long, and 9 broad, and boats pafs by it to Lubeck with goods and paffengers. It was burnt by the Danes in 1693, and fince that difafter the ftreets have been regularly laid out, and the houfes are built after the Dutch manner. In the market-place is the regency-office, and here is held the chief court of juftice and the confiftory; the garrifon is quartered in barracks; 20 miles S. of Lubeck. N. lat. 53° 43'. E. long. 10° 46'. The principality of the fame name is fituated between Mecklenburg and Saxe-Lauenburg, and extends about 10 miles each way. The foil is fertile, and produces a confiderable quantity of wheat, befides feeding a number of cattle. It was converted from a bifhopric into a principality by the peace of Weftphalia. It belongs to Mecklenburg-Strelitz.

RATZENSTEIN, a town of the duchy of Stiria; 5 miles S. of Windifch Gratz.

RATZKNITSCHA, a town of Hungary; 10 miles N.N.W. of Cfakathurn.

RAVA. See Rawa.

RAVALEMENT, Fr. equivalent, among organ-builders and harpfichord-makers, to *compafs* in Englifh. The complete fet of keys, or whole fyftem of mufical founds, (faid Rouffeau in 1768,) inftead of confining itfelf to four octaves, like common keyed-inftruments formerly, extends now to five octaves, adding a fifth below double C, and a fourth above C in alt., including five octaves between the loweft F and the higheft. (This was the common compafs of our harpfichords made by Tabel, Kirckman, and Shudi, long before 1768.) The word *ravalement* is confined to keyed-inftruments; there are no others of fo extenfive a compafs as five octaves. But in the year 1777, when Dr. Burney firft compofed and publifhed duets "à quartre mains," or for two performers on one inftrument, the ladies, at that time wearing hoops, which kept them at too great a diftance from each other, had a harpfichord made by Merlin, exprefsly for duets, with fix octaves; extending from the octave below double C in the bafe, to the octave above C in alt. in the treble. And as duets à quatre mains have been compofed by all the great mafters in Europe fince that time, inftruments with additional keys are now become general. At firft it was only in the treble that the compafs was extended, except in the inftrument above-mentioned by Merlin; but at prefent notes are added in the bafe to complete the fix octaves: and, indeed, the additional notes in the bafe are better worth having for particular effects, than thofe in the treble; which often, from the fhortnefs of the ftrings and feeble vibration, more refemble the tone of wood than wire; whereas the tone of thofe in the bafe of large piano fortes, by the beft makers, is fo rich and full, that

that each found below double F refembles that of an organ-pipe in flow notes, more than the tranfient tone of a ftring.

Rouffeau very juftly obferves, that almoft all inftruments are limited in their compafs *below*, except harps and inftruments with keys. The violoncello can go no lower than double C, its 4th ftring, nor the violin below G. The flute and hautbois defcend only to D and C. But the notes in alt. have been extended in the acute to founds that are feldom in tune, and never pleafing. Like rapid notes of difficult execution, they *furprize*, and the performer's dexterity is applauded; but neither the harmony nor the melody of very high or rapid founds can excite rapture like thofe of moderate quicknefs, when produced with feeling and expreffion, in the middle of the fcale.

RAVALSHE, in *Geography*, a town of Sweden, in Weft Gothland; 24 miles N.W. of Uddevalla.

RAVANA, in *Hindoo Mythology*. See Ravena.

RAVANAK, in *Geography*, a town of European Turkey, in Macedonia; 16 miles E.S.E. of Saloniki.

RAUAND, a town of Perfia, in the province of Kerman; 105 miles E. of Sirgian.

RAVA-POU, in *Botany*, Rheede Hort. Malab. v. 4. 99. t. 48, a plant erroneoufly cited by Linnæus for his very different *Nyctanthes hirfuta*. See Guettarda *Speciofa*.

RAUCA Avis, in *Ornithology*, the name of a bird defcribed by Nieremberg, as common about the lakes and rivers of America, and of the kingfifher kind, but nearly as large as a duck, and black on the crown, and white on the breaft and belly. Its neck is naturally very long in proportion to its body, yet it can occafionally contract and fhorten it in a very wonderful manner. It is a native of Mexico, and is efteemed very good for the table. Mr. Ray has placed this among the birds, the accounts of which he is diftruftful of.

RAUCH, in *Geography*, a town of Germany, in the lordfhip of Schwarzenberg; 10 miles S.W. of Scheinfeld.

RAUCHENEGG, a town of Auftria; 2 miles W. of Baden.

RAUCHT, a town of Ruffia, in the government of Viborg, near lake Ladoga; 44 miles S.E. of Viborg.

RAUDANAGUR, a town of Bengal; 30 miles E. of Ramgur.

RAUDEN, a town of Pruffia, in the palatinate of Culm; 10 miles N.E. of Culm.—Alfo, a town of Silefia, in the principality of Ratibor; 12 miles N.E. of Ratibor.

RAUDNIZ, a town of Bohemia, in the circle of Schlan; 12 miles N.N.E. of Schlan.—Alfo, a town of Bohemia, in the circle of Chrudim; 16 miles N.N.W. of Chrudim.

RAUDRI, a name of the Hindoo goddefs *Parvati*, confort of *Siva*, the deftroying power. In this character fhe may be confidered as his *Sakti*, or energy in his form of *Rudra*, or Fate. *Rudri*, and *Rudrani*, are other modes of writing this name of the goddefs in her avenging character, in which fhe does not apparently differ much from her attributes, as Sakti of *Mahakala;* under which name, and the others occuring in this article, diftinguifhed by italics, farther and fufficient information may be fought. See alfo Trisakti-devi, and Tamasi.

RAUDTEN, in *Geography*, a town of Silefia, in the principality of Wohlau; 18 miles N.W. of Wohlau. N. lat. 51° 30′. E. long. 16° 15′.

RAVEL Bread, a fort of bread, called alfo *blackwhytlof*, as being of a middle finenefs betwixt white and brown.

RAVELIN, in *Fortification*, was anciently a flat baftion, placed in the middle of a curtain.

Ravelin is now a detached work, compofed only of two faces, which make a faliant angle, without and fometimes with flanks; and raifed before the curtain on the counterfcarp of the place; ferving to cover it and the joining flanks from the direct fire of an enemy.

A ravelin is a triangular work, refembling the point of a baftion, with the flanks cut off. (See *Plate* V. *Fortification*, *fig*. 4. lit. i i i. &c.) Its ufe before a curtain is, to cover the oppofite flanks of the two next baftions. It is ufed alfo to cover a bridge or a gate, and is always placed without the moat.

What the engineers call a ravelin, the foldiers generally call a demi-lune, or half-moon. See Demi-lune.

There are alfo *double* ravelins, which ferve to defend each other. They are faid to be double when they are joined by a curtain.

Ravelins, or half-moons, are conftructed by fetting off 50 toifes from the re-entering angle O of the counterfcarp (*Plate* VII. *Fortification*, *fig*. 4.) on the capital O L of the ravelin, or on the perpendicular produced, and from the point L drawing lines to the fhoulders A, B; whofe parts L M, L N, terminated by the counterfcarp, will be the faces M O, O N, the femi-gorges of the ravelin required. Others will have the faces of the ravelin to terminate on thofe of the baftions within three toifes of the fhoulders, in which cafe the ravelins cover the flanks better than the others. The ditch before the ravelin is 12 toifes, and its counterfcarp parallel to the faces of the ravelins, and made in a circular arc before the faliant angle. When the ravelins are made with flanks, the faces fhould terminate thofe of the baftions, at leaft 5 toifes from the fhoulders. Thefe flanks are made by fetting off 10 toifes from the extremities of the faces, and from the points thus determined, the flanks are drawn parallel to the capital of the ravelin. When redoubts, or keeps, are formed in the ravelin, this is done by fetting off 16 toifes from the extremities of the faces, on the femi-gorges from N to *b*, and from M to *a*; and from the points *b*, *a*, the faces are drawn parallel to thofe of the ravelin: the ditch before this redoubt is 6 toifes, and its counterfcarp parallel to the faces. This work fhould be covered in the faces by a wall, a foot or two thick, furnifhed with loopholes for the mufketry to fire through; and it will ferve to fecure a retreat for the troops who defend the ravelin; they may thus prevent the enemy from making a lodgment in the outward part of the ravelin, or at leaft greatly obftruct their attempts for this purpofe. Nor can they be drove from this place, until the enemy has erected a battery, and brought cannon on the ravelin to batter the redoubt. When the *counterguard* (which fee) is placed before the ravelin, 40 toifes are fet off on the capital of the ravelin from its faliant angle to the faliant angle of the counterguard, and 10 on the counterfcarp of the ditch. For the conftruction of crown-works before the ravelin, fee Horn-*work*. Within the ravelin are conftructed a rampart of about 16 or 20 yards, and a parapet of about 6 yards: ramps are alfo annexed in the flope of a rampart, and a barbet, when it is proper, is conftructed in a faliant angle. In wet ditches, where the troops pafs from the town to the ravelin in boats, it is proper to make, in the gorge of the ravelin, a kind of harbour, where the boats may be covered from the fire of the enemy. In dry foffes, there fhould be ramps or ftairs in the gorge of the ravelin, to preferve a free communication, if the bridges fhould be broken down by the enemy's fhot. The celebrated general Coehorn, in the ravelins which he built at Bergen-op-zoom, contrived a very good defence for the covered way before the faces of the baftions, by making retired flanks in the breafts of the ravelin, where one

one or two cannon might be placed as ſecure from the enemy's fire as thoſe behind the orillon of a baſtion. See *Military* CONSTRUCTION.

RAVELLO, in *Geography*, a ſea-port town of Naples, in Principato Citra, the ſee of a biſhop, united to Scala; 11 miles W.S.W. of Salerno. N. lat. 40° 39′. E. long. 12° 10′.

RAVELWATER, a river of the county of Antrim, Ireland, riſing in the mountains in the northern part, and flowing through Ravel glen to the river Main.

RAVEN, CORVUS, in *Aſtronomy*. See CORVUS.

RAVEN, *Corvus corax* of Linnæus, in *Ornithology*, a large bird of the crow kind, well known throughout the world, as being found in all climates, and all regions. The colour of the whole bird is black, finely gloſſed with a rich blue, the belly excepted, which is duſky. The ravens build in high trees, or upon the ruins of lofty buildings in the neighbourhood of great towns, being held in the ſame veneration as the vultures are in Egypt, and for the ſame reaſon; for devouring the carcaſes and filth that would otherwiſe prove a nuiſance. They lay five or ſix eggs, of a pale greeniſh colour, marked with ſmall browniſh ſpots. There are many fabulous ſtories of the longevity of the raven; but birds are in general long lived, and the crow kind not leſs ſo than the reſt. The raven is a very docile bird, and may be taught to ſpeak, as well as to fetch and carry. In clear weather, ravens are remarked to fly in pairs at a great height, making a deep loud noiſe, different from the common croaking; and their ſcent is remarkably good. See CORVUS *Corax*.

The quills of a raven are uſed in tuning the lower notes of a harpſichord, when the wires are ſet at a conſiderable diſtance from the ſticks.

It is rare to find this creature white, yet it happens ſometimes. Boyle mentions one. There was alſo one ſhewn to the Royal Society ſome years ago. Boyle's Works abr. vol. ii. p. 46.

RAVEN, *Night*, an Engliſh name for a heron, which flies in the night, and makes a very odd and hoarſe noiſe. It has been applied by ſome to the bittern, or *ardea ſtellaris*, but improperly, belonging of right to the ſmaller grey heron, called *nycticorax*. See HERON.

RAVEN, *Sea*, or *Corvorant*. See CORVUS *Aquaticus*.

RAVENA, in *Hindoo Mythology*, is the name of a celebrated king of Lanka, or Ceylon. Such was his proweſs, and the oppreſſion which he exerciſed over his ſubjects, that it became neceſſary for Viſhnu, the preſerving power of the deity, to deſcend on earth for his deſtruction, and the relief of the ſuffering world. He accordingly became incarnate in the perſon of Rama; and the wars that enſued between the forces of the tyrant and the divine general, for the recovery of Sita, his raviſhed ſpouſe, are the ſubject of the fine epic poem, the *Ramayana;* under which article of this work, and under *Rama*, and others thence referred to, the poem, and the hiſtorical traditions connected with theſe points, are ſufficiently deſcribed and diſcuſſed.

Although obſcured by mythological fables, theſe perſons and wars are admitted to have had hiſtorical exiſtence; and ſome important points of chronology hinge upon them. We have, therefore, in this and other articles, noticed at ſome length the legends connected with theſe ſubjects.

In the Hindoo theogony, the origin of Ravena is thus related. Two etherial warders of Viſhnu's palace carried the pride of office ſo far as to inſult the ſeven Maharſhis, (ſee MAHARSHI, or RISHI,) who had come to offer their adorations. The offended ſaints pronounced an imprecation on the inſolent warders, condemning them to be *adhoyoni*, or *born below*, thrice in mortal forms, before they could be re-admitted into the divine preſence. The imprecation of a Riſhi, even if provoked by a god, is ſcarcely to be averted; and the offenders, in conſequence, appeared in their firſt birth as Hiranyakſha, or golden-eyed, and Hiranyakaſipu, or clad in gold; ſecondly, as Ravena and Kumbhakarna; and laſtly, as Kanſa and Siſupala.

The hiſtory, if ſuch it may be called, of Ravena, Rama, &c. is perpetually alluded to in Hindoo writings: the Ramayana, containing an infinity of ſuch legends, being one of the moſt popular works of the Eaſt. Ravena, or Ravana, has become a generic name for a tyrant. He is alſo called Daſagriva, or the ten-necked; he being uſually repreſented with that number of heads, and twenty hands, ſymbolical of ſapience and prowefs. A couplet in the Ramayana may be thus tranſlated. "Where Ravana is, the ſun loſes his force, the winds ceaſe to blow, the fire ceaſes to burn: the rattling ocean, ſeeing him, ſtills its waves." Such are the hyperbolical relations of his potency, obtained by the uſual proceſs of ſelf-inflicted auſterities. So ardent was he in this irreſiſtible ſpecies of merit, that he offered to Siva nine of his ten heads ſucceſſively; and thus extorting the favour of the condeſcending deity, pleaſed with ſuch an important ſacrifice, he obtained a promiſe, with ſome equivocal ſtipulations, of whatever he ſhould deſire. This ſort of auſterity is called *Tapas*, under which word ſome account is offered of various modes of practiſing it. The gods and demi-gods, alarmed at Siva's promiſe, beſought him to recall it. But ſuch conduct is deemed unbecoming in deities, who, however, do not ſcruple to evade the performance of their promiſes by deceit or prevarication: and, on this occaſion, Nareda was deputed to ſound Ravena as to what he would demand, which, as uſual, was univerſal dominion, &c. Nareda artfully perſuaded Ravena that Mahadeva (or Siva) was drunk, and had promiſed him what he could not perform: whereupon the vindictive giant tears up Kailaſa, the paradiſe of Siva, which, being contrary to the ſtipulations, releaſes Siva from his promiſe, and he conſents to the deſtruction of Ravena, which is brought about by the avatara, or deſcent, of Viſhnu in the perſon of Rama. From this ſtory we are told to learn that all worldly affairs are the predeſtined ordainments of providence; whoſe will, that any event ſhould take place on earth, includes preſciently all the routine and detail of its accompliſhment; although we only ſee the links of a chain of cauſes leading naturally to its effect.

We will here add an extract from the Hindu Pantheon, whence a conſiderable part of this article is taken, ſhewing how unceaſingly the mythological machinery of that poetical people is introduced into their popular works. The names diſtinguiſhed by capitals imply that articles are given under thoſe words, in this work; and a reference may be made to them for any deſired information.

"Reſpecting Ravena," ſays the author of the publication adverted to, "I will notice but one more tale, as related to me by a Brahman; who, unable fully to make me feel the poetical beauties, or comprehend the morality of the Ramayana, bluſhed while he developed its follies; which, in conformity with popular taſte, or if taken ſeparately, are apparently very numerous; although it muſt be confeſſed, they are ſo contrived as to be intimately connected with the main action of the poem. The following idle tale is of this deſcription: but I ſhall not here explain the cauſes that led to the predicament, or the conſequences that enſued.

"Ravena, by his power and infernal arts, had ſubjugated all

all the gods and demi-gods, and forced them to perform menial offices about his perfon and houfhold. INDRA made garlands of flowers to adorn him withal. Agni, or PAVAKA, was his cook. SURYA, regent of the fun, fupplied light by day; and SOMA, regent of the moon, by night. VARUNA, the Hindoo Neptune, purveyed water for the palace. KUVERA, their Plutus, furnifhed cafh. The whole NAVA-GRAHA (the nine planetary fpheres, including RAHU and KETU) fometimes arranged themfelves into a ladder, by which, they ferving as fteps, the tyrant afcended his throne. BRAMA (for the great gods were there alfo, and I give this anecdote as I find it in my memoranda, without any improved arrangement) was a herald, proclaiming the giant's titles, the day of the week, month, &c. daily in the palace; a fort of fpeaking almanac. MAHADEVA, in his character or incarnation of KANDEH-RAO, performed the office of barber, and trimmed the giant's beards. VISHNU had the honourable occupation of inftructing and drilling the dancing and finging girls, and felecting the faireft for the royal bed. Ganefa, or POLLEAR, had the care of the cows, goats, and herds. VAYU fwept the houfe. YAMA wafhed the linen. And in this manner were all the gods employed in the menial offices of Ravena, who rebuked and flogged them in default of induftry and attention. Nor were the female divinities exempted: for PARVATI, in her form of SATWI, was head Aya, or nurfe, to Ravena's children. LAKSHMI and SARASWATI were alfo among them, but it does not appear in what capacity. Earthly kings and queens were alfo forced into this degrading fervitude, to the number of ninety-fix royal families; as is faid to be detailed in the RAMAYANA. But I have fome doubt if fuch a relation be actually in this fhape, in that poem: this we fhall fee, when its other books are tranflated and publifhed. In my abftract of it, however, fuch a godly predicament feems effential to the main action; RAMA being thereby impelled by every confideration of piety and duty to immediate and energetic meafures, for the relief and liberation of the degraded divinities."

Ravena, as we have noticed, is furnamed Dafagriva, or the ten-headed. He is alfo called Vifravana, or fon of Vifrava, the father likewife of Kuvera. The brothers are fometimes named *Pulaftya*, or *Paulaftya*. (See thefe articles.) Another of his names is equivalent to lord of Rakfhafhas, a race of malignant beings, common agents in the hands of fuperhuman tyrants for the annoyance of the virtuous portion of mankind, or thwarting the benificent views of the gods. Many fpecific varieties of thefe demons are enumerated in the firft book of the Ramayana, as aiding Ravena in defence of himfelf and his kingdom of Lanka. In pictures illuftrative of the Ramayana, which are very common throughout India, they are depicted efpecially ill-favoured, painted green, red, blue, &c. and engaged in fierce contefts with Rama's fimian foldiery. Several legions of thefe Rakfhas, each of 14,000, were deftroyed by Rama. See RAKSHA.

RAVENALA, in *Botany*, Adanf. Fam. des Plantes, v. 2. 67. Juff. 62. See URANIA.

RAUENBACH, in *Geography*, a town of Germany, in the principality of Anfpach; four miles S.S.W. of Anfpach.

RAVENGLASS, a market-town and fea-port in the parifh of Muncafter, Allerdale ward, above Darwent, county of Cumberland, England, is fituated on the Solway Frith, near the confluence of the rivers Efk, Mite, and Irt. Though poffeffing many advantages for trade, it is but a poor place, and chiefly fupported by its oyfter fifhery, for which it is much celebrated. This town ftands at the diftance of 57 miles S.S.W. from Carlifle, and 287 N.W. by N. from London. The manor originally conftituted part of the barony of Egremont, but was granted by Richard Lucy to the Penningtons, from whom the prefent owner, lord Muncafter, is lineally defcended. The market day is Saturday, weekly; and there are two annual fairs, one of which is held on the eve, day, and morrow, of St. James, and is remarkable for the ceremonies attending its proclamation and continuance. On the firft day, the earl of Egremont, or his proxy, attends, accompanied by the ferjeant of the borough of Egremont, with the infignia, called the Bow of Egremont; by the forefters, with their bows and arrows; and by all the tenants of the foreft of Copeland, who hold their eftates by the fpecial fervice of attending the earl, or his reprefentative, during the fair. On the third day, at noon, the earls, officers, and tenants of the foreft, depart, after proclamation; and lord Muncafter, and his tenants, take formal re-poffeffion of the place, and the day is concluded by horfe-racing, and various ruftic diverfions.

Near Ravenglafs, on the northern bank of the river Efk, ftands Muncafter-houfe, the feat of lord Muncafter; and eaft from it, on the oppofite fide of the river, are feen ruins of confiderable magnitude, refpecting which no hiftorical documents are known to exift. They are now called the *city of Barnfcar*; and its foundation is afcribed, by tradition, to the Danes, who are faid "to have gathered for its inhabitants the men of Drig, and the women of Beckermont," whence the popular faying, "let us go together like lads of Drig and laffes of Beckermont." Thefe ruins extend about three hundred yards in length from eaft to weft, and 100 in breadth, from north to fouth; and are enclofed, except at the eaft end, by a wall, nearly three feet in height. "There appears," fays Hutchinfon, "to have been a long ftreet, with feveral crofs ones; the remains of the houfefteads within the walls are not very numerous; but on the outfide they are innumerable, efpecially at the fouth fide and weft end. The circumference of the city, and fuburbs, is nearly three computed miles; the figure is an oblong fquare. There is an ancient road through the city, leading from Ulpha to Ravenglafs. About the year 1730, a confiderable quantity of filver coin was difcovered in the ruins of one of the houfes, concealed in a cavity formed in a beam." A Hiftory of the County of Cumberland, &c. by William Hutchinfon, F.S.A., two vols. 4to. Beauties of England and Wales, vol. iii., 1802, by John Britton and Edward Wedlake Brayley.

RAVENNA, a very ancient city of Italy, in the department of the Amone, feated on the river Mentone, near the Adriatic. This city, as Strabo informs us, was built by the Theffalians, on feveral iflands, long before the war of Troy, and they were driven out by the Tufcans. In the time of this Greek writer, it was fituated in the midft of a marfh, and attached to the continent, and in procefs of time the Po accumulated mud and fand, fo that the land was raifed and the fea removed to a greater diftance. The fame writer informs us, that it was made a Roman colony by Auguftus; and Dion fays, that a fleet of 250 veffels was ftationed in this port by that prince, from which circumftance it was called "portus claffis," or the port of the fleet. He ftationed, fays Suetonius, one fleet at Mifenum, and another at Ravenna, for guarding the upper and lower fea. Tiberius repaired its walls, and erected fome new gates, which ftill bear an infcription to this purpofe. Trajan alfo contributed towards embellifhing this city. Honorius made it the place of his refidence, both before and after Alaric had captured and burned Rome. When Odoacer made a conqueft of Italy, he refided at Ravenna, and fuftained here a fiege of of three years, at the termination of which he was taken and slain by Theodoric. Theodoric fixed the seat of his empire in this place, and adorned it with magnificent churches and palaces, and re-constructed the aqueduct of Trajan. His daughter Amalasoutha, and his grandson Athalaric, contributed towards the improvement of this city. When the Goths were driven from Italy by Narses, general of the emperor Justinian, he was made governor of Ravenna; and having continued in this station for 16 years, he was recalled by Justin II., successor to Justinian; and in the year 567 he was succeeded by Longinus, who took up his residence at Ravenna, under the title of exarch. (See Exarch.) The famous battle of Ravenna was fought near this town between Gaston de Foix, duke of Nemmes, and nephew of Louis XII. and the army of pope Julius II., Ferdinand, king of Spain, and the Venetians, in which the former young general, being only 24 years of age, having killed between 16 and 18,000 of the enemy, proved victorious, though he himself was killed by too ardently following the pursuit. This happened on Easter-day 1512. The French, enraged by the loss of their brave general, took Ravenna by storm, and pillaged the city with such severity that it has never recovered. On the road to Forli, by the banks of the little river Ronco, three miles from the city, a cross shews the spot where Gaston de Foix was killed. Fresh water has always been so scarce at Ravenna, that it has occasioned a pleasant epigram by Martial. This city was of late the capital of Romagna, with the title of an archbishopric. It has produced several persons of eminence, as Faustinus, often mentioned by Martial; the sophist Aspasius, who lived under the reign of Alexander Severus; Cassiodorus, chancellor to Theodoric, king of the Goths in Italy; pope John XVII.; Peter Damien, cardinal of Ossa, and several others. Ravenna was also the seat of many councils at successive periods. The three last councils, in 1311, 1314, and 1317, were summoned for the purpose of reforming the corrupted manners of the ecclesiastics, which were, in those days, very debauched. It is now a mean and inconsiderable town; the houses are old and in a ruined state, and the number of inhabitants scarcely amounts to 14 or 15,000. In the time of the Romans, it was seated on a kind of bay formed by the Adriatic, and its harbour was celebrated; but it is now three miles from the sea. The mud thrown up by the tide having formed a tract of land, which is cultivated, and on which the city itself has been enlarged towards the sea. The air is insalubrious; but has been somewhat amended by conveying along the sides of the city the rivers Mentone and Ronco, which carry off the foetid water from the marshy grounds. It contains several churches, and 24 convents; 42 miles E. of Bologna. N. lat. 44° 27'. E. long. 11° 5'.

RAVENPOINT, a headland of the county of Wexford, Ireland, at the N. side of the entrance into Wexford haven. N. lat. 52° 23'. W. long. 6° 18'.

RAVENSARA, in *Botany*, a barbarous appellation, altered by Sonnerat from the Madagascar name of the plant, *Raven-tsara*, or *Voaravendsara*, meaning, it seems, *a good leaf*, and applying to the aromatic qualities, and economical uses, of the leaves. Hence Jussieu was induced to contrive the apt generic name *Agathophyllum*, from αγαθος, *good or profitable*, and φυλλον, *a leaf;* under which this genus ought to have been described in its proper place, in our first volume. But one of our predecessors has, by mistake, referred the reader to *Ravensara*, as a genuine Linnæan name, attributing Agathophyllum to professor Martyn; see that article. To correct this error, and supply the consequent deficiency, we subjoin an account of the tree in question, under its proper and received denomination.

Agathophyllum. Juss. 431. Schreb. 806. Willd. Sp. Pl. v. 2. 842. Mart. Mill. Dict. v. 1. Lamarck Illustr. t. 825. (Ravensara; Sonnerat Ind. Occ. v. 2. 226. Euodia; Gærtn. t. 103. Lamarck Illustr. t. 404.)—Class and order, *Dodecandria Monogynia*. Nat. Ord. uncertain, perhaps akin to the *Lauri*, Juss.

Gen. Ch. *Cal.* Perianth inferior, very small, abrupt, entire, permanent. *Cor.* Petals six, ovate, inserted into the calyx, somewhat villous on the inside. *Stam.* Filaments twelve, broadish, very short, alternately inserted into the base of the petals and the inside of the calyx; anthers roundish. *Pist.* Germen superior, very small; style very short; stigma downy. *Peric.* Drupa nearly globose, umbilicated. *Seed.* Nut the shape of the drupa, tipped with a small abrupt point, divided internally half way, into six coriaceous cells; kernel convex above, six-lobed below, one lobe being received into each cell.

Eff. Ch. Calyx abrupt, entire. Petals six, inserted into the calyx. Drupa superior, nearly globose. Nut with six incomplete cells. Kernel solitary, with six lobes.

Obs. Schreber, by a casual oversight, describes the fruit as crowned with the calyx, though he justly terms the germen superior.

1. A. *aromaticum*. Willd. n. 1. (Ravensara aromatica; Sonnerat Ind. Or. v. 2. 226. t. 127. Euodia Ravensara; Gærtn. v. 2. 101.)—Native of Madagascar. A large and tufted, somewhat pyramidal tree, with a reddish aromatic *bark*, and heavy, hard, inodorous, white *wood*, intermixed with red fibres. *Leaves* alternate, stalked, simple, obovate, entire, generally obtuse; smooth on both sides; pale and rather glaucous beneath; single-ribbed, of a firm or coriaceous texture. *Flowers* very minute, numerous, in axillary panicles about the ends of the branches, shorter than the leaves. *Fruit* an inch in diameter, solitary at the end of each branch, so that, as Sonnerat remarks, one would think the *flowers* had grown on a different tree; the panicles being obliterated, probably, in consequence of one flower alone, in each, bearing fruit. The tree produces fruit at the age of five or six years, which is ten months in coming to perfection. The inhabitants of Madagascar gather it at the age of six or seven months, as being, in that state of growth, more fit for use as a spice. The kernel, when fresh, has a fine aromatic odour, but its taste is bitter, and so highly acrid as to burn the throat very disagreeably. The *leaves* are also very aromatic, and being made into a sort of garlands, are left for a month in the open air to dry; after which they are plunged, for four or five minutes, into boiling water, and then dried, either in the sun, or by a fire. The *fruits* are treated in the same manner. The *flowers* appear in January or February. The dried *leaves*, as well as the *fruit*, of this tree, are said to partake of the flavours of the four most esteemed spices. They have not, however, come into use as an article of commerce, though some of the French, resident in Madagascar, have endeavoured to call the attention of their countrymen to this object. Gærtner found the odour of the fruit, though agreeable, too weak to promise much utility.

RAVENSBERG, in *Geography*, a county of Germany, lying between the bishoprics of Munster, Osnaburgh, and Paderborn, the principality of Minden, and the counties of Schauenberg and Lippe. The soil is in some parts sandy, but in others, especially towards the principality of Minden, it produces corn, flax, and hemp; coal is found in some of the mountains, and good stone for building. Its name is derived from that of an ancient castle, and it had formerly its own counts. It lately belonged to the king of Prussia; but by the peace of Tilsit was transferred to the kingdom of Westphalia.

Westphalia. The approaching congress (1814) may possibly fix its future destination.

RAVENSBURG, a town of Bavaria, which anciently belonged to the Guelphs, counts of Altorf; but it was an imperial town before the time of king Rodolphus, and continued such till the year 1802, when it was given, among other indemnities, to the elector of Bavaria. The Roman Catholics and Lutherans are united with regard to the temporal and spiritual concerns of the place, and the magistracy is shared betwixt them. They have one church in common; but the Lutherans are exclusively possessed of another, and the Roman Catholics have also two parish-churches; 21 miles N.E. of Constance. N. lat. 47° 41′. E. long. 9° 38′.

RAVENSBURG, a town of the Rhenish palatinate, on the Elsass; 16 miles W. of Heilbronn.

RAVENSBURN, a small stream of England, which runs into the Thames between Greenwich and Deptford.

RAVENSCROFT, THOMAS, in *Biography*, an active English musician and publisher, who flourished from the beginning of the 17th century to 1635. He was the editor and composer of the best collection of psalm tunes in four parts, which had till then appeared in England. He was a bachelor of music, and a professor not only well acquainted with the practice of the art, but seems to have bestowed much time in the perusal of the best authors, and in meditation on the theory.

This book, published in small octavo, 1621 and 1633, contains a melody for every one of the hundred and fifty psalms, many of them by the editor himself, of which a considerable number is still in use; as Windsor, St. David's, Southwell, and Canterbury. There are others, likewise, which are sung by the German, Netherlandish, and French Protestants. To these the base, tenor, and counter-tenor parts have been composed by twenty-one English musicians: among whom we find the names of Tallis, Dowland, Morley, Bennet, Stubbs, Farnaby, and John Milton, the father of our great poet. The tunes which are peculiar to the measure of the 100dth psalm, the 113th, and 119th, were originally Lutheran, or perhaps of still higher antiquity. And though Ravenscroft has affixed the name of Dr. John Dowland to the parts which have been set to the 100dth psalm, yet, in the index, he has ranked the melody itself with the French tunes; perhaps from having seen it among the melodies that were set to the French version of Clement Marot and Theodore Beza's Psalms, by Goudimel and Claude le Jeune. Ravenscroft, in imitation of these harmonists, always gives the principal melody, or, as he calls it, the *playn-song*, to the tenor. This part, indeed, he sometimes erroneously terms *Fa-burden*. This is a corruption of *faux-bourdon*, and *falso bordone*, which originally implied such simple harmony as arises from a series of thirds and sixths to the base. His publication is, in some measure, historical: for he tells us not only who composed the parts to old melodies, but who increased the common stock, by the addition of new tunes; as well as which of them were orignally English, Welch, Scots, German, Dutch, Italian, French, and imitations of these.

No tunes of triple time occur in Claude le Jeune, and but five in Ravenscroft: the principal of which are Cambridge, Martyrs, Manchester, and the 81st. This last is still much used, and often played by chimes: it is called an imitation of a foreign tune, and has the name of Richard Allison prefixed to it. Muller's German edition of the psalm tunes at Frankfort is exactly that of Claude le Jeune, in two parts only; except that he has transposed some of the melodies, and inserted easy leading and connective notes, to assist, not only the singer, but sometimes the tunes themselves; which, without them, would now be very bald and uncouth. Many of these old melodies are still sung to German hymns as well as psalms.

In 1614 Ravenscroft published "A briefe Discourse of the true, but neglected, Use of characterizing the Degrees by their Perfection, Imperfection, and Diminution in measurable Musicke, against the common Practice and Custome of the Times," 4to.

Ravenscroft had been educated in St. Paul's choir, under Mr. Edward Pierce, and was particularly conversant with old authors; he, therefore, wished to revive the use of those proportions in time, which, on account of their intricacy, had been long discontinued.

Ravenscroft practised these exploded doctrines ineffectually, though to his Discourse he added examples to illustrate his precepts, expressed in the harmony of four voices, concerning the pleasure of the five usual recreations of hunting, hawking, dancing, drinking, and enamouring. He was not always very successful in his attempts at imitative harmony; and melody was then so crude and uncouth throughout Europe, as to afford little assistance in imitative strains.

Ravenscroft was also the author of a collection of songs, entitled "Melcimata, Musical Phancies, fitting the Court, City, and Country Humours, in three, four, and five Voyces," published in the year 1611.

RAVENSCROFT, JOHN, one of the waits of the Tower Hamlets, and in the band of the Goodman's-fields playhouse, was a ripieno violin; yet, notwithstanding so humble a station, he was a performer of sufficient abilities to lead in any such band as that just mentioned; and could perform with great firmness a concerto of Corelli, or an overture of Handel. He was in great request at balls and dancing parties; but excelled most others, not only in *playing* hornpipes with the true sailor's *flang*, but in *composing* them: and there are two of his compositions, that a tar, if he had any leg to stand on, would irresistibly be impelled to dance, the moment he heard them.

RAVENSPUR, or RAVENSER, in *Geography*, was formerly a noted sea-port at the mouth of the Humber. It is celebrated by our historians for the descents of Henry IV. A.D. 1399, and of Edward IV. A.D. 1471, when these princes came to contend for the crown of England. It was shortly after, however, swallowed up by the ocean, together with many villages in its vicinity. The precise spot on which it stood is now unknown; but it is usually supposed to have been placed very near to Spurn Head, the Ocellum Promontorium of Ptolemy. For some additional account of the coast here, see PATRINGTON.

RAVENSTAIN, a town of Saxony, in the circle of Erzgeburg; 8 miles N.N.W. of Wolkenstein.—Also, a town of Hinder Pomerania; 7 miles E.S.E. of Zachan.

RAVESTEIN, a town of Brabant, on the S. side of the Meuse, the capital of a signiory, including 14 towns and villages; 15 miles N.E. of Bois le Duc.

RAVI, a name, in Sanscrit, of Surya, the Hindoo regent of the sun. It means the *Riser*, and has perhaps other meanings. See SURYA.

RAVIERES, in *Geography*, a town of France, in the department of the Yonne; 27 miles E. of Auxerre.

RAUJESHI, a circar of Bengal, bounded N. by Rajemal, E. by Bettooriah, S. by Mahmudshi, Shahjole, and Kishenagur, and W. by Birboom and Hindooa; about 55 miles long, and 18 broad. The capital is *Moorshedabad*; which see.

RAVILLE, a town of France, in the department of the Moselle; 5 miles S. of Bouley.

RAVILLY, a ſmall town of the county of Carlow, Ireland, in the barony of the ſame name. It is ſituated on the river Slaney, 3 miles S. from Baltinglaſs, and 32 S. by W. from Dublin.

RAVINA, a town of European Turkey, in Albania; 52 miles E. of Valona.

RAVINE, in *Field Fortification*, a deep hollow, uſually formed by a great flood, or long continued running of water; frequently turned to good purpoſes in the field.

RAVIS, the ſame with *raucedo*. See Hoarseness.

RAVISHMENT, in *Law*, denotes an unlawful ſeducing either a woman, or an heir in ward; for which there is a remedy by a writ of raviſhment, or action of treſpaſs *vi & armis, de filio vel filia rapto vel abducto*, in the ſame manner as the huſband may have it *de uxore raptâ et abductâ*, on account of the abduction of his wife. This action lay at the common law; and thereby the huſband ſhall recover, not the poſſeſſion of his wife, but damages for taking her away: and by ſtatute Weſtm. 1. 3 Edw. I. c. 13. the offender ſhall alſo be impriſoned two years, and fined at the pleaſure of the king. Both the king and the huſband may, therefore, have this action; and the huſband is alſo entitled to recover damages in an action on the caſe againſt ſuch as perſuade and entice the wife to live ſeparate from him, without a ſufficient cauſe.

Sometimes it is alſo uſed in the ſame ſenſe as *rape;* which ſee.

Ravishment *de Gard*, is a writ which anciently lay, and ſtill lies, for the guardian in ſocage againſt him who took from him the body of his ward, or pupil: but then he muſt account to his pupil for the damages he ſo recovers. It is expreſsly provided by ſtatute 12 Car. II. c. 24. that teſtamentary guardians may maintain an action of raviſhment, or treſpaſs, for recovery of any of their wards, and alſo for damages, to be applied to the uſe and benefit of the infants.

RAVITZ, or Rawisch, in *Geography*, a town of the duchy of Warſaw, moſt of the inhabitants of which are Lutherans: it has a conſiderable manufacture of cloth; 24 miles S. of Poſen.

RAVIUS, or Rave, Christian, in *Biography*, a learned German Orientaliſt, was born at Berlin in the year 1613. From a very early period he was attached to the ſtudy of the eaſtern languages, and after ſpending eight years in different univerſities on the continent, he came over to England in the year 1638, and took up his reſidence at the univerſity of Oxford. He brought with him recommendations from Voſſius, and other learned men; and was invited to Dublin by archbiſhop Uſher, primate of Ireland, who ſettled upon him a handſome ſtipend, and engaged him to take a voyage into the Eaſt, for the purpoſe of collecting ancient manuſcripts. About the ſame time he was invited by cardinal Richelieu to enter into his employment for a ſimilar purpoſe, which he declined, having already accepted the propoſals of Uſher. In 1639 he became acquainted with our countryman, the learned Edward Pococke, at Conſtantinople, where he improved himſelf in many languages, to which he had already applied his talents; and made himſelf maſter of the Turkiſh, Arabic, and Perſian languages. In the mean time he did not neglect the main object of his miſſion, but collected more than 300 choice manuſcripts. For this ſervice he was, on his return, amply rewarded. In 1642 he taught the Oriental languages at Greſham college, in London. During the following year he went to Holland, and was appointed profeſſor of the Oriental languages at Utrecht. We find him again in England in 1648, when he took the covenant, and was made fellow of Magdalen college, Oxford, by the parliamentary viſitors. In the courſe of a few months he left England, and went to Sweden, where he obtained the appointment of profeſſor of the Oriental languages at the univerſity of Upſal. This place he was obliged to leave about the year 1657; the revenues, that ought to have been devoted to the Upſal profeſſors, having been applied towards defraying the expences of the war between Sweden and Denmark. After this he for ſome time filled the chair of Oriental literature at the univerſity of Kiel, and from thence he removed to occupy the ſame profeſſorſhip at Frankfort on the Maine. He died in 1677, about the age of 64. His works are very numerous, of which the following are titles of the principal: "Obteſtatio ad univerſam Europam pro dicendis Rebus et Linguis Orientalibus, ac conjuganda Africæ atque Aſiæ Eruditione," 1644; "Orthographiæ et Analogiæ vulgo Etymologiæ Ebraiæ Delineatio, juxta vocis partes abſtractas;" "A Diſcourſe of the Oriental Tongues, *viz.* Hebrew, Samaritan, Chaldee, Syriac, Arabic, and Ethiopic," 1649; "Concordantiarum Hebraicarum et Chaldaicarum Epitome;" "Chronologia Biblica nova;" "Epiſtolæ variæ ad doct. Viros." He gave alſo to the world a tranſlation, from the Arabic language, of Apollonius's Conic Sections. He had a brother, named John Ravius, who was profeſſor of philoſophy at Roſtock, about the year 1638. In 1664-5 he was appointed counſellor and librarian to the elector of Brandenburg. He was author of "Commentarius in Cornelium Nepotem," 1635; "Summa Studiorum pro Nobilitate Danica;" "Aphoriſmi Militares," and other learned works.

RAULIN, John, a French writer in the 15th century, was born at Toul in the year 1443. He purſued his ſtudies at the univerſity of Paris, where he obtained the degree of D.D. in 1480, and afterwards filled the profeſſor's chair in theology with great diſtinction. He was elected grand maſter of the college of Navarre, and founded a good library in that ſeminary. Becoming diſſatisfied with the world, he embraced the monaſtic life at the abbey of Cluny, in Burgundy, in 1497. He died in 1514, at he age of 71. He attracted much attention as a preacher, and ſeveral of his ſermons have been publiſhed, which exhibit ſtriking ſpecimens of the bad taſte which prevailed in France in the 15th century. The works of this author were collected, and publiſhed at Antwerp, in 6 vols. 4to., 1612. They are accompanied with a curious and valuable collection of "Letters," that illuſtrate the hiſtory, manners, and ſentiments of the age in which he lived. They were firſt publiſhed after his death, in quarto, in 1521, under the title of "Joannis Raulin Epiſtolæ Illuſtrium Virorum." Moreri.

RAULT, Felix, the favourite performer on the German flute at Paris, in 1770; where we heard him ourſelves with as much pleaſure as a flute can give, by neat execution, perfect intonation, and a mellifluous embouchure. M. Laborde has rendered his biographical article intereſting by a detail of his profeſſional merits and private character.

"M. Felix Rault was born at Bourdeaux, in 1736. He was the ſon of Charles Rault, of the king's band, and firſt baſſoon at the opera. Felix was received there in 1753, and in the king's band in 1768. His talents are ſo well known at Paris, as to be above praiſe. Since Blavet's time, no one has brought the art of playing upon the German flute to ſuch perfection, eſpecially in accompanying the voice; a much more difficult art than playing concertos of great execution, generally well ſtudied at home previous to performance. But ſuch ſtudy is uſeleſs to Rault; for no one reads music more readily and with more facility, or gives it more meaning, than this performer. The beauty of his tone, the precision of his execution, the richness of his embouchure, however extraordinary, merit still less praise than his personal qualities, which endear him to all his acquaintance." Laborde.

RAUMO, in *Geography*, a sea-port town of Sweden, in the province of Finland, on the E. coast of the gulf of Bothnia; 50 miles N. of Abo.

RAUNPIKED, in *Rural Economy*, a provincial word used to signify stag-headed, among trees, as an old overgrown oak, having the stumps of the boughs standing out.

RAURAH, in *Geography*, a town of Thibet; 26 miles N. of Jemlah. N. lat. 31° 2′. E. long. 81° 40′.

RAURAVA, a Sanscrit word meaning *dreadful*, and a name of one of the Hindoo hells; they reckoning twenty-one of these receptacles for sinners. Naraka is called Maharaurava, or most dreadful.

RAURIS, in *Geography*, a town of the archbishopric of Salzburg; 32 miles S. of Salzburg.

RAUSCHENBERG, a town of Hesse; 4 miles N. of Marburg. N. lat. 50° 53′. E. long. 8° 53′.

RAUSHENBERG, a town of Germany, in the principality of Culmbach; 7 miles N.N.E. of Neustadt.

RAUSNITZ, a town of Moravia, in the circle of Brunn; 10 miles E. of Brunn.

RAUTA Lambi, a town of Sweden, in the government of Kuopio; 27 miles S.W. of Kuopio.

RAUTENBURG, a town of Prussian Lithuania; 27 miles W. of Tilsit.—Also, a town of Prussia, in the province of Samland; 36 miles N.E. of Königsberg.

RAUTERN, a town of Austria; 6 miles W.N.W. of Drosendorf.

RAUTIO, a town of Sweden, in the government of Ulea; 36 miles S. of Braheftad.

RAUTPOUR, a town of Hindoostan, in Allahabad; 18 miles N.N.W. of Corah.

RAUTY Dungaree, a town of Hindoostan, in Guzerat, on the coast; 50 miles S.W. of Noanagur.

Rauty-*Mummy*, or *Rauty-muddum*, *stone-mummy*, a name given by the people of the East Indies to a kind of fossile substance, much valued for its medicinal virtues. It is of the nature of the selenites, and is found upon the high rocks, and supposed to be generated of the dew which falls from the heavens; but this is an idle opinion, and the formation of it is evidently the same with that of the European rhomboidal selenites. They beat it to powder, and after boiling it in milk, they give it in cases of the venereal kind. In a common clap, they give half a scruple, night and morning.

RAUVEE, in *Geography*, a river of Asia, which rises on the borders of Thibet, and joins the Chunaub in the country of Lahore, 28 miles N.E. of Moultan. The Rauvee is the "Hydraotes" of Alexander, and though it is represented as a noble river, it is somewhat inferior in bulk to the Chunaub. Its sources are in the mountains near Nagorkote, a famous place of Hindoo worship; and it enters the plains near Shahpour (called also Rajapour), from whence the famous canal of Shah Nahr was drawn to Lahore, 48½ common cosses in length. The space between the Rauvee and Chunaub, at their entry on the plains, is about 54 geographical miles; and they gradually approach each other during a course of 170 miles. The junction of the Rauvee with the Chunaub (or rather the Chunaub and Behut collectively) is effected nearly midway between Toulumba and Moultan. The Ayin Acbaree allows 27 cosses between the junction of the Behut and Chunaub, and that of the Rauvee with the Chunaub; but this distance must be applied to the course of the river, not to the road by land. When these three rivers are united, they form a stream equal to the Indus itself, at the place of confluence; which is from 20 to 30 miles below Moultan. Rennell.

RAUWOLFIA, in *Botany*, was so named by Plumier, in memory of Leonard Rauwolf, a native of Augsburg, and a pupil of Rondelet. He sailed from Marseilles, in 1573, for the Levant, and performed a laborious and dangerous journey through Syria, Mesopotamia, Palestine and Egypt; of which he has left an account in German, full of curious information relative to medical and other rare plants, with several wooden cuts. He died physician to the Austrian army, at Hatvany, in Hungary, in 1606, according to Dryander, Bibl. Banks. v. 395, though Haller says 1596. The latter writer mentions his being obliged to quit his country on account of his religion, which was Protestant. His splendid herbarium, once the property of queen Christina, and of Isaac Vossius, is preserved in the university of Leyden. From it Gronovius composed his *Flora Orientalis*.—Linn. Gen. 115. Schreb. 160. Willd. Sp. Pl. v. 1. 1217. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 64. Juss. 148. Plum. Gen. 19. t. 40. Lamarck Illustr. t. 172. Gærtn. t. 52.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Contortæ*, Linn. *Apocineæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, minute, with five segments, permanent. *Cor.* of one petal, salver-shaped; tube cylindrical, globular at the base; limb in five deep, roundish, emarginate, oblique segments. *Stam.* Filaments five, shorter than the tube; anthers erect, simple, acute. *Pist.* Germen roundish; style very short; stigma capitate. *Peric.* Berry nearly globose, marked with a furrow along one side, of one cell. *Seeds* two, convex at the base, tapering at the summit, compressed, divided, more or less completely, into two cells.

Ess. Ch. Corolla oblique, salver-shaped. Stamens included. Berry globose, with two seeds, each of two cells.

1. R. *nitida*. Shining Rauwolfia. Linn. Sp. Pl. 303. Hort. Cliff. 75. t. 9. Willd. n. 1. Ait. n. 1. (R. tetraphylla angustifolia; Plum. Ic. 232. t. 236. f. 1.)—Leaves in fours, lanceolate, pointed, very smooth and shining. Flowers axillary or terminal, cymose.—Native of mountainous woods in the West Indies. A *shrub* about twelve feet high, erect, very smooth and shining, abounding with viscid milk. *Leaves* four together at each joint of the branches, spreading, on short stalks, lanceolate, with a blunt point, entire, unequal in size, from two to five inches, or more, with one rib, and many fine transverse parallel veins. *Flowers* small, white, inodorous, in axillary, rarely terminal, stalked *cymes*, shorter than the leaves. *Fruit*, according to Jacquin, at first yellow, then purplish-black, thrice the size of a pea, milky. Linnæus tells us his figure in the Hortus Cliffortianus was drawn by Ehret, from a plant in the Chelsea garden; so that this *Rauwolfia* must have flowered under Miller's care, in the year 1736. In Ait. H. Kew. a later date is given. The corolla in the figure just mentioned is more concave in the limb, as well as more notched, than Plumier represents it.

2. R. *glabra*. Smooth Rauwolfia. Cavan. Ic. v. 3. 50. t. 297. Willd. n. 2.—Leaves alternate, ovato-lanceolate, smooth. Cymes opposite to the leaves, of few flowers.

Native of New Spain. The whole plant is smooth. *Stem* shrubby, a yard high, with pliant, round, leafy branches. *Leaves* scattered, rounded at the base, rather pointed, single-ribbed, two or three inches long, on shortish *footstalks*. *Flowers* small, white, about four together, in small cymes or clusters,

clusters, opposite to the leaves. *Berry* obovate, with only one *seed*; at least in garden specimens, which very probably differ in those respects from wild ones. This species flowered at Madrid from August to October.

3. R. *canescens*. Hoary Rauwolfia. Linn. Sp. Pl. 303. Willd. n. 3. Ait. n. 2. (R. hirsuta; Jacq. Amer. 47. R. tetraphylla latifolia; Plum. Ic. 232. t. 236. f. 2.)—Leaves in fours, elliptic-obovate, acute, downy. Flowers axillary or terminal. Segments of the corolla obtuse.—Native of dry, sunny, bushy places in the West India islands, as well as on the neighbouring continent. It was cultivated by Miller at the same time with the first species. We received a specimen in flower, from the stove at Kew, in June 1807. Jacquin says this species varies greatly in the size of all its parts, according to soil and situation, and in the height of its *stem* from one to eight feet. The young *branches, flower-stalks, footstalks*, and both sides of the *leaves*, are clothed with short dense pubescence, which almost entirely disappears by culture, though the upper side of the *footstalks* continues rough with bristly glands. The *leaves* are from one and a half to two inches long, obovate, more or less inclining to elliptical, acute, unequal. *Flowers* in small, axillary, downy, stalked tufts, or umbels. *Corolla* green with a tinge of red, its segments obtuse. *Fruit* cloven at the top, first red, then black, containing two *seeds*, as Jacquin well describes it. One cell of each seed is usually, according to him, abortive.

4. R. *tomentosa*. Downy Rauwolfia. Jacq. Amer. 48. Obs. fasc. 2. 9. t. 35.—Leaves in fours, obovato-lanceolate, downy, tapering at each end. Flowers axillary or terminal. Segments of the corolla acute.—Native of rocky places about Carthagena; sometimes on the stone walls of the town. Jacquin alone seems to have known this species, which principally differs from the last, as far as we can judge, in having white *flowers*, the segments of whose *corolla* are ovate and acute. The *leaves* moreover are rather tapering at each end; but that circumstance varies. *Fruit* the size of a pea, first red, then black. We have seen no specimen.

5. R. *Pulaparia*. East Indian Rauwolfia. Roxb. MSS.—Leaves in threes, elliptical, bluntly pointed, smooth and shining. Flowers terminal, in forked panicles. Corolla many times longer than the calyx. Sent by Dr. Roxburgh, from Calcutta, with the above name. We rely on him for the genus, having seen no fruit. This *shrub* is smooth in nearly every part, with round *branches*. *Leaves* about three inches long, and above one broad, coriaceous and shining; their transverse veins very fine and numerous. *Flower-stalks* very minutely downy, as well as the imbricated *bracteas*, and keeled pointed segments of the *calyx*. *Corolla* apparently white, with a red tube, which is near three quarters of an inch long, cylindrical, swelling at the top: segments of the limb rounded.

Rauwolfia, in *Gardening*, contains plants of the tender, exotic, shrubby kind for the stove, of which the species cultivated are: the shining rauwolfia (R. nitida); and the hoary rauwolfia (R. canescens).

Method of Culture.—These may be increased by the seeds or berries, which should be sown in pots filled with light mould, in the autumn or spring, plunging them in a mild hot-bed. When the plants have attained some growth, they should be removed into separate pots, and have the management of other exotic stove plants. They may likewise be raised by layers and cuttings, laid down or planted out in pots, plunged in the hot-bed in the spring and summer months, till they have stricken root, being afterwards managed as those from seed.

They afford much ornament and variety in hot-house collections, both in their foliage and flowers.

RAUZAN, in *Geography*, a town of France, in the department of the Gironde; 9 miles S.S.E. of Libourne.

RAUZZINI, Venanzio, in *Biography*, a native of Italy, who, when he arrived here in 1774, to succeed Millico at the opera, was a beautiful and animated young man, with a soprano voice. He was an excellent musician, having studied counterpoint with as much application as the art of singing: so that he may truly be said not only to know his own business, but that of a maestro di cappella; having been as able to compose an opera as to perform a principal part in it. "Piramo e Tisbe," and "La Vestale," may be instanced in proof of this assertion.

His voice was not very powerful when he came hither from Munich, where we first knew him; and where he had enjoyed the highest favour several years. His taste, governed by science, was correct and exquisite. His voice, though not of great volume, was sweet, clear, flexible, and extensive; being in compass more than two octaves. But he is supposed to have injured his chest in early youth by a rage for counterpoint. He played the harpsichord neatly, accompanied well, and had real genius for composition, which inclined him to devote that time to the pen and the improvement of his hand, which, perhaps, in his station, would have been more usefully bestowed in nursing and exercising his voice.

It was some time before the extent of his merit and science were known in this country, and favoured by the public. Nothing can so speedily convey the merits of a singer to an audience, as a *great* and powerful voice. However, his taste, fancy, knowledge, and delicacy, together with his beautiful person, and spirited and intelligent manner of acting, before the first season was over, gained him general approbation and favour. And since he has quitted the stage, and made Bath his residence. Though he has been long obliged to discontinue singing in public, it is not too much to say that he has disseminated good taste throughout the kingdom, by the numerous scholars he has taught among the nobility and gentry, as well as by those whom he has prepared for public patronage, professionally.

RAW, in *Agriculture*, any sort of plant, substance, or material, which is in a green, unripe, or undigested condition, or which is employed in its more fresh and crude state; as, for instance, dung before it has been much reduced, and lost many of its nutrient principles or properties by the process of fermentation. See Dung.

Raw *Cream*, in *Rural Economy*, such as is raised in the natural way, not *scalded* or *clouted*.

Raw *Hide*. See Hide.

Raw *Lands*, in *Agriculture*, a term applied to wet, cold, heavy lands, which are unfit to receive the seed.

Raw *Silk*. See Silk.

RAWA, or Rava, in *Geography*, a town of the duchy of Warsaw, late capital of a palatinate of the same name. The castle is appropriated for the confinement of state prisoners; 45 miles S.W. of Warsaw. N. lat. 51° 55′. E. long. 20° 17.

Rawa, a town of Poland, in the palatinate of Belz; 18 miles S.W. of Belz.

Rawa. See Rava.

RAWAK, a small island in the Pacific ocean, near the N. coast of the island of Waygoo, with which it forms a harbour. E. long. 131° 15′.

RAWAPSKITCHWOCK, a small westerly branch of Machias river. See Machias.

RAWAY, or *Bridge-town*, a truly commercial village of Middlesex county, New Jersey, on Raway river, four or five miles S.W. of Elizabeth-town, and 75 from Philadelphia.

phia. It contains a post-office, a presbyterian church, and about 50 or 60 houses.

RAWDON, a town of Nova Scotia, 40 miles from Halifax, containing about 50 or 60 houses.

RAWDON, a township of the county of Hastings, in Upper Canada, N. of Sidney.

RAWLINSON, CHRISTOPHER, in *Biography*, of Cork-Hall, in Lancashire, was born in 1677, educated in Queen's college, Oxford, and died in 1733: he was much attached to Saxon and Northern literature, and published an edition of "King Alfred's Translation of Boethius de Consolatione," 8vo. 1698.

RAWLINSON, RICHARD, a distant relation of the preceding, a learned antiquarian, was the son of sir Thomas Rawlinson, knight, and once lord mayor of London. He was educated at St. John's college, Oxford, and was admitted to the degree of doctor of the civil law in 1719. He devoted himself to antiquarian pursuits, and made large collections for a continuation of Wood's Athenæ Oxonienses, and History of Oxford, and published the life of that industrious antiquary. The principal work of Mr. Rawlinson was "The English Topographer," or, An historical account of all the pieces that have been written relating to the ancient natural history or topographical description of any part of England, 1720. He published the "Latin Letters of Abelard and Heloisa," and "A Translation of Du Fresnoy's New Method of Studying History," 2 vols. 8vo. He died at Islington in 1755, and by his will ordered that his heart should be deposited in the chapel of St. John's college, Oxford. That university was indebted to him for various benefactions of books, manuscripts, medals, &c. as well as landed property, and an endowment for an Anglo-Saxon lecture.

RAWLLOW, in *Geography*, a town of Hindoostan, in Palnaud; 27 miles W.S.W. of Timerycotta.

RAY, JOHN, in *Biography*, whom Haller terms the greatest botanist in the memory of man, and to whose transcendent merits we have already briefly adverted, in treating of the genus dedicated by Plumier to his name, see RAIANIA; was born at Black Notley, near Braintree, in Essex, Nov. 29, 1628. His father, Roger Ray, though in the humble station of a blacksmith, gave him a learned education; first at the grammar-school of his native town, at that time not very well conducted; and subsequently at Cambridge, where he entered at Catharine Hall, in his 16th year, June 28th, 1644, being designed for holy orders. In about a year and three quarters afterwards, he removed to Trinity College, where he found the young men occupied in a more liberal train of studies, with less of scholastic disputations and quibbles. Ray was fortunate in having for his tutor at Trinity, Dr. Duport, an eminent Greek scholar, under whose fostering and partial care, he soon made up for all the deficiencies of his early education, in the learned languages, including Hebrew. By this gentleman he was always mentioned with peculiar regard. He was no less happy in a youthful literary friend and fellow-student, afterwards the celebrated Dr. Isaac Barrow. Even at this early period, Ray began to cultivate natural history; and distinguished himself by many school exercises as an orator, no less than by his general taste for study, his love of virtue, and his gentleness of manners, qualities which shone brighter and brighter to the latest period of his life. His merit occasioned him to be chosen a Minor Fellow of Trinity, along with his friend Barrow, September 8th, 1649. On taking his degree of Master of Arts, he became a Major or Senior Fellow; and afterwards, October 1st, 1651, Greek Lecturer of the college. At the end of two years he was appointed Mathematical Lecturer, and in two years more, October 2d, 1655, Humanity Reader. He subsequently filled several respectable offices in his college, as Junior Dean, College Steward, &c., and during his residence in the university, became tutor to many gentlemen of rank and fortune, who were sensible of their obligations to him; amongst whom the most eminently distinguished by personal worth, and congeniality of talents with himself, was Mr. Francis Willughby, of Middleton-hall in Warwickshire, so well known by his posthumous works on Birds and Fishes, edited by the affectionate care of Ray.

At this period it was usual for young men of ability and learning, though not in orders, to deliver sermons, and common-place readings, as they were called; not only in the chapels or halls of their own colleges, but even before the university body, at St. Mary's church. In these Ray eminently distinguished himself. He was among the first who ventured to lead the attention of his hearers, from the unprofitable subtleties of scholastic divinity, and the trammels of Aristotelian philosophy, to an observation of nature, and a practical investigation of truth. The rudiments of many of his subsequent writings originated in these juvenile essays, particularly his celebrated book on the "Wisdom of God manifested in the Works of the Creation," known all over the world by its numerous editions and translations, and universally admired for its rational piety, sound philosophy, and solid instruction. This book is the basis of all the labours of following divines, who have made the book of nature a commentary on the book of revelation; a confirmation of truths, which Nature has not authority, of herself, to establish. In it the author inculcates the doctrine of a constantly superintending Providence; as well as the advantage, and even the duty, of contemplating the works of God. This, he says, is part of the business of a sabbath day, as it will be, probably, of our employment through that eternal rest, of which the sabbath is a type. Archbishop Tennison is recorded to have told Dr. Derham, that "Mr. Ray was much celebrated, in his time, at Cambridge, for preaching solid and useful divinity, instead of that enthusiastic stuff, which the sermons of that time were generally filled with." Two of his funeral discourses are mentioned with particular approbation; one on the death of Dr. Arrowsmith, master of his college; the other on that of one of his most intimate and beloved colleagues, Mr. John Nid, likewise a Senior Fellow of Trinity, who had a great share in Ray's first botanical publication, the *Catalogus Plantarum circa Cantabrigiam nascentium*, printed in 1660; which may be considered as the prototype of his *Synopsis*, hereafter mentioned. Indeed before this little volume appeared, its author had visited various parts of England and Wales, for the purpose of investigating their native plants, as he did several times afterwards; nor were his observations confined to natural history, but extended to local and general history, antiquities, the arts, and all kinds of useful knowledge. His amusing Itineraries were published, along with his life, by Dr. Derham, and a few letters to that gentleman, by the care of Dr. George Scott, F.R.S., in 1760, under the title of "Select Remains of the learned John Ray, M.A., &c." Ray's first botanical tour occupied nearly six weeks, from August 9th to September 18th, 1658. On the 23d of December 1660, he was ordained, both deacon and priest at the same time, by Dr. Sanderson, then bishop of Lincoln. In 1661 he travelled with Mr. Willughby into Scotland, returning by Cumberland and Westmoreland; and the following year, with the same companion, he accomplished a more particular investigation of Wales. How critically he studied the botany of the countries

countries he vifited, is evident from the different editions of his *Catalogus Plantarum Angliæ*, and *Synopfis Methodica Stirpium Britannicarum.*

All this while Mr. Ray continued to enjoy his fellowfhip, and to cultivate his Cambridge connections; but in September 1662, his tranquillity was difturbed by the too famous Bartholomew act, by which 2000 confcientious divines were turned out of their livings, and many fellows of colleges deprived of their maintenance, and means of literary improvement. Among the latter was the fubject of our memoir, with thirteen honeft men at Cambridge befides, of whofe names he has left us a lift. One of them, Dr. Dillingham, was mafter of Emanuel college; but Ray was the only perfon of his own college who fuffered this deprivation. The reader muft not fuppofe that he, or perhaps any other perfon in this illuftrious catalogue, was, in the leaft degree, deficient in attachment to the doctrine or difcipline of the church of England, or that they had taken the oath called the Solemn League and Covenant; which Ray certainly had neither taken nor ever approved. They were required to fwear to the infamous propofition, that the faid oath was not binding to thofe who had taken it, and on this ground they confcientioufly gave up their preferment. It is curious to read the apology made for Ray to Dr. Derham, on this fubject, by a Mr. Brokefby—"that he was at that time abfent from his college, where he might have met with fatisfaction to his fcruples; and was among fome zealous non-conformifts, who too much influenced him, by the addition of new fcruples. And we may alfo afcribe fomewhat to the prejudice of education in unhappy times." By this it appears, that the "fcruples" of non-conformifts were moft favourable to the fanctity of an oath; and that the "unhappy times" alluded to, were more advantageous to principle, than the golden days of Charles II.; whofe minifters doubtlefs valued the obedience, far more than the honefty, of any man; nor is this tafte, by any means, peculiar to them or their profligate mafter.

Mr. Ray, or, as he wrote his name, for a while, about this period, Wray, having thus the world before him, made an arrangement with Mr. Willughby for a tour on the continent; and in this plan two of his pupils were included, Mr. Nathaniel Bacon, and Mr., afterwards fir Philip, Skippon. They failed for Calais in April 1663, but being prevented, by the ftate of political affairs, from profecuting their journey through France, they traverfed the Low Countries, Germany, &c. proceeding by Venice into Italy; moft of whofe cities they vifited, either by fea or land; as well as Malta and Sicily; and returned, by Switzerland, through France, into England, in the fpring of 1666. Mr. Willughby indeed feparated from the reft of the party at Montpellier, and vifited Spain. An ample account of their obfervations was publifhed by Ray, in 1673, making a thick octavo volume. The travellers appear to have been diligent and acute in every thing relative to politics, literature, natural hiftory, mechanics, and philofophy, as well as antiquities and other curiofities; but in the fine arts they affume no authority, nor difplay any confiderable tafte or knowledge. Mr. Willughby's account of Spain makes a part by itfelf; and a rich critical catalogue of fuch plants, not, for the moft part, natives of England, as were obferved in this tour, concludes the volume. Haller gives to Ray the credit of having difcovered feveral fpecies in Switzerland, previoufly not known as natives of that country.

Ray paffed the fummer of 1666 partly at Black Notley, and partly in Suffex, ftudying chiefly the works of Hook, Boyle, Sydenham on Fevers, and the Philofophical Tranfactions, "making few difcoveries," fays he, "fave of mine own errors." The following winter he was employed at Mr. Willughby's, in arranging that gentleman's mufeum of natural hiftory and coins, and in forming tables of plants and animals for the ufe of Dr. Wilkins, in his famous work on an Univerfal Character. He now alfo began to arrange a catalogue of the Englifh native plants, which he himfelf had gathered; rather for his own ufe, than with any immediate view of publication; "at prefent," as he wrote to Dr. Lifter, "the world is glutted with Dr. Merret's bungling Pinax. I refolve never to put out any thing which is not as perfect as is poffible for me to make it. I wifh you would take a little pains this fummer about graffes, that fo we might compare notes." The above refolution of our author is, no doubt, highly commendable, but the world has rather to lament that fo many able men have formed the fame determination, at leaft in natural fcience. If it were univerfally adhered to, fcarcely any work would fee the light; for few can be fo fenfible of the defects of any other perfon's attempt to illuftrate the works of nature, as a man of tolerable judgment muft be of his own. This is efpecially the cafe with thofe who, like Ray, direct their afpiring views towards fyftem, and philofophical theory. Happily he did not try this arduous path, till he had trained himfelf by wholefome practical difcipline, in obfervation and experience. His firft botanical works affumed the humble form of alphabetical catalogues. His and Mr. Willughby's labours in the fervice of bifhop Wilkins, were indeed of a fyftematical defcription; and accordingly the authors themfelves were, more than any other perfon probably, diffatisfied with their performance. They relaxed from thefe labours in a tour of practical obfervation through the weft of England, as far as the Land's-End, in the fummer of 1667, and returning by London, Mr. Ray was folicited to become a Fellow of the Royal Society, into which learned body he was admitted November 7th. Being now requefted by his friend Wilkins to tranflate the "Real Character" into Latin, he undertook, and by degrees accomplifhed, that arduous performance, depofiting his manufcript in the library of the Royal Society, where it has ever fince repofed. The following fummer was agreeably fpent, in vifits to various literary friends, and in a folitary journey to the north; for his former companion Willughby, being juft married, ftayed at home; there Ray joined him in September 1668, and remained for moft part of the enfuing winter and fpring.

The feclufion and leifure of the country, with the converfe and affiftance of fuch a friend, were favourable to the profecution of a new fubject of enquiry, which now ftrongly attracted the attention of our great naturalift, the theory of vegetation. The firft ftep of the two philofophers, in this little-explored path, was an examination of the motion of the fap in trees; and the refult of their enquiries, communicated to the Royal Society, appeared foon after in the Philofophical Tranfactions. Their experiments clearly prove the afcent of the fap through the woody part of the tree; which is eafily detected by boring the trunk, at different depths, before the leaves are unfolded; and they obferved alfo the mucilaginous nature of the flowing fap, "precipitating a kind of white coagulum or jelly, which," fays Ray, in a note preferved by Derham, "may be well conceived to be the part which, every year, between bark and tree, turns to wood, and of which the leaves and fruit are made. It feems to precipitate more when the tree is juft ready to put out leaves, and begins to ceafe dropping, than at its firft bleeding." The accuracy of the leading facts recorded by thefe ingenious men, is confirmed by fubfequent obfervers, who have further purfued the fame fubject, which is now

fufficiently

fufficiently well underftood. They indeed, like the reft of the world till lately, feem not to have fufpected, that the fap was quiefcent till their perforations in the tree were made; nor did they advert, as they ought, to phenomena dependent on the principle of life, in the vegetable body. See CIRCULATION *of the Sap*.

At this time Ray began to prepare for the prefs his "Collection of Proverbs," a curious book in its way, by which he is perhaps better known to the generality of his countrymen, than by any other of his literary labours. The firft edition was publifhed in 1672; but the work was fubfequently much enlarged, and the author may almoft be faid to have exhaufted his fubject. From its very nature, delicacy and refinement muft often be difpenfed with; but this is evidently not the fault, or the aim, of the writer. His learning and critical acutenefs diffufe light over the whole, and make us overlook the coarfe vehicle of our inftruction.

The firft edition of the Catalogue of Englifh Plants, already mentioned, came out in 1670, and the fecond in 1677. Their great author gave his work to the world with that diffidence, for which he alone perhaps could perceive any juft foundation. We poftpone our remarks till we fpeak of the fame work in its fyftematic form hereafter.

About this period the health of Mr. Ray feems to have been confiderably impaired. He refufed a tempting offer to travel again on the continent, as tutor to three young noblemen; nor could the powerful attractions of alpine botany, which made a part of his profpect, overcome the reluctance to leaving home, which arofe from a feeble fta·e of body. Indeed this very reluctance, or liftlefsnefs, is accounted for, by the turn which his diforder took, as it terminated in the jaundice. After this depreffing complaint had left him, he refumed, with frefh alacrity, his botanical travels at home, vifiting the rich ftores of the north of England, with a companion named Thomas Willifel, whofe name and difcoveries he afterwards, on many occafions, has gratefully commemorated. Nothing forms a more ftriking feature in Ray's character, than the unreferved and abundant commendation, which he always gave to his friends and fellow-labourers. We are about to narrate an event, which called forth all his affectionate feelings of this kind, as well as his moft important and beneficial exertions; when, even to his own prejudice, he fulfilled the facred duties of friendfhip, and delighted in adorning the buft of his friend with wreaths, that he himfelf might juftly have affumed. On the 3d of July 1672, Mr. Willughby was unexpectedly carried off by an acute diforder, in the 37th year of his age. The care of his two infant fons was confided by himfelf to Mr. Ray, who was alfo appointed one of his five executors, and to whom he left an annuity of 60*l.* for life. The eldeft of thefe youths was created a baronet at the age of 10 years, but died before he was 20. Their fifter Caffandra afterwards married the duke of Chandos. Thomas, the younger fon, was one of the ten peers created, all on the fame day, by queen Anne, and received the title of lord Middleton. His early youth was much indebted to the care of his faithful guardian, who compofed, for his and his brother's ufe, and publifhed in 1672, a *Nomenclator Claſſicus*, far more exact, efpecially in the names of natural objects, than any that had previoufly appeared. The care of his pupils, and of the literary concerns of their deceafed parent, now interrupted Mr. Ray's botanizing excurfions, and caufed him alfo to decline the offer of Dr. Lifter, then a phyfician at York, to fettle under his roof. Bifhop Wilkins did not long furvive Mr. Willughby, and his death made another chafm in the fcientific and focial circle of our great natural philofopher, who felt thefe loffes as deeply and tenderly as any man. He fought confolation in a domeftic attachment, fixing his choice on a young woman, of good parentage, whofe name was Margaret Oakeley, and who refided in the family at Middleton-hall. He was married at the parifh church, June 5th, 1673, being then in the 45th year of his age, and his bride about 20. This lady took a fhare in the early education of his pupils, as far as concerned their reading Englifh. She is faid to have been recommended by her character, as well as her perfon, to the regard of her hufband. She bore him three daughters, who, with their mother, furvived him.

Ray's communications to the Royal Society became now very frequent, and extended to various fubjects relative to the natural hiftory of animals, as well as to the phyfiology, and even the botanical characters, of vegetables. He was, at the fame time, in the courfe of the years 1674 and 1675, much occupied in digefting Mr. Willughby's zoological papers. Thefe were compofed in Latin, in which language the Ornithology firft appeared in 1676, making a folio volume, accompanied by 77 plates, engraved, at the expence of the author's widow, from his own drawings. An Englifh tranflation by Ray, with ftill more additions than he had fupplied to the former publication, and one more plate, iffued from the prefs in 1678. The account which Dr. Derham received from the lips of Mr. Ray, about eight months previous to his deceafe, refpecting the primary intentions of himfelf and his late friend, and which is recorded in his life, p. 48, is too curious to be omitted here, as their project and its execution form an epocha in the hiftory of natural fcience. "Thefe two gentlemen," fays Derham, "finding the hiftory of Nature very imperfect, had agreed between themfelves, before their travels beyond fea, to reduce the feveral tribes of things to a method; and to give accurate defcriptions of the feveral fpecies, from a ftrict view of them. And forafmuch as Mr. Willughby's genius lay chiefly to Animals, therefore he undertook the Birds, Beafts, Fifhes, and Infects, as Mr. Ray did the Vegetables." Derham adds, that Mr. Willughby, during his fhort life, "profecuted his defign with as great application, as if he had been to get his bread thereby." The writer of the prefent article has elfewhere obferved, (Introductory Difcourfe, Tr. of Linn. Soc. v. 1,) that "from the affectionate care with which Ray has cherifhed the fame of his departed friend, we are in danger of attributing too much to Mr. Willughby, and too little to himfelf." His own ftatement, no doubt, was correct, as to their original aims; but it is impoffible not to perceive that the furvivor executed or perfected what his friend, in many inftances, could only have projected, or fcarcely begun. Had Willughby lived, there can be little doubt of his career being as glorious in the fequel as that of his friend; and poffibly, from the advantages of fortune which he enjoyed, even more widely beneficial to fcience. Yet who can tell that he might not have flackened his courfe? Though he glorioufly avoided the fnares of luxury and folly in his youth, who fhall fay that politics or ambition might not have dazzled his riper age? or that he would always have efcaped that ruinous vanity, which grafps at univerfal knowledge, or rather at univerfal fame; and knowing nothing deeply, is moft flattered with any praife which is leaft deferved. So often has this laft been the cafe with literary men, that one cannot but miftruft a character of the faireft promife. What Ray has done, we know and can appreciate. Equal to his friend in learning, talents, and zeal, the advantages of ample fortune were compenfated by the leifure and tranquillity of a fequeftered country life. His duties went hand in hand with his ſtudies and recreations, and he enjoyed, as Haller obſerves, the rare felicity of giving 50 years uninterruptedly to his favourite ſcience. His long-protracted ſtudies, and ripened experience, enabled him to achieve what at firſt he could but regard at a diſtance, as the great object of his wiſhes, a ſyſtematic arrangement of the animal as well as vegetable kingdoms. Every body had, hitherto, been content with Ariſtotle's claſſification of animals, of whoſe imperfections Ray, daring to think for himſelf, could not but be aware. He invented a new one, founded on the ſtructure of the heart. "The Harveian experiments, and doctrine of the circulation, had called the peculiar attention of philoſophers to every organ which has a ſhare in that phenomenon; and to this cauſe, probably, we owe the method of Ray." The mode of breathing in animals, whether by lungs or by gills, and the ſingle or double ſtructure of the heart, in the former caſe, conſtitute the baſis of his ſyſtem; which, in theſe particulars at leaſt, ſucceeding naturaliſts have adopted. His ſubordinate characters of the principal claſſes evince great ſkill and ſagacity, and the Linnæan ſyſtem of Quadrupeds is highly indebted to that of our illuſtrious countryman.

His zoological publications indeed did not follow each other in rapid ſucceſſion; for after the Ornithology had come forth in Engliſh, eight years elapſed before the *Hiſtoria Piſcium* of Willughby was given, by his care, to the world. This was printed in folio, with 188 plates of fiſhes, in 1686, at Oxford, owing to the intereſt of biſhop Fell, and the pecuniary aſſiſtance of the Royal Society. It does not appear why the relict of Mr. Willughby withheld, in this inſtance, the contributions which had ſo much benefited her huſband's former work, and which ſhe juſtly owed to his fame. It ſeems that the intimate connexion of Ray with this family, was much impaired by the death of lady Caſſandra Willughby, the mother of his friend, about the year 1675 or 1676; when the children were taken from his tuition, and he left Middleton-hall, fixing for a ſhort time at Sutton Cofeld, four miles diſtant. At Michaelmas 1677 he removed from thence to Falborne-hall, in Eſſex, not far from his native village. On the 15th of March following, his mother, at the age of 78, died at Black Notley, "in her houſe on Dewlands;" of whom he ſpeaks with that reverence and regret, which has peculiarly marked the characters of ſome of the greateſt and beſt men on the ſame occaſion. At Midſummer 1679, he finally ſettled at Black Notley, for the remainder of his days, or "for the ſhort pittance of time he had yet to live in this world," as he himſelf expreſſed it; which pittance, however, extended to more than twenty-five years.

The firſt fruit of our author's leiſure and retirement was his *Methodus Plantarum Nova*, publiſhed in 1682, making an octavo volume. His principles of arrangement are chiefly derived from the fruit. The regularity and irregularity of flowers, which take the lead in the ſyſtem of Rivinus, make no part of that of Ray. It is remarkable that he adopts the ancient primary diviſion of plants, into trees, ſhrubs, and herbs, and that he blamed Rivinus for aboliſhing it, though his own prefatory remarks tend to overſet that principle, as a vulgar and caſual one, unworthy of a philoſopher. That his ſyſtem was not merely a commodious artificial aid to practical botany, but a philoſophical clue to the labyrinth of Nature, he probably, like his fellow-labourers, for many years, in this department, believed; yet he was too modeſt, and too learned, to think he had brought this new and arduous deſign to perfection; for whatever he has incidentally or deliberately thrown out, reſpecting the value of his labours, is often marked with more diffidence on the ſubject of claſſification, than any other. He firſt applied his ſyſtem to practical uſe in a general *Hiſtoria Plantarum*, of which the firſt volume, a thick folio, was publiſhed in 1686, and the ſecond in 1687. The third volume of the ſame work, which is ſupplementary, came out in 1704. This vaſt and critical compilation is ſtill in uſe as a book of reference, being particularly valuable as an epitome of the contents of various rare and expenſive works, which ordinary libraries cannot poſſeſs, ſuch as the *Hortus Malabaricus*. The deſcription of ſpecies is faithful and inſtructive; the remarks original, bounded only by the whole circuit of the botanical learning of that day; nor are generic characters neglected, however vaguely they are aſſumed. Specific differences do not enter regularly into the author's plan, nor has he followed any uniform rules of nomenclature. So ample a tranſcript of the practical knowledge of ſuch a botaniſt, cannot but be a treaſure; yet it is now much neglected, few perſons being learned enough to uſe it with facility, for want of figures, and a popular nomenclature; and thoſe who are, ſeldom requiring its aſſiſtance. A mere catalogue or index, like the works of Tournefort and Caſpar Bauhin, which teach nothing of themſelves, are of readier uſe. The Species Plantarum of Linnæus unites the advantages of the cleareſt moſt conciſe ſpecific definition, and, by the help of Bauhin, of an univerſal index.

But if the fame or the utility of Ray's great botanical work has, neither of them, been commenſurate with the expectations that might have been formed, a little octavo volume, which he gave to the world in 1690, amply ſupplied all ſuch defects, and proved the great corner ſtone of his reputation in this department of ſcience. We ſpeak of the *Synopſis Methodica Stirpium Britannicarum*. The two editions of his alphabetical catalogue of Engliſh plants being ſold off, and ſome pettifogging reaſons of his bookſeller's ſtanding in the way of a third, with any improvements, he re-modelled the work, throwing it into a ſyſtematic form, reviſing the whole, ſupplying generic characters, with numerous additions of ſpecies, and various emendations and remarks. The uſes and medicinal qualities of the plants are removed to the alphabetical index at the end. A ſecond edition of this *Synopſis* was publiſhed in 1696, nor did its author ever prepare another. The third, now moſt in uſe, was edited twenty-eight years afterwards by DILLENIUS. (See that biographical article.) Of all the ſyſtematical and practical Floras of any country, the ſecond edition of Ray's *Synopſis* is the moſt perfect that ever came under our obſervation. "He examined every plant recorded in his work, and even gathered moſt of them himſelf. He inveſtigated their ſynonyms with conſummate accuracy; and if the clearneſs and preciſion of other authors had equalled his, he would ſcarcely have committed an error. It is difficult to find him in a miſtake or miſconception reſpecting Nature herſelf, though he ſometimes miſapprehends the bad figures, or lame deſcriptions, he was obliged to conſult." *Tr. of Linn. Soc. v.* 4. 277. Above a hundred ſpecies are added, in this ſecond edition, and the cryptogamic plants, in particular, are more amply elucidated. A controverſial letter from Rivinus to Ray, and its anſwer, with remarks upon Tournefort, are ſubjoined to this ſecond edition. Much of the diſpute turns upon the now obſolete diſtinction of plants, in a methodical ſyſtem, into trees, ſhrubs, herbs, &c. The letters are well written, in Latin: and liberal, though perhaps hypercritical, in their ſtyle. Ray took no delight in controverſy. Its inevitable

evitable afperities were foreign to his nature. We muft not omit to notice that, in the preface to both editions of his *Synopfis*, the learned author, venerable for his character, his talents, and his profeffion, as well as by his noble adherence to principle in the moft corrupt times, has taken occafion to congratulate his country, and to pour out his grateful effufions to Divine Providence, in a ftyle worthy of Milton, for the eftablifhment of religion, law, and liberty, by the revolution which placed king William on the throne. An honeft Englifhman, however retired in his habits and his purfuits, could not have withheld this tribute at fuch a time; nor was any loyalty ever more perfonally difinterefted than that of Ray.

The year 1690 was the date of the firft publication of his noble work on "The Wifdom of God in the Creation," of which we have already fpoken, and whofe fale, through many editions, was very extenfive. In 1700 he printed a book, more exclufively within the fphere of his facred profeffion, called "A Perfuafive to an Holy Life;" a rare performance of the kind, at that day, as it would be at the prefent; being devoid of enthufiafm, myfticifm, or cant, as well as of religious bigotry or party fpirit, "and employing the plain and folid arguments of reafon, for the beft of purpofes." His three "Phyfico-Theological Difcourfes, concerning the Chaos, Deluge, and Diffolution of the World," of which the original materials had been collected and prepared formerly at Cambridge, came out in 1692, and were reprinted the following year. A third edition, fuperintended by Derham, was publifhed in 1713. This able editor took up the fame fubject himfelf in a fimilar performance, the materials of which, like Ray's, were firft delivered in fermons, at Bow church, he having been appointed reader of Mr. Boyle's lectures.

While Ray was from time to time intent on thefe moral and religious performances, in which he laboured equally to imprefs and elucidate the truths of natural and revealed religion, as well as to enforce its precepts and duties, he was no lefs attentive than formerly to his fyftematical ftudies. Dr. Tancred Robinfon is recorded by Derham, as having firft prompted our great naturalift to undertake a *Synopfis Methodica*, or claffical arrangement, of the whole animal, as he had done of the vegetable, kingdom. He even wifhed him to extend his attention to foffils, anticipating, in fhort, what Linnæus afterwards performed. Nor did he fhrink from the tafk. Though now for fome time oppreffed with bodily infirmity, and particularly with very troublefome ulcers in his legs, his mind was tranquil and unimpaired. He foon finifhed his *Synopfis Methodica Animalium Quadrupedum et Serpentini Generis*, which came out in 1693, making a thin, but clofely printed, octavo volume. We have already fpoken of the originality of his method. The volume in queftion, however, is not confined to dry fyftematical arrangement. It enters deeply into the general and particular hiftory of animals, their external forms, and internal ftructure, with abundance of entertaining and curious facts and obfervations. Linnæus was poffeffed of this book from the year 1734, and appears to have ftudied it well. A fimilar volume on birds, and another on fifhes, were prepared by the author; but the manufcripts of thefe lay neglected in the hands of fome carelefs or ignorant bookfeller, till they were difcovered by Dr. Derham, and publifhed in 1713. They contain more of particular defcriptions and hiftories, than of general remarks; but otherwife accord with the plan of the Synopfis of Quadrupeds. Many things are fupplied from materials obtained fince the publication of Willughby's Ornithology and Ichthyology, and feveral figures of fifhes were added by Derham, at the perfuafion of Petiver, whofe works they fomewhat refemble.

Having accomplifhed fo many great and laborious publications, our venerable naturalift began, as Dr. Derham informs us, to enjoy the thoughts of repofing from his labours. He was neverthelefs ready, at the call of his friends, to revife a tranflation of Rauwolf's Travels, the original having even then become very fcarce, befides being unintelligible to mere Englifh readers. This tranflation, with fome other rare tracts annexed, and a catalogue of Grecian, Syrian, Egyptian, and Cretan plants, drawn up by Mr. Ray, iffued from the prefs in 1693. See RAUWOLFIA.

Poffibly the *Stirpium Europæarum extra Britannias nafcentium Sylloge*, which appeared in 1694, originated in the author's attention being recalled, by the laft-mentioned publication, to the contemplation of exotic plants. In this volume he collects from Clufius, Bauhin, Columna, and others, various additions to his own difcoveries, and the whole are difpofed in alphabetical order. A geographical view of the plants, which he had himfelf gathered in his foreign travels, is fubjoined; and the volume concludes with alphabetical catalogues, felected from Boccone's Sicilian plants, and other recent authors. It is in the preface to this book, that he firft adverts to the fyftem of Rivinus, not without juft applaufe of that author's work, a copy of which had been prefented to Ray. He commends the apt diftribution of the genera, the clearnefs and concifenefs of the ftyle, the purity of the Latin, and the beauty as well as exactnefs of the plates. He, however, contends for the ancient diftinction of plants into trees and herbs, which, as we have feen, he had himfelf mentioned as unphilofophical. In the reft of his criticifms, though "much may be faid on both fides," and though thefe controverfialifts, like others, profit of the intricacies and anomalies of Nature, to make good their arguments, concealing themfelves, like the cuttle-fifh, in their ink; ftill we cannot but give our teftimony to the greater folidity of Ray's principles, as derived from the fruits and feeds of plants, than to the feemingly more elegant ones of Rivinus, deduced from the flower; which laft undoubtedly lead, in their practical application, to fome paradoxical combinations. But on this fubject we may fay more in its proper place. (See RIVINUS.) In this preface Ray points out the importance and ufe of the ftamens and piftils, fuccinctly explaining the fexual doctrine, as now univerfally admitted.

One advantage arofe from the epiftolary altercation of Rivinus and Ray, that it led the latter to revife his own fyftem, and to republifh it, in an improved ftate. Happy if fuch were more generally the fruit of contention, that each party fhould correct himfelf, inftead of aggravating the defects of his adverfary. Some notice is taken, in the preface to this edition, both of the fyftem of Tournefort and that of Hermann, which laft was moft congenial to the principles of Ray. The work was finifhed in 1698, but not given to the public till 1703, recourfe having been had to a Dutch bookfeller, who thought it for his intereft to place an Englifh publifher's name in the title-page; a proceeding which, however harmlefs, fhocked the honeft feelings of the author; and this perhaps excited the thrifty Hollander's furprize. By his exertions, however, the book, and the fame of its author, became more widely diffufed, and continental botanifts were much further initiated into Ray's fyftem than they had previoufly been.

But now the mortal career of this eminent man was drawing towards a clofe. He complained in his letters, that, fo far from being able to vifit the London gardens, as he wifhed, in in order to make obſervations upon plants, for the greater perfection of this laſt edition of his *Methodus*, he was not able to walk into his neighbouring fields. He ſtill, nevertheleſs, kept up to the laſt his correſpondence with his friends, in the vivacity and clearneſs of ſtyle which was natural to him. Latin and Engliſh, it is ſaid, were equally ready to his pen. So indefatigable was he in the cultivation of the ſtudy of Nature, that within a year or two of his death, he began to collect his ſcattered notes for a work on Inſects, and actually drew up a *Methodus Inſectorum*, which was printed, ſoon after his deceaſe, in a little octavo of ſixteen pages, and republiſhed in the front of his *Hiſtoria Inſectorum*. This laſt book, compriſing all his own and Mr. Willughby's deſcriptions of inſects, came from the preſs in 1710, at the expence of the Royal Society, and under the ſuperintendance of Dr. Derham. It conſiſts of 375 quarto pages, beſides an appendix of twenty-three more, on Britiſh Beetles, by Liſter. Ray attributes to Willughby that part of his ſyſtem which concerns inſects ſuppoſed to undergo no metamorphoſis. Theſe are moſtly the *aptera* of Linnæus, excluding the *cruſtacea*, but admitting inteſtinal *vermes*, earth-worms, and even leeches. All the deſcriptions and remarks of his departed friend are marked with the initials F.W. This work is a maſs of accurate and authentic obſervation; but, for want of plates, has never come into popular uſe. Linnæus ſtudied it much, and has often cited the deſcriptions, the appropriation of which is, however, too difficult and uncertain to render them of general or extenſive ſervice. Thoſe which regard the *Lepidoptera*, and their caterpillars, are moſt copious.

The ſtudy of inſects was probably the laſt that engaged the attention of this great and wiſe man; who, though on the verge of eternity, in the full poſſeſſion of himſelf, and in the anticipation of the moſt glorious manifeſtations of his Creator, did not diſdain or neglect to contemplate him in his leaſt and loweſt works. Such an example might ſerve for an occaſional anſwer to thoſe who affect to think the ſtudy of any of the works of God below the dignity of their philoſophy; for the moſt inordinate vanity muſt look with reſpect on what formed the abſtruſe ſtudies of ſo diſtinguiſhed a perſon as Ray. His laſt letter to Dr. Derham, who had juſt been to viſit him, is dated Auguſt 16, 1704. He ſpeaks of having lately obtained Mr. Willughby's entomological papers, and deſcribes himſelf as then entering on his Hiſtory of Inſects. How well he employed his time during the autumn, is evident from what we have related concerning this work, for he never ſaw another ſpring. He died at Black Notley, in a houſe of his own building, Jan. 17, 1705, in the 77th year of his age. His character is thus conciſely given by Derham. "In his dealings, no man more ſtrictly juſt; in his converſation, no man more humble, courteous, and affable; towards God, no man more devout; and towards the poor and diſtreſſed, no man more compaſſionate and charitable, according to his abilities." The friend who wrote this eulogium, in his "Life of Mr. Ray," aſſerts, that he was buried, according to his own deſire, in *the church* of Black Notley; but the authors of the Biographia Britannica are probably more correct, in ſaying, that he declined the offer made him by the rector, of a place of interment in the chancel, chooſing rather to repoſe with his anceſtors, in the church-yard. He perhaps thought, with biſhop Hall, that "the houſe of God ought not to be made a repoſitory for dead carcaſes." However this might be, the latter account is confirmed by the original ſituation of his monument, erected at the expence, in part at leaſt, of biſhop Compton. The long and elegant Latin epitaph has often been publiſhed. Its author was the Rev. William Coyte, M.A., father of the late Dr. Coyte of Ipſwich, and the original manuſcript is now before us, containing the information that Ray was interred in the church-yard. In 1737, the monument in queſtion, which ſeems to have been a ſort of altar tomb, being nearly ruined, was reſtored at the charge of Dr. Legge, and removed for ſhelter into the church; where therefore it became *a cenotaph*, as an inſcription added on this occaſion terms it. Forty-five years afterwards the tomb again underwent a repair, by the care of the preſent ſir Thomas Gery Cullum and others, who ſubjoined a third inſcription, as follows:

Tumulum hunc,
a nonnullis humanitati, et ſcientiæ
naturali, faventibus,
olim conditum,
et aliorum bonâ diligentiâ
poſteà reſtauratum, 1737,
nunc e vetuſtatis ſitu et ſordibus
pauci de novo revocarunt, 1792.
ανδρων επιφανων πασα γη ταφος.

A more laſting monument was dedicated to the memory of our great Engliſh naturaliſt, in the genus of plants which bears his name. (See Raiania.) The opinion we have there, in few words expreſſed, of his high rank in botanical ſcience, it is hoped the preſent more diffuſe account will juſtify. It muſt be lamented that he made, as far as we can learn, no collection of dried plants, which might ſerve to aſcertain, in every caſe, what he deſcribed. The great Herbariums of Buddle, Uvedale, &c. ſtill kept in the Britiſh Muſeum, are indeed ſuppoſed to ſupply, in a great meaſure, this defect; they having been collected by perſons who had frequent communication with Ray, and were well acquainted with his plants. Whatever he had preſerved relative to any branch of natural hiſtory, he gave, a week before his death, to his neighbour Mr. Samuel Dale, author of the *Pharmacologia*. Nothing is ſaid of his library, which was probably inconſiderable. His pecuniary circumſtances were very limited, for he merely conformed as a layman to the church of England, and was unwilling to ſubſcribe what was requiſite for receiving preferment. He is recorded nevertheleſs to have diſapproved of ſeparatiſts from the national church; juſtly diſguſted, probably, by the contentions and fanaticiſm he had ſeen throughout the greater part of his life. His principles and feelings ſoared far above the faſtidious diſtinctions, which marked the orthodox or the heterodox of thoſe times, and his mind was uncontaminated with their paſſions. His good ſenſe might well lead him to regret, that thoſe who had ſo lately eſcaped a moſt tremendous common enemy, ſhould be ſo prone to quarrel amongſt themſelves. It is an honour to both theſe parties that they have been emulous to claim him as their ally.

In the preceding review of the literary productions of Ray, more numerous, as Haller ſays, than thoſe of any other botaniſt, Linnæus excepted, we have been obliged to paſs over ſeveral things of leſs note; ſuch as his liſts of native Britiſh plants, for Gibſon's edition of Camden's *Britannia*; and even a variety of communications to the Royal Society. Neither have we touched on the principles of his botanical ſyſtem, that ſubject being explained at length by our predeceſſor, the late Rev. Mr. Wood, under the article Classification. Thoſe who are anxious to peruſe a more full and critical inveſtigation of his works and ſtudies, than it has been poſſible to give in this place, will do well to conſult Dr. Pulteney's "Sketches of the Progreſs of Botany in England." The "Philoſophical Letters," collected and publiſhed in 1718, by Dr. Derham, containing 68 written by Ray, and many more by his correfpondents, throw much light on his character and purfuits. We cannot help remarking that his hand-writing was peculiarly fair and elegant. A fpecimen of it exifts among fir Henry Spelman's vaft and curious collection of manufcripts, now in the poffeffion of John Patterfon, efq. late M. P. for Norwich.

The portraits of Ray are not numerous. One in oil, taken at an advanced period of his life, remains in the Britifh Mufeum, and Dr. John Sims is poffeffed of a miniature, of an earlier date, of which its owner has given an engraving, by way of frontifpiece to the firft volume of the "Annals of Botany," publifhed in 1805. The latter is rather deficient in that ftrength of character which appears in the more common prints, after a picture by Faithorne, often prefixed to the third edition of the *Synopfis*, and fometimes to the *Hiftoria Plantarum*. One of thefe prints was engraved by Elder; the other by Vertue. Neither of them is ftrictly appropriated to any particular book. That in the German edition of his "Wifdom of God in the Creation," publifhed at Leipfic in 1732, appears to be copied from one of thefe, and yet is fo unlike them in expreffion, that if it were poffible, one would fuppofe it taken from fome other portrait of the fame perfon. Ray's Works. His Life by Dr. Derham. Haller's Bibl. Bot. Pulteney's Sketches. Aikin's General Biography. S.

RAY, in *Geography*, a town of France, in the department of the Upper Saone; 12 miles E. of Champlitte.

RAY, in *Geometry*. See RADIUS.

RAY, *Radius*, in *Optics*, a beam or line of light, propagated from a radiant point, through any medium.

Sir Ifaac Newton defines rays to be the leaft parts of light, whether fucceffive in the fame line, or contemporary in feveral lines.

For, that light confifts of parts of both kinds, appears hence, that one may ftop what comes this moment in any point, and let pafs that which comes the next; and again, one may ftop what comes in this point, and let pafs that in the next. Now, the leaft light, or part of light, which may be thus ftopped alone, he calls a *ray of light*.

A ray of light is, therefore, confidered as an infinitely narrow portion, or an evanefcent element of a ftream of light; and a pencil, as a fmall detached ftream, compofed of a collection of fuch rays accompanying each other. As we cannot exhibit to the fenfes a fingle mathematical line, except as the boundary of two furfaces; in the fame manner, we cannot exhibit a fingle ray of light, except as the confine between light and darknefs, or as the lateral limit of a pencil of light.

If the parts of a ray of light do all lie ftraight between the radiant and the eye, which is the cafe when it moves through the fame uniform fubftance or a vacuum, called a medium, the ray is faid to be *direct:* the laws and properties of which make the fubject of optics. If any of them be turned out of that direction, or bent in their paffage, the ray is faid to be *refracted:* and that branch of optics which treats of thefe refracted rays, is called *dioptrics;* which fee. See alfo REFRACTION.

If it ftrike on the furface, or medium attached to the furface, of any body, and be driven back, it is faid to be *reflected:* and that branch of optics which treats of thefe refracted rays, is called *catoptrics;* which fee. See alfo REFLECTION.

In each cafe, the ray, as it falls either directly on the eye, or on the point of reflection, or of refraction, is faid to be *incident:* and the angle which the incident ray makes with the perpendicular to the reflecting furface at the point of incidence, is called the angle of incidence; and the angle which the reflected ray makes with the fame perpendicular, is called the angle of reflection; and alfo, the angle which the refracted ray makes with a perpendicular to the refracting furface produced, is called the angle of refraction.

Again, if feveral rays be propagated from the radiant equidiftantly from one another, they are called *parallel* rays. If they come inclining towards each other, they are called *converging* rays. And if they go continually receding from each other, they are called *diverging* rays.

It is evident that the rays of light, which come from a luminous point, muft fall divergingly upon any given furface; yet when the object is very diftant, compared with the interval that feparates thefe rays, the divergency of the rays becomes infenfible; hence the rays of the fun, of the moon, of the ftars, &c. are deemed parallel rays. When the luminous point is near, then the rays are fenfibly diverging.

It is from the various circumftances of rays, that the feveral kinds of bodies are diftinguifhed in optics. A body, *e. gr.* that diffufes its own light, or emits rays of its own, is called a *lucid*, or *luminous* body. If it only reflect rays which it receives from another, it is called an *illuminated* body.

This diftinction, however, is not always obferved; for a luminous body, in common language, means any vifible object, whether it be vifible by the emiffion of original light, like the fun, a candle, &c. or by reflected light, like the moon, or any other celeftial or terreftrial object that has no native light, or that does not emit its own light.

If an object only tranfmit rays, it is called a *tranfparent* body. So that tranfparent bodies, fuch as water, glafs, &c. are thofe through which light will pafs, or through which our eyes can perceive objects fituated on the other fide, and all fuch bodies, as alfo a vacuum, are denominated mediums in optics.

If it intercept the rays, or refufe them paffage, fo that nothing can be feen through it, it is called an *opaque* body.

Hence no body radiates, *i. e.* emits rays, unlefs it be either luminous, or illumined.

It is by means of rays reflected from the feveral points of illumined objects to the eye, that they become vifible, and that vifion is performed; whence fuch rays are called *vifual* rays.

When an eye views any object directly, fome of the rays, which proceed from every perceivable point of the object, enter the eye, and the whole number of rays, or quantity of light, which thus enters the eye, is circumfcribed by the rays which proceed from the extreme points of the object: and the angle which thefe extreme rays form at the eye is called the *vifual angle*, from the magnitude of which we principally judge of the diftance of a known object. Thus, if the fame object is reprefented at different diftances, it is evident that the farther the object is from the eye, the fmaller will the vifual angle be. Suppofing alfo the diftance between the eye and the object to remain the fame, if by any means the rays of light are bent fo as to enlarge the vifual angle, then the object will appear larger, or it is faid to be magnified; and on the contrary, if the vifual angle be diminifhed, then the object will appear fmaller, in which cafe it is faid to be diminifhed.

In effect, we find that any point of an object is feen in all places to which a right line may be drawn from that point: but it is allowed, nothing can be feen without light; therefore every point of an object diffufes innumerable rays every way. Again, from other experiments it appears, that the images of all objects, whence right lines may be drawn to the

the eye, are painted in the eye, behind the cryſtalline, very ſmall, but very diſtinct.

And laſtly, from other experiments, that each ray produces an image of the radiating point: and that the ſeveral rays emitted from the ſame point are again united in one point, by the cryſtalline, and other humours of the eye, and thus thrown on the retina.

It is the ſpiſſitude or cloſeneſs of the rays emitted from a luminous body, that conſtitutes the intenſeneſs of the light. Yet the direction in which the rays ſtrike the eye, has a conſiderable influence. In effect, a perpendicular ray, ſtriking with more force than an oblique one, in the ratio of the whole ſine to the ſine of the angle of obliquity (as follows from the laws of *percuſſion*, which ſee,) a perpendicular ray will affect the eye more vividly than an oblique one, in that ratio.

If then the ſpiſſitude of the rays be equal, the intenſity will be as the direction: if the direction be the ſame, the intenſeneſs will be as the ſpiſſitude: if both differ, the intenſeneſs will be in a ratio compounded of the direction and the ſpiſſitude.

Hence, firſt, if light be propagated in parallel rays through an unreſiſting medium, its intenſity will not be varied by diſtance.

Secondly, if light be propagated in diverging rays through an unreſiſting medium, its intenſity will decreaſe in a duplicate ratio of the diſtances from the radiant point, reciprocally.

Thirdly, if light be propagated in converging rays through an unreſiſting medium; its intenſity will increaſe in a duplicate ratio of the diſtances from the point of concourſe, reciprocally.

Fourthly, if the breadth of an illumined plane be to the diſtance of the radiant point as 1 to 2,000,000, it is the ſame thing as if the ray ſtruck upon it parallel: and hence, ſince the diameter of the pupil of the eye, when largeſt, ſcarcely exceeds $\frac{1}{4}$th or $\frac{1}{5}$th of an inch; the rays will fall upon it parallel as to ſenſe, at the diſtance of 3860 Engliſh feet, which is nearly ſix furlongs. See LIGHT.

The effect of concave lenſes, and convex mirrors, is to make parallel rays diverge; converging rays become parallel; and diverging rays to become more divergent.

The effect of convex lenſes, and concave mirrors, is to make diverging rays become parallel; parallel rays become convergent; and converging rays to converge the more. See LENS.

The rays of light are not homogeneous, or ſimilar, but differ in all the properties with which we are acquainted; *viz.* refrangibility, reflexibility, and colour.

It is probable that from the different refrangibility the other differences have their riſe; at leaſt it appears, that thoſe rays which agree or differ in this, do ſo in all the reſt. Thus, from the different ſenſations the differently diſpoſed rays excite in us, we call them *red* rays, *yellow* rays, &c.

The effect of the priſm is to ſeparate and ſort the different kinds of rays, which come blended promiſcuouſly from the ſun; and to throw each kind by itſelf, according to its degree of refrangibility and colour, red to red, blue to blue, &c.

Beſides refrangibility, and the other properties of the rays of light already aſcertained by obſervation and experiment, ſir Iſaac Newton ſuſpects they may have many more: particularly, a power of being inflected, or bent, by the action of diſtant bodies; and thoſe rays which differ in refrangibility, he conceives likewiſe to differ in this flexibility.

In paſſing by the edges and ſides of bodies, he conceives that the rays may be bent ſeveral times backwards and forwards, with a motion like that of an eel; and that thoſe rays which appear to fall on bodies are reflected or refracted before they arrive at the bodies: and adds, that they may be refracted, reflected, and inflected, all by the ſame principle acting in different circumſtances. See INFLECTION and LIGHT. See alſo REFLECTION and REFRACTION.

Again, do not the rays, falling on the bottom of the eye, excite vibrations in the retina; which, being propagated along the fibres of the optic nerve into the brain, cauſe viſion? and do not ſeveral ſorts of rays make vibrations of ſeveral bigneſſes, which excite ſenſations of ſeveral colours, much after the manner as the vibrations of the air, according to their ſeveral bigneſſes, excite ſenſations of ſeveral ſounds?

Particularly, do not the moſt refrangible rays excite the ſhorteſt vibrations, to make a ſenſation of a deep violet; and the leaſt refrangible the largeſt, to make a ſenſation of a deep red? and the ſeveral intermediate kinds of rays, vibrations of intermediate bigneſſes, to make ſenſations of the intermediate colours?

And may not the harmony and diſcord of colours ariſe from the proportion of theſe vibrations; as thoſe of ſound depend on the vibrations of the air; for ſome colours, if viewed together, are agreeable, as gold and indigo; others diſagreeable. See COLOUR.

Again, have not the rays of light ſeveral ſides endued with ſeveral original properties? It is certain we find, that every ray of light has two oppoſite ſides, originally endued with a property, on which the unuſual refraction of iſland cryſtal depends, and other two oppoſite ſides endued with that property.

Laſtly, are not the rays of light very ſmall bodies emitted from ſhining ſubſtances?

Such bodies may have all the conditions of light: and there is that action and re-action between tranſparent bodies and light, which very much reſembles the attractive force between other bodies. Nothing more is required for the production of all the various colours, and all the degrees of refrangibility, but that the rays of light be bodies of different ſizes; the leaſt of which may make violet the weakeſt and darkeſt of the colours, and be the moſt eaſily diverted by refracting ſurfaces from its rectilinear courſe; and the reſt as they are bigger and bigger, may make the ſtronger and more lucid colours, blue, green, yellow, and red. (See COLOUR and LIGHT.) Nor is any thing more requiſite for the putting of the rays into fits of eaſy reflection, and eaſy tranſmiſſion, than that they may be ſmall bodies, which, by attraction, or ſome other force, excite vibrations in the bodies they act upon; which vibrations, being ſwifter than the rays, overtake them ſucceſſively, and agitate them ſo as by degrees to increaſe and diminiſh their velocity, and thereby put them into thoſe fits. Laſtly, the unuſual refraction of iſland cryſtal appears very much as if it were performed by ſome attractive virtue lodged in certain ſides both of the rays, and of the cryſtal.

RAYS *of Heat* denote ſeparate portions of that emanation, which proceeds from an heated body, when placed in a colder temperature, and which expands itſelf in every direction, provided it be not prevented by the interpoſition of particular ſubſtances. This appellation is adopted and thus applied, not becauſe that emanation is certainly known to conſiſt of ſeparate ſtreams, but merely for the convenience of explanation. The rays of heat are not the ſame with the rays of light. If this were the caſe, a certain quantity of of heat ought to be accompanied with the fame quantity of light; whereas it is found, that feveral fubftances emit a confiderable quantity of light without any fenfible heat, and others give out a confiderable portion of heat without any light. But that thefe are two diftinct powers of nature is a propofition, that has been amply illuftrated, and moft fatisfactorily eftablifhed by the difcoveries and experiments of Dr. Herfchel. This celebrated aftronomer cautions thofe, who perufe the account of his experiments and obfervations upon them, from concluding, that in ufing the word rays, he means to oppofe, much lefs to countenance, the opinion of thofe philofophers, who ftill believe, that light itfelf comes to us from the fun, not by rays, but by the fuppofed vibration of an elaftic ether, every where diffufed through fpace: he merely claims the fame privilege for the rays that occur in heat, which they do not fcruple to allow to thofe that illuminate objects. For in what manner foever this radiance may be effected, he undertakes to prove, that the evidence, either for rays, or for vibrations, which occafion heat, ftands on the fame foundation on which the radiance of the illuminating principle, light, is built.

Propofing to give a comparative view of the operations that may be performed on the rays that occafion heat, and of thofe which are known to have been effected on the rays that occafion light, he felects fuch facts as are well known with regard to the latter. Light, he fays, both folar and terreftrial, is a fenfation occafioned by rays emanating from luminous bodies, which have a power of illuminating objects; and, according to circumftances, of making them to appear of various colours. The rays of light are fubject to the laws both of reflection and of refraction; but they are of different refrangibility. They are liable to be ftopped in certain proportions, when tranfmitted through diaphanous bodies; and alfo to be fcattered on rough furfaces. They are alfo fuppofed to have a power of heating bodies: but this is a fubject "fub judice." The fimilar propofitions, which it is his defign to prove, and which by a variety of curious and well-conducted experiments he has confirmed, are fuch as follow. Heat, both folar and terreftrial, is a fenfation occafioned by rays emanating from candent fubftances, which have a power of heating bodies. Thefe rays are fubject to the laws of reflection and of refraction; and they are of different refrangibility. They are liable to be ftopped, in certain proportions, when tranfmitted through diaphanous bodies; and to be fcattered on rough furfaces: and in a certain ftate of energy, they may be fuppofed to have a power of illuminating objects, which latter property remains to be examined.

In the examination of the illuminating and heating power of the prifmatic colours, our author obferves, that the red-making rays are very far from having the former in an eminent degree: the orange poffeffes more of it than the red; and the yellow rays illuminate objects ftill more perfectly. The maximum of illumination lies in the brighteft yellow, or paleft green. The green itfelf is nearly equally bright with the yellow; but from the full deep green, the illuminating power decreafes very fenfibly; that of the blue is nearly upon a par with that of the red; the indigo has much lefs than the blue; and the violet is very deficient. Our author infers from other experiments, that the heating power of the prifmatic colours is very far from being equally diftributed; and that the red rays are chiefly eminent in this refpect. Allowing that the power of heating is chiefly lodged in the red-making rays, it accounts for the comfortable warmth that is thrown out from a fire, when it is in the ftate of a red glow, and for the heat which is given by charcoal, coke, and balls of fmall coal mixed up with clay, ufed in hot-houfes; all which throw out red light. It alfo explains the reafon, why the yellow, green, blue, and purple flames of burning fpirits mixed with falt, occafion fo little heat that a hand is not materially injured, when paffed through their corufcations.

Having afcertained, that radiant heat is fubject not only to the laws of refraction, but to thofe alfo of the different refrangibility of light, Dr. Herfchel is led to furmife, that this heat confifts of particles of light of a certain range of momenta, which range may extend a little farther, on each fide of refrangibility, than that of light. In a gradual expofure of the thermometer to the rays of the prifmatic fpectrum, beginning from the violet, he found that he arrived at the maximum of light long before he came to that of heat, which lies at the other extreme. By feveral experiments it appears, that the maximum of illumination has little more than half the heat of the full red rays; and from other experiments our author concludes, that the full red falls ftill fhort of the maximum of heat, which perhaps lies even a little beyond vifible refraction. In this cafe, radiant heat will at leaft partly, if not chiefly, confift, if the expreffion may be allowed, of invifible light, that is, of rays coming from the fun, that have fuch a momentum as to be unfit for vifion. Admitting it as highly probable, that the organs of fight are only adapted to receive impreffions from particles of a certain momentum, this will explain why the maximum of illumination fhould be in the middle of the refrangible rays, as thofe which have greater or lefs momenta, are likely to become equally unfit for impreffions of fight. Whereas, in radiant heat, there may be no fuch limitation to the momentum of its particles. From the powerful effects of a burning lens, however, we derive information, that the momentum of terreftrial radiant heat is not likely to exceed that of the fun; and that, confequently, the refrangibility of *calorific* rays cannot extend much beyond that of *colourific* light. Hence we may alfo infer, that the invifible heat of red-hot iron, gradually cooled till it ceafes to fhine, has the momentum of the invifible rays, which, in the folar fpectrum viewed by daylight, go to the confines of red, and this will afford an eafy folution of the reflection of invifible heat by concave mirrors.

Our author deduces from various experiments with the thermometer abundant evidence, that there are rays coming from the fun, which are lefs refrangible than any of thofe that affect the fight. They are invefted with a high power of heating bodies, but with none of illuminating objects; and on this account they have hitherto efcaped notice. At the diftance of fifty-two inches from the prifm, there was ftill a confiderable heating power exerted by the invifible rays, an inch and a half beyond the red ones, meafured upon their projection on a horizontal plane. Moreover, the power of heating is extended to the utmoft limits of the vifible violet rays, but not beyond them; and it is gradually impaired, as the rays become more refrangible. The maximum of the heating power is found to be vefted among the invifible rays, and it is probably not lefs than half an inch beyond the laft vifible ones. It is alfo fhewn, that the fun's invifible rays, in their lefs refrangible ftate, and confiderably beyond the maximum, ftill exert a heating power fully equal to that of red-coloured light; and confequently, if we may infer the quantity of the efficient from the effect produced, the invifible rays of the fun probably far exceed the vifible ones in number. The general conclufion with which Dr. Herfchel clofes his account of one feries of of experiments and his reafoning upon them, is in the following manner: "if," fays he, "we call *light* thofe rays which illuminate objects, and *radiant heat*, thofe which heat bodies, it may be inquired whether light be effentially different from radiant heat? In anfwer to which I would fuggeft, that we are not allowed by the rules of philofophizing to admit two different caufes to explain certain effects, if they may be accounted for by one. A beam of radiant heat emanating from the fun, confifts of rays that are differently refrangible. The range of their extent, when difperfed by a prifm, begins at violet-coloured light, where they are moft refracted, and have the leaft efficacy. We have traced thefe calorific rays throughout the whole extent of the prifmatic fpectrum, and found their power increafing, while their refrangibility was leffened, as far as to the confines of red-coloured light. But their diminifhing refrangibility, and increafing power, did not ftop here: for we have purfued them a confiderable way beyond the *prifmatic fpectrum* into an invifible ftate, ftill exerting their increafing energy, with a decreafe of refrangibility up to the maximum of their power; and have alfo traced them to that ftate, where, though ftill lefs refracted, their energy, on account, we may fuppofe, of their now failing denfity, decreafed pretty faft; after which the invifible *thermometrical fpectrum*, if I may fo call it, foon vanifhed."—"If this," continues our author, "be a true account of folar heat, for the fupport of which I appeal to my experiments, it remains only for us to admit, that fuch of the rays of the fun as have the refrangibility of thofe which are contained in the prifmatic fpectrum, by the conftruction of the organs of fight, are admitted, under the appearance of light and colour; and that the reft, being ftopped in the coats and humours of the eye, act upon them, as they are known to do upon all other parts of our body, by occafioning a fenfation of heat."

Although, as we have above ftated, the rays of light and thofe of heat poffefs many fimilar properties, yet Dr. Herfchel has fhewn, that there are fome ftriking and fubftantial differences between them. The rays of heat are of a much more extenfive refrangibility than thofe of light, as our author has clearly and inconteftibly demonftrated both by reafoning and experiment: nor do thofe rays agree either in their mean refrangibility, nor in the fituation of their maxima. Where we have moft light, there is but little heat, and where we have moft heat, we find no light at all. (See Refrangibility.) It is found, that the fines of refraction of the heat-making rays are in a conftant ratio to the fines of incidence; but that the focus of the rays of heat in burning glaffes is different from the focus of the rays of light: that of heat being farther removed from the lens than the focus of light, probably not lefs than a quarter of an inch: the heat at half an inch beyond the focus of light being ftill equal to that in the focus. Although light and heat are both refrangible, the ratio of the fines of incidence and refraction of the mean rays is not the fame in both. Heat is evidently lefs refrangible than light. From experiments relating to the tranfmiffion of light and heat through diaphanous bodies it appears, that no kind of regularity takes place in the proportion of rays of one fort and of another, which are ftopped in their paffage. Heat and light feem to be entirely unconnected, and the rays that occafion them are different. We have feveral tables, formed from the author's experiments, and fhewing the quantities of light and heat intercepted by different fubftances. The blueifh-white and flint-glaffes, *e. gr.* ftop nearly three times as much heat as light, whereas the greenifh crown glafs ftops only about one-fourth more of the former than of the latter.

From a table exhibiting the effects of coloured glaffes, it appears, that a yellow glafs ftops only 333 rays of heat, but ftops 819 of light; on the contrary, a pale blue ftops 812 rays of heat, and but 684 of light. Again, a dark blue glafs ftops only 362 rays of heat, but intercepts 801 of light; and a dark red glafs ftops no more than 606 rays of heat, and yet intercepts nearly all the light, fcarcely one ray out of 5000 being able to make its way through it. For the conclufions deduced from thefe tables, as they evince the non-identity of the rays of heat and thofe of light, and for the tables themfelves, we muft refer to the author's own paper, *ubi infra*. We are reftrained by our limits from purfuing this curious fubject, and from entering on a detail of Dr. Herfchel's experiments, illuftrating and confirming principles, the difcovery of which muft be allowed to be one of the greateft that has been made fince the days of Newton, although the theories of fome fpeculative philofophers might have led to it a few years earlier. Dr. Herfchel was occupied in determining the properties of various kinds of coloured glafs, which rendered them more or lefs fit for enabling the eye to view the fun through a telefcope; and for this purpofe it was neceffary to inquire which of the rays would furnifh the greateft quantity of light, without fubjecting the eye to the inconvenience of unneceffary heat. He firft obferved that the heat became more and more confiderable as the thermometer approached the extreme red rays in the prifmatic fpectrum; and purfuing the experiment, he found not only that the heat continued beyond the vifible fpectrum, but that it was even more intenfe where the thermometer was at a little diftance without the limits of the fpectrum, than in any point within it; as we have already ftated. For Dr. Herfchel's communications to the Royal Society on this fubject, we refer to the 90th volume of the Philofophical Tranfactions for the year 1800, part ii. p. 255, &c. p. 284, &c. p. 293, &c. part iii. p. 437, &c.

Sir Henry Englefield has repeated Dr. Herfchel's experiments with many precautions, and Mr. (fir H.) Davy was a witnefs of their perfect accuracy. The excefs of heat beyond the fpectrum was even confiderable enough to be afcertained by the fenfe of warmth occafioned by fhewing it on the hand.

It was firft obferved in Germany by Ritter, and foon afterwards in England by Dr. Wollafton, that the muriate of filver is blackened by invifible rays, which extend beyond the prifmatic fpectrum, on the violet fide. It is therefore probable, that thefe black or invifible rays, the violet, blue, green, perhaps the yellow, and the red rays of light, and the rays of invifible heat, conftitute feven different degrees of the fame fcale, diftinguifhed from each other into this limited number, not by natural divifions, but by their effects on our fenfes; and we may alfo conclude that there is fome fimilar relation between heated and luminous bodies of different kinds. See Young's Phil. Lect. vol. i. p. 639. See Heat and Refraction.

M. Delaroche has found, that the rays of invifible heat traverfe glafs with difficulty at a temperature below that of boiling water; but that they traverfe it with a facility, always increafing with the temperature, as it approaches the point when bodies become luminous, and from thefe experiments it would appear, that the modification, whatever it be, which muft be impreffed upon the invifible rays to render them more and more capable of paffing through glafs, makes them approach more and more to the ftate in which they muft be when they penetrate our eyes, and occafion the fenfation of vifion. The fame ingenious philofopher has likewife found, that the rays of heat which have paffed

through

through a plate of glafs are proportionably more adapted to pafs through a fecond plate; and from this circumftance we deduce a new proof of the peculiar ftate of thefe rays, and of the modification which they acquire. Meffrs. Gay-Luffac and Thenard have proved that all the changes of colour produced by light may be imitated and produced by heat, and by an elevation of temperature not exceeding 212°. Other phenomena previoufly obferved indicated, that in the comparifon of the actions of heat and light in heating bodies, or producing chemical changes in them, there is a great difference in the rays of different colours. M. Rochon announced the fact amply confirmed by Dr. Herfchel, that the heat produced by the different rays of the prifmatic fpectrum was unequal. As Dr. Herfchel fixed the maximum effect beyond the red rays, and fhewed, as we have already ftated, that the moft heating rays of the fpectrum were entirely, or nearly, invifible; Dr. Wollafton, and Meffrs. Ritter and Beckmann, having examined the oppofite, or violet end of the fpectrum, found that this likewife poffeffed peculiar properties, and that, beyond the violet, there are invifible rays, which poffefs, in greateft perfection, the power of determining chemical combinations. It has been a fubject of interefting refearch, whether the invifible, or almoft invifible rays, fituated beyond the extremities of the fpectrum, poffefs any other properties of light. *E. gr.* If the reflection of them from polifhed glafs can give them that modification which Malus has diftinguifhed by the name of "polarization." (See LIGHT.) M. Berthollet engaged Meffrs. Malus and Berard to undertake this double object. M. Malus's death prevented his profecution of the fubject; but what he began M. Berard accomplifhed with the utmoft poffible exactnefs. By means of the helioftate, which Malus caufed to be conftructed for the philofophical cabinet of M. Berthollet, he obtained a ray of light, perfectly fixed, on which he could make experiments at pleafure. By decompofing this ray with a prifm, he obtained an immoveable coloured fpectrum; and by placing very fenfible thermometers in the fpaces occupied by the different colours, he was enabled to compare their calorific effects with the utmoft certainty. He alfo afcertained their chemical properties by fubftituting, in place of the thermometers, chemical compounds eafily altered. He firft of all obferved the calorific power of the different rays, which, it is known, are in this refpect unequal. M. Rochon, who is faid to have firft obferved this inequality, placed the maximum of heat in the yellow ray, where the illuminating power is the greateft. Dr. Herfchel, as we have before fhewn, placed it out of the fpectrum, and beyond the red ray. The experiments of Herfchel have been confirmed by thofe of Berard, as far as they refpect the progreffive heating power of the rays from the violet to the red; but he found the greateft heating power at the extremity of the fpectrum itfelf, and not beyond it. He fixed it at the point, where the bulb of the thermometer was ftill entirely covered with the red ray; and he found that the thermometer funk progreffively, in proportion as the diftance of its bulb from the red ray increafed. When he placed the thermometer quite beyond the vifible fpectrum, on the fpot where Herfchel fixed the maximum of heat, its elevation above that of the ambient air was only one-fifth of what it had been in the red ray itfelf. The abfolute intenfity of the heat produced was likewife lefs in the experiments of Berard than in thofe of Herfchel.

M. Berard wifhed to know if thefe properties would exift in each of the pencils into which the ray divides itfelf in paffing through a rhomboid of Iceland fpar. In this cafe each of the two fpectra exhibited the fame properties. In both, the calorific power diminifhed from the violet to the red end; and it exifted beyond the laft vifible red rays. In this operation the luminous molecules are polarized by the cryftal. In order to determine whether the invifible rays of heat experience the fame effect, M. Berard received the folar ray upon a polifhed and tranfparent glafs, which polarized a portion of it by reflection. This reflected ray was then received upon a fecond glafs, fixed in an apparatus, which permitted it to be turned round the ray under a conftant incidence, and this incidence itfelf was determined in fuch a manner, that in a certain pofition of the glafs the reflection ceafed to take place. We know, from the experiments of Malus, that a glafs may be always difpofed in fuch a manner that this condition is fulfilled. Things being thus difpofed, by collecting with a mirror the calorific and luminous rays reflected from the fecond glafs, and directing them upon a thermometer, M. Berard found, that as long as light was reflected the thermometer was elevated, and of courfe the heat was reflected likewife; but when, from the pofition of the fecond glafs, the light was totally tranfmitted, the heat was tranfmitted at the fame time, and the thermometer was not elevated. In this experiment, then, as well as the preceding, the calorific principle, whatever it may be, never feparates from the luminous molecules.

To the ray of folar light employed in this experiment, M. Berard fubftituted a pencil of radiant heat proceeding from a body hot, but not red, and even not luminous. The effect was the fame as before. The thermometer rofe when the fecond glafs was fo fituated as to reflect light, and it did not rife when the fecond could not reflect light. Therefore the particles of invifible radiant heat are modified by reflection, precifely like light.

After having ftudied the calorific properties of the different rays of the fpectrum, M. Berard examined their chemical properties. When muriate of filver, or other white falts of filver, are expofed to light, they become dark coloured very fpeedily. Guaiac thus expofed to light paffes from yellow to green, as Dr. Wollafton obferved. Gay-Luffac and Thenard difcovered another action of this light ftill more prompt and energetic. When a mixture of oxymuriatic acid gas and hydrogen gas are expofed to the action of folar light, a detonation takes place, and water and muriatic acid are formed. Thefe different phenomena enabled M. Berard to examine the chemical powers of the different rays of the fpectrum. By expofing to the different coloured rays, pieces of card impregnated with muriate of filver, or fmall phials filled with the detonating mixture, he was enabled to judge of the energy of each by the intenfity or rapidity of the chemical change which it produced. He found that the chemical intenfity was greateft at the violet end of the fpectrum, and that it extended, as Ritter and Wollafton had obferved, a little beyond that extremity. When he left fubftances expofed for a certain time to the action of each ray, he obferved fenfible effects, though with an intenfity continually decreafing in the indigo and blue rays. Hence we muft confider it as extremely probable, that if he had been able to employ re-actives ftill more fenfible, he would have obferved analogous effects, but ftill more feeble, even in the other rays. To fhew clearly the great difproportion which exifts in this refpect between the energies of the different rays, M. Berard concentrated, by means of a lens, all that part of the fpectrum which extends from the green to the extreme violet; and he concentrated, by means of another lens, all that portion which extends from the green to the extremity of the red. This laft pencil formed a white point fo brilliant that the eyes were fcarcely able to endure it; yet the muriate of filver remained more than two hours expofed to this brilliant light without undergoing any fenfible alteration. On the other hand, when expoſed to the other pencil, which was much leſs bright, and leſs hot, it was blackened in leſs than ſix minutes. M. Berard concluded, from this experiment, that the chemical effects produced by light are not ſolely owing to the heat developed in the body by its combining with the ſubſtance of the body; becauſe, on ſuch a ſuppoſition, the faculty of producing chemical combinations ought to be greateſt in thoſe rays which poſſeſs the faculty of heating in the greateſt perfection: but perhaps we ſhould find leſs oppoſition between theſe two opinions, if we attended to the different reſults which may be produced by the ſame agent placed in different circumſtances, and if we conſidered that agents of a nature quite diſſimilar may determine the ſame combinations when they are employed.

Various hypotheſes have been ſuggeſted in order to account for the properties above ſtated. If we wiſh to conſider ſolar light as compoſed of three diſtinct ſubſtances, one of which occaſions light, another heat, and the third chemical combinations; it will follow that each of theſe ſubſtances is ſeparable by the priſm into an infinity of different modifications, like light itſelf; ſince we find, by experiment, that each of the three properties, chemical, colorific, and calorific, is ſpread, though unequally, over a certain extent of the ſpectrum. Hence we muſt ſuppoſe, on that hypotheſis, that there exiſt three ſpectrums one above another; namely, a calorific, a colorific, and a chemical ſpectrum. We muſt, likewiſe, admit that each of the ſubſtances which compoſe the three ſpectrums, and even each molecule of unequal refrangibility which conſtitutes theſe ſubſtances, is endowed, like the molecules of viſible light, with the property of being polarized by reflection, and of eſcaping from reflection in the ſame poſitions as the luminous molecules, &c.

Inſtead of this complication of ideas, let us conceive ſimply, according to the phenomena, that light is compoſed of a collection of rays unequally refrangible, and of courſe unequally attracted by bodies. This ſuppoſes original differences in their ſize and velocity, or in their affinities. Why ſhould thoſe rays, which differ already in ſo many things, produce upon thermometers, or upon our organs, the ſame ſenſations of heat or light? Why ſhould they have the ſame energy to form or ſeparate combinations? Would it not be quite natural that viſion ſhould not operate on our eyes, except within certain limits of refrangibility; and that too little or too much refrangibility ſhould render it equally incapable of producing that effect. Perhaps theſe rays may be viſible to other eyes than ours, perhaps they are ſo to certain animals, which would account for certain actions that appear to us marvellous. In a word, we may conceive the calorific and chemical faculty to vary through the whole length of the ſpectrum, at the ſame time with the refrangibility, but according to different functions; ſo that the calorific faculty is at its minimum at the violet end of the ſpectrum, and at its maximum at the red end; while, on the other hand, the chemical faculty expreſſed by another function is at its minimum at the red end, and at its maximum at the violet end, or a little beyond it. This ſimple ſuppoſition, which is only the ſimple ſtatement of the phenomena, equally agrees with all the facts hitherto obſerved, and accounts for thoſe eſtabliſhed by M. Berard, and even enables us to predict them. In fact, if all the rays, which produce theſe three orders of phenomena, are rays of light, they muſt of courſe be polarized in paſſing through Iceland cryſtal, or in being reflected from a poliſhed glaſs with a determined incidence: and when they have received theſe modifications, they muſt be reflected by another glaſs, if it is properly placed, to exert its reflecting energy on the luminous molecules. On the other hand, if that force is null on the viſible luminous molecules, the inviſible light will not be any longer reflected: for the cauſe which occaſions or prevents reflection appears to act equally upon all the molecules, whatever their refrangibility may be. It ought, therefore, to act upon the molecules of inviſible light, the condition of viſibility or inviſibility relating merely to our eyes, and not to the nature of the molecules which produce theſe ſenſations in us.

This mode of viewing the facts appeared to Meſſrs. Berthollet, Chaptal, and Biot, who made a report to the Inſtitute on the Memoire of Berard, the moſt natural and ſimple; though the modeſt reſerve of Berard reſtrained him from deciding in a caſe, not ſufficiently examined by the teſt of experiment. Annal. de Chimie, vol. lxxxv. p. 309. or Thomſon's Annals of Philoſophy, N° 9.

Ray, *Common*, in *Optics*, is ſometimes uſed for a right line drawn from the point of concourſe of the two optical axes, through the middle of the right line which paſſes through the middle of the centres of the pupils of the two eyes.

Rays, *Cone of*. See Cone.

Rays, *Deflection of*. See Deflection.

Rays, *Inclination of incident*. See Inclination.

Rays, *Optic*. See Optic.

Rays, *Reflexibility of*. See Reflexibility.

Ray, *Principal*, in *Perſpective*, is the perpendicular diſtance between the eye and the vertical plane or table, as ſome call it. See Perspective.

Rays, *Pencil of*. See Pencil *of Rays*.

Rays, *Pyramid of*. See Optic *Pyramid*.

Ray *of Curvature*, in *Geometry*, is uſed to ſignify the ſemi-diameter of the circle of curvature. See Radius and Curvature.

Ray, *Raia*, in *Ichthyology*. See Raia.

Ray, *Clavated*. See Raia *Clavata*, and Thornback.

Ray, *Eagle*. See Raia *Aquila*.

Ray, *Electric* or *Smooth*, a ſpecies of the raia. See Raia, Torpedo, and *Anatomy of* Fish.

Ray, *Fuller*, *Raia fullonica*, a ſpecies of ray, deriving its name from the inſtrument which fullers uſe in ſmoothing cloth, the back being rough and ſpiny. See Raia *Fullonica*.

Ray, *Oblong*. See Raia and Rhinobatos.

Ray, *Oculated*. See Raia and Miraletus.

Ray, *Rough*. See Raia *Rubus*. At Scarborough, where it is common, it is called the white hans or gullet.

Ray, *Shagreen*, called at Scarborough the French ray, is about the ſize of the ſkate, but narrower in its form than the common kinds. The upper part of the body is covered cloſely with ſmall ſhagreen-like tubercles, reſembling the ſkin of the dog-fiſh; and from the noſe to the beginning of the pectoral fins is a tuberculated ſpace. Pennant.

Ray, *Sharp-noſed*. See Raia *Oxyrinchus*. This fiſh makes a ſnorting noiſe, and is ſuppoſed to be the *bos* of the ancients, which Oppian deſcribes as the broadeſt among fiſhes, and fond of human fleſh; adding, that the method it takes of deſtroying men is by overlaying and keeping them down by its vaſt weight till they are drowned. Pennant.

Ray, *Sting*. See Raia *Paſtinaca*, and Pastinaca *Marina*.

Ray, in our *Old Writers*, a word appropriated to cloth never coloured, or dyed, 11 Hen. IV. c. 6. Blount, Cowel.

Rays, in *Botany*, the ſpreading marginal florets of a compound flower; ſee Radius. The ſame term is applied to the ſub-diviſions of an umbel, more properly denominated its

its general and partial ſtalks; unleſs we, like Linnæus, conſider the whole umbel as one aggregate flower. See UMBELLA, and INFLORESCENCE.

RAY-*Graſs*, in *Agriculture*, an uſeful ſort of early graſs that has long been, and ſtill is, much cultivated by the farmer in ſome diſtricts. There are ſaid to be different varieties of this graſs, but that grown by Mr. Peacey, of Devonſhire, has been found, on experience, much ſuperior to the common ſort. This graſs has ſometimes the title of rye-graſs. See LOLIUM *Perenne*.

It has been remarked by the Rev. Mr. Duncan, of Kilmarnock, in the fourth volume of Communications to the Board of Agriculture, that it has been found of late that there is an annual and perennial kind; that the latter ſhould only be ſown; but that the annual ſeed, he thinks, affords the greateſt and moſt palatable crop of hay, and may be ſown on thoſe light ſoils which more readily tend to graſs, at leaſt a conſiderable proportion of it ſhould be blended with the perennial ſeed. He adds, that the two kinds of ſeeds are readily diſtinguiſhed by a careful obſerver, as the perennial is ſmaller, and fairer in colour, than the annual, and likewiſe much lighter. Good annual ſeed weighs from 21 to 24lbs. avoirdupois weight *per* buſhel, but the perennial only from 16 to 18lbs. As no diſtinction of theſe ſorts was formerly made by farmers, he ſuggeſts it as probable that they have come to be known and diſtinguiſhed, from the circumſtance of no ray-graſs diſappearing wholly the firſt year, by which ſome perſons have been tempted, from the high price of the ſeed, to allow what remained in the ſecond year to advance to maturity, though to the great injury of the paſture. It is therefore from the ſeed of the ſecond year's crop that he ſuppoſes the perennial graſs has gradually originated; and its inferiority in point of ſubſtance ſeems, he thinks, to prove the ſuppoſition. By this means the farmer may, by allotting a ſmall portion of good land for the purpoſe, ſupply himſelf with what is ſaid to be the perennial ſeed, without ſubmitting to the impoſition of an extravagant price, and may probably enſure or improve upon the durability of it, by collecting ſeed from the third or fourth year's growth.

It is found to be an excellent graſs for paſture as well as hay. It has an early, but not very abundant, foliage. It is highly reliſhed by cattle and ſheep. From its being apt to run up into flowering ſtems, it ſhould be kept well fed down. From its ſecreting and depoſiting much ſaccharine matter in the joints of the ſtems, it affords a large proportion of nutritious matter for the ſupport of animals, both in its green ſtate and when made into hay. And it is ſaid not to affect the wind of horſes, which renders it particularly valuable for hunting and racing horſes.

It has, however, been objected to by ſome, from the quantity of flower ſtems which it ſends up; but this is aſſerted by others to be only the caſe when it grows in dry upland ſituations. It is found, of courſe, to vary much under different circumſtances and ſituations.

The ſoils that are moſt ſuitable for it are thoſe of the loamy and ſandy kinds, but it is capable of being grown on thoſe of the clayey ſorts when not too ſtiff. On the two firſt ſorts, in mixture with other graſſes, it frequently becomes permanent, and affords an uſeful ſpring food, eſpecially for ſheep ſtock.

As it is found to produce a thick well-connected ſward in ſoils of the rich fertile kinds, it has been ſuppoſed only ſuited to them, though occaſionally met with in thoſe of the poorer deſcriptions.

In Eſſex it is found very bad for the ſtrong wet heavy lands. But in other diſtricts it is moſt ſown in ſtiff clayey ſoils, where clover is liable to fail in coming up well. Some, however, find that a light ſoil is quite as ſuitable for it as one of a clayey nature; and that though it may be moſt ſown in ſtiff heavy lands, it is not from the notion that lighter ſoils are leſs ſuited to it, but that ſuch lands may be covered with this graſs, ſhould the clover crop not turn out well in conſequence of the great ſtiffneſs of theſe clayey ſoils.

On the ſtiff clayey ſoils the proportion of ſeed is uſually from one buſhel to one buſhel and a half of ray-graſs, with eight or ten pounds of red clover ſeed, to the acre. On other ſoils from ſix to ten gallons of ray-graſs, with from five to eight pounds of red clover ſeed, and from two to four pounds of trefoil ſeed, are uſed to the acre; ſome adding to theſe, two, three, or more, pounds of white clover ſeed.

In Suſſex, for a layer for one or two years, they employ of ray-graſs ſeed three gallons, and of red clover and trefoil ſeed each one gallon, to the acre.

But for permanent paſture the proportion is this. Of ray-graſs ſeed four gallons, Dutch clover and trefoil ſeed, of each two gallons to the acre. Other different proportions are made uſe of in different caſes.

It has been well remarked by Dr. Campbell, in the third volume of Communications to the Board of Agriculture, that when land is in a proper ſtate of manure, ray-graſs united with white clover, will form a perfect ſward the latter end of the ſecond year after it is ſown. A particular field, of about five acres, that was ſown with theſe two graſſes only, was, he ſays, more perfectly graſſed over, than others, which had the addition of trefoil and rib-graſs, and which were ſown at the ſame time. A neighbour of his, the only man in the county that had tried ray-graſs, told him it would not anſwer, and referred him to a particular field where ſome had been ſown. The fact was, the doctor ſays, that he had cropped his field with oats until it was no longer worth ploughing, and then, with his laſt ſeed, he ſowed ray-graſs, which certainly did not flouriſh. But his argument would, he thinks, have been equally concluſive againſt any graſs or grain whatever. The ray-graſs languiſhed, and finally died away, giving place to the vegetation ſuited to the ſtate of the land. If it be expected that ray-graſs, or any other good graſs, ſhould thrive and produce abundant crops on exhauſted or poor land, it muſt not, he ſays, be in the ſoil which occurs here. And he adds the following uſeful remarks, on converting ray-graſs into hay; it is neceſſary to cut it at a period previous to its being ſo ripe as to have perfected its ſeed, and changed to a yellow colour; for in this caſe a great part of the juices of the plant, which conſtitute a principal part of the nutriment it is to afford, will be converted into a ſpecies of ſtraw, and its nutritive properties be proportionably diminiſhed. When it is made into hay, perſons not acquainted with its qualities are apt to object to its apparent coarſeneſs, which proceeds from its conſiſting almoſt entirely of flowering-ſtems, the ray-graſs having a comparatively ſmaller proportion of leaves than any other graſs. Whether this be a defect or a merit will, he thinks, depend upon a ſolution of this queſtion: Do the ſtems and flowering parts of graſs, or the leaves taken weight for weight, contain the greater proportion of nutriment? It does not appear, he ſays, that this has been determined by experiments inſtituted for the purpoſe; but it ſeems probable, from the ſtems being ſo much ſweeter than the leaves, (which is particularly perceptible upon chewing them when about half dry,) and from thoſe vegetables which contain much ſaccharine matter being particularly nutritious, that the greater proportionate quantity of nutriment

nutriment will be found to refide in the ftalks; and if fo, the advantages of ray-grafs will be decifive. But, however this may be, it is certain that, fuppofing wet weather comes on during the procefs of hay-making, the firft part of the grafs that decays is the leaf, which foon becomes yellow, and then black, lofing all pretenfions to nutritive properties; in which cafe it is evident that almoft the whole nutriment contained in the hay muft refide, exclufively, in the flowering-ftalks. Ray-grafs then has, in unfavourable hay-feafons, an advantage, he thinks, over all others, inafmuch as from having fewer leaves it is not fo apt to be injured by a continuance of rain; and it is, befides, when in the cocks, more acceffible to the air and wind from lying more open and light; and confequently not fo apt to heat and mould as other graffes in fimilar fituations and feafons. And he concludes that it certainly poffeffes the following valuable properties. 1. That there are few graffes fo early in the fpring. 2. That there are none better relifhed by cattle, or more nutritive. 3. That it has the power of refifting the effects of bad weather, in ticklifh feafons, in a greater degree than other graffes. 4. That there is a greater facility in collecting its feed than of any other grafs.

It is fuppofed that the prejudices againft it have proceeded, 1. From its having been fown in land not capable of producing a full crop of any good vegetable. 2. From allowing it to fhoot up fo far, as to have formed the feed in the flowering-ftalk, before cattle have been turned into pafture, or that it has been cut for hay. Ray-grafs appears, he thinks, to partake more of the nature of grain than any other grafs. Hence, when it has perfected its feeds, it fhoots out no more ftalks, and but few leaves that feafon, as lord Kaimes has juftly obferved. Hence it is neceffary to turn cattle into a field of this grafs early in the fpring, and to keep it well under by a fufficient quantity of ftock; in which cafe it will continue to put out frefh flowering-ftalks and leaves during the whole feafon. 3. The hay, for the reafon juft affigned, fhould be cut before it becomes a mere ftraw. Common hay-grafs, being compofed of graffes in various ftages of growth and ripenefs, admits of greater latitude than a field of ray-grafs, becaufe many of them will generally be in a proper ftate for cutting, although others may have paffed their prime.

He adds the following facts in fupport of its nutritious properties. No hay, fays he, could be better relifhed by my horfes than this was; not a particle of it was wafted by them, or left in the rack; no animals could thrive, coat, or do their work better, than they did, whilft they had this ray-grafs hay to take to. Never was there a greater contraft than when they were put to the natural hay-grafs of the country, after they had finifhed the other. They were literally ftarved into the eating of it; and in fpite of an additional quantity of corn, they fell away (agreeable to his farming man's mode of expreffion) a limb a-piece. This year nothing can look better than his horfes do upon this hay, (with which fome red clover is mixed,) and this, with the addition of very little corn, and that moftly light, the tailings of oats and barley.

Thefe facts place the utility of this grafs in a very ftriking point of view. And the following, given by Mr. Duncan, are of the fame tendency, as he found in a comparative experiment of pieces of ground laid to pafture with it, and meadow foft-grafs alone and in mixture, that the ray-grafs portion was not only more early ready for the fcythe by nearly three weeks, but the hay of it always more greedily eaten by the horfes and cattle, as well as the pafture in fucceeding years, on the ray-grafs divifion, conftantly eaten bare before the cattle ftock would touch that of the foft grafs.

In the county of Effex the farmers in many places have, however, a very indifferent opinion of ray-grafs, believing it to do great injury to the land, efpecially when of the better kind. When fown with red clover, it does not do fo well or is fo good as a preparation for wheat, but it anfwers well for peafe. In trying it mixed and unmixed with clover, fome have found that when without it, it is all the better for the wheat; and that the wire-worm after ray is fure to deftroy the wheat.

In weaning calves it is found extremely ufeful and advantageous, as it agrees very well with them, far better than tares, which are liable to run through them, or fcour.

In Suffex this fort of grafs is employed in mixture with others, as a fheep-feed, with great benefit and fuccefs.

The farmers in the tillage parts of Oxfordfhire alfo confider ray-grafs as preparing badly for wheat; they conceive that the wheat which follows will never be found fo good where it is fown as where there is none. It is thought far from having any ameliorating effects on the land, as it *draws* too much. It is never fown alone by fome. It makes the very worft hay, unlefs cut at an early period, or very young, in the opinion of many.

In Berkfhire this grafs is fown in the chalk diftrict, and found to a certainty lefs nutritious than many other forts, as well as more exhaufting in its nature. When intended for permanent pafture, it is found, in general, to fail in a very few years; and, unlefs the feed is changed, it will degenerate under any mode of management. It, however, poffeffes the advantage of being cheap, and of producing early feed, which are objects of no inconfiderable importance on a farm. Some find that the Peacey variety furnifhes feed a fortnight or three weeks fooner than the common fort. It is feldom fown fingly, but in mixture with many other artificial graffes, in proportions to fuit the difference of foil. In fome places it is fown with different other artificial graffes in variety, every four years, on different parts of the land, fo as to prevent it getting fick of the fame kind of feeds.

In the intention of hay, it fhould be cut early, or its juices will be much exhaufted. Horfes fed on this fort of hay are found to preferve their wind better than on hay of other graffes.

In Chefhire the dairy farmers do not confider it a good grafs for producing milk, on which account it is not fo much cultivated; its earlinefs, however, has made it efteemed by many; as on almoft any foil, fome fuppofe it will be a pafture a week or ten days fooner than any other kind. And its having the property of correcting the tendency of clover to produce flatulency, renders it alfo highly worthy of the farmer's attention.

When for hay, if not cut early, the produce is fcarcely fo nutritious as ftraw.

This grafs-feed is fometimes fown alone, and the quantity of feeds which the plants afford, and the facility of collecting it, are probably the reafons of its being very common; while the advantages of its earlinefs have led to its more frequent cultivation. It is fuggefted, however, that feveral graffes, as the vernal, the fox-tail, the meadow poa, and fome others, are equally as early as this grafs, and that the meadow fefcue, the oat-grafs, and fome others, feem to be as well deferving of the attention of the farmer.

According to the ingenious experiments on this grafs, made under the direction of the duke of Bedford, as ftated in the appendix to fir Humphry Davy's Agricultural Chemiftry, the refults were as follow.

The

	lbs. per Acre.		
The quantity of produce from a rich brown loam, taken at the time of the plant's flowering, was	7827	3	0
Weight when dry	3322	4	13
Weight of produce loft by drying	4494	14	3
Quantity of nutritive matter	305	11	15
The quantity of produce taken at the time when the feed was ripe	14973	12	0
Weight when dry	4492	2	0
Weight of produce loft in drying	10481	10	0
Quantity of nutritive matter	643	6	7
Lofs of weight in nutritive matter by taking the crop at the time of flowering, nearly half its value	337	8	8

Proportional value of the flowering grafs to that taken at the time the feed is ripe, as 10 to 11.

The quantity of latter math produce	3403	2	0
Quantity of nutritious matter	53	2	12

Proportional value of the latter math grafs to that of the time of flowering, as 4 to 10, and to that of the time the feed is ripe, as 4 to 11. See GRASS.

RAYA, in *Geography*, a river on the W. coaft of Java, which runs into the fea, S. lat. 7° 27′. E. long. 107° 30′.

RAYEN, a town of the Rhenifh palatinate; 11 miles N.W. of Heilbronn.

RAYGEN, or RAYHRAD, a town of Moravia, in the circle of Brunn; 8 miles S. of Brunn.

RAYLEIGH. See RALEIGH.

RAYMANGUR, a fortrefs of Hindooftan, in Myfore, taken in 1791 by the Britifh troops; 15 miles E. of Nundydroog.

RAYMATLA, a river of Bengal, which runs into the bay of Bengal, N. lat. 21° 35′. E. long. 88° 49′.

RAYMON, a town of France, in the department of the Cher; 14 miles S.E. of Bourges.

RAYMOND DE PEGNAFORT, in *Biography*, a faint in the Roman calendar, was a Spaniard by nation, and born at the caftle of Pegnafort, in Catalonia, in the year 1175. He received the early part of his education at Barcelona, from whence he removed to the univerfity of Bologna, where he ftudied the law, took his degrees, and afterwards taught the canon law for fome time with great reputation. He was afterwards called to Barcelona, by Berenger, bifhop of that city, who made him a canon, and provoft of his cathedral church. He held thefe pofts in the year 1218, when he eftablifhed an inftitution which led the way to the foundation of the *Order of* MERCY, (fee that article.) In 1222 he refigned his dignities, and became a member of the Dominican order of preaching friars at Barcelona. In 1230, pope Gregory IX. fent for him to Rome, appointed him his chaplain and confeffor, and devolved on him the care of carrying on the compilation of the "Decretals." The pontiff would willingly have recompenfed him for his labours by prefenting him with very confiderable church preferment, but he chofe rather the quiet of a monaftery to the honours and emoluments of the richeft fees in Spain and Portugal, which were offered to him. In 1238 he was called to affume the poft of general of his order; but upon the plea of his infirmities, he was fuffered, in about two years, to return to his monaftery, where he fpent the remainder of his long life. He died in 1275, having entered on the 100dth year of his age. To his everlafting difgrace, he is faid to have been principally inftrumental in introducing the Inquifition in the kingdom of Arragon, and into Languedoc, a circumftance which probably was the means of his canonization in the year 1601. He was author of "Summa de Caffibus pœnitentialibus, feu de Pœnitentia et Matrimonio," which was long popular in the Catholic world, and went through numerous impreffions. The beft edition of it is that publifhed by father Laget, at Lyons, in 1708. Raymond's chief work is "Lib. V. Decretalium," commencing with the papacy of Alexander III., where the decretals of Gratian terminate, which was approved by pope Gregory IX., and conftitutes the fecond volume of the papal canon law. Moreri.

RAYMOND LULLY, a philofopher of much celebrity in the dark ages, was born at Majorca in 1234. He was brought up a foldier, and led the life of a man of pleafure. Falling in love with a young woman, who was deaf to his addreffes, on account of a cancer with which fhe was afflicted, and which fhe exhibited to his view, in order to make him defift from his importunities, he was fo much affected with the fight, that he retired from the world, devoting himfelf to pious purfuits, and in the fearch of a remedy for the difeafe with which the object of his affection was afflicted; this was the chief motive for the chemical ftudies for which he became fo famous. He undertook a courfe of travels into the Eaft, for the purpofe of converting the Mahometans to the Chriftian faith, and incurred very great hardfhips, and the moft ferious dangers. So great was his zeal for this object, that being unable to perfuade certain Chriftian princes to engage in it, he entered into the Francifcan order, and returned to Africa, with the hope of obtaining the honour of dying a martyr. He was accordingly thrown into prifon, and after fuffering much torture, and long imprifonment, he was freed through the intereft of fome Genoefe traders, who took him on board their fhip to convey him home. He died juft when he had arrived within fight of his native land, in the year 1315. As a chemift, his chief object was the purfuit of the philofopher's ftone, and the univerfal remedy for all diforders. Boerhaave, who had perufed the works of Lully, fpeaks highly of their merit; he finds them, he fays, "beyond all expectation, excellent, fo that he doubted whether they could be the work of that age. So full are they of the experiments and obfervations which occur in later writers, that either they muft be fuppofititious, or the ancient chemifts muft have been acquainted with many things which pafs for modern difcoveries." Lully is fuppofed to have derived his chemical knowledge from his travels in the Eaft, particularly from the writings of Geber. A complete edition of all the writings attributed to him, was printed at Mentz. Raymond Lully is chiefly celebrated for an invention by which he pretended to enable any one, mechanically, to invent arguments and illuftrations upon any fubject, and thus to reach the fummit of fcience at a fmall expence of time and labour. This "Great Art" profeffes to furnifh a general inftrument for affifting invention in the ftudy of every kind of fcience. For this purpofe, certain general terms, which are common to all fciences, are collected and arranged, not according to any natural divifion, but merely according to the caprice of the inventor. An alphabetical table of fuch terms was provided, and fubjects and predicates taken from thefe were infcribed in angular fpaces, upon circular papers. The effences, qualities, affections, and relations of things, being thus mechanically brought together, the circular papers of fubjects were fixed in a frame, and thofe of predicates were fo placed upon them as to move freely, and in their revolutions to produce various combinations of fubjects and predicates; whence would arife definitions, axioms, propofitions, varying infinitely, according to the different application of general terms to particular fubjects. Such is the general idea of the Lullian art, which, however applauded by certain writers of that period, may be pronounced as unworthy of notice, except as a ſpecimen of the artifice with which men frequently impoſe upon vulgar credulity. Enfield's Hiſtory of Philoſophy.

Raymond, in *Geography*, a townſhip of America, in Rockingham county, New Hampſhire, incorporated in 1764, containing 898 inhabitants; 12 or 14 miles W. of Exeter.

Raymond, or *Raymond-town*, a poſt-town in Cumberland county, and diſtrict of Maine, containing 825 inhabitants; 142 miles N.N.E. of Boſton. The land is generally level, excepting one large hill, called Rattleſnake-hill, from its abounding with thoſe reptiles. The greater part of the growth is pine and white oak, and the ſoil is difficult of culture.

RAYNAL, William-Francis, in *Biography*, a French writer of celebrity, was born at St. Genies, in the Rovergue, in 1713. He entered at a very early age among the Jeſuits, and by his abilities excited high expectations of his future celebrity. His diſlike of reſtraint induced him to quit the ſociety in the year 1748, although he had made his profeſſion, and had been ordained prieſt. He now entered his career of authorſhip, and diſtinguiſhed himſelf as a political, hiſtorical, and miſcellaneous writer. His firſt piece, publiſhed the ſame year in which he quitted the ſociety, was entitled "Hiſtoire du Stadhouderat;" he next publiſhed "Hiſtoire du Parlement d'Angleterre," which gained him much reputation, though it had little claim to the dignified title of hiſtory, and was, moreover, tinged with many prejudices, religious and political. He alſo compoſed "Anecdotes Literaires," in three vols. 12mo.; and "Memoires de Ninon de l'Enclos," and was much employed in the "Mercure de France." The great work of the abbè Raynal was entitled "Hiſtoire Philoſophique et Politique des Etabliſſemens et du Commerce des Europeens dans les deux Indes," to the compoſition of which he was led by his engaging in ſome commercial ſpeculations, thinking them likely to turn out more profitably than literary purſuits. His hiſtory was publiſhed in 1770, and as it contained hiſtory, deſcription, and calculation, intermixed with political and philoſophical reflections, and was, through the whole, animated by an ardent ſpirit of philanthropy, and hatred of tyranny, civil and religious, it became popular, and the author was looked up to as one of the reformers of the age. Critics, however, ſoon found that, as a literary and philoſophical work, it would not bear the teſt of examination. The ſtyle, though rich, was exceedingly declamatory; the images were frequently inflaming; and his principles vitiated by the licentiouſneſs of his country; and the facts upon which the whole was founded were derived from incorrect or dubious documents. The author, it ſhould ſeem, was ſoon made ſenſible of the imperfections of his work, and determined to improve it by travel: with this view he viſited the principal commercial towns in France, and paſſed into England and Holland, at every place making inquiries among travellers and merchants with the moſt unremitting aſſiduity. On his return, he publiſhed at Geneva an improved edition of his work, in 10 vols. 8vo. containing many additions and corrections. Its tone was unaltered, and its attacks upon exiſting authorities were ſo bold, that the parliament of Paris ordered it to be burnt, and iſſued a decree for apprehending the author. He retired to Spa, whence he travelled through Germany, and after having viſited all the principal places, he returned to France, and lived ſome time quietly in the ſouthern provinces. At the academies of Marſeilles and Lyons he founded ſeveral prizes for eſſays on given ſubjects, of which the moſt remarkable was whether the diſcovery of America had been more uſeful or prejudicial to Europe.

America has now, owing to the quarrel and war ſubſiſting between Great Britain and its colonies, become an object of peculiar intereſt; and the abbè Raynal, in 1781, publiſhed "Tableau et Revolutions des Colonies Angloiſe dans l'Amerique Septentrionale," which was commented upon and expoſed by Thomas Paine, who was a zealous and able defender of the American cauſe, againſt the mother country.

The abbè came to Paris in the important year 1788, when the revolution was juſt ready to burſt forth. He had not been long in the city, before the National Aſſembly was convoked, and one of its early acts annulled the decree paſſed againſt him; for this favour, he addreſſed a letter of thanks to the preſident, containing a retraction of certain principles contained in his work. Obſerving, afterwards, that the conſtituent aſſembly were occupied in decrees which he thought were violent infringements on the rights of property, and in others calculated to augment the popular effervescence, he wrote, in May 1791, a long letter of advice and remonſtrance. It was ſoon ſeen that the ſentiments in this letter were very different from thoſe which were generally expected from the author of the "Hiſtoire Philoſophique," their tendency being to repreſs popular licence, and to ſtrengthen the hands of civil authority. Raynal, like many other philoſophers of that day, had aided all in his power to produce the change, at which, when put into practice, he and they were greatly alarmed. But it was now too late to return: they had ſhewn the people their power, had taught them their rights, which it was in vain to expect they would be induced to abandon for any arguments he could produce. In the letter referred to, he ſays, "I have long dared to ſpeak to kings of their duty, ſuffer me now to ſpeak to the people of their errors, and to their repreſentatives of the dangers which threaten us. I am, I own to you, deeply afflicted at the crimes which plunge this empire into mourning. It is true that I am to look back with horror at myſelf for being one of thoſe who, by feeling a noble indignation againſt arbitrary power, may perhaps have furniſhed arms to licentiouſneſs. Do then religion, the laws, the royal authority, and public order, demand back from philoſophy and reaſon the ties which united them to the grand ſociety of the French nation, as if, by expoſing abuſes, and teaching the rights of the people and the duties of princes, our criminal efforts had broken theſe ties? But no!—never have the bold conceptions of philoſophy been repreſented by us as the ſtrict rule for acts of legiſlation." He next proves, that it was not the buſineſs of the aſſembly to aboliſh every ancient inſtitution; that the genius of the French people is ſuch, that they can never be happy or proſperous but under a well regulated monarchical government; and that if they wiſhed not the nation to fall under the worſt kind of deſpotiſm, they muſt increaſe the power of the king. Raynal was conſidered to be in his dotage, and himſelf and his writings were now diſregarded. He retired in the midſt of ſtorms to Paſſy, where, being reduced to a ſtate of indigence, he died in March 1794, at the age of 85. Beſides the works already mentioned, the abbè Raynal publiſhed "The Hiſtory of the Divorce of Catharine of Arragon, by Henry VIII.;" and "A Hiſtory of the Revocation of the Edict of Nantes," in four volumes; but he committed many of his papers to the flames during the bloody reign of the monſter Robeſpierre.

RAYNERIUS, a learned Italian monk, who flouriſhed moſt probably in the 13th century, was a native of Piſa. He

He acquired the character of a confummate divine and civilian, and was appointed profeffor of divinity, as well as raifed to the moft confiderable offices of truft and honour belonging to his order. It is uncertain at what period he died. He left behind him many works, of which the chief is entitled "Pantheologia, feu, Summa univerfæ Theologiæ." This is a dictionary of theology, with the fubjects difpofed of in alphabetical order; it has been held in high eftimation among the members of the Catholic communion. It has gone through feveral editions in folio and quarto. The laft edition was printed at Paris in 1655, in 3 vols. folio, with additions of father Nicolai.

RAYNHAM, in *Geography*, a townfhip of Maffachufetts, in Briftol county, taken from Taunton, and incorporated in 1731. It contains 1154 inhabitants. Befides the great river Taunton, this townfhip is watered by feveral ftreams, upon which are fix faw-mills, three grift-mills, a furnace, a forge, and fulling-mill. Here are alfo numerous ponds, of which Nippanniquit, or Nippahonfit, is two miles long and one broad. In this pond millions of alewives annually refort and leave their fpawn in it. An excellent kind of ore, and various kinds of fifh, are found in this townfhip. Befides the ufual occupations of hufbandry and mechanics, many of the inhabitants are employed in the manufactories of bar-iron, hollow ware, nails, iron for veffels, iron-fhovels, potafh, fhingles, &c. The firft forge fet up in America was introduced into this town by James and Henry Leonard, natives of England, in 1652. The fame family, in the 6th generation, now poffefs it. King Philip's hunting houfe ftood on the northern fide of Fowling pond, about one mile and a quarter from the pond. When the war broke out in 1675, which terminated in the death of the king and the ruin of his tribe, he left ftrict orders to all his Indians not to hurt the Leonards. Before Philip's time, Fowling pond was two miles long, and three miles and a quarter wide. But the water is now almoft gone, and the large tract it once covered is grown up to a thick-fet fwamp of cedar and pine. The vicinity has abounded with excellent ore, which has fupplied the forge for 80 years; it is, however, incapable of being wrought into iron of the beft quality.

RAYNOLDS, or RAINOLDS, JOHN, in *Biography*, a learned Englifh divine, was born at Pinhoe, near Exeter, in the year 1549. In 1562 he was admitted a ftudent at Merton college, Oxford, whence he was removed, in 1563, to a fcholarfhip of Corpus Chrifti college. In 1572, having taken his degrees in the arts, he was appointed Greek lecturer in his college, in which department he acquitted himfelf with great applaufe. Fuller fpeaks of him in the higheft terms as a commentator of Ariftotle's Rhetoric. He had hitherto been zealoufly attached to the Popifh religion, while his brother William was equally zealous for the Reformation. The difference in their fentiments leading them to frequent conferences and difputations, they made converts of each other, William becoming a determined Papift, and John a fteady Proteftant. He frequently appeared in the pulpit, and was greatly admired as a preacher. In the year 1588 he was admitted to the degree of doctor of divinity, and foon afterwards the fame of his great learning induced queen Elizabeth to appoint him profeffor extraordinary in that faculty at Oxford; after which fhe gave him the deanery of Lincoln, which he held only a fhort time, when he exchanged it for the prefidentfhip of Corpus Chrifti college, of which he was a fellow. He made this exchange from his attachment to an academical life, and his love of retirement and ftudy. Similar motives led him afterwards to refufe a bifhopric which queen Elizabeth offered him. He retrieved the finances of his colleges, which had been fuffered to fall into dilapidation, and he reftored its decayed difcipline, ftrictly obeying the ftatutes himfelf, and compelling all the other members to obferve them. After the acceffion of James, he was appointed, with Dr. Sparks, Mr. Chadderton, and Mr. Knewftubs, to appear on behalf of the Puritans in the pretended conferences at Hampton Court; of which we have a full account in the fecond volume of Neal's "Hiftory of the Puritans," by Dr. Toulmin, p. 10—20. Dr. Raynolds did not on this occafion act according to his ufual fpirit, and, fuffering himfelf to be browbeaten by the royal tyrant, loft much of the refpect which his character ufually laid claim to. It was at the conclufion of this conference, that the king faid to Dr. Raynolds and his friends, in anfwer to their arguments; "If this be all your party hath to fay, I will make them conform themfelves, or elfe I will harrie them out of the land, or elfe do worfe, only hang them, that's all." When James gave directions for undertaking a new and more correct tranflation of the bible, Dr. Raynolds was one of the Oxford divines who were commiffioned to give a new verfion of the four greater prophets, the book of Lamentations, and the twelve minor prophets. While employed in this great work he was feized with the gout, under which he had been a fufferer many years, and which at length proved fatal to him. In the midft of the fevereft pains, he perfevered in the tafk affigned to him, and once a-week his fellow-labourers at Oxford regularly affembled in his apartments, where they compared the fruits of their refpective ftudies, determining what appeared to them to be the moft faithful tranflation, till they had accomplifhed their tafk. Dr. Raynolds died in the year 1607, highly refpected for his erudition, his piety, his modefty, and humility. Several of his biographers fpeak of him in the higheft terms. Wood fays he was moft prodigioufly feen in all kind of learning, and had turned over all writers, profane, ecclefiaftical, and divine, all the councils, fathers, and hiftories of the church. He was author of many theological works, of which we may mention "De Romanæ Ecclefiæ Idolotria, in Cultu Sanctorum, Reliquiarum, Imaginum," &c. 1596; and "Cenfura Librorum Apocryphorum Veteris Teftamenti, adverfus Pontificios," which was a pofthumous work, and printed at Oppenheim, in Germany, 1611, in 2 vols. 4to.

RAYNPOUR, in *Geography*, a town of Hindooftan, in Bahar; 40 miles N.W. of Chuprah.

RAYNULLAH, a town of Hindooftan, in Bahar; 32 miles E. of Bahar.

RAYPOUR, a town of Bengal; 55 miles W.S.W. of Burdwan. N. lat. 22° 48′. E. long. 87° 5′.—Alfo, a large and commercial town of Hindooftan, in the country of Ruttunpour; 55 miles S. of Ruttunpour. N. lat. 21° 24′. E. long. 82° 28′.

RAYPOUR, or *Ray-Gaut*, a remarkable pafs on the Beyah river, about 17 or 18 coffes from Noorpour; fituated a confiderable way within the level country of the Panjab.

RAYTE, or RYCHE, in *Ichthyology*, a name given by Joannes Cuba, Albertus, and others, to the common fkate, or flaire. See RAIA *Batis*.

RAZANT. See RASANT.

RAZANT *Flank*. See FLANK.

RAZANT *Line of Defence*. See DEFENCE.

RAZBOINIKOVA, in *Geography*, a town of Ruffia, in the government of Irkutfk, on the Angara; 56 miles N.W. of Balaganfkai.

RAZBOINOI, a fort of Ruffia, on the Ural; 92 miles E. of Orenburg.

RAZE,

RAZE. See TOMB.

RAZE, in the *Manege*. A horfe is faid to have *razed*, whofe corner teeth ceafe to be hollow; fo that the cavity, where the black mark was, is filled up; that is, wholly difappears, and the age of the animal cannot be known with any degree of certainty. See MARK.

RAZI, in *Biography*, one of the furnames of the famous Muffulman Mohammed Ben Omar Ben Khatid Rei, Al Temini Al Bekri, a native of the city of Reï, in the Perfian Irak, of which the word Razi is the appellative. He was born in the year of the Hegira 543, correfponding with 1148 of the Chriftian era, and became one of the moft celebrated doctors. His knowledge was not confined to the learning ufually taught in the Mohammedan fchools, but it comprehended likewife the fciences imported into the Eaft with the writings of the Grecian fages. He was, moreover, a very eloquent preacher both in the Arabic and Perfian languages. By thefe qualifications he acquired the favour of feveral princes, particularly of a fultan of the Gaurid dynafty, who erected a college for him in the city of Herat in Chorafan. He was driven from this fituation by the intrigues of Cadi Abdalmegid, of the fect of Keramians, who contended that the deity was corporeal, and of human fhape. Having challenged Razi one day to a public difputation on the attributes of God, he was fo confounded by the fuperior reafoning of the latter in defence of the divine fpirituality, that he became his bitter enemy, and feized every opportunity of calumniating him to the fultan, as a man who, under the cloak of philofophy, concealed irreligious and impious notions. By his perfuafions, the prince banifhed Razi from the city, but he foon repented of his rafh decree, and recalled him. This happened in the year 606 of the Hegira. He was author of an " Introduction to the moft fubtile Myfteries for the Ufe of Men of Genius," in which he explains the principles of the Mohammedan philofophy; and feveral other pieces. " Select Aftronomical Refearches" have been attributed to him, but perhaps on infufficient authority.

RAZI is alfo the furname of a celebrated philofopher, chemift, and aftronomer, called Mohamed Ben Zakaria, a native of the fame city as the preceding, who flourifhed under the caliphate of Moctader of the dynafty of the Abaffides. He died about the year 922 of the Chriftian era.

RAZIMIERZ, in *Geography*, a town of the duchy of Warfaw, fituated between Slepezka and Pofen, where the unfortunate count Patkul was broken alive on the wheel, and impaled by order of Charles XII. of Sweden in 1708.

RAZNIPNAIA, a fort of Ruffia, in the government of Upha, on the Ural; 56 miles S.W. of Orenburg.

RAZOIS, PORT, a port at the S.W. extremity of the coaft of Nova Scotia, and N.E. of cape Negro.

RAZOR, a well-known edged inftrument ufed in fhaving. Heat appears to give a partial increafe of tenacity to a razor's edge, probably becaufe the edge cools fafteft, contracts, and is ftretched.

RAZOR-*Bill*, in *Ornithology*, the common Englifh name of the alca, a web-footed bird with no hinder toes, common on our fea-fhores. See ALCA *Torda*.

RAZOR-*Fifh*, in *Ichthyology*, the *Coryphæna novacula* of Linnæus, having the head and fins barred with blueifh lines. See NOVACULA.

RAZOR *Ifland*, in *Geography*, a fmall ifland on the coaft of Brafil; 12 miles S. of Rio Janeiro.

RAZUDA, a town of Hindooftan, in Guzerat; 40 miles E.S.E. of Chitpour.

RE', an ifland in the Atlantic, near the weft coaft of France, about 16 miles long, and 3 broad; feparated from the coaft of Vendée by the ftraits of Breton, which are about 7 miles wide. The principal town is St. Martin de Ré. N. lat. 46° 13'. W. long. 1° 20'.

RE, in *Commerce*. See REE.

RE, in *Grammar*, &c. an infeparable particle, or prepofition, prefixed to the beginning of words, to vary, double, or otherwife modify their meaning.

The modificative *re* was firft introduced by the Latins, from whom it is borrowed into moft of the modern tongues. Prifcian derives it from *retro*, backwards; others rather derive *retro* from *re*; others derive *re* from the Greek ῥεα, *eafy*; or from ῥεω, *I flow*.

The effect of the *re* is various: ufually it fignifies *again*, *rurfum*, ανα; as in *re*-join, *re*-fign, *re*-fume, *re*-courfe, *re*-bound, *re*-cite, *re*-hear, *re*-cognize, *re*-compare, *re*-double, *re*-linquifh, &c.

Sometimes it ftands for *contra*, αντι, *againft*; as in *re*-luctance, *re*-cumbent, *re*-cline, &c.

Sometimes for υπερ, *fuper*, *over*, as in *re*-dundant; fometimes for πορρω, *longe*, *far*, as in *re*-moving, &c.

RE, in *Mufic*, the name of the fecond of the keys in the three hexachords of Guido, G, C, and F. See SOLMISATION, GAMMUT, HEXACHORDS, and MUTATIONS.

RE *Alla Caccia*, *Il*, the Italian title of a comic opera, taken from our " Miller of Mansfield." It was fet to mufic for our opera-houfe in 1768, by Aleffandri, a young compofer of promifing abilities. He was hufband of La Guadagni, the original " Buona Figliuola" in Italy, and fifter to Gaetano Guadagni, the celebrated finger. But the Miller of Mansfield was firft formed into a comic opera for Paris, by Sedaine, and fet by Monfigni, under the title of " Le Roi et le Fermier," in 1762.

RE *Teodoro*, *Il*, a comic opera, founded on the adventures and viciffitudes of the unfortunate Theodore, king of Corfica. The mufic of this drama is one of the innumerable inftances of the fertility of Paefiello's pen. It had been performed all over Italy and Germany with the greateft applaufe, previous to its being brought on our ftage. The mufic, that was not changed, is extremely original and pleafing, particularly the *finales*. There was a mixture of airs by Corri, Mazzinghi, and Storace; but befides deftroying the unity of ftyle, the certainty of there being merit of fome kind or other in every compofition of Paefiello, inclines lovers of mufic to lament that any of his airs fhould be changed or omitted.

REA, in *Geography*, a river of England, which runs into the Tame, 3 miles N.E. of Birmingham.

REA, *Lough*, a lake of Ireland, in the county of Galway, on the border of which is the town of Loughrea. See LOUGHREA.

REACH, in *Sea Language*, the diftance between any two points on the banks of a river, in which the current flows in a ftraight uninterrupted courfe.

RE-ACTION, in *Phyfics*, the action by which a body acted upon, returns the action by a reciprocal one upon the agent.

The Peripatetics define re-action to be that which a paffive body returns upon the agent, by means of fome quality contrary to that received from it, in the fame part with which the agent acted, and at the fame time; as if water, while it is heated by the fire, does at the fame time cool the fire.

It was known, even in the fchools, that there is no action in nature without re-action; and it was a maxim among them, *omne agens*, *agendo repatitur*.

But the equality of the actions was not known. Sir Ifaac Newton eftablifhed it as one of the laws of nature, that *action and re-action are equal and contrary*; or that the mutual actions of two bodies, ftriking one againft another, are exactly equal, but in contrary directions; or, in other words, that by the action and re-action of bodies one on another, there are produced equal changes in each: and thofe changes are impreffed towards directly contrary parts or ways. See *Laws of* NATURE.

Some of the fchool-philofophers deny any fuch thing as re-action, properly fo called, at all; urging, that action arifes only from the ratio of the greater inequality; that is, we are only to account for action the excefs of action, or what the agent does more than is returned by the patient. But the equality between action and re-action fets afide this exception.

READ, in *Geography*, a river of England, in the county of Northumberland, which runs into the Tyne, 10 miles N. of Hexham.

READ *Head*, a cape on the E. coaft of Scotland. N. lat. 56° 35′. W. long. 2° 28′.

READFIELD, a poft-town of America, in Kennebec county, and diftrict of Maine, bounded on the E. by Hallowell, and feparated from Sterling on the W. by the eaftern branch of the Androfcoggin river; 8 miles W. of Hallowell, and 190 N.E. of Bofton. It contains 1396 inhabitants.

READING, JOHN, in *Biography*, organift, firft at Lincoln, then at Hackney, and finally of St. Dunftan's church in Fleet-ftreet, London. He was a fcholar of Dr. Blow, and Stanley's firft mafter. He publifhed Hymns early in life, for pfalmodifts in parochial congregations; and, laftly, a work engraved on copper, which he called "A Book of my Anthems, with a Thorough-bafe, for the Organ or Harpfichord." He died in 1766, far advanced in years.

READING, in *Geography*, a borough and market-town in the hundred of Reading, and county of Berks, England, is 38 miles W. by S. from the metropolis. It is a town of confiderable extent and importance, and contains, according to the parliamentary returns of 1811, 2032 houfes, and 10,788 inhabitants.

Hiftorical Events.—Reading is unqueftionably of very great antiquity; but whether it is indebted for its origin to the Britons, the Romans, or the Saxons, is unknown. Conjectures, however, have been hazarded on the fubject by various writers. Camden thinks its foundation ought to be referred to the Britons; Leland calls it the Pontes of Antoninus; and Dr. Beeke, the learned profeffor of modern hiftory at Oxford, confiders it the Calleva of Richard of Cirencefter. But the circumftances which are alleged in favour of thefe opinions, by their refpective authors, are far from being fatisfactory. This place is firft mentioned in hiftory, under its prefent appellation, in the year 871; at which time it is defcribed by Affer as being a fortified town, belonging to the Saxon kings, but then occupied by the Danifh invaders, who had retreated hither after their defeat at Englefield. The victorious Saxons immediately invefted the town; but their enemies, having received reinforcements, attacked the befiegers with fuch impetuofity, that, after an obftinate conteft, they deemed it prudent to retire to Afhdown. Hither they were followed by the Danifh forces, which were again overthrown, and driven back to Reading. Here the latter remained unmolefted till the following year, when they marched to London. In the reign of Alfred, who mounted the throne of Weffex foon after this event, the Danes once more feized upon Reading, and they doubtlefs poffeffed it occafionally during their incurfions in the tenth century. Throughout that long period of inceffant hoftility and depredation, however, this town feems to have efcaped any very ferious difafter; but in 1006 it was reduced to afhes by Sweyn, king of Denmark, along with its famous nunnery, faid to have been founded by Elfrida, widow of king Edgar, as an atonement for the murder of Edward the Martyr. Reading foon recovered from this difafter, and in the courfe of a century afterwards became a place of confiderable importance. In 1121 king Henry I. laid the foundation of its magnificent abbey, in which his remains were fubfequently interred, according to his own defire. Stephen, who ufurped the throne after Henry's death, built a caftle here, which was furrendered to his antagonift Henry Fitz-Emprefs, who no fooner obtained the crown, than he ordered it to be demolifhed; fo that even the feite of it is now uncertain. That monarch, however, otherwife evinced much partiality for Reading. Here he paffed much of his time, and convened a parliament, as alfo an ecclefiaftical convocation, in which Baldwin was elected archbifhop of Canterbury. The abbey church was finifhed in this reign, and dedicated in prefence of the king. In 1185 he came hither from London, to receive Heraclius, patriarch of Jerufalem, who prefented him with the keys of the holy fepulchre, and the royal banners of Jerufalem, which Henry returned. In the reign of his fucceffor, Richard I., a convention for the trial of Longchamp, chancellor and bifhop of Ely, who had been appointed regent of the kingdom during the king's abfence, was held here. King John alfo held a convention in this town, in 1206; and in 1212 a council was convened here by the pope's legate, for the purpofe of effecting a reconciliation between that infatuated prince and the exiled bifhops. In 1213 the king met the legate and barons at the abbey, and held a parliament. King Henry III. fpent his Chriftmas at Reading in 1226; and twice during his reign fummoned the eftates of the realm hither, for the tranfaction of national bufinefs. He was the firft monarch who granted a charter of incorporation to the town. In 1346, Edward III. held a great tournament here; and in 1359, the marriage of his fon, John of Gaunt, with Blanche, daughter of Henry, duke of Lancafter, was folemnized in the abbey church. In 1384, Richard II. and his court, together with the mayor and aldermen of London, being affembled at Reading, John Northampton, the preceding mayor of that city, was convicted before them of feditious practices, and fentenced to perpetual imprifonment. In 1389 a great council was held at Reading, at which the king and his barons were reconciled by John of Gaunt. Parliaments were held here alfo in 1440 and 1451; in the former of which the order of nobles called vifcounts was firft eftablifhed; and in the year following, the parliament adjourned hither from Weftminfter, on account of the plague. King Edward IV.'s marriage with Elizabeth, lady Grey, was firft acknowledged at Reading, in 1464; on which occafion fhe made her public appearance at the abbey, conducted by the duke of Gloucefter and the earl of Warwick. In 1466 parliament was a fecond time adjourned to Reading, to avoid the plague. King Henry VIII. frequently refided here, having converted the diffolved abbey into a palace. His fon, king Edward VI., vifited this town in 1552, when he was met by the mayor and aldermen at Coley-Crofs, and prefented with two yokes of oxen; the mayor riding before him, uncovered, to the palace. The fame ceremony was repeated, when Reading was vifited by the bigotted Mary, and her hufband, king Philip of Spain. Queen Elizabeth was a frequent vifitant here, and had a feat in the church of St. Lawrence.

Early in the reign of Charles I., when the plague raged with

with great violence at London, the courts of chancery, king's bench, and common pleas, were held here, as were likewife the court of exchequer, the court of wards and liveries, and the court of requefts. In 1642, Reading was a parliamentary poft, but the garrifon, being defective as to ordnance and ammunition, quitted the town, without refiftance, on the approach of a party of the king's horfe. In confequence of this event it became a royal garrifon, and continued to be fo till taken by the earl of Effex in April 1643, after a fiege of eight days. The king, however, again recovered it in September the fame year, and held it till May following, when he ordered the works to be demolifhed, and evacuated the town. After this event Reading was frequently occupied as the head-quarters of the parliamentary army, and was confequently much impoverifhed by the contributions levied upon its inhabitants for the fupport of the military. In 1688 the army of king James II. was quartered in this town, but quitted it on the approach of the prince of Orange. On this occafion a fkirmifh took place in the market-place between two detachments of horfe, which terminated in favour of the Proteftant intereft, and is ftill commemorated, by bell-ringing, on the anniverfary of its occurrence. Queen Anne vifited Reading in 1700, when fhe was received by the corporation in ftate, and prefented with forty broad pieces of gold in an elegant purfe made for the occafion.

Municipal Government.—Reading claims the honour of having been originally conftituted a guild, by charter from Edward the Confeffor. This claim, however, is extremely queftionable; and at all events we feel convinced that the ancient guild was nothing more than an affociation of mechanics and tradefmen for their individual benefit. The firft monarch who conferred upon Reading the privilege of feparate jurifdiction was Henry III., in the 37th year of his reign. His charter was fubfequently confirmed by all his fucceffors, but without any material alterations, till the reign of Henry VI., when the corporation is firft mentioned by the title of the mayor and burgeffes. Thus it continued to be defignated till queen Elizabeth divided the burgeffes into capital and fecondary, and declared the mayor and them to be a common council for the borough. That princefs further conferred upon the corporation confiderable eftates. Charles I. authorized aldermen to be elected, and invefted the mayor and them with ample powers for the government of the town. This charter was confirmed, after the reftoration, by his fon Charles II., and is the one under which the corporation now acts. By it the officers are declared to be a mayor, twelve aldermen, and the fame number of capital burgeffes; the mayor, and his deputy, (the preceding mayor,) the fenior alderman, the bifhop of Salifbury, and his chancellor, being juftices of the peace for the borough, and empowered to hold feffions, and a court of record. The recorder is an officer added by Charles II., who likewife firft acknowledged the town-clerk. Reading fent members to parliament from the time of the earlieft records. Before 1716 the right of election was vefted in the freemen not receiving alms, and in the inhabitants paying fcot and lot; but in that year it was limited, by a decifion of the houfe of commons, to the inhabitants paying fcot and lot only. The number of voters is eftimated at 560, and the mayor is the returning officer. The fpring affizes for the county are held at this town, as are likewife the Epiphany feffions, but the fummer affizes are held at Abingdon, and the Michaelmas, either there or at Reading, as the magiftrates may judge moft convenient.

Reading is a town of confiderable extent, fituated on both banks of the river Kennet, which feparates itfelf into feveral branches in paffing through the town. It contains three parifhes, St. Giles, St. Mary, and St. Lawrence, and is divided into five wards, called the High-ward, New-ward, Minfter-ward, Old-ward, and London-ward, for each of which a conftable is appointed. Formerly it was a place of great trade in woollens, but that manufacture fell to decay during the feventeenth century, and has never fince revived. At prefent the chief manufactured products are, coarfe linens, (fuch as fheeting, fail-cloth, floor-cloth, and facking goods,) gauze, crapes, mullinets, ribbons, hat-bands, fhoe-ftrings, and other fimilar articles. Thefe afford employment to a great portion of the inhabitants among the lower orders; but the principal fupport of the town arifes from its water communications with London, Bath, and Briftol. The articles exported are, flour, of which 20,000 facks are fent annually to the metropolis, timber, bark, ftraight hoops, linen, wool, cheefe, beer, and a variety of minor articles: in exchange are received groceries of every kind, iron, fpirits, fir timber, deals, ftaves, Portland ftone, bricks, hemp, flax, hides, leather, coals, Bath free-ftone, Birmingham goods, &c. For the convenience of trade, feveral wharfs are formed at Reading, and many improvements have been lately made in the internal navigation of the diftrict at large.

This town, from time immemorial, has been noted for its markets, which are held weekly, on Wednefday and Saturday. The Wednefday's market is chiefly for fruit; but that of Saturday embraces corn and every article of provifion. The fpot on which the corn market is held, is a fpacious piece of ground, of a triangular form, environed by commodious fhops for the accommodation of people attending the market, who may be fupplied here with colonial or manufactured goods cheaper than in any other town in the county. This market-place is kept in repair by the corporation, for which they are entitled to take one pint out of each fack of corn fold in the market, amounting to about 54,600 quarters annually. The provifion market buildings adjoin to the corn market-place, and form a long fquare, confifting, one-half of two ranges of butchers' fhops, and the other half of apartments for the market-women, who bring butter, eggs, poultry, &c. for fale. At the fouthern end of this building is a fquare open area for fifhmongers' and huckfters' ftalls, and next to this, and fronting a ftreet called Fifher-ftreet, is a large fquare gate-way, over which is the houfe occupied by the clerk of the market. Befides thefe market-places, there is another for the fale of ftore pigs, conveniently fituated between Friar-ftreet and Broad-ftreet. This is private property, but the corporation receive the toll. At Reading are four annual fairs, one on the 2d of February, another on the 1ft of May, a third on the 25th of July, and a fourth on the 21ft of September. The three firft are chiefly for the fale of horfes and cows; but the laft is alfo a ftatute fair for the hiring of fervants, and is further remarkable for the quantity of cheefe brought hither from the counties of Gloucefter and Wilts. Hops are alfo plentiful at this fair.

The houfes of Reading are moftly conftructed of brick, and are generally difpofed in regular ftreets, fome of them very narrow, which have been paved under the authority of an act of parliament, paffed in the year 1785.

The principal public buildings and inftitutions in the town are the three churches of St. Lawrence, St. Mary, and St. Giles, and feveral diffenting meeting-houfes, the town-hall and free-fchool, the blue-coat fchool, the green fchool, the foundation fchool, the fchool of induftry, the Lancaftrian fchool, the fchool for national education, the theatre, and the county gaol.

The

The church of St. Lawrence was chiefly erected towards the close of the 16th century, and is partly constructed of materials taken from the buildings of the abbey. Among the parts of it, so pilfered from the monastery, is a large door-way, which is composed of a circular arch, ornamented with rich mouldings, from which were suspended on each side the arms of the abbey; but these are now nearly obliterated. This door-way is likewise ornamented with niches, in which statues formerly stood. The advowson of the church belongs to St. John's college, Oxford. St. Mary's church is somewhat more ancient than that of St. Lawrence, having been constructed about the year 1547, in the stead of a previous one, which had gone to decay. Some portions of this building have evidently belonged to an older edifice, particularly a window over the west door, which is in the early pointed style of architecture. St. Giles's church was probably constructed at the commencement of the 12th century. The tower only is modern, the ancient one having been demolished during the civil war. The livings of both the churches last mentioned are in the gift of the lord chancellor. The principal meeting-houses for dissenters are the Calvinistic or Independent meeting-house in Broad-street, a Baptist meeting-house and a Quaker's meeting-house in Church-street, a Methodist chapel in Castle-street, and another in Minster-street, a Cudworthian and an Unitarian meeting-house in London-street, and a Catholic chapel in Vastern-lane. Another meeting-house for Baptists has also been lately erected in Sievier-street.

The town-hall and free-school form one building; the free-school occupying the ground story, and the hall, court-room, and offices, the floor above. The free-school was established in the reign of Henry VII., by John Thorne, abbot of Reading, with the funds of a suppressed alms-house. This school has two scholarships in St. John's college, Oxford, the gift of sir Thomas White, in 1557. Julius Palmer, one of the masters of this school, fell a martyr to his Protestant tenets in 1556. The blue-coat school, which is so named from the dress of the scholars, was founded in 1656, by Mr. Richard Aldworth, who bequeathed 4000*l.* for the support of a master, lecturer, and twenty boys. The present school-house is of late erection, and consists of a centre and two wings. Several donations and bequests having been made to this establishment by various persons, it now usually supports about 48 boys. The green school is situated in Broad-street, and is appropriated for the education of the daughters of decayed tradesmen, residents in the town, and of orphans, who have been left unprovided for by their parents. The inhabitants of Reading are indebted for the institution of this school to the Rev. Charles Sturges, the Rev. Dr. Nicholls, and the Hon. and Rev. W. B. Cadogan, former vicars of the three parish churches belonging to the town. It is supported by annual subscription, and the proceeds of different donations and bequests. In the foundation school, founded in 1766, eight male and eighteen female children are taught to read. It was instituted with a legacy left for that purpose by Mr. Joseph Neale. The school of industry originated under the patronage of Mrs. Cadogan, for female children, and is supported by the voluntary contributions of ladies in the town. The Lancastrian school, established in 1810, is situated in Southampton-street, and is attended by about 320 boys, who are nominated by the subscribers individually. The school for national education was opened in September, 1813. It is founded on the plan of instruction recommended by Dr. Bell, and is chiefly supported by the clergy of the town and county. Both these institutions are calculated to be highly beneficial to the rising generation. Besides these seminaries of education, there are in Reading several Sunday schools, all the children attending which receive a suit of clothes annually, from a fund provided by the bequest of Mr. Edward Simeon, who clothed them in the same manner during his life-time. The theatre of Reading is a neat and convenient building, lately erected, under the act for regulating provincial theatres. The gaol was built in 1793, on the scite of some of the abbey ruins. It is a large edifice, and contains commodious apartments for the keeper, a neat chapel, an infirmary, and a room for the reception of the magistrates, in the centre; and two wings, one for male, and the other for female prisoners, with yards, cells for refractory individuals, &c.

Besides the above public buildings and establishments, there is a public library lately established at Reading, under the name of the "Reading Institution;" also a dispensary, which is attended by some of the medical gentlemen of the town. The house is the property of the corporation, and the general expences are defrayed by subscription. The Oracle may likewise be reckoned among the public buildings of Reading. This structure was erected by the mayor and burgesses, in conformity to the will of John Kendrick, who left 7500*l.* "to build a strong house of brick, fit and commodious to set the poor to work therein." The funds of this charity having been at different periods greatly abused and misapplied, the subject has been several times before the supreme courts of justice. The testator's object, in bequeathing his large legacy, was the improvement of the woollen trade; but instead of this, it was perhaps the first occasion of the decay of that manufacture, by enabling such as could obtain its advantages to undersell those who were not so fortunate. The same complaints are made against it, with respect to the manufactures now carried on in it, and, as we suspect, not without some show of reason.

Monastic Establishments.—As already mentioned, the earliest religious institution at Reading was a monastery for nuns, founded by Elfrida, the mother-in-law of Edward the Martyr. This nunnery was founded in 979, and was destroyed, in 1009, by the Danes. The precise scite on which it stood is uncertain, but there can be no doubt of its existence. It appears from the Domesday-book, and also from Tanner's Notitia, that another nunnery was established here at a later period, but nothing of its history is known. The abbey, the ruins of which are still sufficient to attest its extent and importance, was founded by Henry I. in 1121. It occupied a spot of ground, equal, if not superior, to any in Berkshire for fertility of soil and beauty of situation. This spot comprehended about thirty acres, and was environed on three sides by a massive and lofty wall, and on the fourth by the river Kennet. Exterior to this wall was a piece of ground, about fifty yards wide, (like the pomœrium that surrounded the Roman cities,) which it was not allowable either to cultivate or build upon. It had four entrances to it, defended by arched gateways, and having battlements on their tops similar to those on the walls. Within these was the outer court, whence another gate-way led into the inner court. Part of this building remains, and is composed of bricks, chalk, and stone; and, from the dissimilarity of styles which it exhibits, has evidently undergone many alterations and repairs. Some of it is probably as late as the reign of Henry VII., though other portions of it are, undoubtedly, of much higher antiquity. The inner court conducted to the principal entrance to the abbey, the situation of which, owing to the ground having been since built upon, and the confusion occasioned by throwing up the ramparts in the civil war, cannot now be accurately determined. The only entrance on this side at present is through an arched passage, opening into the south-east corner of the cloisters, which is certainly too mean to be fuppofed to have been the grand entrance to this fuperb monaftery. On the right-hand of the paffage is a door-way, leading to a range of apartments, and within is a circular ftaircafe, which conducts to the upper part of the building. This divifion of the abbey is conjectured to have been appropriated as offices for fervants and others, as, underneath it, is a feries of arched cellars, and at its fouthern extremity was the kitchen. The great hall, or confiftory, was entered from the cloifters by three large entrance doors. It meafured 80 feet in length, 40 in width, and the fame in height, to the centre of the ceiling, which was conftructed of ftone, and fupported by arches fpringing from four pilafters, 20 feet high, placed againft each of the fide walls. Thefe walls, and probably alfo the outer ones in every part of the building, meafure twelve feet thick from the foundation to the fet-off, and fix feet thick from thence to the top, and are compofed of flints and rubbifh of various kinds, bedded in mortar, and indurated in the higheft degree. The abbey-church appears to have extended 260 feet in length, and to have been built in the form of a crofs, with a tower and fpire in the centre. The nave was 40 feet wide, and was divided from the fide-aifles by alternate piers and arches. From the maffive character of this ftructure, in general, and from the circular form of the windows in the dormitory, it is conjectured that its windows alfo had circular arches. In the ground to the eaft of the church, many fkeletons have been difcovered, a circumftance which points it out as the probable burial-place of the monks. The above-mentioned buildings conftituted the body of the abbey, but there were likewife many others, both connected with and detached from them. Among thefe were the infirmary, the ftables, and the mill. This laft is yet ftanding, and appropriated to its original purpofe. It is a fubftantial edifice, built of flint and ftone, and is probably coeval with the abbey-church.

Reading monaftery was indubitably among the moft diftinguifhed in England. The monks were of the Benedictine order, and were endowed with many privileges and immunities, not only by the founder, but by feveral of his fucceffors, and by fome of the popes. They had the right of coining granted to them by king Edward III., alfo the right of holding three annual fairs, and a market every Sunday at Thatcham. The abbot was among thofe entitled mitred, and took precedency in the houfe of peers, next after the abbots of Glaftonbury and St. Alban's. He was lord of the manor of Reading, and poffeffed otherwife much influence in the government of the borough. Many of the monks were diftinguifhed for their talents and their acquirements in the learning of their refpective ages. Robert of Reading, one of the firft monks, was particularly famous, as being, with Adelard of Bath, the only Englifhmen of their time who were mafters of the Arabic language. The abbey-church was the place of fepulture of many royal and noble perfons, among whom were Henry I., and his fecond queen, Adeliza, and probably alfo his firft queen, Matilda ; the emprefs Maud, and William, eldeft fon of Henry II. ; Conftance, grand-daughter to Edward III.; Ann, countefs of Warwick ; Richard, earl of Cornwall, and king of the Romans ; and Richard de Curtenea, natural fon of Henry II. At the diffolution, the revenues of this monaftery were eftimated at 2116*l.* 3*s.* 9*d.* annually, above 20,000*l.* according to the prefent value of money. The lands, of courfe, were feized upon by king Henry, who parcelled them off, either in gifts or in leafe, to different individuals ; but the monaftery itfelf was converted into a royal palace, and continued to be occafionally occupied by our kings till its deftruction during the grand rebellion, in the reigns of Charles I. and II.

The other monaftic inftitutions in Reading, befides thofe already noticed, were two convents for Francifcan or Grey friars, St. Edmond's chapel, and Colney chantry. One of the convents was founded about the middle of the thirteenth century, foon after the firft appearance of the Francifcan order in this country. Its original fituation was on a marfhy ground adjoining the Caverfham road, and ftill called the Friery Mead ; but in 1285 the friars removed to their fufequent refidence, at the weftern extremity of Frier-ftreet. After the diffolution this houfe was appropriated as a work-houfe for the poor ; and part of the church now forms the borough prifon. This building is in the early pointed ftyle, and has at its weftern end a very beautiful lancet window. The other convent ftood in Caftle-ftreet, probably on the fpot now occupied by the Methodift chapel. This inftitution feems to have been on a very fmall fcale, though it is mentioned by Leland as "a fayre houfe of Grey freres." St. Edmond's chapel ftood on the rifing ground, called Chapel Hill, near the borough prifon. It was founded, in 1284, by Lawrence Burgefs, then bailiff of the town. In the civil war it was converted into a fort ; and afterwards, about the year 1750, was demolifhed, and another chapel erected in its ftead on Battle-Farm. Colney chantry was inftituted by one of that family in the reign of Richard II., for the fouls of king Edward III., of Thomas Colney, John Colney, and William Catour. It had diftinct incumbents of its own, and was under the patronage of the corporation.

Reading has given birth to feveral perfons of eminence. Sir Thomas White, founder of St. John's college, Oxford, is faid to have been born here ; but Fuller affirms that he was a native of Rickmanfworth. Archbifhop Laud was born in this town in 1573, having been the fon of William Laud, then a clothier in Broad-ftreet, who, as the archbifhop himfelf told lord Say, had borne all offices in the corporation, fave the mayoralty. John Blagrave, the mathematician, is alfo commonly reputed to have been a native of Reading ; as was Jofeph Blagrave, a celebrated aftrological writer, who does not feem to have been related to the mathematician. The other diftinguifhed natives of Reading were, fir Thomas Holt ; fir John Barnard, a noted alderman of London ; James Merrick, the tranflator of the Pfalms ; William Baker, a learned printer ; fir Conftantine Phipps, lord chancellor of Ireland ; and Dr. Phanuel Bacon, author of feveral dramas, &c.

The vicinity of Reading prefents feveral objects worthy of notice. At a fhort diftance to the fouthward, clofe to a place called Catfgrove-lane, may be feen a remarkable ftratum of oyfter-fhells, imbedded in a vein of fea-fand, at leaft twenty fathoms beneath the furface of a hill. This ftratum is from one to two feet in thicknefs, and extends through a circumference of five or fix acres of ground. Mixed with the fhells is a confiderable quantity of fmall teeth, apparently of fifh. Caverfham, formerly a feat of the Craven family, and afterwards of the Cadogans, is fituated nearly oppofite the town, on the north bank of the river Thames. The houfe was built by the earl of Cadogan, in the reign of George I., but has fince undergone material alterations. In the old manfion, Anne of Denmark, queen to James I., was fplendidly entertained by lord Knowles, when on her journey to Bath, in 1613. At the time Charles I. was a prifoner at Windfor, the parliament, through the mediation of general Fairfax, permitted him to vifit Caverfham Lodge, where all his children who were in England, then refided, in the cuftody of the earl of Northumberland. In the hamlet of Woodley is a very pleafing feat, belonging to lord Sidmouth ; and two miles to the

weftward

weftward is another, the property of the Blagrave family. The park is very extenfive, and is noted for fine venifon. South-eaft, about the fame diftance, is White-Knights, the feat of the marquis of Blandford. Sunning, celebrated in hiftory as having been for fome time the feat of the fee of Wiltfhire, and fubfequently the fcite of one of the palaces of the bifhops of Salifbury, is a village three miles to the eaftward, on the road to Maidenhead. Leland mentions the bifhop's palace as ftanding in his time. It was given by bifhop Gheaft, along with the manor, to queen Elizabeth, in exchange for eftates in Dorfetfhire. The antiquity of this place is ftrongly marked by the fepulchral monuments in the church. Clofe to Sunning is an elegant manfion, the feat of Charles Fyfh Palmer, efq. Lyfons's Magna Britannia, 4to. Berkfhire. Beauties of England and Wales, vol. i. by John Britton and E. W. Brayley, 1801. The Hiftory and Antiquities of Reading, by John Mann, 4to. 1814. From the latter work, the chief and moft effential parts of this account have been obtained: and thofe who wifh to poffefs the moft copious and authentic hiftory of Reading will procure this volume.

Reading, a townfhip of America, in Fairfield county, Connecticut, S. of Danbury adjoining. It contains 1717 inhabitants.—Alfo, a large townfhip of Middlefex county, in the ftate of Maffachufetts, incorporated in 1644, and containing 2228 inhabitants, many of whom are employed in the manufacture of fhoes, from 2 to 300,000 pair being annually exported; 12 miles N. of Bofton.—Alfo, a townfhip of Vermont, in Windfor county, W. of Windfor, adjoining. It contains 1565 inhabitants.—Alfo, a beautiful poft-town, and the capital of Berks county, Pennfylvania, fituated on the N.E. fide of Schuylkill river; 54 miles N.W. of Philadelphia. This town is regularly laid out, and flourifhes: its inhabitants are chiefly German: the borough and townfhip contain 3462. The public buildings are, a ftone gaol, a court-houfe, an elegant church for German Lutherans, erected in 1793, a church for Calvinifts, one for Roman Catholics, a meeting-houfe for Friends, and a large edifice for the public offices. In the neighbourhood are 10 fulling mills, and feveral iron-works: and at the diftance of 10 miles, on the road to Harrifburgh, is a fpring, about 15 feet deep and 30 feet wide, from which iffues a copious ftream, containing fome fine trout. In 1795 the fum of 12,000*l.* was voted by the county for building a ftone arched bridge over the Schuylkill, at this town, on the high road to Harrifburgh. N. lat. 40° 21′. W. long. 75° 55′.—Alfo, a townfhip of Adams' county, in Pennfylvania, containing 732 inhabitants.

Reading. See Lectio.

Reading *of a Deed*. See Deed.

READINGS, in *Criticifm*. *Various readings*, *variæ lectiones*, are the different manners of reading the text of authors in ancient manufcripts; where a diverfity has arifen from the corruption of time, or the ignorance of copyifts.

A great part of the bufinefs of the critics lies in fettling the readings, by confronting the various readings of the feveral manufcripts, and confidering the agreement of the words and fenfe. The various readings in the bible, (fee *Hebrew* Bibles,) and in the claffic authors, are almoft innumerable.

Readings are alfo ufed for a fort of commentary or glofs on a law, text, paffage, or the like; to fhew the fenfe an author takes it in, and the application he conceives to be made of it.

READINGTON, or Riddenton, in *Geography*, a town of New Jerfey, in Hunterdon county; 17 miles N.W. by W. of New Brunfwick. It contains 1797 inhabitants.

READ'S Bay, a road for fhips on the W. coaft of the ifland of Barbadoes, between Holetown and Speight's-town; half a mile broad. Ships may anchor here in fafety, in fix to twelve fathoms water, the ground being foft ooze, defended from all winds, except the weft, which blows right into the bay. N. lat. 13° 7′. W. long. 59° 47′.

READSBOROUGH, or Reedsborough, a poft-town of America, in Bennington county and ftate of Vermont; 435 miles from Wafhington. It contains 410 inhabitants.

RE-AFFORESTED, is where a foreft, having been difafforefted, is again made a foreft. As the foreft of Dean was, by an act of parliament in the 20th of king Charles II. See Forest.

RE-AGGRAVATION, in the Romifh *Ecclefiaftical Law*, the laft monitory, publifhed after three admonitions, and before the laft excommunication.

Before they proceed to fulminate the laft excommunication, they publifh an aggravation, and a re-aggravation. Fevret obferves, that in France the minifter is not allowed to come to re-aggravation, without the permiffion of the bifhop or official, as well as that of the lay judge. See Excommunication.

REAH, in *Geography*, a town of Syria, in the pachalic of Aleppo, fituated in a country that abounds with olives, of which confiderable quantities are prepared, and fent to Perfia and other parts. This is the refidence of an Aga; 36 miles S.S.W. of Aleppo.

REAL, Reale, is applied to a being that actually exifts; in which fenfe it coincides with *actual.*

Real, in *Law*, is oppofed to *perfonal.*

Real *Action*, that by which the plaintiff lays title to land, &c. See Action.

Cuftoms are faid to be real; that is, they determine all inheritances within their extent; and none may difpofe of them, but according to the conditions allowed by the cuftoms where they are fituated.

Real *altitude*, *affets*, *character*, *chattels*, *covenant*, *diftinction*, *diftrefs*, *eftate*, *horizon*, *optic place*, *patronage*, *privilege*, *qualities*, *root*, *fervices*, *fuit*, and *writs*. See the feveral fubftantives.

Real, in *Commerce*, a Spanifh money of account, of which there are four different forts. The real *vellon* is that which is moft general; it confifts of $8\frac{1}{2}$ quartos, 17 ochavos, or 34 Maravedis vellon. Madrid, and the whole of Caftile, with moft of the adjacent provinces, and alfo Bilboa, Malaga, and Gallicia, keep accounts in reals and Maravedis vellon. The real of *new plate* (real de plata nuevo, or provincial) is double the real vellon: it is worth 17 quartos, or 34 ochavos: and it is alfo reckoned at 34 Maravedis of new plate. This real is reprefented by an effective coin of bafe filver, but books are not kept in any part of Spain in this money.

The real of *old plate* (real de plata antigua), moftly called the real of plate, is chiefly ufed in foreign commerce and exchanges: it is worth 16 quartos, or 32 ochavos: and it is alfo reckoned at 34 Maravedis of old plate. Cadiz and Seville keep accounts in reals and Maravedis of old plate.

The real of *Mexican plate* (real de plata Mexicano) is ufed in tranfactions with Spanifh America, where accounts are moftly kept in hard dollars, reals, and quarters, and fometimes in fixteenths: 8 Mexican reals make 1 hard dollar (pefo duro): this coin is worth 10 reals of new plate, $10\frac{2}{3}$ reals of old plate, or 20 reals vellon. Thus, 1 real of new plate = 2 reals vellon: and 4 reals Mexican

can = 5 reals of new plate: 64 Mexican reals = 85 reals of old plate: 2 Mexican reals = 5 reals vellon: 16 reals of new plate = 17 reals of old plate: 17 reals of old plate = 32 reals vellon. The piſtole of exchange (dobloon de plata) is worth 32 reals of old plate, or 60 reals 8 Maravedis vellon. The dollar of exchange (peſo de plata) is worth 8 reals of old plate, or 15 reals 2 Maravedis vellon. The ducat of exchange (ducado de plata) is worth 11 reals 1 Maravedi of old plate, or 20 reals $25\frac{15}{17}$ Maravedis vellon. But, in commercial tranſactions within the country, the dobloon is reckoned only at 60, the peſo at 15, and the ducat at 11 reals vellon.

The coins now current in Spain are as follow:

		Reals Vellon.	Maravedis Vellon.
In gold.—	The dobloon of 8 eſcudos, or quadruple piſtole, paſſing for - -	320	
	The dobloon of 4 eſcudos, or double piſtole -	160	
	The dobloon de Oro, or piſtole - -	80	
	The eſcudo - - -	40	
	The coronilla, or veinten de Oro - -	20	
In ſilver.—	The dollar, or peſo duro -	20	
	The half dollar, or eſcudo vellon - -	10	
	The peceta Mexicana - - -	5	
	The real of Mexican plate -	2	17
In baſe ſilver.—	The peceta provincial -	4	
	The real of provincial plate -	2	
	The real vellon - - -	1	
In copper.—	The piece of two quartos - -		8
	The quarto - - - -		4
	The ochavo - - - -		2

From 1730 to 1772, the gold was 22 carats, and the ſilver 11 dineros fine (the dinero = 24 grains): but in 1772 the gold was reduced to $21\frac{1}{2}$ carats, and the ſilver to $10\frac{3}{4}$ dineros fine, the pecetas and reals being reduced to $9\frac{3}{4}$ dineros fine. In 1786 the ſtandard of the gold was again reduced to 21 carats for the different dobloons and their diviſions; and to $20\frac{1}{4}$ carats for the coronilla or veinten de Oro. For the value of the piſtole, ſee Pistole.

The dollar (coined ſince 1772) contains $374\frac{7}{8}$ troy grains of fine ſilver, or $405\frac{4}{7}$ grains of Engliſh ſtandard ſilver: its value therefore in Engliſh ſilver coin is 4*s.* $4\frac{1}{2}$*d.*; and the half dollar in proportion. The value of the peſo of plate, or dollar of exchange, in Engliſh ſilver coin, is $39\frac{1}{2}$*d.*; of the dobloon of plate, or piſtole of exchange, 13*s.* 2*d.*: and of the ducat of plate, 4*s.* $6\frac{1}{2}$*d.* The real of old plate is worth about 5*d.*; and the real vellon $2\frac{3}{5}$*d.* nearly; or more accurately, 1*l.* ſterling = 48 reals, $20\frac{3}{5}$ Maravedis of old plate, or 91 reals 17 Maravedis vellon.

By the reports of average aſſays lately made on the quadruple and dollar at the London mint by order of the bank of England, the quadruple weighs 17 dwt. 8 gr.; its fineneſs $4\frac{1}{2}$ gr. worſe than Engliſh ſtandard: hence its value in Engliſh gold coin is 3*l.* 4*s.* $0\frac{1}{2}$*d.* The dollar weighs 17 dwt. 8 gr.; its fineneſs 8 dwt. worſe than Engliſh ſtandard: hence its value in Engliſh ſilver coin is 4*s.* $3\frac{3}{4}$*d.* See Pistole.

The value of reals of Spain, and monies of account, expreſſed in pence and decimals of pence, according to the mint price both of gold and ſilver in England, *i.e.* 3*l.* 17*s.* $10\frac{1}{2}$*d.* *per* ounce for gold, and 5*s.* 2*d.* *per* ounce for ſilver, is as follows:

	Value in Silver. D.	Value in Gold. D.
Real of old plate - -	4.93	4.57
Real of new plate - -	5.24	4.86
Real of Mexican plate - -	6.55	6.07
Real vellon - - -	2.62	2.43
The dollar of old plate, or of exchange - -	39.45	36.59

The aſſay, weight, &c. of Spaniſh ſilver coins compared with the Engliſh ſtandard of 11 oz. 2 dwt., and according to the mint price of ſilver in England, *i. e.* 5*s.* 2*d.* *per* ounce ſtandard, are as follow, W. denoting worſe than Engliſh ſtandard.

	Aſſay.			Weight.			Contents in Pure Silver.	Value in Sterling.	
		oz.	dwt.	oz.	dwt.	gr.	grains.	s.	d.
Dollar, old Mexican ſquare (1747) - - -	W.	0	$4\frac{1}{2}$	0	17	7	376.1	4	$4\frac{1}{2}$

For the aſſay, weight, value, &c. of gold coins, ſee Pistole.

Real, or *Reali*, is alſo a money of account at Leghorn. At Zante, and alſo Cefalonia and Corfu, accounts are kept in reali, of 10 lire, or 100 ſoldi, alſo called aſpri.

Real is the name of a kind of boat in ſome places.

Real *el Novita*, in *Geography*. See Novita.

Real *Nuevo*, a town of Mexico, in the province of New Biſcay; 120 miles N.W. of Parral. N. lat. 29° 10′. W. long. 107° 20′.

REAL *del Rofario*, a town of Mexico, in the province of Chiametlan, on the Spiritu Santo; 24 miles N. of Chiametlan.

REAL *de Frayles*, a town of New Mexico, in the province of Mayo; 60 miles from Santa Cruz. N. lat. 27° 44′. W. long. 110° 22′.

REAL *de Minas*, a town of New Navarre; 180 miles S.S.E. of Cafa Grande.

REAL *de St. Juan*, a town of New Navarre; 195 miles S.S.E. of Cafa Grande.

REAL *de la Jura, El*, a town of Spain, in the province of Seville; 25 miles N.W. of Carmona.

REALE, *Knights of the*, or *Knights of the Lionefs*, owed their inftitution to the following event. Ladiflaus, fon of Charles Duras, having been proclaimed and crowned king of Naples at Gæta, the Neapolitans fet up Lewis II. duke of Anjou, and laid the foundation of the bloody wars that followed. Thefe troubles divided the Neapolitan nobles into two factions; and of thofe who declared for the houfe of Anjou, fome wore on their left arm a golden *reale* embroidered or on a red ground, by way of contempt to queen Margaret, widow of Charles III. who wanted to hold the reins of government during the minority of Ladiflaus, and called themfelves "knights of the Reale;" whilft others wore on their breaft the figure of a "lionefs, with her feet tied," pendant to a ribbon which paffed round their necks, indicating by it, that they looked upon queen Margaret as tied by the leg; and then ftyled themfelves "knights of the Lionefs."

REALEJO, in *Geography*, a town of Mexico, in the province of Nicaragua, fituated on a bay of the Pacific ocean, at the mouth of a river, both of the fame name. The river is fo deep and capacious as to be capable of receiving 200 fail of fhips. The town is defended by large intrenchments, and very fine docks for building and repairing fhips; but the place fuffered confiderably from the Buccaneers. The town is large, has three churches, and an hofpital; but the place is unhealthy, on account of the creeks and ftinking fwamps in its vicinity. Its chief trade confifts in pitch, tar, and cordage. At the mouth of the harbour is an ifland, which intercepts the fea, and renders it fafe and commodious: it forms two channels, but that on the N.W. fide is much the beft; 18 miles N.W. of Leon. N. lat. 12° 45′. W. long. 87° 30′.

REALGAR, in *Mineralogy*, fometimes called red orpiment, an ore of arfenic, confifting, according to Thenard, of

75 parts arfenic,
25 fulphur.

The colour of realgar is a bright deep red, paffing into fcarlet and orange: it occurs both maffive, and cryftallized in prifms, which have either 4, 6, 8, 10, or 12 fides, terminated by four-fided fummits. The primitive form of the cryftal is an octahedron, with fcalene triangles. The luftre of realgar is between vitreous and waxy: it is femi-pellucid, foft, fragile, and eafily fufible, burning in the air with a blue flame, and giving out arfenical and fulphureous vapours. By friction it becomes negatively electrical. Realgar is found in the vicinity of volcanos, and accompanying other metallic ores, both in primitive and fecondary mountains. This fubftance is ufed as a pigment; and is formed by the Chinefe into toys. See *Sulphurated Arfenic* under ARSENIC.

In the hiftory of the French Academy, we have an account of a cup brought to Paris by the ambaffadors of Siam, and prefented there, as a remedy ufed by that people againft all difeafes.

Upon an examination, which had like to have coft M. Homberg dear, he found it to be a kind of realgar, or red arfenic, much more cauftic than our's.

Its ufe among the Siamefe, he takes to have been the fame with that of regulus of antimony; *viz.* to give an emetic quality to the wine drank out of it.

As the dofe of medicines is much ftronger in the torrid zone than among us (the quantity of ipecacuanha, *e. gr.* ordinarily taken by the Indians, being twenty times as great as that among us), it is very poffible a cup of realgar, though enough to poifon an European, may prove a gentle medicine to a Siamefe.

REALIJO, in *Geography*, a fmall ifland in the Pacific ocean, near the coaft of Popayan. N. lat. 4° 16′.

REALIZE, in *Commerce*, a term little known in trade before the year 1719, when thofe immenfe fortunes began to be made in France and England, by the bufinefs of actions or ftock.

By *realizing* is meant the precaution many of thofe who had gained moft, took, to convert their paper into real effects: as lands, houfes, rich moveables, jewels, plate; but, above all, into current fpecies. A precaution capable of ruining the ftate; but the French regency had the wifdom to fruftrate it, by taking proper meafures to have the money, thus ready to be hoarded up, returned to the public.

REALISTS, REALISTÆ, a fect of fchool-philofophers who followed the doctrine of Ariftotle with refpect to univerfal ideas, formed in oppofition to the NOMINALISTS, (fee that article,) who embraced the hypothefis of Zeno and the Stoics upon that perplexed and intricate fubject.

Ariftotle held, againft Plato, that, previous to, and independent on, matter, there were no univerfal ideas or effences, and that the ideas or exemplars which the latter fuppofed to have exifted in the divine Mind, and to have been the models of all created things, had been eternally impreffed upon matter, and were coeval with, and inherent in, their objects. Zeno and his followers, departing both from the Platonic and Ariftotelian fyftems, maintained, that thefe pretended univerfals had neither form nor effence, and were no more than mere terms and nominal reprefentations of their particular objects.

Under the Realifts are included the Scotifts, Thomifts, and all excepting the followers of Occam.

Their diftinguifhing tenet is, that univerfals are realities, and have an actual exiftence, out of an idea and an imagination; or, as they exprefs it in the fchool-language, *a parte rei;* whereas the Nominalifts contend, that they exift only in the mind, and are only ideas, or manners of conceiving things.

Doctor Odo, or Oudard, a native of Orleans, afterwards abbot of St. Martin de Tournay, was the chief of the fect of the Realifts. He wrote three books of dialectics; where, on the principles of Boethius and the ancients, he maintained that the object of that art is things, not words; whence the fect took its rife and name.

REALITY, REALITAS, in the *Schools*, a diminutive of *res*, *thing*, firft ufed by the Scotifts to denote a thing which may exift of itfelf, or which has a full and abfolute being of itfelf, and is not confidered as a part of any other.

Yet a reality is conceived as fomething lefs than *res;* and accordingly every *res* is fuppofed to contain a number of realities, which they otherwife call *formalities*.

Thus, *e. gr.* in a man, according to the doctrine of the Scotifts, are a number of realities; *viz.* a fubftance, life, animal, and reafon.

Some

Some diſtinguiſh reality into ſubjective and objective.

REALM, Regnum, *Kingdom*, a country which gives its head or governor the denomination of king.

The word is formed of the French *royaume*, which denotes the ſame.

REALMONT, in *Geography*, a town of France, in the department of the Tarn, and chief place of a canton, in the diſtrict of Alby; 9 miles S. of Alby. The place contains 2247, and the canton 8949 inhabitants, on a territory of $247\frac{1}{2}$ kiliometres, in 19 communes.

REALVILLE, a town of France, in the department of the Lot; 8 miles N.E. of Montauban. N. lat. 44° 6'. E. long. 1° 34'.

REAMLA, a town of the Arabian Irak; 10 miles W. of Baſſora.

REAMO, a town of Naples, in Abruzzo Ultra; 6 miles W.N.W. of Teramo.

REAMUR, a town of France, in the department of the Vendée; 18 miles N. of Fontenay le Comte.

REANG, a town of Bengal; 45 miles S. of Silhet.

REAPER, a perſon whoſe buſineſs it is to reap or cut grain.

REAPING, the operation of cutting crops by means of the ſickle. It is a very laborious ſort of field-work, and one which requires conſiderable attention and care to perform it in a neat and exact manner. Reaping is performed with ſome other ſorts of crops, beſides thoſe of the grain kinds; as occaſionally for peas, beans, flax, and others of a ſimilar nature. Work of this nature is executed in many different ways, according to the differences in the cuſtoms of different diſtricts; as by ſets of men hired by the month, for this particular purpoſe, called harveſt-men; by perſons taking it by the piece, or by the acre, and by the ſheaf or ſtouk of eight ſheaves.

In ſome methods, by the piece or the quantity is unqueſtionably the beſt, in moſt caſes, on account of the very high prices which are exacted at this very buſy ſeaſon, and the very ſmall extent of labour which is performed in working by the day, which cannot be controlled by the farmer at ſuch hurrying times. Beſides, the work is, for the moſt part, the beſt and moſt expeditiouſly performed in theſe ways; which are objects of very great importance, and deſerving of much conſideration in this ſort of buſineſs. The eye of the farmer is, however, conſtantly neceſſary to ſee that all goes on in a right manner.

In the northern parts of Lancaſhire, this ſort of labour is moſtly performed by the day, or the hattock of ten ſheaves, or the ſtouk of twelve ſheaves; three-pence being often paid for the former, and four-pence or five-pence for the latter, in theſe places.

In ſome diſtricts, the reaping of the crops commences before they are quite ripe; but in others, not until this has fully taken place.

Reaping *of Corn*, the practice of cutting it with the ſickle, or otherwiſe, by perſons employed for the purpoſe. It may be obſerved, that the buſineſs of reaping or cutting grain crops differs much in the manner of performing the work, in different diſtricts of the kingdom, and kinds of crops. In the more ſouthern parts of the iſland, the crops of this ſort are moſtly cut by means of ſhort ſtiff ſcythes, made for the purpoſe, having bows formed of bent ſticks, or what in ſome places are termed *cradles*, fixed upon the lower parts of the handles, for the more readily depoſiting the ears or heads of the corn in one uniform direction, as much as poſſible, in order that it may be afterwards bound up into ſheaves. But in other caſes, the naked ſcythe is made uſe of; the corn being ſeldom bound up, being ſimply raked together into ſmall heaps, in a ſimilar manner to hay.

In the more northern parts of England, and in Scotland, the reaping of grain crops is, however, in general performed by the ſickle, or reaping hook; the different handfuls, as ſoon as cut, being depoſited upon bands, formed by twiſting together a few ſtalks of the corn at the ends next the ears, and afterwards bound up into ſheaves, in order to their being ſet up into *ſhocks* or *hattocks*. This method is, in moſt inſtances, adopted with the wheat and rye crops, in every part of the iſland; as in cutting them with the ſcythe, it is difficult to be performed without much loſs being ſuſtained by the ſhedding of the grain. And, in addition, it is of great advantage to have theſe ſorts of crops bound up regularly into ſheaves, the ſtraw being much better.

Beſides theſe, there is another mode ſometimes practiſed, which is by means of a hook with a ſharp edge, without any teeth; the labourer, in executing the work, hooking up the corn towards him. It is moſtly made uſe of in the ſouthern diſtricts, where it is known by the name of *bagging*, the grain in this way being cut very low.

In this way the reaper collects enough for one ſheaf at a time, binds it, and ſets it up in tens, called a ſhock in Middleſex. This bagging (or ſagging) practice is, to all intents and purpoſes, mowing with one hand againſt the ſtanding corn. The toothleſs hook, employed in doing it, is of nearly twice the weight of the common ſickle. It is ſharpened occaſionally, when neceſſary, in the manner of the ſcythe; and the operation of cutting the crop down is by a ſucceſſion of blows made upon the ſtraw of the ſtanding grain, very nearly in the direction down towards the ſurface of the ground. Reaping in Middleſex is moſtly all done in this way, as the proper uſe of the ſcythe is but little known.

This method has the advantage of being done cloſer, and with equal or more expedition than the hand reaping mode, beſides the ſaving in ſtraw, which is here ſuppoſed worth 7*s*. the acre.

In Eſſex wheat crops are generally reaped or cut with the ſickle, though in the vicinity of the metropolis it is not uncommon to have it mown with the ſcythe, as cloſe to the ground as other ſorts of grain crops, in the view of increaſing the quantity of ſtraw, which is there very valuable. It is thrown, in theſe caſes, with great ſkill and dexterity into ſwaths. When perfectly ripe, it is ſoon bound up into ſheaves of ſix or eight inches diameter, with bands of wheat-ſtraw of ſingle or double lengths; but when not in this ripe or dry ſtate, it is allowed to remain in the ſwaths two or three days, as neceſſary. However, in more than three quarters of the county, it is reaped or cut with the ſickle; and indeed in almoſt all places, when beaten down by the wind and rain.

In regard to the time of reaping the grain, there is conſiderable difference in different diſtricts; ſome not reaping it until it is quite ripe, while others cut it when ſomething ſhort of this ſtate. This, however, ſhould probably be regulated by the nature of the ſeaſon, and the kind ſtate or quality of the crop, as well as the uſes to which the grain is to be put.

In reſpect to the manner of reaping grain crops, whether the ſickle or ſcythe be employed for the purpoſe, there is much difference in the height at which the crops are cut in different places. In ſome it is the practice to have the buſineſs performed in as cloſe a manner as poſſible; while in others a ſtubble of eight, ten, and fifteen inches, or more, is is left. These different practices have their advocates; one party supposing that the work proceeds more slowly, where it is executed in so close a manner; while the other contend that the contrary is the case. But as the stubble which is left is not only useless to the land, but in many cases very troublesome in its succeeding culture, being frequently under the necessity of being removed, it would seem to be the best as well as cheapest practice, to have the business constantly executed in a close manner. It has been observed by a late practical writer, that by this means the agricultor will not only have more litter at command, for the bedding of his yards, stalls, and other places, and consequently an increase of manure, but have the business more expeditiously performed, with much less waste of grain, and at the same time be freed from the trouble and expence of removing the stubble. It has indeed been fully shewn, by a careful trial, made with the view of ascertaining the difference between high and low reaping, that the advantage is considerably in favour of the close method.

And the result of the trial is thus stated by the writer of the Agricultural Survey of the West Riding of Yorkshire, who observes that the experiment was made upon part of a field of wheat, two ridges of which were cut close by the ground, and the other two considerably higher, though not so high as the general run of the Yorkshire stubbles. Each of the divisions was apparently of equal quality, and measured a trifle more than a quarter of a Scotch acre, which is about one-fifth larger than the English statute acre. The crop was stacked separately, and the time taken to the part cut low was one hour and twenty-four minutes, of eight shearers; while the high cutting was performed by the same number of hands in forty-eight minutes. The wages paid that week were 18*d.* *per* day, and the supposed expence of maintenance 6*d.* or 2*s.* *per* day altogether. When threshed, the grain and straw were carefully measured and weighed, and the result of the experiment was as follows:

	£	s.	d.
Result—8 shearers, 1 hour 24 minutes, at 2*s.* *per* day, or 22½*d.* *per* hour	0	2	4
The same hands in 48 minutes	0	1	4
Difference of expence	0	1	0

In favour of high cutting one shilling, or four shillings *per* acre.

	£	s.	d.
1¼ peck of wheat more upon the low cut ridges than those cut high, at 1*s.* 4*d.* *per* peck	0	1	8
14 stones (22 avoirdupois pounds) of more straw, at 2*d.* *per* stone	0	2	4
	0	4	0

Or sixteen shillings *per* Scotch acre.

From which deduct the increased expence of cutting, there remains a benefit of twelve shillings *per* acre in favour of low cutting.

It is noticed farther, that the above trial, according to the best of the reporter's judgment, was fairly made; and the reason which urged him to make it, was to silence the objections of some neighbours, who alleged low shearing was not profitable. It is also proper to observe, that the field of wheat, on which the trial was made, was not broke down nor straggled, so was in a favourable condition for high cutting. We have seen wheat-fields, where three times the quantity might have been left, unless great pains were used.

But the methods of reaping grain crops, both with the sickle and the scythe, have each their advantages and disadvantages. In the first manner, the crops are deposited with more regularity and exactness, and consequently bound into sheaves with greater facility and dispatch. Besides, in many cases less loss is incurred by shedding, in the time the work is in performing; but the labour is executed with greater difficulty and trouble. The latter possesses the superiority of being more expeditious, and of being performed to any degree of closeness that may be required; while it has the evident disadvantage of leaving the cut grain in a more irregular and uneven situation, by which it is rendered less fit for being bound up into sheaves, which in many cases is an inconvenience of great consequence. When the grain has attained a high degree of ripeness, there may likewise be great loss sustained, by its being shed during the operation, in this way of reaping and cutting the crop. Where this method is practised, it is, however, not unfrequently the case to have it bound into sheaves; though the most common custom is to let it remain in the rows or swaths, till fit for being put into the stack. When bound, it is generally the practice to cut it inwards against the crop on which it rests: in the other case, it is cut in the manner of grass for hay. It is obvious, therefore, that when labourers are procured with difficulty, this mode of reaping is the most adviseable; while, under the contrary circumstances, the former may be had recourse to with more advantage, as the work may be executed in a neater and more exact way. See Harvesting and Sickle.

It may be remarked, that this is a sort of work that is often let by the acre to persons that go about for harvest work; and it may, in many cases, be the best performed in this manner. But great attention should be paid by the farmer, to see that the grain is cut and bound up in a proper method, and that the work be not performed in improper weather. The prices vary according to the nature of the crops, the season, and other circumstances, sometimes rising as high as eleven or twelve shillings the acre, and sometimes much higher.

Reaping *Fork*, a tool of the fork kind, invented for the purpose of raising and collecting the mown grain into sheaves, so that it may be bound up. It is constructed with two, rather long, prongs below, slightly curving upward, somewhat in the manner of the common large hay fork, to which are attached, at the upper part, near the insertion into the handle, two other upright prongs, which bend a little forward towards their tops or ends; by means of which, with the under prongs running along the ground, the tool being pushed forward by the labourer, the grain in the straw is raised up, brought together, held in a firm manner, and removed from the swathe so as to be bound into sheaves. In this way, the lower prongs perform the work of picking the strawy material from the land, while the higher upright ones prevent it from falling backwards, and determine the quantity which is necessary for a sheaf. In this manner, by this simple contrivance, the mown grain can be brought together and bound up with much greater regularity, and in a much more expeditious method than is possible to be done by mere hand labour.

Reaping *Hook*, an implement of the sickle kind, with which the business of reaping is performed in some districts.

These hooks are sometimes formed with teeth, or in a toothed manner, and sometimes with a cutting edge. In Devonshire, and some other counties, those with smooth edges are generally preferred to sickles with sawed ones: these thefe forts of hooks are ufed occafionally with either hand, the operator fhifting hands, chopping the ftraw low down, and gathering about half a fheaf at a time, which, when put together, is bound with reed, combed from former wheat-ftraw, or with a double length of the wheat which is reaping. See SICKLE.

REAPING *Machine*, a contrivance for the purpofe of reaping grain by means of animal labour. With this view, and to facilitate an operation of fuch importance to the farmer, different attempts have been made to conftruct machines, fo as to difpatch the work in a rapid manner by the affiftance of horfe labour, but the fuccefs with which they have been attended, has hitherto been far from complete. An implement of this fort has lately been made by Mr. Plunknett; it is upon a fomewhat new principle, the horfe drawing the machine inftead of pufhing it forward, as was the old mode of applying the power.

In this machine, the horfe tracks from the front fide of it, which is feen at once by the appearance of the implement, fo as to be clear of the crop, and the two large wheels, by means of the axle, drive another wheel, which communicates with the two other wheels, the latter of which is found in the axis of the cutter: a man at the handles regulates the direction, &c. This machine may be feen fully reprefented in the fecond volume of the Farmer's Dictionary; and a reaping machine for clover may be feen in the fame work in the fame plate.

Other machines of this kind have ftill more lately been invented by other perfons, but without anfwering the purpofe in that full and complete manner which is neceffary in this fort of work.

What appears to be chiefly wanting in thefe forts of machines, to render them complete and effective, as tools for the purpofe of reaping, is that of their having more power or velocity in the cutting parts, fo that the work may be performed in a perfectly clean neat manner, without the ftraw being drove or forced down in an improper manner before the inftruments which are to cut it; their cutting it out fully in the whole of its breadth; their being capable of being regulated to cut at different heights, and to different breadths; their being made capable of directing the cut ftrawy grain all in one even regular direction, fo that it may be bound up with facility; the horfes, or other animals, being fo attached to them as to permit of their walking along on the fide of the ftanding grain, where the former cut was made, or where they pufh the implements before them, the having them fo conveniently fixed in them as to admit of no fort of interruption to the labour in any way; their being made light and of ready application, as well as at a cheap rate; and their keeping the fcythes or cutting parts in a perfectly fharp ftate, without their being taken out, and undergoing the operation of whetting. There are, befides thefe, fome other points, which fhould be attended to, but thefe are, probably, the moft material.

REAPS, fmall parcels of corn, laid along on the ftubble, in reaping, to be afterwards gathered into fheaves by the binder. This is moft commonly the cafe, when the weather is moift, as in dry times the reaps of corn are ufually laid in the bands, and tied up, as foon as they are in fufficient quantity, into fheaves.

REAR, a term frequently ufed in compofition, to denote fomething behind or backward in refpect of another; in oppofition to *van*, or *avant*, *before*.

It is formed by corruption of the French *arriere*, fignifying the fame.

REAR, in a *Military Senfe*, is ufed for the hind-part of an army, &c. in oppofition to the *front*, or face of it.

REAR, in *Naval Language*, is a name given to the laft divifion of a fquadron, or the laft fquadron of a fleet, and which is accordingly commanded by a rear-admiral, or the third officer of the faid fleet or fquadron.

REAR-*admiral*. See ADMIRAL.

REAR-*guard*. See GUARD.

REAR-*half-files*, are the three hindmoft ranks of a battalion, when it is drawn up fix deep. See FILE-*leaders*.

REAR-*line* of an army encamped, is always twelve hundred feet at leaft from the centre line, both of which run parallel to the front line, and alfo to the referve.

REAR-*rank*, is the laft rank of a battalion, or fquadron, when drawn up, and generally fixteen or eighteen feet from the centre line, when drawn up in open order.

REAR-*up*, in the *Manege*, called in French *cabrer*, is the action of a horfe, when he raifes himfelf upon his houghs or hinder legs, as if he would fall quite over in a backward direction, to the great danger of his rider. This is often caufed by his having too much of the curb.

REAR, in *Rural Economy*, to raife the roof part of any fort of fhed or other building for containing fome kind of live-ftock.

REARED, or *Wale*-REARED. See WALE-*reared*.

REARING ANIMALS, in *Agriculture* and *Rural Economy*, the bufinefs of breeding and bringing them up to the moft fuitable ftates for the purpofes of the farmer. The principles of this art depend upon a variety of different circumftances and kinds of knowledge, as has been already explained. See BREEDING, and LIVE-*Stock*.

Animals of the horfe kind fhould invariably be brought up in the beft manner, without any fort of ftinting in their food, according to the ufes they are defigned to ferve, in order that they may have their full growth and power. In the labouring cattle kinds of animals, attention fhould, in fome degree, be paid to hardinefs, both in their food and their expofure, by having recourfe to the more coarfe forts of feeding in the lefs fheltered fituations, but nothing of ftinting fhould ever be allowed, as by thefe means they become large, and capable of fuftaining a greater degree of exertion. There is, likewife, much utility in good training, in rearing all forts of animals in this intention; and it requires careful, fteady, mild perfons to be employed in it, as they, for the moft part, acquire the habits and difpofitions of thofe about them, in fome meafure; and the more early they are obtained the better. This point deferves much more attention from farmers and others than it has hitherto met with, as moft of the bad habits of working animals arife from the neglect of it. Befides, good training and mild difpofitions are highly favourable to fattening animals. See HORSE.

In rearing poultry, pigeons, rabbits, and fifh, much care, management, and circumfpection, are conftantly neceffary, in order to their perfect fuccefs. Too little attention is for the moft part beftowed on the nature of the birds, in fome forts of the more wild poultry kinds, as thofe which are of the game defcription, for inftance, the galena, the pheafant, the fwan, and fome others. Thefe cannot be fo readily reared, or with fo much facility, under hens of the domeftic kind, as other forts are, fuch as the turkey, peacock, &c. This circumftance fhould therefore be always kept in mind in rearing fuch birds. See POULTRY, PIGEONS, RABBIT, &c.

A very nice attention and management is alfo requifite in the rearing and perfecting of fifh. See FISH, POND-*Fifheries*, and *Salmon* FISHERY.

In rearing birds of the game kind, fuch as the above, in the way of ornament about a refidence, Mr. Loudon has remarked, much depends upon encouraging them, when allowed

lowed to go wild, by giving them proper and abundant cover, and fowing among it fuch herbs and plants as they are particularly fond of, as thofe of the crefs, chervil, parfley, thyme, and fome other kinds. They have likewife a tendency to encourage and domefticate hares. Abundance of fearlefs game about a refidence, he thinks, give a peculiar noblenefs, and appearance of freedom, which few things elfe can communicate or afford.

REASON, Ratio, a faculty or power of the foul, by which it diftinguifhes good from evil, and truth from falfhood. Or, reafon is that principle, by which, comparing feveral ideas together, we draw confequences from the relations they are found to have.

Some of the later fchool-philofophers define reafon to be the comprehenfion of many principles which the mind fucceffively can conceive and from which conclufions may be drawn.

Others conceive reafon as no other than the underftanding itfelf, confidered as it difcourfes.

Reafon, Mr. Locke obferves, comprehends two diftinct faculties of the mind; *viz. fagacity*, by which it finds intermediate ideas; and *illation*, by which it fo orders and difpofes of them, as to difcover what connection there is in each link of the chain, by which the extremes are held together; and by them, as it were, draws into view the truth fought for.

Illation, or inference, confifts in nothing but the perception of the connection there is between the ideas in each ftep of the deduction, by which the mind comes to fee either the certain agreement or difagreement of any two ideas; as in demonftration, in which it arrives at knowledge; or their probable connection, on which it gives or withholds its affent; as in opinion.

Senfe and intuition reach but a little way; the greateft part of our knowledge depends upon deductions, and intermediate ideas. In thofe cafes, where we muft take propofitions for true, without being certain of their being fo, we have need to find out, examine, and compare, the grounds of their probability; in both cafes, the faculty which finds out the means, and rightly applies them to difcover certainty in the one, and probability in the other, is that which we call *reafon*.

In reafon, therefore, we may confider four degrees; firft, the difcovering and finding out of proofs. See Invention.

Secondly, the regular and methodical difpofition of them, and laying them in fuch order, as that their connection may be plainly perceived. See Method.

Thirdly, the perceiving of their connection (fee Judgment.) And,

Fourthly, the making a right conclufion.

Reafon fails us in feveral inftances; as, firft, where our ideas fail.

Secondly, it is often at a lofs, becaufe of the obfcurity, confufion, or imperfection, of the ideas it is employed about. Thus, having no perfect idea of the leaft extenfion of matter, nor of infinity, we are at a lofs about the divifibility of matter.

Thirdly, our reafon is often at a ftand, becaufe it perceives not thofe ideas which would ferve to fhew the certain or probable agreement or difagreement of any two other ideas.

Fourthly, our reafon is often engaged in abfurdities and difficulties, by proceeding upon falfe principles, which, being followed, lead men into contradictions to themfelves, and inconfiftency in their own thoughts.

Fifthly, dubious words, and uncertain figns, often puzzle men's reafon, and bring them to a nonplus.

Though the deducing one propofition from another be a great part of the office of reafon, and that about which it is ufually employed; yet the principal act of ratiocination is the finding the agreement or difagreement of two ideas one with another, by the intervention of a third. As a man, by a yard, finds two houfes to be of the fame length, which could not be brought together to meafure their equality by juxta-pofition. Words have their confequences as the figns of fuch ideas and things agree or difagree with what they really are; but we obferve it only by our ideas.

Hence we may be able to form an idea of that ordinary diftinction of things, into fuch as are *according to*, thofe that are *above*, and thofe *contrary to reafon*.

Thofe *according to reafon* are fuch propofitions, whofe truth we can difcover by examining and tracing thofe ideas we have from fenfation and reflection, and by natural deduction find to be true or probable.

Thofe *above reafon* are fuch propofitions, whofe truth or probability we cannot by reafon derive from thofe principles.

Thofe *contrary to reafon* are fuch propofitions as are inconfiftent with, or irreconcileable to, our clear and diftinct ideas.

Thus the exiftence of one God, is according to reafon; the exiftence of more than one God, is contrary to reafon; and the refurrection of the body after death, above reafon.

Above reafon may be alfo taken in a double fenfe; *viz.* above probability or above certainty.

They who difpute moft againft the power and privileges of human reafon, do it becaufe their own reafon perfuades them to that belief; and fo, whether the victory be on their or our fide, they are equally defeated.

They feek to terrify us with the example of many great wits, who, by following this *ignis fatuus* (fo they call the only pole-ftar God has given us to direct our courfe by), have fallen into wild and ridiculous opinions, and increafed the catalogue of herefies to fo great a number; but thefe men either followed not their reafon, but made it follow their will; or elfe they firft hoodwinked it by intereft and prejudice, and then bade it fhew them the way; or were wanting in thofe neceffary diligences required for fo doubtful a paffage: or if, without any of thefe, the weaknefs of their underftanding had deceived them, the error is neither hurtful to themfelves, nor would be to others, if this doctrine of governing ourfelves by our own reafon, and not by authority and example, were generally eftablifhed. Dif. Concern. Hum. Reaf.

It is not the ufe of fuch liberty, but the appropriating it to ourfelves, that is the caufe of all the diforders charged upon it; for thofe who lay a reftraint on other men's reafon, have firft made ufe of their own to fettle them, and to make ufe of it in this very reftraining of others. Ibid.

Reason, in *Matters of Religion*, is ufed in oppofition to *faith*.

This ufe of the word, Mr. Locke takes to be in itfelf very improper; for faith is nothing but a firm affent of the mind; which, if it be regulated, as it is our duty, cannot be afforded to any thing but upon good reafon, and fo cannot be oppofite to it.

He that believes without having any reafon for believing, may be in love with his own fancies; but he neither feeks truth as he ought, nor pays the proper obedience due to his Maker, who would have him ufe thofe difcerning faculties he has given him, to keep him out of miftake and error.

But ſince reaſon and faith are by ſome men oppoſed to one another, it may be neceſſary to conſider them together.

Reaſon, as contradiſtinguiſhed to faith, is the diſcovery of the certainty or probability of ſuch propoſitions, or truths, which it has got by the uſe of its natural faculties; *viz.* by ſenſation, or reflection.

Faith, on the other hand, is the aſſent to any propoſition upon the credit of the propoſer, as coming immediately from God; which we call *revelation*, which ſee.

Reason, in *Logic* and *Rhetoric*, denotes a neceſſary or probable argument; or an anſwer to the queſtion, *cur eſt? why is it?*

As if it be inquired, why do the ſubject and predicate agree? and it is anſwered, becauſe they are ſpoken of the ſame thing: this laſt enunciation is a reaſon. Hence, ſay the ſchoolmen, becauſe *quia* is the ſign or character of a reaſon, as *non, no,* of a negation, and *eſt, is,* of an affirmation.

They make three kinds of reaſons, *rationes;* viz. *ratio ut, that; ne, leſt;* and *quia, becauſe.* For, anſwering to a queſtion, *cur, why,* we begin with becauſe, *quia;* as, why do you ſtudy? that I may become learned; which is the *ratio ut.* Again, why do you ſtudy? leſt I ſhould be ignorant; which is the *ratio ne.* Laſtly, why is a body tangible? becauſe matter is impenetrable; which is the *ratio quia.*

The *reaſon ut* properly denotes the end, or final cauſe; and *reaſon ne* the beginning: accordingly the one is called the beginning, the other end; ſo that the *reaſon quia* is left the only reaſon, properly ſo called.

Reason, among *Metaphyſicians,* is uſed in the ſame ſenſe with eſſence; or that by which any thing is what it is.

This is ſometimes alſo called formal reaſon, as repreſenting the thing under that form or nature under which it is conceived.

Reason, in *Mathematics.* See Ratio.

Reason *of State, Ratio Status,* in *Matters of Policy,* denotes a rule or maxim, whether it be good or evil, which may be of ſervice to the ſtate.

The phraſe is borrowed from the Italians, who firſt uſed *ragione di ſtato* in this ſenſe.

Reaſon of ſtate is properly underſtood of ſomething that is neceſſary and expedient for the intereſt of the government, but contrary to moral honeſty, or juſtice.

Politicians have a long time diſputed about the *ratio ſtatus;* whether ſtates and governments are tied down to the ſame laws of morality with individual perſons; or whether things, otherwiſe immoral and unlawful, may not be practiſed on urgent occaſions, by way of reaſon of ſtate?

The queſtion is, whether any thing be unlawful, or prohibited a ſtate, that is neceſſary to the preſervation of that ſtate, or whether it be allowed to preſerve itſelf on any terms?

Reason, *Challenge upon.* See Challenge.

Reason *ſufficient of Leibnitz.* See Leibnitzian *Philoſophy.*

REASONABLE Aid, a duty which the lord of the fee anciently claimed of his tenants, holding in knight's ſervice, or on ſocage, towards the marrying his daughter, or the making his eldeſt ſon knight.

This is taken away by ſtat. 2 Car. II. See Aid.

REASONING, Ratiocination, the exerciſe of that faculty of the mind called *reaſon:* or, it is reaſon deduced into *diſcourſe;* which ſee.

The agreement or diſagreement of two ideas does not appear from the bare conſideration of the ideas themſelves, unleſs ſome third be called in, and compared, either ſeparately, or conjointly with it: the act, then, by which, from ideas thus diſpoſed and compared, we judge this or that to be ſo, or not ſo, is called *reaſoning.* Or, it is that operation of the mind, by which we infer one thing, *i. e.* one propoſition from two or more propoſitions premiſed. Or, again, it is the drawing of a concluſion, which before was either unknown, or dark, or doubtful, from ſome propoſitions which are more known and evident. It is the narrowneſs of the human mind which introduces the neceſſity of reaſoning; for if the mere perception and compariſon of two ideas would always ſhew us whether they agree or diſagree, then all rational propoſitions would be matters of intelligence, or firſt principles, and there would be no uſe of reaſoning, or drawing any conſequences. But when we are unable to judge of the truth or falſehood of a propoſition in an immediate manner, by the mere contemplation of its ſubject and predicate, we are then conſtrained to uſe a medium, and to compare each of them with ſome third idea, that by ſeeing how far they agree or diſagree with it, we may be able to judge how far they agree or diſagree among themſelves. Watt's Logic, part iii. chap. 1.

Rohault defines reaſoning to be a judgment depending on ſome antecedent judgment: thus, having judged that no even number can be compoſed of five uneven numbers, and that ten is an even number; to conclude, that ten cannot be divided into five uneven parts, is a ratiocination, or reaſoning.

This agrees with father Malebranche's doctrine, one of the great points of which is, that reaſoning, on the part of the underſtanding, is only a mere perceiving.

That ingenious author endeavours to ſhew, that, as to the underſtanding, there is no difference between a ſimple *perception,* a *judgment,* and a *reaſoning,* except in this, that the underſtanding perceives a ſimple thing without any relation to any thing elſe, by a ſimple *perception;* that it perceives the relations between two or more things in a *judgment;* and, laſtly, that it perceives the relations that are between the relations of things, in a *reaſoning.* So that all the operations of the underſtanding are no more than mere perceptions.

Thus, *e. gr.* when we conclude, that 4 being leſs than 6, twice 2 being equal to 4, are of conſequence leſs than 6, we do no more than perceive the relation of the inequality between the relation of twice 2 and 4, and the relation of 4 and 6.

The manner of proceeding juſtly in reaſoning; ſo as to arrive with the greater ſafety at the knowledge of truth, makes what we call *method.*

For the real benefit of logic to reaſoning, ſee Logic and Syllogism.

RE-ATTACHMENT, in *Law,* a ſecond attachment of him who was formerly attached, and diſmiſſed the court without day, by not coming of the juſtices, or the like caſualty.

Brook makes re-attachment either *general* or *ſpecial. General* is where a man is re-attached for his appearance on all writs of aſſize lying againſt him: *ſpecial,* for one or more certain writs.

REAU, in *Geography,* a town of Germany, in the principality of Culmbach; 9 miles S.E. of Hof.

REAVE, in *Rural Economy,* a provincial term, uſed to ſignify the unroofing or diſturbing the thatch or other covering of a building by winds, &c.

REAUMUR, René-Antoine Ferchault, *Sieur de,* in *Biography,* was born in 1683 at Rochelle. He was brought up to the ſtudy of the law, which he quitted for that

that of the mathematics, natural hiftory, and natural philofophy. In 1703 he went to Paris, and fo diftinguifhed himfelf in a few years, that in 1708 he was admitted into the Academy of Sciences. From that time he entirely gave himfelf up to the purfuits of natural hiftory in all its branches, and few men have paffed a life more actively and ufefully employed. Utility was the conftant aim in all his enquiries, even into the moft minute parts of nature; and experiment and obfervation were his perpetual guides. No one furpaffed him in the patient induftry with which he obferved natural phenomena, or followed the proceffes of art. The Memoirs of the Academy of Sciences, from 1709 to 1756, are enriched with his communications. The improvement of manufactures was a great object of his attention. In 1722 he publifhed a work, entitled "L'Art de convertir le Fer forgè en Acier, et l'Art d'adoucir le Fer fondu," which contained a minute and fcientific account of the proceffes employed in that branch of manufacture, with hints for their improvement. He introduced into France the manufacture of tinned iron, which article had before been imported from abroad; and he made a great many experiments in the manufacture of porcelain, which contributed to its perfection in France. He alfo performed numerous experiments relative to the art of hatching chickens by artificial heat, as practifed in Egypt, an account of which he publifhed in two vols. 1752. M. Reaumur rendered his name celebrated by his peculiar method of graduation on the thermometer, which is ftill the only one ufed in France and many parts of the continent. In this thermometer the freezing point is marked zero, and the boiling point at 80°. (See THERMOMETER.) Some of the moft valuable of Reaumur's phyfiological experiments were thofe relating to the concoctive powers of the ftomach in granivorous and carnivorous birds, in which he clearly eftablifhes the different modes of action in thefe two claffes, *viz.* by trituration, and by folution. In natural hiftory, he acquired the greateft fame as an entomologift. Befides a number of curious papers on this fubject in the Memoirs of the Academy, he publifhed a very elaborate work, entitled "Memoires pour fervir à Hiftoire Naturelle des Infectes," in fix vols. 4to. 1734—1742. This work was the labour of many years, and the refult of innumerable obfervations made in his garden, in which he kept infects of all kinds, that he might examine their generation, changes, and mode of life. Reaumur was a man of much private worth, of mild and amiable manners, and correct morals. He died in 1757, at the age of 75. He bequeathed his manufcripts, and cabinet of natural philofophy, to the Academy of Sciences.

REAUMURIA, in *Botany*, fo called in honour of the great French naturalift, René Antoine Ferchault de Reaumur, principally known, as a botanift, by his examination of the fructification of *Fuci*, but chiefly celebrated as a philofophical inquirer into the hiftory of infects, and their transformations, to which the fpecific name of the original fpecies, *vermiculata*, evidently alludes. Linnæus mentions Haffelquift as the author of the name *Reaumuria;* of which we can find no traces in his book, though the fpecimen of the plant in the Linnæan herbarium, has fome appearance of having been gathered by this diftinguifhed Oriental traveller. Is it poffible, that the *Anonyma dubia*, n. 15, of his Iter Palæftinum, 465, which his editor Linnæus could not make out, can be the *Reaumuria*? The defcription is not inapplicable, except what concerns the ftamens and ftyle. Yet this does not make him the author of the name, though it may poffibly account for Linnæus's mention of him in conjunction therewith. The latter appears, by his manufcripts, to have once deftined *Vermicularis* for the generic appellation.—Linn. Gen. 276. Schreb. 371. Willd. Sp. Pl. v. 2. 1249. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 327. Juff. 316. Lamarck Illuftr. t. 489. Dict. v. 6. 84.—Clafs and order, *Polyandria Pentagynia*. Nat. Ord. *Succulentæ*, Linn. *Ficoideæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of five prominent, ovate, pointed, permanent leaves. *Cor.* Petals five, oblong, equal, feffile, rather longer than the calyx, oblique, or lobed, at the extremity. Nectary of five double, fringed fcales, at the meeting of the petals, attached to their lower part. *Stam.* Filaments numerous, capillary, the length of the calyx, inferted into the receptacle; *Desfont.*; anthers roundifh, incumbent. *Pift.* Germen fuperior, roundifh; ftyles five, thread-fhaped, erect, approaching each other, on a level with the ftamens; ftigmas fimple. *Peric.* Capfule ovate, of five cells, with five flat, at length reflexed, valves; the partitions membranous, unconnected, deciduous. *Seeds* feveral, erect, oblong, entirely clothed with numerous, filky, fimple hairs, twice their own length.

Eff. Ch. Calyx of five leaves. Petals five, with ten fringed fcales at their bafe. Capfule of five cells, with five valves, and five deciduous partitions. Seeds feveral, oblong, hairy.

Obf. Specimens in feed, from profeffor Desfontaines, have enabled us to reconcile his account, and that of Linnæus, with the obfervation of Forfkall, that "the capfule has only one cell," the partitions being deciduous, and concealed among the hairy feeds. Not having examined the nectariferous fcales, we have, in adverting to Labillardiere's and Hooker's plates of the fecond fpecies, made the defcription fo general as to accord with both.

1. R. *vermiculata.* Saltwort-leaved Reaumuria. Linn. Sp. Pl. 754. Willd. n. 1. Forfk. Ægypt. Arab. 101. Desfont. Atlant. v. 1. 431. Lamarck Illuftr. t. 489. f. 1. (Sedum ficulum maritimum vermiculatum, flore Saxifragæ albæ, femine villofo; Bocc. Sic. 6. t. 4. f. C, G. S. minimum arborefcens vermiculatum; Lob. Ic. 380. Kali vermiculatum albo et amplo fedi rofei flore; Barrel. Ic. t. 888. Vermicularis frutex minor; Ger. Em. 523; at leaft the figure, which is that of Lobel. The defcription accords rather with *Salfola fruticofa*, as cited by Hudfon.)—Leaves linear-awlfhaped, convex beneath. Calyx entire.—Native of barren fandy ground towards the fea, in Sicily, Barbary, Egypt, and Syria, flowering in fummer. The habit of the plant is like a *Tamarix*, or *Salfola*. *Stem* fhrubby, bufhy, much branched, round, fmooth, whitifh, leafy. *Leaves* numerous, fcattered, feffile, from a quarter to three quarters of an inch long, fpreading, linear-awlfhaped, acute, flefhy, fmooth, glaucous; convex beneath; flat above; dotted on both fides with minute depreffions. Desfontaines compares the *leaves* to thofe of *Sedum reflexum*. *Flowers* terminal, folitary, white, not unlike thofe of *Saxifraga Cotyledon*, each encompaffed with a number of imbricated floral leaves, like thofe of the ftem or branch, but longer. *Calyx-leaves* ovate, with a narrow, entire, membranous edge, and awlfhaped leaf-like point. *Petals* terminating in three flight lobes, well reprefented by Barrelier. *Capfule* brown, very fmooth, and fomewhat fhining; its valves rigid, reflexed after the feeds are difcharged, and permanent. *Seeds* clothed with long, tawny, fhining hairs. Forfkall fays this plant is ufed at Alexandria as a cure for the itch, being applied bruifed externally, and taken internally in the form of a decoction. It is an elegant little fhrub, well worthy of a place in our gardens, or green-houfes, to which it is as yet a ftranger.

2. R. *hypericoides.* Elliptic-leaved Reaumuria. Willd. n. 2. Ait. n. 1. Lamarck f. 2. (R. linifolia; Salif. Parad.

Parad. t. 18. Hypericum alternifolium; Labillard. Syr. fasc. 2. 17. t. 10.)—Leaves elliptic-lanceolate, flat. Calyx minutely crenate.—Gathered in barren dry ground, near the desert of Syria, by M. Labillardiere, to whom we are obliged for a wild specimen. The plant is said to have been introduced into England, by the late Mr. John Bell, about 1800, and is marked by Mr. Aiton as a hardy perennial. Its true genus is well ascertained by Lamarck, Poiret, and Salisbury. The *stem* is herbaceous, about a foot high, simple, or branched, smooth, pale or reddish. *Leaves* alternate, glaucous, from half an inch to an inch in length, elliptic-oblong, or somewhat lanceolate, varying greatly in breadth, dotted all over. *Flowers* terminal, solitary, pale rose-coloured, with oblique petals. *Calyx-leaves* broader than in the former, their membranous edges finely crenate, their points very small. We know nothing of the *capsule* or *seeds*.

REAY, in *Geography*, a town of Scotland, in the county of Caithness; 6 miles W. of Thurso.

REBACH, a river of France, which runs into the Rhine, nearly opposite to Manheim.

REBAIS, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the district of Coulommiers; six miles E.N.E. of it. The place contains 1256, and the canton 11,284 inhabitants, on a territory of 190 kiliometres, in 18 communes.

RE-BAPTISANTS, a religious sect, who maintain, that persons irregularly baptised are to be baptised afresh.

The Anabaptists are re-baptisants, inasmuch as they baptise those at maturity, who had been before baptised in childhood.

St. Cyprian and pope Stephen had mighty differences about the re-baptization of converted heretics.

Donatus was condemned at Rome in a council, for having re-baptized some persons, who had fallen into idolatry after their first baptism.

REBAT, in *Geography*. See RABAT.

REBATE, in *Architecture*. See JOINERY and PLANE.

REBATE, or *Rabat*, *Rebatement*, in *Commerce*, a term much used at Amsterdam for a discount or abatement in the price of certain commodities, when the buyer advances the sum in hand, for which he might have taken time. See DISCOUNT.

Rebate (among us usually called *prompt payment*) is estimated by months, and is only allowed for certain kinds of merchandizes, which, according to the custom of Amsterdam, are

15 months, or 10 *per cent.* on German, Prussian, and Polish wools.

18 months, or 12 *per cent.* on brown Muscovado sugar, pot-ashes, soda, Italian Armoisines, satin, damask, and silk stuffs.

21 months, or 14 *per cent.* on Spanish wool and lamb's wool.

33 months, or 22 *per cent.* on Italian silk and raw silk from the Levant, which silks are sold by the Antwerp weight, about 5 *per* 100 lighter than that of Amsterdam.

Dutch cloths, camlets, &c. are sold with 4 *per cent.* rabat, for ready money, or without any rabat at 9 months' credit.

Dutch silk stuffs are sold with 2 *per cent.* rabat at 6 months' credit: with 4 *per cent.* at 3 months; or with 6 *per cent.* for ready money.

In all sales of goods, except those last mentioned, a further abatement is made of 1 or 2 *per cent.* for prompt payment.

At Hamburgh, some sorts of merchandise, when sold in large quantities, have an allowance made of 7, 13, or 19 months rabat, reckoned at 8 *per cent. per annum*; which the buyer, when he pays ready money, or pays within four weeks of the day of sale, deducts from the nominal price.

Refined sugars, English and Dutch cloths, English baize, shalloons, flannels, kerseymeres, ratteens, and serges, are sold with 7 months' rabat, or $4\frac{2}{3}$ *per cent.*; that is, $4\frac{2}{3}$ are deducted from $104\frac{2}{3}$, or 7 from 157.

Cotton, cinnamon, cochineal, indigo, ginger, nutmegs, cloves, mace, rice, raw sugars, capers, currants, cumine, gall-nuts, Russian leather, linen, crape, Italian silks, table-linen, Silesia cloth, Marseilles soap, almonds, sumac, molosses, Turkish yarn, Italian tartar, are sold with 13 months' rabat, or $8\frac{2}{3}$ *per cent.*; that is, 13 is deducted from 163. Silks from the Levant, as Ardassette, Barutine, and Cerbassi, are sold with 16 months' rabat, or $10\frac{2}{3}$ *per cent.*; that is, 8 is deducted from 83. Kelly's Un. Camb. vol. i.

This interest, called *rebate*, or *rabat*, is usually regulated on the footing of 8 *per cent. per annum.*

The reason of this expedient is, that the merchants having not always wherewithal to pay for their goods in hand, by means of the rebatement, such as have, will find their account in it; and such as have not will be engaged to discharge themselves as soon as possible, for the sake of the discount.

REBATEMENT, in *Heraldry*, a diminution or abatement of the dignity of the figures or bearing in a coat of arms. See ABATEMENT.

REBEBE, in *Commerce*, a measure of corn in Egypt, particularly at Alexandria, equal to about $4\frac{1}{2}$ bushels; as *kisloz*, another measure, is equal to $4\frac{2}{3}$ bushels, English measure: 17.94 rebebes are equal to 10 English quarters, and each of them contains 9587 cubic inches; and 16.51 kislos are equal to 10 English quarters, and each contains 10418 cubic inches.

REBEC, a musical instrument resembling a fiddle, with a neck, finger-board, three strings tuned 5ths, and played with a bow.

Etymologists have tortured themselves to find a derivation for the name of a vulgar instrument, no longer in use. Some trace it from the Arabic, some from the Celtic, the Welsh, the Spanish, Italian, and old French. Indeed, so numerous, discordant, and unsatisfactory are their opinions, as neither to be worth writing, nor perusal, if we could give them a place.

Rebec and ribible seem to be the same instrument, and are often indiscriminately used by Gower, Chaucer, and the still more ancient bards of Normandy, and our own country.

As the head, or scroll-work, of old viols and violins used to be curiously carved, so seems to have been that of the rebec. Chaucer compares the face of an old woman, an old trot, to the head of a rebec. Rabelais does the same.

—"A tel menestrier tel rebec
Tenant toujours le verre au bec
Car elle avoit visage de rebec."

REBECCO, in *Geography*, a town of Italy, in the department of the Panaro; 29 miles S.W. of Modena.

REBEL, JEAN-FERRY, sen. in *Biography*, one of the 24 violins of the king of France's band, and chamber composer to his majesty. He beat time for many years at the opera, and, in his day, passed for a great composer. His music for dances is still heard with pleasure. His capriccios, freaks, and dancing characters, have enjoyed great reputation. In 1703 he set the opera of Ulysses, written by Guichard.

Rebel

Rebel left two children: Francis, who died in 1775, and Anne, the wife of the celebrated Lalande, mafter of the king's band.

Rebel, François, knight of St. Michael, mafter, like his father, of the king's band, and director of the opera, born 1702, and died in 1775. He was the fon of Jean-Ferry Rebel, director of the orcheftra at the opera, and one of the twenty-four violins of the king's band. His fon had obtained the reverfion, in 1717, of chamber mufician to the king, and in 1703, that of compofer; having given proofs of his abilities by many different works, but, above all, by his "Pyramus and Thifbe," compofed in partnerfhip with Francœur.

He was fucceffively appointed to all the mufical pofts of honour and profit under the royal patronage and that of the public. The clofe and uninterrupted friendfhip between this mufician and Francœur, does honour to the memory of both; having compofed jointly, for 50 years, fuccefsful pieces, without difcovering to which of them the greateft honour was due. Laborde. See Francœur.

REBELLION originally fignified a fecond refiftance or rifing of fuch as had been formerly overcome in battle by the Romans, and had yielded themfelves to their fubjection.

It is now generally ufed for a traiterous taking up of arms againft the king, either by his own natural fubjects, or by thofe formerly fubdued; whether their view be to deprive him of the fupreme authority, or whether they intend to refift his commands in fome particular affairs, in order to impofe conditions on him. Popular commotion is a concourfe of people, tumultuoufly affembled, and refifting the voice of their fuperiors, whether their defigns be againft thofe fuperiors themfelves, or only fome private perfons. Such violent commotions are common when the people think themfelves aggrieved, and are occafioned by no order of men fo frequently as the tax-gatherers. (See the next article.) If the rage of the malcontents be particularly levelled at the magiftrates, or others vefted with the public authority, and they proceed to a formal difobedience or violent proceedings, it is called a "fedition." When the evil fpreads, infecting great numbers in the city or provinces, and fubfifts in fuch a manner, that the fovereign is no longer obeyed, fuch a diforder cuftom has more efpecially diftinguifhed by the name of "infurrection." All thefe violences difturb the public order, and are crimes of ftate, even when arifing from juft caufes of complaint. For violent meafures are interdicted in civil fociety; the injured party fhould have recourfe to the magiftrates, to whom they may apply for redrefs; and if juftice be not obtained from them, their complaints may then be laid at the foot of the throne. Every citizen fhould even patiently fuffer fupportable evils, rather than difturb the public peace. Nothing lefs than a denial of juftice from the fovereign, or affected delays, can excufe the furious commotions of a provoked people; they in fome meafure juftify themfelves, if the evils be intolerable, and the oppreffions great and manifeft. But, it may be afked, what conduct fhall the fovereign obferve towards the infurgents? The reply in general is, that which fhall at the fame time be moft confonant to juftice, and moft falutary to the ftate. If he is to reprefs thofe who unneceffarily difturb the public peace; he is, by the fame reafoning, to fhew clemency towards unfortunate perfons, to whom juft caufe of complaint has been given, and who are guilty only in having undertaken to do themfelves juftice; fo that they have been wanting in patience rather than fidelity. The fovereign fhould confider that his rights are derived from thofe of civil fociety, from the truft repofed in him, from the obligation devolved upon him of watching over the welfare of the nation, of procuring its greateft happinefs, and of maintaining in it order, juftice, and peace. He will alfo duly diftinguifh the nature and degree of the different diforders which may difturb the ftate, oblige him to take arms, or fubftitute the means of force inftead of thofe of authority. By confiderations of this kind he will regulate his behaviour towards revolted fubjects. It cannot be queftioned, that fubjects rifing againft their prince without caufe deferve fevere punifhments; yet in this cafe the number of delinquents calls for the fovereign's clemency; fhall he depopulate a city, or defolate a province, in punifhing their rebellion? Such a chaftifement, however juft in itfelf, becomes a cruelty when extended to fo great a number of perfons. Had the infurrection of the Netherlands againft Spain been totally unwarrantable, every man of virtue would ftill execrate the memory of the duke of Alva, who made it his boaft that he had caufed above 20,000 heads to be ftruck off by the hands of the common executioner. Let not his fanguinary imitators (fays the excellent Vattel) expect to juftify their enormities by neceffity. Who was ever more undefervedly infulted by his fubjects than Henry the Great of France? His conquefts were ever accompanied by an uniform clemency, and at length that excellent prince obtained the fuccefs he deferved: he thereby gained over faithful fubjects; whereas the duke of Alva loft his mafter the United Provinces. Tyrants alone will treat, as feditious, thofe brave and refolute citizens, who exhort the people to preferve themfelves from oppreffion in the vindication of their rights and privileges; a good prince will commend fuch virtuous patriots, provided their zeal be tempered with moderation and prudence. If he has juftice and his duty at heart; if he afpires to that immortal and unfullied glory of being the father of his people; let him miftruft the felfifh fuggeftions of a minifter, who reprefents to him as rebels all thofe citizens who do not hold out their hands to chains, who refufe tamely to fuffer the ftrokes of arbitrary power.

The fafeft, and the moft juft way thoroughly to appeafe fedition, is to give the people fatisfaction; and if the infurrection has been without caufe, which perhaps has never been the cafe, ftill an amnefty is to be granted where the offenders are numerous. When this amnefty is once publifhed and accepted, whatever has paft muft be buried in oblivion. A prince who makes any confcience of his word, is faithfully to keep what he has promifed to rebels themfelves; *i. e.* to thofe fubjects who have revolted without reafon or neceffity. If his promifes are not inviolable, what fecurity have the rebels in treating with him? When they have once drawn the fword, they have nothing to do but, as one of the ancients expreffes it, to throw away the fcabbard. The prince will then want the mild and falutary means of appeafing a revolt: to exterminate the rebels will be the only expedient remaining. Thefe will become formidable through defpair: compaffion will beftow fuccours on them; their party will increafe, and the ftate will be in danger. Vattel's Law of Nations, b. iii. See *Civil* War.

Rebel is fometimes alfo ufed, in our ancient ftatutes, for a perfon who wilfully breaks a law; and fometimes for a villain difobeying his lord.

Rebellion, *Commiffion of.* See Commission.

REBELLIOUS Assembly, a gathering of twelve perfons, or more, intending, going about, or practifing, unlawfully, and of their own authority, to change any laws of the realm, or to deftroy the inclofure of any park or ground inclofed, banks of fifh-ponds, pools, conduits, &c. to the intent the fame fhall remain void, or that they fhall have way in any of the faid grounds; or to deftroy the deer in any park, fifh in ponds, coneys in any warren, dove-

houfes,

houfes, &c. or to burn ftacks of corn, or to abate rents, or prices of victuals. See RIOT, ROUT, and UNLAWFUL *Affembly*.

REBENSOE, in *Geography*, a fmall ifland in the North fea, near the coaft of Norway. N. lat. 70°.

REBHIANG, one of the Hebrew accents, anfwering to our comma, and enumerated among their kings and paufes. It is marked by a dot over the middle of a letter. See ATHNACH, SYLLUK, &c. See alfo ACCENTS.

REBINARE, was to give a fecond ftirring or ploughing to arable land that lay fallow, to prepare it for fowing wheat, &c. or to plough the ground a third time for that purpofe. "Tempus rebinandi erit poft feftum Nativitatis fancti Johannis Baptifte cum terra pullulaverit poft carucam." Fleta, lib. ii. cap. 73.

REBNITZ, in *Geography*. See RIBNITZ.

REBORDAOS, a town of Portugal, in the province of Tras los Montes; two miles S. of Bragança.

REBOUND. See RECOIL.

REBOUX, in *Geography*, a town of France, in the department of Mont Blanc; 9 miles N.W. of Chambery.

REBTORF, a town of Bavaria, in the principality of Aichftatt; 3 miles W. of Aichftatt.

REBUS, a name-device, as Camden englifhes it; or an enigmatical reprefentation of fome name, &c. by ufing figures or pictures, inftead of words, or parts of words. Such is that of the gallant mentioned by Camden, who expreffed his love to Rofe Hill, by painting in the border of his gown a rofe, a hill, an eye, a loaf, and a well; which, in the rebus ftyle, is read, *Rofe Hill I love well.*

The Picards have the honour of the invention of this notable kind of wit; whence the French, to this day, call it *rebus de Picardie.* Camden adds, that the Englifh firft learnt it of them in the reign of our Henry III. by means of the garrifons we then had in Calais, Guienne, and other places bordering on Picardy.

Its origin is by Menage, &c. afcribed to the priefts of Picardy, who, it feems, anciently, in carnival time, ufed every year to make certain libels, entitled *de rebus quæ geruntur,* being railleries on the intrigues and tranfactions that had paffed about the city; in which they made great ufe of fuch fort of equivoques and allufions, breaking and joining words, and fupplying them with paintings.

Camden tells us, the rebus was in wonderful efteem among our forefathers; and that he was nobody who could not hammer out of his name an invention by this wit-craft, and picture it accordingly.

The Sieur des Accords has made an ample collection of the moft famous rebufes de Picardie. And Mr. Camden has done fomething of the fame kind in his Remains.

Abel Drugger's device in Ben Johnfon's Alchemift, and Jack of Newbury, in the Spectator, are known to every body. But the rebus, being once raifed to fign-pofts, grew out of fafhion at court.

Yet has rebus antiquity on its fide, as having been in ufe in the pure Auguftan age: Cicero, in a dedication to the gods, infcribed Marcus Tullius, with a little pea, called by the Latins *cicer*, by us a *chich pea.* And Julius Cæfar, in fome of his coins, ufed an elephant, called *Cæfar* in the Mauritanian tongue. Add to thefe, that the two mintmafters in that age, L. Aquilius Florus, and Voconius Vitulus, ufed, the firft a flower, the fecond a calf, on the reverfe of their coins.

REBUS, in *Heraldry*, a coat of arms which bears an allufion to the name of the perfon: as three caftles, for Caftleton; three cups, for Butler; three conies, for Conifby; a kind of bearings which are of great antiquity.

Rebus is alfo ufed by the chemical writers, fometimes to fignify four milk, and fometimes for what they call the ultimate matter of which all bodies are compofed.

REBUTTER, from *re*, and the French *bouter*, to *repel*, or *bar*, in *Law*, the anfwer of the defendant in a caufe to the plaintiff's fur-rejoinder.

The plaintiff's anfwer to the defendant's rebutter, is called a *fur-rebutter*.

REBUTTER is alfo when a man warrants any land or hereditament to another, and the perfon making the warranty, or his heir, fues him to whom the warranty is made, or his heir or affignee, for the fame thing: if he, who is fo fued, plead the deed or fine with warranty, and pray judgment, if the plaintiff fhall be received to demand the thing which he ought to warrant to the party, againft the warranty in the deed, &c. this is called a rebutter.

Again, if I grant to the tenant to hold *fine impetitione vafti*, and afterwards implead him for wafte, he may debar me of the action, by fhewing my grant; which is likewife a rebutter.

REC, in *Geography*, a river of France, which runs into the Sarre, at Sarre Alb.

RECANATI, a town of the marquifate of Ancona; near which towards Macerata are feen the ruins of Helvia Ricina; a town built by the emperor Sept. Severus, and deftroyed by the Goths; 8 miles N.N.E. of Macerata. N. lat. 43° 25'. E. long. 13° 39'.

RECANGED, in *Rural Economy*, a term provincially ufed to fignify lifted or difcoloured in ftripes.

RECANTATION. See PALINODY, or RETRACTATION.

RECAPITULATION, in *Oratory*, &c. a part of the peroration, or conclufion; called alfo *anacephalæofis*.

Recapitulation is a fummary of the preceding difcourfe; or a concife, tranfient enumeration of the principal things infifted on at large in it; by which the memory of the hearer is refrefhed, and the force of the whole collected into one view.

An inftance of this may be given in the peroration of Cicero's Manilian: "Quare, cum bellum ita neceffarium fit, ut negligi non poffit: ita magnum, ut accuratiffime fit adminiftrandum; & cum ei imperatorem præficere poffitis, in quo fit eximia belli fcientia, fingularis virtus, clariffima auctoritas, egregia fortuna; dubitabitis, Quirites, quin, &c."

In order to conftitute a good repetition or recapitulation, it muft be fhort and concife: it is alfo convenient to recite things in the fame order in which they were at firft laid down; but fometimes a repetition is made, by running a comparifon between the fpeaker's own argument, and thofe of the adverfe party, and placing them in oppofition to each other; and this method Cicero takes in the conclufion of his third oration upon the Agrarian law. In fome cafes, when the difcourfe is very long, and the arguments infifted on have been many, the orator only mentions fuch things which he thinks of leaft confequence, by faying that he omits or paffes over them, till he comes to what is of greater moment, which he reprefents more fully. Ward's Orat. vol. i. fect. 18. See PRETERITION.

RECAPTION, RECAPTIO, or *Reprifal*, in *Law*, is a remedy given to the party himfelf for an injury to his perfonal property. This happens, when any one hath deprived another of his property in goods or chattels perfonal, or wrongfully detains one's wife, child, or fervant; in which cafe the owner of the goods, and the hufband, parent, or mafter, may lawfully claim and retake them, wherever he happens to find them, fo it be not in a riotous manner, or or attended with a breach of the peace. Thus, *e. gr.* if my horfe is taken away, and I find him in a common, a fair, or a public inn, I may lawfully feize him to my own ufe; but I cannot juftify breaking open a private ftable, or entering on the grounds of a third perfon to take him, except he be felonioufly ftolen, but muft have recourfe to an action at law. Recaption is unlawful, if it be done with intention to fmother or compound a larciny. See RESTITUTION *of Stolen Goods*.

RECAPTION alfo is the taking a fecond diftrefs of one formerly diftrained for the fame caufe, and alfo during the plea grounded on the former diftrefs.

Recaption is alfo the name of a writ lying for the party thus diftrained to recover damages. See REPLEVIN.

RECAPTURE, in *Naval Infurance*, denotes the recovery of a fhip, or its cargo wholly or in part, after having been taken by an enemy. For every lofs occafioned by capture, whether lawful, *i. e.* when made by a declared enemy, according to the laws of war, or unlawful, *i. e.* when it is againft the rules eftablifhed by the law of nations, whether by friends or enemies, the infurer is liable, agreeably to the comprehenfive and exprefs words of the policy: and in every cafe of capture the infurer is anfwerable, to the extent of the fum infured, for the lofs actually fuftained. This may be either *total*, as where the fhip and goods infured are not recovered; or *partial*, as where the fhip is recaptured or reftored before abandonment; in which cafe the infurer is bound to pay the falvage, and any other neceffary expence the infured may have incurred by the recovery of his property. The infurer is liable for a lofs by capture, whether the property in the thing infured be changed by the capture or not. As to the length of poffeffion by an enemy, which is deemed fufficient to diveft the property out of the original owner, or the effect of a recapture in revefting it; thefe are matters which can never now come directly in queftion between the infurer and infured, in any cafe of infurance upon real intereft. In gaming infurances, or infurances without intereft, indeed, when there was a recapture, the claim, as for a total lofs, feems formerly to have involved the queftion, whether the property in the thing infured had, by the capture, or any proceeding founded on it, been divefted out of the original owner, or not, before the recapture. Neverthelefs, when a fhip is infured "intereft or no intereft," it has been repeatedly determined, that if the fhip be taken, it is a total lofs, however illegal the capture may be, and though the fhip may be retaken and reftored to the owner. But though no queftion can now arife between the infured and the infurer, as to the effect of a capture or recapture, in diverting or revefting the property; it may not be deemed unimportant to inquire when a capture fhall be deemed to transfer the property to an enemy, and what fhall be the effect of a recapture in revefting it in the original owner. The general opinion feems to be, that by the law of nations, the property of things captured in war is changed when all reafonable hope of recovering them is gone; and, with refpect to things moveable, all reafonable hope of recovering them is prefumed to be gone when they are brought within the protection of the enemy's fortrefs. Grotius fays, that fhips or goods, taken at fea, become the property of the captors, when they are brought into the enemy's harbours, or to the place where his whole fleet is ftationed; for then all hopes of recovering them may be faid to vanifh. But, he adds, that by the law of nations, as introduced among European ftates in more modern times, things are confidered as captured, when they have been 24 hours in the power of the enemy. Others deny this rule of the law of nations, and infift on the rule of the Roman law, that the prize muft be carried "infra præfidia" before it can become the property of the captors; and by "præfidia" Bynkerfhoeck underftands the camps, the ports, the towns, and the fleets, of the enemy. In our courts of admiralty, however, it has always been holden, by the marine law of England, independent of the ftatute which commands reftitution, and fixes the rate of falvage, the property is not changed in favour of a vendee or recaptor, fo as to bar the original owner, till there has been a regular fentence of condemnation: and in the reign of king Charles II., a folemn judgment was given upon this point; and reftitution of a fhip taken by a privateer was decreed, after fhe had been fourteen weeks in the enemy's poffeffion, *becaufe fhe had not been condemned*. The fame doctrine has, in feveral inftances, prevailed in our courts of common law. In one cafe it was holden that nine days' poffeffion by the captor, and in another, that four years' poffeffion, and feveral voyages performed, will not change the property, without a fentence of condemnation.

In general, whenever a fhip is taken by the enemy, the infured may abandon, and demand as for a total lofs; and he is not bound to make any claim or appeal in the enemy's courts of admiralty, or to litigate there the validity of the capture.

But the infured is in no cafe *bound* to abandon; and, as the law now ftands, no capture by the enemy can be fo total a lofs as to leave no poffibility of recovery, for the *jus poftliminii* continues for ever, except in the cafe of a captured fhip converted into a fhip of war. (Stat. 33 G. III. c. 66. § 42.) If the owner himfelf fhould retake his fhip or goods, he will be fully intitled to them; and if they be retaken at any time, whether before or after condemnation, he will be intitled to reftitution, upon payment of a fettled falvage. Stat. 29 G. II. c. 34. § 24; and 33 G. III. c. 66. § 42.

The chance of the owner's recovering his property, does not, however, fufpend the demand of the infured, as for a total lofs: but in the cafe of a recapture, juftice is done to the infurer by putting him in the place of the infured. In queftions upon policies of infurance, the nature of the contract as an *indemnity*, and nothing elfe, is always liberally confidered.

When there has been a capture, whether legal or not, and the fhip has been recaptured or reftored, the infurer is bound to defray all neceffary expences which the infured has been put to for the recovery of his property. He is therefore liable for a fum of money paid by the infured to the captors, as a *compromife* made *bonâ fide*, to prevent the fhip being condemned as prize. See RANSOM.

It often happens that a recaptured fhip is in a ftate to profecute her original voyage; and, in that cafe, it is the intereft of the recaptors, as well as of the other parties concerned, that fhe fhould be permitted to do fo. The laft prize act (ftat. 33 Geo. III. c. 66. § 44.) has therefore very properly provided, "That if a fhip be retaken before fhe has been carried into an enemy's port, it fhall be lawful for her, if the recaptors confent thereto, to profecute her voyage; and it fhall not be neceffary for the recaptors to proceed to adjudication till fix months after the recapture, or till the return of the fhip to the port from whence fhe failed; and the mafter, owners, or agents, with the confent of the recaptor, may difpofe of their cargoes before adjudication: and in cafe the veffel fhall not return to the port from whence fhe failed, or the recaptors fhall have had no opportunity of proceeding regularly to adjudication within the fix months, on account of the abfence of the faid veffel, the court of admiralty fhall, at the inftance of the recaptors, decree reftitution to the former owners, they paying falvage, upon fuch evidence as to the court fhall, under all the circumſtances of the caſe, appear reaſonable; the expence of ſuch proceeding not to exceed *fourteen pounds.*"

We ſhall here obſerve, that there is an obvious difference between capture and arreſt of princes; the object of the one is prize, that of the other detention, with a deſign to reſtore the ſhip or goods detained, or to pay the value to the owner. When a ſhip is detained in a port after a declaration of war, or the iſſuing of letters of repriſal, this more reſembles a capture than a detention, and gives the injured an immediate right to abandon, as for a loſs by capture, even though no condemnation be pronounced, and though the ſhip be afterwards reſtored. The moſt frequent cauſe of detention is an embargo, which is a proclamation or order of ſtate, uſually iſſued in time of war or threatened hoſtilities, prohibiting the departure of ſhips or goods from ſome or all of the ports of ſuch ſtate until further order. An embargo laid on ſhips and merchandize in the ports of this kingdom by virtue of the king's proclamation, is ſtrictly legal, when the proclamation does not contravene the ancient laws, or tend to eſtabliſh new ones; but only to enforce the execution of ſuch laws as are already in being, in ſuch manner as the king ſhall judge neceſſary. But whether an embargo be legally or illegally laid, the injury to the owner, by the detention of his ſhip or goods, is the ſame; and the inſurer is equally liable for the loſs occaſioned by it. If a ſhip be ſeized after a ceſſation of arms and preliminary articles of peace are ſigned, this ſhall not be deemed a capture, but only an arreſt of princes. For the regulation of ſalvage upon a recapture, we refer to the article SALVAGE.

Capture by an enemy or a pirate, or an arreſt of princes, or even an embargo, is *primâ facie* a total loſs; and immediately upon the capture, or upon a mere arreſt, or at any time while the ſhip continues under detention, the inſured may elect to abandon, and give notice to the inſurer of his intention ſo to do; and thus entitle himſelf to claim as for a total loſs from the inſurer. For, from the moment of the capture, the owners loſe their power over the ſhip and cargo, and are deprived of the free diſpoſal of them; and, in the opinion of the merchant, his right of diſpoſal being ſuſpended or rendered uncertain, is equivalent to a total deprivation. It would therefore be unreaſonable to oblige the inſured to wait the event of capture, detention, or embargo.

There is this difference between a policy *upon intereſt*, and a *wager policy*, that in the one caſe the inſured may, if he thinks proper, abandon the moment he has notice of a capture or detention, and this will bind the underwriters, whatever may be the ultimate fate of the ſhip; but in the caſe of a wager policy there can be no abandonment, becauſe the inſured has nothing to abandon.

But a capture or arreſt does not neceſſarily, and at all events, terminate in a total loſs, ſo as to entitle the inſured to abandon; for as he cannot abandon till he has received advice of the loſs; if, at the time he receives ſuch advice, or before he has elected to abandon, he receive advice that the ſhip or goods inſured are recovered, or are in ſafety, he cannot then abandon; becauſe he can only abandon *while* it is a total loſs, and he knows it to be ſo; not after he knows of the recovery. Therefore, if a captured ſhip be retaken and permitted to proceed on her voyage, ſo that ſhe ſuffers but a ſmall temporary inconvenience; this would only be a partial, and not a total, loſs.

On the other hand, a title to reſtitution upon a recapture does not neceſſarily, and at all events, deprive the inſured of the right to abandon; for if, in conſequence of the capture, the voyage be loſt, or not worth purſuing; if the ſalvage be very high; if farther expence be neceſſary, and the inſurer will not undertake at all events to pay it, he may abandon. The rule is, that, if the thing inſured be recovered before any loſs is paid, the inſured is entitled to claim as for a total, or a partial loſs, according to the final event; that is, according to the ſtate of the caſe at the time he makes his claim. There is no veſted right to a total loſs, till the inſured, having a right to abandon, elects to do ſo; for he is only entitled to an indemnity for his loſs as it ſtands at the time of the action brought, or offer to abandon.

But if, after a total loſs has been actually paid, the thing inſured be recovered, the inſurer cannot oblige the inſured to refund the money he has received; but he ſhall ſtand in the place of the inſured, and ſo no injuſtice is done.

Caſes are mentioned by Mr. Serjeant Marſhall, which ſerve as examples to ſhew, that though a captured ſhip be recaptured, yet if the voyage be loſt, the loſs will be total, and the inſured will have a right to abandon.

By the marine law, the property was not changed by the capture, till after condemnation: and ſince the 29 Geo. II. c. 34, the "jus poſtliminii" continues for ever. A recapture does not in all caſes prevent the loſs being total. If the voyage be abſolutely loſt, or be not worth purſuing; if the ſalvage be very high; if further expence be neceſſary; if the inſurer will not engage, at all events, to bear that expence, though it ſhould exceed the value, or fail of ſucceſs: under theſe, and many other ſimilar circumſtances, the inſured may diſentangle himſelf and abandon, notwithſtanding there was a recapture. Upon a recapture the property returns to the original owner, pledged to the recaptors for the amount of the ſalvage: upon the payment of which he is intitled to reſtitution. If upon a recapture the captain, finding that the voyage cannot be purſued, and, acting fairly for the benefit of all concerned, ſell the ſhip and cargo to pay the ſalvage, and thereby put an end to the voyage, the inſured may abandon and recover as for a total loſs. However, a capture does not neceſſarily amount to a total loſs, nor does a recapture prevent its being total. If the captain purchaſe the ſhip from the captors for account of his owners, the money paid, being in the nature of ſalvage, is only partial loſs.

To this article we ſhall ſubjoin two or three remarks on the ſubject of abandonment, which do not elſewhere occur. A time ſhould be fixed when the degree of the inſurer's reſponſibility ſhould be aſcertained. In ſeveral maritime ſtates on the continent, poſitive regulations have been eſtabliſhed, limiting the time, after a loſs has happened, within which the inſured may abandon. In England we have no ſuch poſitive regulation, nor any time limited by law for abandoning. But the courts have laid down a rule, better adapted to the purpoſe; and the rule is, that as ſoon as the inſured receives advice of a total loſs, he muſt make his election whether he will abandon or not. If he determines to abandon, he muſt give the underwriters notice of this within a reaſonable time after the intelligence arrives; and any unneceſſary delay in giving this notice will amount to a waver of his right to abandon; for unleſs the owner does ſome act, ſignifying his intention to abandon, it will be only a partial loſs, whatever may be the nature of the loſs, or the extent of the damage. If the inſurers in any manner prevent the abandonment, they ſhall pay the whole loſs, to the amount of the ſum inſured. If no intelligence be received of a ſhip within a reaſonable time, it ſhall be preſumed that ſhe foundered at ſea: when the time has elapſed which affords that preſumption, the inſured may abandon, and claim as for a total loſs. Marſhall on Inſurance, vol. ii.

RECARDAINS, in *Geography*, a town of Portugal, in the province of Beira; 6 miles E. of Bragança Nova.

RECCAN. See Arracan.

RECCO, a town of the Ligurian republic, near the sea-coast; 11 miles S.E of Genoa.

RECEIF, a fort and harbour on the coast of Brazil. S. lat. 8° 10′.

RECEIPT, or Receit, in *Commerce*, an acquittance or discharge; or a written acknowledgment of having received a sum of money.

Where the receipt is on the back of a bill, &c. it is usually called an *endorsement*.

Among tradesmen the receipt usually makes the second of the three articles of an account; the receipt contains the monies received; the two others the expence, and the return or balance.

By the 44 Geo. III. c. 98, the former stamp duties were repealed, and others imposed; by the 48 Geo. III. c. 149, these last were repealed, and the following were imposed; *viz.*

	Duty. £	s.	d.
Receipt or discharge given for or upon the payment of money			
Amounting to 2*l.* and not amounting to 10*l.*	0	0	2
ditto 10*l.* - ditto - 20*l.*	0	0	4
ditto 20*l.* - ditto - 50*l.*	0	0	8
ditto 50*l.* - ditto - 100*l.*	0	1	0
ditto 100*l.* - ditto - 200*l.*	0	2	0
ditto 200*l.* - ditto - 500*l.*	0	3	0
ditto 500*l.* or upwards - - -	0	5	0
And where any sum of money whatever shall be therein expressed, or acknowledged to be received in full of all demands - - -	0	5	0

And any note, memorandum, or writing whatsoever, given to any person for or upon the payment of money whereby any sum of money, debt, or demand, or any part of any debt or demand therein specified, and amounting to 2*l.* or upwards, shall be expressed or acknowledged to have been paid, settled, balanced, or otherwise discharged or satisfied, or which shall import or signify any such acknowledgment, and whether the same shall or shall not be signed with the name of any person, shall be deemed and taken to be a receipt for a sum of money of equal amount with the sum, debt, or demand so expressed or acknowledged to have been paid, settled, balanced, or otherwise discharged, or satisfied, within the intent and meaning of this schedule, and of the foregoing act, and shall be charged with a duty accordingly.

And any receipt or discharge, note, memorandum, or writing whatever, given to any person for or upon the payment of money, which shall contain, import, or signify any general acknowledgment of any debt, account, claim, or demand, debts, accounts, claims, or demands, whereof the amount shall not be therein specified, having been paid, settled, balanced, or otherwise discharged or satisfied, or whereby any sum of money therein mentioned shall be acknowledged to be received in full, or in discharge or satisfaction of such debt, account, claim, or demand, debts, accounts, claims, or demands, and whether the same shall or shall not be signed with the name of any person, shall be deemed and taken to be a receipt for the sum of 500*l.* or upwards, within the intent and meaning of this schedule, and of the foregoing act, and shall be charged with the duty of 5*s.* accordingly.

By 43 Geo. III. c. 126, such receipt shall not be available in law or equity as such acknowledgment, or be given in evidence, unless duly stamped as aforesaid.

And all receipts, discharges, and acknowledgments of the description aforesaid, which shall be given for or upon payments made by or with any bills of exchange, drafts, promissory notes, or other securities for money, shall be deemed and taken to be receipts given upon the payment of money within the intent and meaning of this schedule and of the foregoing act.

Exemptions from the preceding Duties on Receipts.

Receipts exempted from stamp duty by any act or acts of the present session, relating to the assessed taxes.

Receipts or discharges given by the treasurer of the navy for any money imprested to or received by him for the service of the navy.

Receipts or discharges given by any agent for money imprested to him on account of the pay of the army or ordnance.

Receipts or discharges given by any officer, seaman, marine or soldier, or their representatives respectively, for or on account of any wages, pay, or pension due from the navy-office, army pay-office, or ordnance-office.

Receipts or discharges given for the consideration money, for the purchase of any share in any of the government or parliamentary stocks or funds, or in the stocks and funds of the governor and company of the bank of England, or of the East India company, or South Sea company, and for any dividend paid on any share of the said stocks or funds respectively.

Receipts given for money deposited in the bank of England, or in the bank of Scotland, or royal bank of Scotland, or in the bank of the British linen company in Scotland, or in the hands of any banker or bankers, to be accounted for on demand, provided the same be not expressed to be received of or by the hands of any other than the person or persons to whom the same is to be accounted for; but if with interest, see Promissory *Notes*.

Receipts or discharges written upon promissory notes, bills of exchange, drafts or orders for the payment of money duly stamped according to the laws in force at the date thereof, or upon bills of exchange drawn out of, but payable in Great Britain.

Receipts or discharges given upon bills or notes of the governor and company of the bank of England; letters by the general post acknowledging the safe arrival of any bills of exchange, promissory notes, or other securities for money.

Receipts or discharges indorsed or otherwise written upon, or contained in any bond, mortgage, or other security, in any conveyance, deed, or instrument whatever, duly stamped according to the laws in force at the date thereof, acknowledging the receipt of the consideration money therein expressed, or the receipt of any principal money, interest, or annuity thereby secured.

Releases or discharges for money by deeds duly stampt according to the laws in force at the date thereof.

Receipts or discharges given for drawbacks or bounties upon the exportation of any goods or merchandise from Great Britain.

Receipts or discharges for the return of any duties of customs upon certificates of over entry.

Receipts or acknowledgments of payments indorsed upon any bills, orders, remittance bills, or remittance certificates, drawn by commissioneed officers, masters, and surgeons in the navy, or by any commissioner or commissioners of the navy, under the authority of the act passed in the 35th year of his majesty's reign, for the more expeditious payment of the wages and pay of certain officers belonging to the navy.

Receipts or acknowledgments of payments indorfed upon any bills drawn purluant to any former act or acts of parliament, by the commiffioners of the navy, or by the commiffioners for victualling the navy, or by the commiffioners for managing the tranfport fervice, and taking care of fick and wounded feamen, upon and payable by the treafurer of the navy.

If any perfon fhall write or fign any receipt liable to any ftamp duty, without being firft duly ftamped as aforefaid; or with a ftamp of a lower value than is herein directed: he fhall forfeit 10*l.* if the fum paid or expreffed therein fhall not amount to 100*l.*; and 20*l.* if the fum amount to 100*l.* or upwards. 31 Geo. III. c. 27. f. 17. 35 Geo. III. c. 55. f. 8.

Every perfon who fhall give any receipt or writing acknowledging the payment of money, in which a lefs fum fhall be expreffed than the fum actually paid or received, or who fhall feparate or divide the fum actually paid or received into divers fums, or fhall write off any part of any debt, or demand, or be guilty of or concerned in any contrivance with intent to defraud his majefty, fhall forfeit 50*l.* 35 Geo. III. c. 55. f. 9.

And the perfons, or their agent, from whom any fum fhall be due or payable, and who fhall have paid fuch fum, may provide a ftamp with the proper duty, or of fome higher rate of duty than required, and demand of the perfon entitled to fuch fum, or any agent to whom the fame fhall have been paid, a receipt for fuch fum, and alfo the amount of the duty thereon as aforefaid; and if fuch perfon refufe to give fuch receipt upon demand thereof, or to pay the amount thereof, every fuch perfon fhall forfeit for each offence 10*l.* 43 Geo. III. c. 126. f. 5.

Stamps denoting the duties under former acts may be ufed, provided they be applied to receipts of the like amount as required by this act. f. 8.

And all vellum, parchment, and paper liable to any ftamp duty as aforefaid, fhall be ftamped before the fame be written or printed upon; or may be brought to the faid commiffioners or their officers to be ftamped within 14 days after fuch receipts fhall be given or bear date, and fhall be ftamped on payment of 5*l.* over and above the duty; and if brought after 14 days within one calendar month, on payment of 10*l.* over and above the duty. 31 Geo. III. c. 25. f. 19, 20. 35 Geo. III. c. 55. f. 10, 11.

All penalties by this act incurred may be fued for in the courts at Weftminfter; or any neighbouring juftice may hear and determine any offence which fubjects the offender to any pecuniary penalty; who may, on complaint made within three calendar months, fummon the party accufed, and the witneffes, and examine into the matter of fact; and on confeffion, or the oath of one witnefs, may give judgment therein, and levy fuch penalty by diftrefs on the goods of the offender, which, if not redeemed within fix days, may be fold; and fuch penalty fhall be diftributed half to the king, and half to the informer; and for want of fufficient diftrefs, the offender fhall be committed to prifon for three calendar months, unlefs fuch penalty fhall be fooner paid. 31 Geo. III. c. 25. f. 24, 25. 35 Geo. III. c. 55. f. 12, 13.

If any perfon fhall find himfelf aggrieved by the judgment of fuch juftice, he may, upon giving fecurity to the amount of fuch penalty and cofts, appeal to the next feffions, which fhall happen 14 days next after fuch conviction, on giving reafonable notice; and in cafe fuch judgment be affirmed, they may award the perfon appealing fuch cofts as to them fhall feem meet. Id.

Provided, neverthelefs, that fuch juftice may, where he fhall fee caufe, mitigate any fuch penalty, fo as not to reduce the fame to lefs than one moiety thereof over and above the cofts. 31 Geo. III. c. 25. f. 26. 35 Geo. III. c. 55. f. 14.

Witneffes not appearing, having been duly fummoned, without reafonable caufe to be allowed by fuch juftice, or refufing to give evidence, fhall forfeit 40*s.* to be recovered in like manner. 31 Geo. III. c. 25. f. 27. 35 Geo. III. c. 55. f. 15.

Perfons counterfeiting or forging any ftamp hereby directed to be made ufe of fhall be guilty of felony without benefit of clergy. 31 Geo. III. c. 25. f. 29. 35 Geo. III. c. 55. f. 17. 43 Geo. III. c. 126. f. 11.

All powers given by any former act relating to the ftamp duties fhall extend to this act. 31 Geo. III. c. 25. f. 30. 35 Geo. III. c. 55. f. 18. 43 Geo. III. c. 126. f. 12.

Perfons fued or profecuted on account of any thing done in purfuance of this act may plead the general iffue and give the fpecial matter in evidence; and if a verdict be for the defendant, or the plaintiff be nonfuited, treble damages fhall be awarded againft fuch plaintiff. f. 15.

By the 44 Geo. III. c. 98, the former duties on legacies under the care of the commiffioners for ftamp duties were repealed, and new duties were impofed. By the 45 Geo. III. c. 28, additional duties were impofed, and by the 48 Geo. III. c. 149, the following were impofed (being by f. 3. of this laft act placed under the provifions of former acts relating to fuch duties,) and thofe impofed by former acts were repealed.

Schedule, Part III.

Legacies and fucceffion to perfonal or moveable eftate upon inteftacy.

I. *Where the teftator, teftatrix, or inteftate, died before or upon the 5th of April* 1805.

For every legacy, fpecific or pecuniary, or of any other defcription, of the amount or value of 20*l.* or upwards, given by any will or teftamentary inftrument of any perfon who died before or upon the 5th day of April 1805, out of his or her perfonal or moveable eftate, and which fhall be paid, delivered, retained, fatisfied, or difcharged, after the 10th of October 1808.

Alfo for the clear refidue (when devolving to one perfon), and for every fhare of the clear refidue (when devolving to two or more perfons), of the perfonal or moveable eftate of any perfon who died before or upon the 5th of April 1805 (after deducting debts, funeral expences, legacies, and other charges firft payable thereout), whether the title to fuch refidue, or any fhare thereof, fhall accrue by virtue of any teftamentary difpofition, or upon a partial or total inteftacy; where fuch refidue, or fhare of fuch refidue, fhall be of the amount or value of 20*l.* or upwards, and where the fame fhall be paid, delivered, retained, fatisfied, or difcharged, after the 10th of October 1808.

	£	s.	d.
Where any fuch legacy, or refidue, or fhare of fuch refidue, fhall have been given, or devolved, to or for the benefit of a brother or fifter of the deceafed, or any defcendant of a brother or fifter of the deceafed; a duty at and after the rate of 2*l.* 10*s.* *per cent.* on the amount of the value thereof - - - - - - - -	2	10	0
Where to or for the benefit of a brother or fifter of the father or mother of the deceafed; or any defcendant of a brother or fifter of the father or mother of the deceafed; a duty at and after the rate of 4*l.* *per cent.* on the amount or value thereof - - - - - - - - -	4	0	0

Where

	£	s.	d.
Where to or for the benefit of a brother or fifter of a grandfather or grandmother of the deceafed, or any defcendant of a brother or fifter of a grandfather or grandmother of the deceafed; a duty at and after the rate of 5*l. per cent.* on the amount or value thereof - - -	5	0	0
Where to or for the benefit of any perfon in any other degree of collateral confanguinity to the deceafed, than is above defcribed, or to or for the benefit of any ftranger in blood to the deceafed; a duty at and after the rate of 8*l. per cent.* on the amount or value thereof - -	8	0	0

II. *Where the teftator, teftatrix, or inteftate, fhall have died after the 5th of April* 1805.

For every legacy, fpecific or pecuniary, or of any other defcription, of the amount or value of 20*l.* or upwards, given by any will or teftamentary inftrument, of any perfon who fhall have died after the 5th of April 1805; either out of his or her perfonal or moveable eftate, or out of or charged upon his or her real or heritable eftate, or out of any monies to arife by the fale, mortgage, or other difpofition of his or her real or heritable eftate, or any part thereof, and which fhall be paid, delivered, retained, fatisfied, or difcharged after the 10th of October 1808.

Alfo, for the clear refidue, (when devolving to one perfon), and for every fhare of the clear refidue (when devolving to two or more perfons), of the perfonal or moveable eftate of any perfon who fhall have died after the 5th of April 1805, (after deducting debts, funeral expences, legacies, and other charges firft payable thereout), whether the title to fuch refidue, or any fhare thereof, fhall accrue by virtue of any teftamentary difpofition thereof, or upon a partial or total inteftacy, where fuch refidue, or fhare of refidue, fhall be of the amount or value of 20*l.* or upwards, and where the fame fhall be paid, delivered, retained, fatisfied, or difcharged after the 10th of October 1808.

And alfo for the clear refidue (when given to one perfon), and for every fhare of the clear refidue (when given to two or more perfons), of the monies to arife from the fale, mortgage, or other difpofition of any real or heritable eftate, directed to be fold, mortgaged, or otherwife difpofed of, by any will or teftamentary inftrument of any perfon who fhall have died after the 5th of April 1805, (after deducting debts, funeral expences, legacies, and other charges, firft made payable thereout, if any), where fuch refidue, or fhare of refidue, fhall amount to 20*l.* or upwards, and where the fame fhall be paid, retained, or difcharged, after the 10th of October 1808.

	£	s.	d.
Where any fuch legacy or refidue, or any fhare of fuch refidue, fhall have been given, or have devolved, to or for the benefit of a child of the deceafed, or any defcendant of a child of the deceafed; a duty at and after the rate of 1*l. per cent.* on the amount or value thereof - -	1	0	0
Where to or for the benefit of a brother or fifter of the deceafed, or any defcendant of a brother or fifter of the deceafed; a duty at and after the rate of 2*l.* 10*s. per cent.* on the amount or value thereof - - - - - -	2	10	0
Where to or for the benefit of a brother or fifter of the father or mother of the deceafed, or any defcendant of a brother or fifter of the father or mother of the deceafed; a duty at and after the rate of 4*l. per cent.* on the amount or value thereof - - - - - - - -	4	0	0
Where to or for the benefit of a brother or fifter of a grandfather or grandmother of the deceafed, or any defcendant of a brother or fifter of a grandfather or grandmother of the deceafed; a duty at and after the rate of 5*l. per cent.* on the amount or value thereof - - - -	5	0	0
Where to or for the benefit of any perfon in any other degree of collateral confanguinity to the deceafed, than as above defcribed, or to or for the benefit of any ftranger in blood to the deceafed; a duty at and after the rate of 10*l. per cent.* on the amount or value thereof - -	10	0	0

And all gifts of annuities, or by way of annuity, or of any other partial benefit, or intereft, out of any fuch eftate or effects as aforefaid, fhall be deemed legacies within the intent and meaning of this fchedule.

Exemptions.

Legacies and refidues, or fhares of refidue, of any fuch eftate or effects as aforefaid, given or devolving to or for the benefit of the hufband or wife of the deceafed, or to or for the benefit of any of the royal family.

And all legacies which were exempted from duty by the 39 Geo. III. c. 73, for exempting certain fpecific legacies, given to bodies corporate or other public bodies, from the payment of duty.

By f. 43. of 48 Geo. III. c. 149, the commiffioners are authorized to remit penalties incurred before paffing this act by non-payment of the duty on legacies, if the duty in arrear fhall be paid on or before the 31ft Jan. 1809.

By f. 44, in all cafes not provided for by f. 43, where any receipt for any of the above matters fhall be brought to the head office to be ftamped after the expiration of three calendar months from the date thereof, it may be ftamped on payment of the duty, together with the penalty incurred for not ftamping the fame in due time: and if the receipt have been figned out of Great Britain, and be brought to be ftamped within 21 days after being received in Great Britain, and no penalty to be incurred.

The faid duties to be under the management of the commiffioners of the ftamp duties. 35 Geo. III. c. 52. f. 3.

And in cafe of fpecific legacies, where the refidue of any perfonal eftate fhall confift of property not reduced into money, the perfon taking adminiftration of fuch effects, or by whom the duty ought to be paid, may fet a value thereon, and offer the duty accordingly; and may, at his own expence, require the ftamp commiffioners to appoint a perfon to fet fuch value, and fuch commiffioners may accept the duty fet by fuch perfon with an appraifement, but if they fhall not be fatisfied with the value fo fet, they may appoint a perfon to appraife fuch effects, and to fet the value thereon, and require the duty to be paid accordingly; but if the perfon who ought to pay fuch duty fhall not be fatisfied with fuch valuation, he may caufe the fame to be reviewed by the commiffioners of the land-tax of the diftrict where fuch effects fhall be, at their next meeting, if fourteen days have elapfed before fuch meeting, and if not, at the next fucceeding meeting, of which appeal fix days notice fhall be given to the ftamp commiffioners; and the faid commiffioners of the land-tax may appoint a perfon to appraife fuch effects, and to fet a value thereon, and may hear and determine fuch appeal in like manner as appeals to them in other cafes, and their judgment fhall be final; and if the valuation made under the authority of fuch ftamp commiffioners fhall not be appealed from within the time aforefaid, or fhall be affirmed upon appeal, the duty fhall be paid accordingly; and if any variation fhall be made on fuch appeal,

appeal, the duty ſhall be paid according to ſuch variation; and if the duty aſſeſſed in manner aforeſaid ſhall exceed the duty offered to and refuſed by ſuch ſtamp officers, the expences ſhall be borne by the perſon liable to pay ſuch duty. If any diſpute ſhall ariſe between perſons entitled to any ſuch legacy, or reſidue, or taking adminiſtration as aforeſaid, reſpecting the value thereof, or duty to be paid thereon, the duty ſhall be aſſeſſed by ſuch ſtamp commiſſioners on reference to them by either party; and if the value of ſuch property ſhall be in diſpute, ſuch ſtamp commiſſioners ſhall cauſe an appraiſement to be made thereof, at the expence of the perſon liable to pay the duty, in manner aforeſaid; and if ſuch perſon ſhall be diſſatisfied with ſuch valuation, the ſame ſhall be reviewed and finally determined by the ſaid commiſſioners of the land-tax, upon appeal to them within the time and in the manner aforeſaid. And if the effects whereon ſuch duty is payable ſhall be ten miles from London, ſuch perſons as ſhall be deputed by the ſaid ſtamp commiſſioners ſhall act in their ſtead. ſ. 22. 36 Geo. III. c. 52.

And if it ſhall appear to the ſaid ſtamp commiſſioners, upon oath, to be adminiſtered by a juſtice, or maſter extraordinary in chancery, that leſs duty has been paid than ought to have been, by miſtake, without intention of fraud, ſuch miſtake may be rectified by ſuch commiſſioners, who may accept the duty really due within three calendar months, if no ſuit hath been inſtituted, and on payment of 10*l. per cent.* thereon by way of penalty. ſ. 30.

Every perſon paying or receiving money contrary to this act, who ſhall within twelve calendar months diſcover the other party offending, ſo as he be convicted thereof, ſhall be indemnified and diſcharged from all penalties againſt this act. ſ. 31.

And all powers of forming acts relating to the ſtamp duties, not hereby altered, ſhall be in force, in the execution of this act. ſ. 42.

Wherever any executor or adminiſtrator ſhall not have paid the ſaid duties within time, the court of exchequer may, on application from the ſtamp office on ſatisfactory affidavit, grant a rule for ſuch executor to ſhew cauſe why he ſhould not deliver to the commiſſioners an account on oath of all legacies, or of the perſonal property paid or payable by him, and why the duties thereon have not been, or ſhould not be forthwith paid, and may make ſuch rule abſolute where it appears proper. And regiſtrars of eccleſiaſtical courts ſhall, within a month of requiſition, deliver to the ſtamp office an account of wills and letters of adminiſtration in their cuſtody, with particulars relating thereto, and extracts from any wills deemed neceſſary by the commiſſioners, on payment of fees agreed on or allowed by the eccleſiaſtical court, on pain of 50*l.* recoverable by information by the attorney-general. 42 Geo. III. c. 99. ſ. 2, 3.

And by the 5 W. c. 21, the probate of the will or letters of adminiſtration of any common ſoldier or ſeaman, ſlain or dying in the ſervice, ſhall be exempt from the ſtamp duties. ſ. 6.

Receipt, or *Reſceit*, in *Law*. See Resceit.

Receipt *of Homage*. See Resceit.

Receipt *of the Exchequer*. See Court *of Exchequer*.

Receipt, in *Medicine*. See Recipe.

Receipts, *Auditor of*. See Auditor.

RECEIVER, or Recipient, in *Chemiſtry*, a globe-ſhaped veſſel, which is adapted to the neck or beak of an alembic, retort, or other diſtillatory veſſel, in order to collect, receive, and contain the products of diſtillations.

Receivers ſhould be made of glaſs, not only becauſe this matter reſiſts the action of the ſtrongeſt and moſt corroſive ſubſtances, but alſo becauſe being tranſparent, it allows the operator to ſee through it, and to judge by the frequency of the drops, if the diſtillation be too quick or too ſlow, and alſo if the quantity and nature of the ſubſtances that come over be ſuch as are required.

Almoſt all receivers are kinds of bottles of different ſizes, of a ſpherical form, the necks of which are cut ſhort, and each of which is pierced with a ſmall hole in its lateral or upper part, to give vent to the air or vapours, which are too expanſive. Receivers of this form are called *balloons*; which ſee. Some receivers are matraſſes with long necks. Theſe are generally adapted to the beaks of glaſs alembics. The long neck ſerves to keep the belly of the receiver, where the liquor is collected, at a proper diſtance from the fire.

Receivers have different forms for particular operations. Such are thoſe which have two or three beaks, either to be adapted to other receivers, or to admit at the ſame time the necks of ſeveral diſtillatory veſſels, when the intention of the operator is, that the vapours of different ſubſtances ſhould meet in the ſame receiver. Such alſo are receivers for eſſential oils, obtained from aromatic plants diſtilled with water, which are ſo made, that they are never full, but that the water runs out, and leaves the oil behind. Theſe are a kind of glaſs cucurbits, which contract as they riſe higher; ſo that their neck or upper opening is but nearly of a convenient ſize to receive the beak of the worm. Theſe receivers have another opening about the middle of the ſwelling or belly; and to this opening is joined a glaſs tube, which bends and riſes vertically along the outer part of the receiver, ſo as to be within two inches and a half as high as the upper opening. At this height the tube bends again towards the ſide oppoſite to the body of the receiver, to pour into another veſſel the liquor which ariſes there. It forms the figure of an S.

When this receiver is to be uſed, it is to be placed vertically under the beak of the worm. During the diſtillation, the liquor riſes to an equal height in the body of the receiver, and in the crooked tube: when, therefore, the height of the liquor in the receiver becomes greater than the height of the tube, it muſt begin to flow from the mouth of this tube into another veſſel placed on purpoſe to receive it; but as eſſential oils are either lighter or heavier than water, and as they are, therefore, always collected either above or under the water, and as the liquor which diſcharges itſelf through the tube is taken from the middle part of the receiver, nothing but water can be evacuated at the mouth of the pipe, while the oil always remains in the receiver. With ſuch a receiver diſtillation may be performed without the trouble of changing the veſſels. Macquer's Chem. Dict. See Distillation and Laboratory.

Receiver *of an Air-Pump*, is part of its apparatus; being a glaſs veſſel placed on the top of the plate, out of which the air is to be exhauſted. To an air-pump belong various receivers, of various forms and ſizes, and ſerving for various purpoſes. See Air-*Pump*.

Receiver, *Exhauſted*, in *Pneumatics*. See Exhausted. And for the method of repairing thoſe that are cracked, ſee Cæment.

Receiver, *Receptor*, or *Receptator*, in *Law*, is uſed commonly in the bad ſenſe, for ſuch as knowingly receive ſtolen goods from thieves, and conceal them.

This offence is only a miſdemeanor at common law: however, by the ſtatutes 3 & 4 W. & M. c. 9. and 5 Ann. c. 31. the offender is made acceſſory to the theft and felony. But becauſe the acceſſory cannot in general be tried, unleſs with the principal, or after the principal is convicted, the receivers

receivers by that means frequently eluded juſtice; to remedy which it is enacted by ſtatute 1 Ann. c. 9. and 5 Ann. c. 31. that ſuch receivers may be ſtill proſecuted for a miſdemeanor, and puniſhed by fine and impriſonment, though the principal felon be not before taken, ſo as to be proſecuted and convicted. And in caſe of receiving ſtolen lead, iron, and certain other metals, ſuch offence is, by ſtatute 29 Geo. II. c. 30. puniſhable by tranſportation for fourteen years. So that now the proſecutor has two methods in his choice: either to puniſh the receivers for the miſdemeanor immediately, before the thief is taken (Foſter. 373.); or to wait till the felon is convicted, and then puniſh them as acceſſories to the felony. But it is provided by the ſame ſtatutes, that he ſhall only make uſe of one, and not of both theſe methods of puniſhment.

By the ſame ſtatute alſo (29 Geo. II. c. 30.) perſons having lead, iron, or other metals in their cuſtody, and not giving a ſatisfactory account how they came by the ſame, are guilty of a miſdemeanor, and puniſhable by fine and impriſonment. And by ſtatute 10 Geo. III. c. 48. all knowing receivers of ſtolen plate or jewels, taken by robbery on the highway, or when a burglary accompanies the ſtealing, may be tried as well before as after the conviction of the principal, and whether he be in or out of cuſtody; and, if convicted, ſhall be adjudged guilty of felony, and tranſported for fourteen years. By ſtat. 21 Geo. III. c. 68. the receiving of any ſtolen copper, braſs, bell-metal, or utenſil fixed to any building, or any iron-rails or fencing ſet up in any court or other place, is made tranſportation for ſeven years, or three years' impriſonment to be kept to hard labour. By ſtat. 21 Geo. III. c. 69. the receiving of ſtolen pewter of any kind is ſubjected to the like penalty, although the principal has not been convicted. By ſtat. 22 Geo. III. c. 58. the receiving of any ſtolen goods, (except lead, iron, copper, braſs, bell-metal, and ſolder,) is made a miſdemeanor, puniſhable by fine and impriſonment, or whipping, as the court ſhall appoint; which ſhall exempt the offender from being puniſhed as acceſſory, although the principal be afterwards convicted, and the offence ſhall appear to be grand larceny, or ſome greater offence. (See Larceny.) For the puniſhment of receivers of goods ſtolen by bum-boats, &c. on the river Thames, ſee ſtat. 2 Geo. III. c. 28. § 12. Receivers of linen goods ſtolen from the bleaching-grounds are, by ſtat. 18 Geo. II. c. 27. declared felons without benefit of clergy. In France, receivers are puniſhed with death; and the Gothic conſtitutions diſtinguiſhed alſo three ſorts of thieves: "unum qui conſilium daret, alterum qui contrectaret, tertium qui receptaret et occultaret; pari pœna ſingulos obnoxios."

Receiver alſo denotes an officer, of which there are various kinds, denominated from the particular matters they receive, the places where, or the perſons for whom, &c.

As receiver of rents; receiver-general of the cuſtoms; receiver of the fines, upon original writs in chancery, &c.

Receiver-*General* of the duchy of Lancaſter, is he who gathers all the revenues and fines of the lands of the ſaid duchy, all forfeitures, aſſeſſments, &c.

Receiver-*General* of the public revenue is an officer appointed in every county, to receive the taxes granted by parliament, and remit the money to the treaſury.

Receiver's *Office*. See *Greenwich* Hospital.

RECENT Fruits. See Fruit.

RECEPTACLE *of Stall Manure*, in *Agriculture*, the place where the various matters from the ſtalls, and other places where animals are kept, are depoſited and laid up. Some ſuppoſe that theſe places ſhould be a little hollow or excavated; while others are of quite a different opinion, and think that they ſhould be even, or a little raiſed. A very ſlight hollowing is, however, probably the beſt. An experienced writer on this ſubject ſuggeſts, that it is not to be inferred that, becauſe they ſhould be hollow, they ſhould alſo be deep; as one principal uſe of them is to bring the rain waters, which fall within the yards or incloſed parts, into a ſtagnant ſtate, and to let them off ſuperficially, ſo as to prevent any thing of the ground current kind from carrying away the dung, either in a bodily manner, or in a thick fluid ſtate: they may, in this way, ſuffer the more watery particles only to paſs away into reſervoirs, prepared to preſerve and keep them for future uſe. It is believed that two feet on the lower ſide, or deepeſt parts, may be taken as a mean depth; but leſs may often be quite ſufficient: and the bottoms of the waſte-water channels being laid ſix or eight inches lower than the rim of the baſons, the depth of water which they can contain is, it is concluded, not more than ſixteen or eighteen inches, when empty of manure. But it is ſuggeſted, as neceſſary to good farm management, that, ſoon after the winter's manure has been removed and cleared away, floorings of marle, or ſome other earthy fertilizing material, mixed with lime, to the thickneſs of ten or twelve inches, ſhould be ſpread out over the bottoms of the baſons or hollowed parts; by which means a rich compoſt for graſs lands may be formed at ſmall expence, on which all the offal materials of manure which can be collected, free from ſeeds of weeds, during the ſummer and autumn, ſhould be depoſited. In this manner the receptacles ſhould be filled to the brims, even though no ſtable manure were put into them during the above two ſeaſons; ſo that the winter's ſtall manures may have firm platforms to reſt upon, out of the way of water, the great evil which antiquated prejudice ſo much fears in theſe manure receptacles, as the prevention of the due maturation of their different contents.

With theſe receptacles of manure there ſhould be connected drains from the cattle-houſes, ſtalls, and farm-offices, for receiving and conveying the urine, and other liquid matters, from them to theſe baſons or receptacles; and the mouths of their outlet channels ſhould be well guarded, in order to prevent their being choaked up by the manure, when piled up to conſiderable height above them. The reſervoirs, pits, or wells, which are made before them, are always to be kept free, for the ſuperfluous water, or other liquid matters of the receptacles, to drain or filtrate into; and thence to paſs away in moiſt weather; or to be pent up in them, in dry warm ſeaſons, for the purpoſe of being thrown over the piled-up manures, for the promotion of their decay and maturation.

Where there are graſs lands lying conveniently below theſe receptacles and reſervoirs for receiving their overflowings, all the different parts of the places, where they are ſituated, may be made to ſhelve gently towards them; but where land cannot be commanded for favouring this intention, the receptacles or baſons ſhould receive no other waters than what are ſupplied to them by the atmoſphere. This regulation may eaſily be accompliſhed, ſimply by raiſing their rims a few inches higher than the ſurrounding ſurfaces, which ſhould be frequently cleared from the manure and litter dropped upon them, depoſiting all ſuch ſubſtances within their rims. The rain-water which falls, in theſe caſes, is to be conveyed to the catch-pools, or the moſt contiguous common drains. In all caſes, that which falls upon the buildings ſhould be conveyed away, without being ſuffered to paſs through the receptacles or baſons, unleſs

unleſs where liquid manure is more in demand than that of the bulky kind.

From the ſlow progreſs made by manures of this ſort to maturation, in the winter ſeaſon, in the open air, even when piled up in the drieſt ſituations, on account of its being conſtantly ſoaked or ſaturated with moiſture, and expoſed to the effects of the cold atmoſphere, the plan of giving receptacles of this ſort a long oval ſquare form, and covering them with roofs, to free them wholly from rain, as well as to defend them from cold, has been hit upon, and recommended from authority. As by thus affording the articles of manure the means of paſſing into the ſtate of fermentation, in the winter months, their putrefaction and decay would be beneficially promoted, for the uſe of the more early crops of the ſpring. But how far the advantage, gained in this way, may equal or be ſuperior to the expence of building, and extra labour in the removals of the manure, is a point which is by no means yet fully decided. And the ſuperior benefits, which have lately been derived from the uſe of manure in its more raw or freſh ſtate, render all ſuch ſchemes perhaps of leſs importance than would otherwiſe be the caſe.

As it is a matter of great conſequence to prevent the exceſſive waſte of this ſort of manure, which at preſent frequently takes place in moſt parts of the country, it has been ſuggeſted by an experienced writer, who has attended much to the ſubject, and thought a great deal upon it, that piling it in ſhallow receptacles or baſons, and conducting the liquor, when not wanted for moiſtening the piles of manure, which overflows from them, to reſervoirs or catch-pools, in order to ſtop, depoſit, and arreſt the heavier and more groſs particles that may be conveyed in it, and to provide a valuable collection of liquid manure in particular ſituations, and of rich muddy matters in others, are the moſt appropriate practical means of accompliſhing the matter, in an eaſy and cheap way, that can be adopted or had recourſe to. See Dung, Farm-*Yard*, Homestal, Manure, Reservoir, and Yard *Manure*.

RECEPTACULUM, Receptacle, in *Botany* and *Vegetable Phyſiology*, is the ſeventh, or laſt, part of fructification diſtinguiſhed by Linnæus, being the common baſis, or point of connection, of the others. (See Fructification.) It is evident that ſuch a part muſt exiſt, under ſome ſhape or other; yet the receptacle is not always diſtinguiſhed by any particular figure. In ſimple flowers it is often little more than a mere point; in compound ones it is very remarkable and important, ſerving, by its differences of ſtructure, to afford very good generic diſtinctions. The receptacle of the Daiſy, *Bellis*, is conical; that of *Chryſanthemum* convex. In *Sphæranthus* this part is very nearly globular, while in ſome ſpecies of *Centaurea* and *Carlina* it is either flat, or ſlightly concave. In *Sonchus* it is naked, deſtitute of hairs or ſcales between the florets or ſeeds; while in *Carduus* it is hairy, and in *Anthemis* variouſly ſcaly. This laſt genus differs, by the character in queſtion alone, from *Chryſanthemum*, whoſe receptacle is naked; but the character is not quite ſo natural, in this caſe, as could be wiſhed. Mr. Brown has obſerved to us, that it affords not even a certain artificial diſtinction, in the *Chryſanthemum indicum* of the gardens, Curt. Mag. t. 327; which Willdenow, like M. de Ramatuelle and profeſſor Desfontaines, has referred to *Anthemis*, becauſe they found the receptacle to be ſcaly. We are convinced they are in the right, and yet this appears to be the very ſame plant with *Chryſanthemum indicum*, the ſcales of the receptacle being variable, and ſometimes almoſt, if not altogether, evaneſcent. Some genera of this claſs have a cellular, or honeycomb-like receptacle, as *Onopordum*, and *Tolpis* (*Crepis barbata* of Linnæus). In that caſe the edges of the cells are variouſly jagged, toothed, or fringed, and they now and then are ſcarcely diſtinguiſhable from the reticulations or rugoſities of ſome naked receptacles.

The *receptacle of the flower*, in Linnæan language, means the area or ſpace between the ſtamens and ſtyles, in certain genera whoſe germen is inferior; as the whole umbelliferous order, in which the part in queſtion is more or leſs tumid, often coloured, and aſſumes a glandular aſpect. The *receptacle of the ſeeds* is not unfrequently a diſtinct part from the capſule or its valves, ſerving to connect the ſeeds therewith. (See an example of it in Reduтеа.) The *rachis*, or common ſtalk of a ſpike, or ſpikelet, in *Graſſes*, is alſo termed a receptacle.

In ſome plants the receptacle undergoes great changes, acquiring a different texture in the fruit, from what it had in the flower. Thus, the whole fruit, as we call it, of the Fig, (ſee Ficus,) is a common receptacle, at firſt coriaceous, and, like the reſt of the plant, containing a milky, ſomewhat acrid, juice. It forms a bag, lined with flowers or florets, and having a ſmall aperture at the top. After the flowers are paſt, this bag becomes pulpy, coloured, and full of ſweet aromatic juice. So the fruit of the Strawberry, (ſee Fragaria,) is but an originally ſmall dry receptacle, ſubſequently enlarged, and become pulpy, whoſe outſide is ſtudded with naked ſeeds. In *Brouſſonetia*, deſcribed under our article Papyrius, the ſeparate ſtalk of each germen becomes the enlarged and pulpy ſupporter of a naked ſeed. In Pollichia, (ſee that article,) the common receptacle of the flowers, minutely ſcaly, and hardly diſcernible, in its earlier ſtate, changes to a congeries of white, juicy, ſweet, tooth-like ſcales, elevating the ſeeds in their appropriate withered perianths, and altogether conſtituting one of the moſt extraordinary pulpy fruits that we have ever met with. A ſimilar change of ſubſtance is obſervable in the calyx of the Mulberry, as well as in *Commelina Zanonia*; a change common and natural in the germen of pulpy fruits, though rare in the particular parts of which we have been ſpeaking.

Receptaculum *Chyli*, in *Anatomy*, that portion of the trunk of the abſorbing veſſels, into which the lacteal abſorbents pour the fluids which they have taken up in the alimentary canal: it is uſually rather larger than the neighbouring portions of the veſſel, and ſometimes very conſiderably ſo. See Absorbents.

RECEPTARII, a term of reproach uſed for ſuch phyſicians as wrote pompous receipts for loads of medicines, more conſulting the good of the apothecary than the patient; as alſo for ſuch as gave receipts for general medicines, to be uſed at the diſcretion of people wholly unacquainted with the nature of diſeaſes.

RECEPTION, Receptio, in *Philoſophy*, denotes the ſame with *paſſion*, conſidered as oppoſed to *action*.

Reception is alſo properly uſed for the manner of treating or entertaining a perſon; and the ſolemnities and ceremonies practiſed on that occaſion. See Entry.

The reception of ambaſſadors is uſually performed with a great deal of pomp.

Reception is ſometimes alſo uſed for the act of approving, accepting, and admitting a thing. See Acceptance.

The canon law only binds where it is *received*: the civil law is received in ſome countries, and not in others.

The French would never *receive* the council of Trent, the Spaniſh inquiſition, nor the dogmata of the ultramontane canoniſts.

Reception,

Reception, in *Astrology*, is a dignity befalling two planets when they exchange houses; *e. gr.* when the sun arrives in Cancer, the house of the moon; and the moon, in her return, arrives in the sun's house.

The same term is also used, when two planets exchange exaltation.

RECEPTITIOUS Goods. See Goods.

RECESSION *of the Equinoxes*. See Precession *of the Equinoxes*.

RECESSUS, a word used by some medical writers to express an abscess, or aposthumation.

Recessus *Imperii, Recess of the Empire*, a phrase used in speaking of the affairs of Germany; signifying a collection of the votes or determinations of a diet.

At the end of each diet, before it breaks up, they gather together all their resolutions, and reduce them into writing; the act which contains them they call the *recessus imperii*, because made when on the point of retiring.

RECEY *sur Ousce*, in *Geography*, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the district of Chatillon; 15 miles S.E. of Chatillon. The place contains 880, and the canton 5913 inhabitants, on a territory of 260 kiliometres, in 17 communes.

RECHABITES, a kind of religious order among the ancient Jews, instituted by Jonadab the son of Rechab; and comprehending his family and posterity.

Their founder prescribed them three things: first, Not to drink any wine. Secondly, Not to build any houses, but to dwell under tents. Thirdly, Not to sow any corn, or plant any vines.

The Rechabites observed these rules with great strictness, as appears from Jerem. xxxv. 6, &c. Whence St. Jerom, in his thirteenth epistle to Paulinus, calls them *monachi, monks*. Jonadab, their founder, lived under Jehoash, king of Judah, contemporary with Jehu, king of Israel; his father Rechab, from whom his posterity were denominated, descended from Raguel or Jethro, father-in-law to Moses, who was a Kenite, or of the race of Ken; whence Kenite and Rechabite are used as synonimous in scripture.

The Kenites entered the promised land with the Hebrews, and dwelt in the tribe of Judah, about the Dead sea. They were distinguished from the Israelites by their retired sort of life, and by their contempt of cities and houses. Serrurius distinguishes the ancient Rechabites descended from, and instituted by, Jethro, from the new Rechabites of Jonadab. The injunction of Jonadab laid no obligation on the other Kenites, nor on the other descendants of Jethro. This they continued to observe above 300 years. Jehu began to reign A.M. 3120, and Jehoiakim, king of Judah, was put to death A.M. 3405, B.C. 599; but in the last year of Jehoiakim, king of Judah, Nebuchadnezzar coming to besiege Jerusalem, the Rechabites were forced to take refuge in the city, still, however, lodging in tents. During this siege, Jeremiah received orders from the Lord to converse with the disciples of Rechab, to invite them into the temple, and to offer them wine to drink. But the Rechabites would not accept the offer.

The Rechabites were, probably, led captive, after the taking of Jerusalem by the Chaldæans. (See Psalm lxx.) They returned from their captivity, and settled in the city of Jabez beyond Jordan. (See 1 Chron. ii. 55.) Some have suggested, that the Assidæans of the Maccabees, (1 Macc. ii. 42. vii. 13. and 2 Macc. xiv. 6.) were successors and followers of the Rechabites. Others have confounded them with the Essenes. But it is certain, that the manner of life of the Essenes was very different from that of the Rechabites, as appears from Josephus, Antiq. lib. xviii. cap. 2. who informs us, that the Essenes had fields, and inhabited houses, but had neither wives nor children; and did not perform their religious ceremonies with the other Jews at Jerusalem: all which was contrary to the practice of the Rechabites.

RECHACING, in *Hunting*, the driving back of the deer, or other beasts, into the forests, chaces, &c. which had straggled out into the copses or thickets, &c.

Anciently there were offices of rechacers of the deers bestowed by the king on gentlemen, or old hunters, with salaries for the keeping of running dogs to rechace the deer into the forests, and then to beat the dogs off, without pursuing any farther.

RECHANGE, in *Commerce*. See Re-exchange.

Rechange is also used at sea for such tackle as is kept in reserve aboard the ship, to serve in case of failure of that already in use. See Tackle.

The Levantines use the word *respect* or *respit* in the same sense.

RECHARGE *of a Fire Arm*, is a second loading, or charge. The recharge should never be so deep as the first charge, lest the piece, being over heated, should burst.

RECHBERG, in *Geography*, a town of Austria; eight miles N.W. of Grein.

RECHE, a river of France, which runs into the Amblave, near Malmedy.—Also, a town of England, in the county of Cambridge, on the river Cam, formerly a place of great trade, and before the draining of the fens, a port for vessels of considerable burthen; five miles W. of Newmarket.

RECHEAT, in *Hunting*, a lesson which the huntsman winds on the horn, when the hounds have lost their game, to call them back from pursuing a counter-scent.

RECHENBURG, in *Geography*, a town of Saxony, in the circle of Erzgeberg; four miles S.E. of Frauenstein.

RECHIA, a town of Servia; 100 miles W. of Nissa. N. lat. 43° 12'. E. long. 19° 3'.

RECHICOURT, a town of France, in the department of the Meurthe, and chief place of a canton, in the district of Sarrebourg; five miles N. of Blamont. The place contains 992, and the canton 8516 inhabitants, on a territory of $217\frac{1}{2}$ kiliometres, in 18 communes.

RECHNITZ, a town of Hungary; six miles S.S.W. of Guntz.

RECHPERG, a town of Austria; two miles N. of Stain.

RECIMUS, among the Romans, a kind of square mantle, or veil, worn by women on the head. Salmasius will have it to have been a sort of gown used by the Roman ladies, and tucked up before with a square pin, of a purple colour.

RECINA, in *Geography*, a town of the marquisate of Ancona; three miles N.W. of Macerata.

RECIPE, in *Medicine*, a prescription, or formula, of a remedy, appointed to be administered to a patient. See Prescription.

It is thus called, because always beginning with the word *recipe, take*; ordinarily expressed by the abbreviation ℞.

RECIPIANGLE, or Recipient-angle, a mathematical instrument, serving to take the quantity of angles; used especially in the drawing plans of fortifications.

The recipiangle was formerly a popular instrument among the French, but little known among us; it is usually very simple.

ſimple, in form of a ſquare, or rather a *bevel* (which ſee); conſiſting of two arms, or branches, rivetted together, and yet moveable, like a ſector, on the centre or rivet.

To take an angle with it, they lay the centre of a protractor to the joint, and the degrees cut by the edge ſhew the quantity of the angle: otherwiſe the angle made by the two rulers is drawn on paper, and then meaſured with a protractor.

Sometimes there is a circle divided into degrees added over the centre or rivet, with an index to ſhew the degrees without a protractor. At other times the under branch is divided.

To meaſure a ſaliant angle with any of the recipiangles, apply the inſides to the lines that form the angle; for a re-entering angle, apply the outſides, &c.

RECIPIENDO Excommunicato. See Excommunicato.

Recipiendo *et faciendo attornato.* See Attornato.

RECIPIENT, in *Chemiſtry*. See Receiver.

Recipient, *Italian*, a veſſel like a tea-pot, intended for the ſeparation of eſſential oils from the watery liquor on which they float.

Recipient *of an Air-pump*. See Receiver.

RECIPROCAL, Reciprocus, ſomething that is mutual, or which is returned equally on both ſides, or affects both parties alike.

The end of human ſociety is to afford each other reciprocal aid; there are reciprocal duties between the prince and his ſubjects, the huſband and wife, &c. There is a reciprocal action between the agent and patient.

The *lex talionis* eſtabliſhes a kind of reciprocation of juſtice.

If two ſimilar triangles be cut by parallel lines, the ſections of the ſides will be proportional; and reciprocally, if the ſides be cut proportionably, the triangles are ſimilar.

Reciprocal, in *Logic*, is applied to terms which have the ſame ſignification, or are convertible; as, *reaſonable animal* and *man*.

Schoolmen define *reciprocation* a converſion of the ſeveral terms in an enunciation. And terms are ſaid to be converted in an enunciation, when the predicate is put in the place of the ſubject, and, *reciprocally*, the ſubject in that of the predicate.

Thus, rationality and riſibility are ſaid to reciprocate; for we ſay equally, *a rational is riſible*, and *a riſible is rational.*

Reciprocal, in *Grammar*, is applied to certain verbs and pronouns in ſome of the modern languages; in regard of their turning or reflecting the noun, or perſon, upon himſelf.

Thus the pronoun relative, *himſelf*, refers Cato to Cato's ſelf.

The abbé de Dangeau defines reciprocal verbs to be thoſe whoſe nominative is plural, and denotes perſons acting mutually on one another: as, *Ces quatre hommes s'entrebattoient, theſe four men fought together; Pierre et toi vous vous louez, Peter and you praiſe one another*, &c.

Reciprocal verbs are a ſpecies of thoſe which that author calls *pronominals*, and which he diſtinguiſhes into reciprocal and identical.

Reciprocal, in *Poetry*, is applied to verſes which run the ſame both backwards and forwards; called alſo *recurrents.* See Retrograde.

Reciprocal, in *Arithmetic* and *Algebra*, is the quotient ariſing from the diviſion of unity by any number or quantity. Thus, the reciprocal of $a = \frac{1}{a}$, the reciprocal of $\frac{x}{y} = \frac{y}{x}$, and ſo on.

Reciprocal *Equations*, in *Algebra*, are thoſe equations which contain ſeveral pairs of roots which are the reciprocals of each other. Thus, an equation whoſe roots are $a, \frac{1}{a}$; $b, \frac{1}{b}$; &c. is called a reciprocal equation. Some authors define reciprocal equations, to be thoſe equations whoſe co-efficients proceed in the ſame order from both extremes, and reſpectively equal to each other: thus, $x^5 + a x^4 + b x^3 + b x^2 + a x + 1 = 0$, is a reciprocal equation; but this form ought rather to be conſidered as a neceſſary property of theſe equations, by which they may be readily diſtinguiſhed, than to be employed in the definition of them; it being doubtleſs the reciprocity of the roots from which they have received their peculiar appellation.

The ſolution of theſe equations may always be made to depend upon others of half the original degree, when the equation is of even dimenſions; or upon half the dimenſion *minus* 1, when it is odd.

Thus far, in fact, this property is not excluſively due to reciprocal equations, as the ſame may be done in all caſes where any ſimilar relation is known to have place between the roots of an equation, whether by multiplication, diviſion, addition, or ſubtraction; but in theſe caſes there is nothing in the form of the equation by which ſuch relations may be known to have place, whereas in reciprocal equations their reciprocity becomes immediately obvious by the peculiar order of their co-efficient, theſe being the ſame from both extremes, both with regard to ſign and magnitude. Hence any equation of the form

$$x^m + a x^{m-1} + b x^{m-2} + \ldots . b x^2 + a x + 1 = 0$$

is immediately known to be reciprocal, and we may proceed in its ſolution as follows.

Firſt, if the equation be of odd dimenſions, as

$$x^{2n+1} + a x^{2n} + b x^{2n-1} + \ldots . b x^2 + a x + 1 = 0,$$

then it is obvious that either $+ 1$, or $- 1$, is one of its roots, for either $+ 1$, or $- 1$, ſubſtituted for x, according as the ſigns of the co-efficients may require, will obviouſly render the whole expreſſion equal to zero, and is therefore a root of the equation. The equation may, therefore, be immediately reduced to another of lower dimenſions by diviſion, according to the known theory of equations; thus, let the propoſed equation be

$$x^5 - 5 x^4 + 7 x^3 + 7 x^2 - 5 x + 1 = 0.$$

Here $x = - 1$ is obviouſly one of the roots, as this ſubſtituted for x renders the whole equal to zero; and conſequently the whole equation is diviſible by $x + 1$, according to the known theory of equation, which diviſion being made, we have, for our reduced equation,

$$x^4 - 6 x^3 + 13 x^2 - 6 x + 1 = 0,$$

which is now of even dimenſion one degree leſs than the original equation, and ſtill reciprocal. We need, therefore, only conſider equations of the latter form; *viz.* thoſe of which the index of the higheſt power is an even number.

Let $x^{2n} + p x^{2n-1} + q x^{2n-2} + \text{\&c.}\ q x^2 + p x + 1 = 0$ be any reciprocal equation, whoſe roots are $a, \frac{1}{a}$; $b, \frac{1}{b}$;

c,

$c, \frac{1}{c}$, &c. Then from the theory of equations we may consider this to be made up of the factors $(x - a)\left(x - \frac{1}{a}\right)$ $(x - b)\left(x - \frac{1}{b}\right)(x - c)\left(x - \frac{1}{c}\right)$, &c.

Or, putting $a + \frac{1}{a} = m$, $b + \frac{1}{b} = n$, $c + \frac{1}{c} = r$, &c. these become

$$(x^2 + m x + 1)(x^2 + n x + 1)(x^2 + r x + 1), \text{ \&c.}$$

If, therefore, we really perform this multiplication, and equate the co-efficients, it is obvious, since the multiplication is reduced to half the number of factors, the equation by which the values of m, n, r, &c. are obtained, will be of only half the dimension of the original equation; and having found these, since

$$x^2 + m x + 1 = 0$$
$$x^2 + n x + 1 = 0$$
$$x^2 + r x + 1 = 0$$

we shall have $x = -\frac{m}{2} \pm \sqrt{\left(\frac{m^2}{4} - 1\right)}$

$$x = -\frac{n}{2} \pm \sqrt{\left(\frac{n^2}{4} - 1\right)}$$

$$x = -\frac{r}{2} \pm \sqrt{\left(\frac{r^2}{4} - 1\right)}, \text{ \&c.}$$

Thus, for example, let there be proposed the equation

$$x^4 + 5 x^3 + 7 x^2 + 5 x + 1 = 0.$$

Multiply together $x^2 + m x + 1$
and $x^2 + n x + 1$

$$x^4 + \left.\begin{matrix} m \\ +n \end{matrix}\right\} x^3 + \left.\begin{matrix} m n \\ +2 \end{matrix}\right\} x^2 + \left.\begin{matrix} m \\ +n \end{matrix}\right\} x + 1$$

Comparing the co-efficients, we have $m + n = 5$, and $m n + 2 = 7$.

Hence, $m = \frac{5 + \sqrt{5}}{2}$, and $n = \frac{5 - \sqrt{5}}{2}$

therefore, $x = \frac{5 + \sqrt{5}}{4} \pm \sqrt{\left(\frac{30 + 10\sqrt{5}}{16} - 1\right)}$

and $x = \frac{5 - \sqrt{5}}{4} \pm \sqrt{\left(\frac{30 - 10\sqrt{5}}{16} - 1\right)}$

which are the four roots of the proposed equation.

From the preceding principles are readily deduced the solution of all reciprocal equations under the 10th power.

3d degree. $x^3 + p x^2 + p x + 1 = 0$.

Find z in the simple equation $z + p - 1 = 0$, and call it r; then

$$x = -1,\ x = \tfrac{1}{2} r \pm \sqrt{(\tfrac{1}{4} r^2 - 1)}$$

4th degree. $x^4 + p x^3 + q x^2 + p x + 1 = 0$.

Find the two values of z in the equation $z^2 + p z + q - 2 = 0$, and call them r, r'; then

$$x = \tfrac{1}{2} r \pm \sqrt{(\tfrac{1}{4} r^2 - 1)},\ x = \tfrac{1}{2} r' \pm \sqrt{(\tfrac{1}{4} r'^2 - 1)}$$

5th deg. $x^5 + p x^4 + q x^3 + q x^2 + p x + 1 = 0$.

Find the two values of z in the equation $z^2 + (p - 1) z + q - p - 1 = 0$, and call them r, r'; then $x = -1$

$$x = \tfrac{1}{2} r \pm \sqrt{(\tfrac{1}{4} r^2 - 1)},\ x = \tfrac{1}{2} r' \pm \sqrt{(\tfrac{1}{4} r'^2 - 1)}$$

6th deg. $x^6 + p x^5 + q x^4 + r x^3 + q x^2 + p x + 1 = 0$.

Find the three values of z in the cubic equation $z^3 + p z^2 + (q - 3) z + r - 2p = 0$, and call them r, r', r''; then

$$x = \tfrac{1}{2} r \pm \sqrt{(\tfrac{1}{4} r^2 - 1)}\ x = \tfrac{1}{2} r' \pm \sqrt{(\tfrac{1}{4} r'^2 - 1)}$$
$$x = \tfrac{1}{2} r'' \pm \sqrt{(\tfrac{1}{4} r''^2 - 1)}$$

7th deg. $x^7 + p x^6 + q x^5 + r x^4 + r x^3 + q x^2 + p x + 1 = 0$

Find the three values of z in the cubic equation $z^3 + (p - 1) z^2 + (q - p - 2) z + r - p - q + 1 = 0$, and call them r, r', r''; then $x = -1$

$$x = \tfrac{1}{2} r \pm \sqrt{(\tfrac{1}{4} r^2 - 1)};\ x = \tfrac{1}{2} r' \pm \sqrt{(\tfrac{1}{4} r'^2 - 1)}$$
$$x = \tfrac{1}{2} r'' \pm \sqrt{(\tfrac{1}{4} r''^2 - 1)}$$

8th deg. $x^8 + p x^7 + q x^6 + \ldots\ q x^2 + p x + 1 = 0$.

Find the four values of z in the equation $z^4 + p z^3 + (q - 4) z^2 + (r - 3p) z + s - 2(q - 1) = 0$, and call them r, r', r'', r'''; then

$$x = \tfrac{1}{2} r \pm \sqrt{(\tfrac{1}{4} r^2 - 1)};\ x = \tfrac{1}{2} r' \pm \sqrt{(\tfrac{1}{4} r'^2 - 1)}$$
$$z = \tfrac{1}{2} r'' \pm \sqrt{(\tfrac{1}{4} r''^2 - 1)};\ x = \tfrac{1}{2} r''' \pm \sqrt{(\tfrac{1}{4} r'''^2 - 1)}$$

9th deg. $x^9 + p x^8 + q x^7 + \ldots\ q x^2 + p x + 1 = 0$.

Find the four values of z in the equation $z^4 + (p - 1) z^3 + (q - p - 3) z^2 + (r - q - 2p + 2) z + s - r - q + p + 1 = 0$, and call them r, r', r'', r'''; then $x = -1$

$$x = \tfrac{1}{2} r \pm \sqrt{(\tfrac{1}{4} r^2 - 1)};\ x = \tfrac{1}{2} r' \pm \sqrt{(\tfrac{1}{4} r'^2 - 1)}$$
$$x = \tfrac{1}{2} r'' \pm \sqrt{(\tfrac{1}{4} r''^2 - 1)};\ x = \tfrac{1}{2} r''' \pm \sqrt{(\tfrac{1}{4} r'''^2 - 1)}$$

A reciprocal equation of the 10th and higher powers, requires the general solution of equations of the 5th and higher powers, and therefore cannot be exhibited analytically. Bonnycastle's Algebra, vol. i.

Binomial equations are all reciprocal equations of a peculiar kind, which renders them all resolvable by means of certain trigonometrical formulæ.

Binomial equations are all reducible to the form $x^m \pm 1 = 0$; or $x^m = 1$; or $x^m = -1$. Where it is obvious, that if m is even, or $m = 2n$, then $x^{2n} = 1$ will have two real roots, *viz.* $+1$, and -1; and $x^{2n} = -1$ will have two of its imaginary roots $+\sqrt{-1}$, and $-\sqrt{-1}$; so that, in both cases, such an equation may be reduced two degrees lower, by dividing it by $x^2 - 1$, or $x^2 + 1$, and the resulting equation will be a reciprocal one, having each of its co-efficients equal to unity. If m be odd, then the equation will necessarily have one real root, and no more, which will be $+1$ in the first case, and -1 in the second; consequently, such an equation can be reduced but one degree, the same as those above stated. We may, therefore, find a direct solution for all binomial equations of odd dimensions as far as the 9th power, and of even dimensions as far as the 10th power, by the principles and formulæ already given, by merely making $p = 1$, $q = 1$, $r = 1$, &c. and it would, therefore, be useless to repeat them again in this place; we shall proceed immediately to the general solution of binomial equations, on the principles of analytical trigonometry.

All the imaginary roots of the equation

$$x^n - 1 = 0$$

are

are contained in the general formula

$$x^2 - 2 \text{ cos. } \frac{2 k \pi}{n} x + 1 = 0;$$

k being any integer not divisible by n, and π representing the semi-circumference. For it is a known trigonometrical property, that if

$$2 \text{ cos. } y = x + \frac{1}{x}, \text{ then } 2 \text{ cos. } n y = x^n + \frac{1}{x^n};$$

from which two equations we readily draw the two following; *viz.*

$$x^2 - 2 \text{ cos. } y \cdot x + 1 = 0$$
$$x^{2n} - 2 \text{ cos. } n y \cdot x^n + 1 = 0$$

which have necessarily one common root, being both derived from the same value of x; and since these are both reciprocal equations, if x be one root, $\frac{1}{x}$ will be another; they have therefore two roots common, and consequently, from the known theory of equations, the former is a divisor of the latter. If, now, we make $y = \frac{2 k \pi}{n}$, or $n y = 2 k \pi$, these equations become

$$x^2 - 2 \text{ cos. } \frac{2 k \pi}{n} x + 1 = 0$$
$$x^{2n} - 2 \text{ cos. } 2 k \pi x^n + 1 = 0$$

But the cos. $2 k \pi = 1$, 2π representing the whole circumference; therefore the latter equation is the same as

$$x^{2n} - 2 x^n + 1 = 0, \text{ or } (x^n - 1)^2 = 0,$$

having still for its divisor

$$x^2 - 2 \text{ cos. } \frac{2 k \pi}{n} x + 1 = 0;$$

that is, the roots of the equation

$$(x^n - 1)^2 = 0, \text{ or } x^n - 1 = 0,$$

are all contained in the general formula

$$x^2 - 2 \text{ cos. } \frac{2 k \pi}{n} x + 1 = 0;$$

and, therefore, by giving to k the successive values 1, 2, 3 . . . . $\frac{1}{2}(n - 1)$, the following formulæ will be obtained; *viz.*

$$x^2 - 2 \text{ cos. } \frac{2 \pi}{n} x + 1 = 0$$
$$x^2 - 2 \text{ cos. } \frac{4 \pi}{n} x + 1 = 0$$
$$x^2 - 2 \text{ cos. } \frac{6 \pi}{n} x + 1 = 0$$
$$\cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot$$
$$x^2 - 2 \text{ cos. } \frac{(n - 1) \pi}{n} x + 1 = 0$$

which contain among them all the imaginary roots of the equation $x^n - 1 = 0$.

And if, instead of making $y = \frac{2 k \pi}{n}$, as above, we make $y = \frac{(2 k + 1) \pi}{n}$, our second formula becomes

$$x^{2n} + 2 x^n + 1 = 0, \text{ or } (x^n + 1)^2 = 0;$$

because cos. $(2 k \pi + \pi) = -1$. Consequently, the equation $x^n + 1 = 0$, or $x^n = -1$, will have for its general factor

$$x^2 - 2 \text{ cos. } \frac{(2 k + 1) \pi}{n} x + 1 = 0;$$

which, by substituting for k as above, becomes

$$x^2 - 2 \text{ cos. } \frac{1 \pi}{n} x + 1 = 0$$
$$x^2 - 2 \text{ cos. } \frac{3 \pi}{n} x + 1 = 0$$
$$x^2 - 2 \text{ cos. } \frac{5 \pi}{n} x + 1 = 0$$

&c. &c. &c.

which formulæ contain all the imaginary roots of the binomial equation $x^n + 1 = 0$.

Suppose, for example, all the imaginary roots of the binomial equation $x^{11} - 1 = 0$ were required.

Here we should have

$$x^2 - 2 \text{ cos. } \frac{360^\circ}{11} x + 1 = 0$$
$$x^2 - 2 \text{ cos. } \frac{2 \cdot 360^\circ}{11} x + 1 = 0$$
$$x^2 - 2 \text{ cos. } \frac{3 \cdot 360^\circ}{11} x + 1 = 0$$
$$x^2 - 2 \text{ cos. } \frac{4 \cdot 360^\circ}{11} x + 1 = 0$$
$$x^2 - 2 \text{ cos. } \frac{5 \cdot 360^\circ}{11} x + 1 = 0$$

whence,

$$x = \text{cos. } \frac{360^\circ}{11} \pm \sqrt{\left(\text{cos.}^2 \frac{360^\circ}{11} - 1\right)}$$
$$x = \text{cos. } \frac{720^\circ}{11} \pm \sqrt{\left(\text{cos.}^2 \frac{720^\circ}{11} - 1\right)}$$
$$x = \text{cos. } \&c. \qquad \&c.$$

And if the roots of $x^{11} + 1 = 0$ were required, we should have from the second general formula

$$x^2 - 2 \text{ cos. } \frac{180^\circ}{11} x + 1 = 0$$
$$x^2 - 2 \text{ cos. } \frac{3 \cdot 180^\circ}{11} x + 1 = 0$$
$$x^2 - 2 \text{ cos. } \frac{5 \cdot 180}{11} x + 1 = 0$$

&c. &c.

Whence,

$$x = \text{cos. } \frac{180^\circ}{11} \pm \sqrt{\left(\text{cos.}^2 \frac{180^\circ}{11} - 1\right)}$$
$$x = \text{cos. } \frac{540^\circ}{11} \pm \sqrt{\left(\text{cos.}^2 \frac{540^\circ}{11} - 1\right)}$$
$$x = \text{cos. } \&c. \qquad \&c.$$

For more on this subject, see Barlow's Theory of Numbers, Bonnycastle's Algebra, and our article POLYGON.

RECIPROCAL *Figures*, in *Geometry*, are such as have the antecedents and consequents of the same ratio in both figures. See *Plate* XII. *Geom. fig.* 2. Here

A : B :: C : D, or,
12 : 4 :: 9 : 3

That

That is, as much longer as the fide A, in the firft rectangle, is than the fide B of the fecond rectangle; fo much deeper is the fide C in the fecond rectangle, than the fide D in the firft; and, confequently, the length of one is compenfated by the depth of the other.

Alfo, as the fide A is $\frac{1}{4}$ longer than the fide C, fo the fide B is $\frac{1}{4}$ longer than D: wherefore the rectangles muft be equal.

This is the foundation of that Catholic theorem; that the rectangle of the extremes muft always be equal to that of the means; and, confequently, the reafon of the rule of three, or golden rule.

For, fuppofe there were given any three numbers, or quantities, geometrically proportional, as A, B, and C; and, that it were required to find a fourth, D, proportional to them: fince $A : B :: C : D$, therefore $A D = B C$, and, confequently, $D = \frac{B C}{A}$; that is, the fourth term is equal to the quotient of the fecond, multiplied by the third term, divided by the firft.

Or, thus in numbers: fuppofe given 12, 4, and 9, required a fourth proportional. Now as $12 : 4 :: 9 : Q$. But $12 Q = 4 \times 9 = 36$. Therefore $Q = \frac{4 \times 9}{12} = 3$, by dividing both fides by 12.

And hence it follows, that if any two triangles, parallelograms, prifms, parallelepipeds, pyramids, cones, or cylinders, have their bafes and altitudes reciprocally proportional, thofe two figures or folids are equal to one another, and, *vice verfâ*, if they are equal, their bafes and altitudes are reciprocally proportional.

Reciprocal *Proportion*, is when in four numbers the fourth is lefs than the fecond by fo much as the third is greater than the firft; and *vice verfâ*. See Proportion.

This is the foundation of the inverfe, or indirect rule of three. Thus, $4 : 10 :: 8 : 6$.

Great ufe is made of this reciprocal proportion, by fir Ifaac Newton, and others, in demonftrating the laws of motion.

Reciprocal *Theorem*. See Theorem.

RECIPROCALLY, the property of being reciprocal; thus we fay, that in bodies of the fame weight, the denfity is reciprocally as the magnitude; *viz.* the greater the magnitude the lefs the denfity; and the lefs the magnitude the greater the denfity; fo again, the fpace being the fame, the velocity is reciprocally as the time, and the contrary.

RECIPROCITY. The law of reciprocity is a term ufed by Legendre, in his "Theorie des Nombres," to denote a reciprocal law, which has place between prime numbers of different forms; which is this; that m and n being prime odd numbers,

$$\text{the remainder of } m^{\frac{n-1}{2}} \div n =$$

$$\text{the remainder of } n^{\frac{m-1}{2}} \div m$$

provided m and n are not both of the form $4x - 1$, and if they are both of this form, then

$$\text{the remainder of } m^{\frac{n-1}{2}} \div n = -$$

$$\text{the remainder of } n^{\frac{m-1}{2}} \div m,$$

or they will have only contrary figns.

RECISSION, in *Law*. See Ademption.

RECIT, Fr, a generical term in mufic, for what is fung by a fingle voice. It is likewife applicable to inftruments; as, *recit de baffe, recit de hautbois,* a folo part for the violoncello or hautbois. Indeed *recit*, in French, feems fynonimous with the word folo in Italian, to whatever vocal or inftrumental part it is applied, in oppofition to *tutti*, or chorus, in which the whole band is employed.

Recit in France is not only a technical term in mufic, but in the drama, where, at the opening of a tragedy, or fubfequent to an event, it implies an account, a narration, the recital of an event. In the French and Italian tragedies, in imitation of the Greeks, battles and murders are always recited, but never tranfacted on the ftage.

RECITAL, in *Law*, the rehearfal, or making mention, in a deed or writing, of fomething which has been done before.

A recital is not conclufive, becaufe it is no direct affirmation; and by feigned recitals in a true deed, men might make what titles they pleafed, fince falfe recitals are not punifhable. If a perfon, by deed of affignment, recite that he is poffeffed of an intereft in certain lands, and affign it over by the deed, and become bound by bond to perform all the agreements in the deed; if he is not poffeffed of fuch intereft, the condition is broken; and though a recital of itfelf is nothing, yet being joined and confidered with the reft of the deed, it is material. And where it is but a recital, that before the indenture the parties were agreed to do fuch a thing, it is a covenant, and the deed itfelf confirms it. The recital of one leafe in another, is not a fufficient proof that there was fuch a leafe as is recited. But the recital of a leafe in a deed of releafe, is good evidence of a leafe againft the releffor, and thofe who claim under him. A new reverfionary leafe fhall commence from the delivery, where an old leafe is recited, and there is none, &c. A. recites that he hath nothing in fuch lands, and in truth he has an eftate there, and makes a leafe to B. for years; the recital is void, and the leafe good. In this cafe, if the recital were true, the leafe would not bind.

RECITATION, the act of reciting, or delivering a difcourfe, either in the way of narration, rehearfal, declamation, or the like.

RECITATIVO, Ital., *Recitative.* The Crufca Dictionary gives no more early authority for the ufe of this word, as a mufical term, than that of Batifta Doni, de Præft. Muf. Veteris, publifhed in 1647; who defines it, "a mufical compofition in an andante or plain ftyle, different from air: it is ufed in narrative poetry, in imitation of reciting on the ftage."

Rouffeau's definition is more full and clear. He terms it "a difcourfe, or fpeech, in mufical and harmonical tones. It is a melody nearly approaching to common fpeech; a mufical declamation, in which the mufician ought to imitate, as much as poffible, the inflexions of voice in declaiming. This melody is called recitative, becaufe it refembles a narration, a recital; and is ufed in the dialogue of mufical dramas."

We have prefented our readers, under the article Opera, with extracts from the prefaces of the poets and compofers by whom recitative was invented, as well as from contemporary writers, who thought its origin of fufficient importance to be recorded.

Giovanni Batifta Doni, about the middle of the 17th century, (Op. Omn. tom. ii. in Firenze, 1763, folio,) a learned and elegant writer on mufic, though extremely warped in his judgment by a predilection for the mufic of the ancients, in a differtation on the Origin of Stage-finging, during his own time, gives fo curious and inftructive an account of the firft operas that were performed at Florence, that we fhall tranflate a part of it.

"Some kind of *cantilena*, or melody, has been introduced in in dramatic reprefentations, at all times, either in the form of intermezzi (interludes), between the acts; or, occafionally, in the body and bufinefs of the piece. But it is ftill frefh in the memory of every one, when the whole drama was firft fet to mufic, and fung from the beginning to the end."

The revival of theatrical mufic was brought about by the invention of recitative, as we have already ftated in our article Opera.

"The beginning of this century (1600) was the era of mufical recitation on the public ftage at Florence, though it had been ufed there in feveral private exhibitions before. There refided in that city, during thefe times, fignor Gio. Bardi de' Conti di Vernio, who was afterwards called to the fervice of pope Clement VIII., by whom he was tenderly beloved, and made his maeftro di camera. This moft accomplifhed nobleman was particularly attached to the ftudy of antiquity, and to the theory and practice of mufic, to which he had applied himfelf for many years fo clofely, that he became, for the time in which he lived, a correct and good compofer. His houfe was the conftant rendezvous of all perfons of genius, and a kind of flourifhing academy, where the young nobility often affembled to pafs their leifure hours in laudable exercifes and learned difcourfe; but particularly on mufical fubjects, when it was the wifh of all the company to recover that art of which the ancients related fuch wonders, as well as other noble inventions, which had been ruined by the irruptions of barbarians.

"During thefe difcuffions, it was univerfally allowed that as modern mufic was extremely deficient in grace, and the expreffion of words, it became neceffary, in order to obviate thefe objections, that fome other fpecies of cantilena, or melody, fhould be tried, by which the words fhould not be rendered unintelligible, nor the verfe deftroyed."

Euridice was the firft mufical drama after the invention of recitative. It was written by Ottavio Rinuccini, fet by Jacopo Peri, and performed at Florence in 1600, on occafion of the marriage of Mary of Medicis with Henry IV. of France. The poem and the mufic were publifhed feparately the fame year. The poet, in his dedication to the queen of France, fays, "It is generally imagined that the tragedies of the ancient Greeks and Romans were entirely fung; but this noble kind of finging had not till now been revived, or even attempted, to my knowledge, by any one; and I ufed to think, that the inferiority of our mufic to that of the ancient was the caufe; till hearing the compofitions of Jacopo Peri to the fable of Daphne, I wholly changed my opinion. This drama, written merely as an experiment, pleafed fo much, that I was encouraged to produce Euridice, which was honoured with ftill more applaufe, when fung to the mufic of the fame compofer Jacopo Peri, who with wonderful art, unknown before, had merited the favour and protection of the grand duke our fovereign, it was exhibited in a moft magnificent manner at the nuptials of your majefty, in the prefence of the cardinal legate, and innumerable princes and nobles of Italy and France."

Such is the abridged hiftory of recitative. The only printed copy of the mufic to this primitive opera was in the library of the marchefe Rinuccini, a defcendant of the poet at Florence: in examining and making extracts from which, we obferved that it was printed in fcore, and barred; two very uncommon circumftances at the time of its publication; that the recitative feemed to have been not only the model of fubfequent compofers of early Italian operas, but of the French operas compofed by Lulli, a native of Florence; and that the time was as frequently changed as in the old French operas.

The confufion arifing from all the parts finging different words at the fame time, together with fome other circumftances, mentioned under Opera, account for the neceffity of a recitative, or a *mufica parlante*, a fpeaking mufic, and for folo finging in general on the ftage: befides, poetry was injured, and rendered unintelligible in fugues, canons, and in chorufes, full of imitations and contrivances, all unfit for narration and dialogue.

To defcribe the characteriftic difference of recitative from air, and common fpeech: it is not air, as no time is kept; it is not fpeech, as every inflexion of voice is in tune with fome one note of the inftrument by which it is accompanied; and as to the length or fhortnefs of the notes that are written, the accompanier watches for the accents or termination of phrafes, or lines in the verfe, to give the chord to which the note that is fung belongs.

It is fometimes accompanied by the orcheftra with *ritornelli*, or interftitial fymphonies; but then a regular time muft be kept. This only happens in folemn fcenes of dignity or diftrefs, and in foliloquies.

No flats or fharps are placed at the clef in recitative: thefe are all regarded as accidental; nor is Italian recitative ever confined to any one key.

After recitative was found, it was long ere any thing like an air appeared in thefe mufical dramas. (See Opera, Air, Motivo, and Measure.) Rouffeau has treated the article recitative at large, with great intelligence and good tafte.

Recitative *Style*, is the way of writing accommodated to this fort of mufic.

RECIV, La, in *Geography*, a well-fortified town of Brafil, in the jurifdiction of Fernambuco.

RECKENITZ, a river which feparates the duchy of Mecklenburg from Pomerania, and runs into a lake, which communicates with the Baltic near Ribnitz.

RECKHEIM, or Rekum, a town of France, in the department of the Lower Meufe, which gives name to a county, fituated on the W. fide of the Meufe, and furrounded by the bifhopric of Liege; 7 miles N. of Maeftricht.

RECKLING, in *Rural Economy*, a provincial word, fignifying the laft of the farrow or brood of pigs, poultry, or other forts of domeftic birds.

RECKLINGHAUSEN, in *Geography*, a town of Germany, fortified by a caftle, and capital of a county of the fame name, which is fituated between the bifhopric of Munfter, the duchy of Cleves, and the county of Mark; 16 miles S.S.W. of Munfter.

RECKON, in *Rural Economy*, a term fometimes applied to a pair of pot-hooks of a certain make, occafionally employed in dragging wells, ponds, &c.

RECKONING, in *Navigation*, the act of eftimating the quantity of a fhip's way; or of the diftance run between one place and another.

Or, more generally, a fhip's reckoning is that account, by which at any time it may be known where the fhip is, and on what courfe or courfes fhe is to fteer to gain her port. See Log-*Board*, Log-*Book*, and Journal.

This is ufually performed by means of the log-line; the manner of applying which, fee under its proper article, Log-*Line*.

Yet this is liable to great irregularities. Vitruvius advifes an axis to be paffed through the fides of the fhip, with two large heads projecting out of the fhip, in which are to be included wheels touching the water, by whofe revolution the fpace paffed over in any given time may be meafured. The fame has fince been recommended by Snellius; but

but there are few who have written of navigation, that have not ſhewn the inſufficiency of this method.

Reckoning, *Dead.* See Dead *Reckoning.*

RECKSON, in *Geography*, a town of Bengal; 6 miles E. of Calcutta.

RECLAIMING, or Reclaming, in our *Ancient Cuſtoms*, the action of a lord purſuing, proſecuting, and recalling his vaſſal, who had gone to live in another place, without his permiſſion.

Reclaiming is alſo uſed in a ſimilar ſenſe, for the demanding of a perſon or thing to be delivered up, or ſurrendered, to the prince or ſtate it properly belongs to; when, by any irregular means, it has come into the poſſeſſion of another.

Reclaiming, in *Falconry*, is the calling of a hawk, or bird of prey, back to the fiſt.

The ſparrow-hawk, gos-hawk, &c. are reclaimed with the voice; the falcon only by ſhaking the lure. So that the term luring, with regard to the falcon, is more proper than reclaiming.

The partridge is alſo ſaid to reclaim her young ones, when ſhe calls them together upon their ſcattering too much from her.

Reclaiming is alſo uſed for taming animals that are wild by nature.

Reclaiming, in a monaſtic ſenſe. See Religious.

Reclaiming *Lands*, in *Agriculture*, the buſineſs of reſtoring and bringing them into a ſtate of cultivation and improvement. There are various kinds and ſtates of land, which admit of this ſort of amelioration and improvement; as among the wet ſorts, all thoſe of the bay or eſtuary deſcription, which are waſhed and occaſionally covered by the ſea or other waters; different deſcriptions of fen lands, and thoſe of the more firm marſhy nature, and thoſe in more interior ſituations, which are of a looſe ſwampy or watery quality, as moraſſes and boggy grounds. And among thoſe of the more dry, hard, waſte, and wild deſcriptions; all the varieties of the rough ſtony ſorts of unimproved lands; the many different kinds of rough woody grounds; and the numerous ſorts of moory lands, as well as other varieties, which are now and then to be met with in particular circumſtances and ſituations.

The firſt of the wet or watery ſorts of land, noticed above, are far from being always ready, or in a ripe ſtate for admitting improvement of this nature; yet in different ſituations and circumſtances, they occaſionally permit of its being accompliſhed, without any great difficulty or trouble. See Embankment, and Embanking *againſt the Sea.*

The fenny and marſhy lands, where, in the former, they are wholly or only in a partial manner overgrown by uſeleſs aquatic plants; and in the latter, are become ſo firm as to bear paſturing ſtock, and to afford nutritious herbage for their growth and ſupport, but are notwithſtanding ſtill liable to be overflowed by high tides, or land floods; are, of courſe, capable of very great improvement in the above ways, as well as by many other means. See Fen, Fenny *Land*, Marsh *Land*, and Salt *Marſh.*

Theſe ſorts of watery lands are not incident to the flat bays and inlets of the ſea-coaſts, or the mouths of the large rivers, in a particular manner; but are met with in the more inland ſituations of the country, accompanying the larger rivers and waters in the more central parts of the kingdom: conſequently ſuch ſorts of improvement muſt be very extenſive in their nature, and of very great importance to the nation.

The other kinds of ſwampy watery lands, which are liable to be covered with that fluid during wet ſeaſons; thoſe on the ſides of lakes and ponds; the moraſſes which are choaked and grown up with aquatic vegetables, ſo as to have ſome ſort of hardiſh cruſt formed upon them; and the ſoft boggy lands, formed in ſomewhat ſimilar ways, are all capable of allowing great improvement, by ſuitable draining, and other methods of management. See Spring and Surface *Draining*, Swamp, Bog, and Morass.

Lands of the above kinds are moſtly met with on the lower ſlopes, or at the feet of hilly grounds; being cauſed by the ſtagnation of water in their internal parts, which has the effect of chilling and rendering them too moiſt for the production of a nutritious and uſeful herbage, as well as of promoting the growth of coarſe plants of the aquatic nature, though their ſituations may occaſionally have ſome degree of relative height.

There are many valuable tracts of land of theſe kinds, in many different parts of the iſland, which have been already reclaimed by theſe methods of proceeding; which ſhould have the effect of ſtimulating the owners of ſuch lands in other places, where they ſtill remain unimproved, to exert themſelves in getting them reclaimed.

Among the more dry kinds of unreclaimed lands, the firſt, or thoſe of a rough, ſtony, waſte quality, are all thoſe in the vallies of hilly or mountainous tracts, on the ſkirts or lower parts of mountainous heights, and the rough ſtony lands, fit for cultivation, in other ſituations. They are the moſt readily reclaimed and improved, in the leſs hilly ſorts of lands and ſituations. In ſome caſes, where the ſurfaces of the ground were in a great meaſure covered by large rocks and ſtones of great ſizes, very hard in their qualities, and of ſcarcely any value, the lands have been reclaimed, and brought into an arable ſtate, and let for high rents: the ſtones which were removed paying, in a great degree, the expences of the labour; they being exported and ſold as paving-ſtones, and for other uſes to the metropolis. And though this cannot always be done, it ſhews what is capable of being performed by induſtry and perſeverance; and that, where ſurface ſtones can be turned to uſeful purpoſes, the moſt rugged and barren lands may be reclaimed with advantage, under proper modes of management. In ſuch inſtances, inſtead of leaving the ſurfaces of the grounds in worſe ſtates than they were before, by being taken up with pits, and heaps of uſeleſs rubbiſh, which buried the better moulds, as is common in working ſuperficial quarries, the pits and other hollows were levelled, and filled up to ſome height, with the coarſe and rubbiſh materials produced in the courſe of the works, and the finer mould from other parts thrown back upon the above ſub-ſoil materials, ſo as to form an even top-ſoil; the larger ſpaces of the ground being trenched over to a good depth, leaving the beſt ſoil on the ſurface. It is ſuggeſted, that by following ſimilar eaſy methods of management, in carrying on other undertakings of the ſame kind, lands of a value in proportion to that of the materials which are removed, may commonly be *created*, without incurring any very great expence. Hence it is thought to behove thoſe who have the direction and management of landed eſtates, that comprehend grounds of theſe ſorts, to examine and conſider well whether the ſtony materials which they contain, and encumber their ſurfaces, cannot be turned or converted to ſome profitable purpoſe, by the means of roads, iron railways, canals, or ſome other eaſy mode of conveyance for ſuch heavy ſubſtances.

It muſt be noticed, however, that the method of levelling and trenching over the lands by the ſpade, in ſuch circumſtances, can only be practiſed in a very few caſes, where labour is particularly cheap.

There is another deſcription of ſtony lands, of a much leſs lefs formidable nature, which frequently ftands in need of being reclaimed, and in which the furface is lefs encumbered than the interior parts of the foil. In thefe cafes, the interrupting materials are rather large ftones than rocks, though the latter may fometimes in part form them. The means which are beft fuited to the bringing of thefe into a profitable ftate of cultivation, are to be found in the more northern parts of the ifland, in the practice and exertions of particular fpirited individuals. The plan of the improvement is perfectly fimple, but it is expenfive in its performance; the whole of the lands being trenched over, by means of the fpade, to a proper depth, as from one to two feet. The ftones which are not wanted for ufe are thrown into pits, and the hollow parts, to contribute to their being made level, and fometimes into the deep trenches formed in digging, being firft covered over with the worft of the earthy materials, upon which the better moulds and turfy fubftance, which are ftirred in the work, are fpread out as a foil, by which the whole is rendered very fuitable for agricultural purpofes.

The coft of reclaiming lands in this way depends, in fome meafure, on the caft of furface in the lands, the nature of the interrupting matters, and the depth of the earthy fubftances to be removed, in raifing a fufficiency of mould for forming the furface foil: but from five to twenty pounds the acre may be confidered as the limits of the charges.

And this, it is fuppofed, leaves an ample profit in the fale of fuch lands, or otherwife, in thefe fituations where tythes are not taken, and where the rates and taxes are fo very few and trifling, and where labour and living is fo cheap. It can now, however, be done in this manner in but few inftances, as has been already noticed.

It is, notwithftanding, believed that there are very many lands, not only in thefe northern parts, but in England and Wales, that would more than repay the expences of this fpirited mode of improvement. It may be remarked, that where the ftones are very large, or where fragments of rocks are met with, in thefe undertakings, they may be got rid of either by blafting, or rending their upper parts, or by finking them in the foil, fo as to allow the plough to pafs over them with fafety.

The former method is more fuited to the foft forts of ftones; the latter to thofe of the harder kinds.

Such rocky grounds as are common in hilly and mountainous fituations, which, on account of their climate, and the compact nature of the rocky materials, as well as their quantity, are incapable of being cleared as corn-lands, or fo as to admit the plough, may often be reclaimed and improved as pafture lands for fheep, &c. or fometimes as hay lands. The plan of proceeding, in thefe cafes, is that of removing the ftony matter from the furface, and allowing it entirely to the growth of graffy herbage; the means of accomplifhing which are fimilar to thofe already noticed, but the coft confiderably lefs: the main intention here being merely the fmoothing of the furface ground, for the purpofes of pafturing or mowing; but the more the ftony fubftances are covered with good earthy mould, the better and greater will be the quantity of produce. See TILLAGE.

There are many rough woody tracts of ground, of the fhrubby or other kinds, which may be cleared and reclaimed with vaft advantage to their proprietors, as well as the community in general, as corn-lands, or for other ufes. The moft ufual method of accomplifhing this fort of improvement has been to dig out the whole of the roots, whether of low woods or timber woods, at the time of removing the tops, fo as to admit the plough immediately. In performing this in this way, however, where the ftools are of the timber kind, numerous and large, deep breaking of the ground is often neceffary, which is laborious and expenfive; and rotten wood, mould, leaves, and other furface matters, are apt to be left in mixture with the infertile or poifonous fub-ftrata. As lands, cleared and reclaimed in this manner, have been known to remain in a *raw* unprofitable condition, for feveral years, although limed, dunged, and raifed in fharp ridges, in order to its amelioration.

This improper practice has confequently been highly difadvantageous, injurious, and ruinous, and thrown much difficulty and interruption in the way of clearing and reclaiming fuch wafte lands for the growth of corn, however fuitable they may be for the purpofe in the nature of their foils and fituations, thereby tending to propagate and fupport the notion, that fuch forts of land will not repay the expences and trouble of being improved.

But from attending to what has naturally happened to the cleared parts of wood-lands, it will be feen that a depth of fertile mould, refting on lefs fertile fubftances, form a regular foil and fub-foil, which are free from the roots of trees, ready to receive the plough, and afford corn crops in due fucceffion. This is fuppofed to take place fomewhat in this way. The trees having been fuffered to become decayed, or more properly cut down in due feafon, and the brufh or underwood cut and cleared away from time to time by the occupiers, while fuch commons or other places were fully or too much ftocked with cattle and fheep, the young fhoots were of courfe browzed off and nibbled away quite to the ftumps, confequently weakened, and at length finally deftroyed. The roots and other parts foon followed this courfe, and paffed into a ftate of vegetable mould, increafing and enriching the foil at the fame time. Nay, this may, in the natural ftate, it is fuppofed, be, in fome meafure, effected alone by the grazing animals, as it is effential to their exiftence.

This natural procefs, however affifted in this way, is flow, requiring a length of time for its completion; yet by proper means of art, well applied, it may be accomplifhed in a few years; the larger roots being extracted from the ground, inftead of waiting for their reduction by a flow decay, without any unneceffary difturbance of the fub-foil; and then filling in the pits by the roughneffes of the natural furface: by which means the cleared ground will be fmoothed, and made fit in due time for being cultivated. Where the furface is much incumbered with leaves and rotten woody matters, they are to be raked up, and put into heaps to decay; or they may be burnt, and the afhes fpread out over the furface of the land. Proper draining and further levelling muft likewife take place, where neceffary; as well as harrowing or hacking the furface fward, fo as to fow it with proper grafs feeds; again raking off any rubbifh that may arife, and then rolling the whole quite fmooth for mowing. It fhould be ftocked hard, efpecially with fheep, mowing off occafionally any woody fhoots that may be permitted to arife; keeping the whole in the ftate of clofe pafturage, until the fmaller roots, which were left, be fo decayed as to become obedient to the plough-fhare. At this period, but not before, fuch pafture ground may be broken up for grain crops in proper fucceffion.

The procefs might be haftened by the ufe of lime, or other calcareous matters in union with the vegetable fubftances which were removed, as they would be fooner diffolved or reduced, and the compoft be more rich. And by fpreading them out on the land a fimilar effect might be produced, and a finer fort of herbage be encouraged, which would caufe a clofer bite, and fooner bring the land into a more

more thick fet ftate of fward, which is the prolific matrix for corn crops.

The really neceffary expence of reclaiming and bringing thefe kinds of wooded lands into a ftate of cultivation, by thefe means, is inconfiderable, particularly where fuel is dear. Where the timber wood is properly cut down by the axe, and the underwood taken off rather below the furface, the larger roots, and the ftubs which are left, will, in fome inftances, more than repay the coft of the clearing and levelling the furface. And the other expences will be repaid by the immediate production of a pafture ground, the value of which is conftantly increafing without any further charge, until it may probably be worth two or three times what the lands were while they were in the woody condition.

In cafes where fuel is cheap, and particularly when the timber wood is rapidly fallen, as in the barking feafon, they may be cut off by the faw level with the furface of the land; the ftools and large fuperficial roots being after that carefully difbarked to fome inches within the ground, fo as to prevent their throwing out fhoots to injure the furface and keep the roots alive. In this way the ftools will be fo decayed in a few years as to be capable of being removed with little trouble or expence. See Tillage.

In clearing and reclaiming moory lands where they are too wet, the firft ftep is that of properly draining them; they are afterwards brought into cultivation and to their full value by other means, fuch as in large undertakings, by fuitable divifions of the lands into fields proper for the farm or farms to which they are to be laid, and fo ditched as that the furface water may be effectually taken off, without having deep, open, expenfive troublefome drains in other parts; the furface of each field being adjufted in fuch a manner as to fhoot off the rain water into the interfecting ditches, in order to prevent injury from happening, in that way, fo as to impede the cultivation for any length of time.

As the furfaces of thefe kinds of land are moftly rugged and uneven, as well as of a loofe fpongy texture, which unfits them for the tillage proceffes, without previous affiftance from hand labour; where the moory earth, or vegetable mould, is deep, and rifes to the furface uncovered by foffile matters, fome length of time is requifite to bring it to that folidity and firmnefs of texture which is fuited to the common arable purpofes. Hence the general principle of improving deep moory lands, where there is no foffile covering, is fuppofed to be the fame as that advifed for bringing woodlands into cultivation; namely, that of converting them to a profitable ftate of herbage, before corn crops are attempted to be produced.

The procefs muft be guided and regulated by the nature and fituation of the tract to be improved. Where the furface is very irregular, full of inequalities, and of an abrupt nature, it muft firft be adjufted fo as to admit the means of tillage when they can be properly had recourfe to, and for carrying away the furface waters in the manner already noticed. Then to pare off the leffer hillocks and rifings, as the tufts and haffocks which were formed during its wet ftate, and more or lefs of its general furface, fo as to remove the coarfe plants and ftale mould which occupy it, and thereby produce a frefhnefs in the whole.

In dry feafons, when the furface has fufficient firmnefs to bear the tread of animals, the paring may be done by the plough for that purpofe, but in other cafes by the breaftplough or paring-fpade. When the furface has been cut over in this manner, and any part has the appearance of being too wet, as may be judged of by the colour of the mould, in fome degree, covered drains are to be formed in fuch places, which may commonly be made in a cheap and durable manner by the firm fibrous tufts collected from the furface. The reft of the roots and mould which were pared off fhould be burnt, and their afhes fpread evenly over the furface, being immediately raked or harrowed into the foil. At this period of the improvement almoft any kind of foffile material can be thrown over the afhes at a little expence; and a full quantity of different grafs feeds be covered in with it; leaving the furface to take on a fward without any further trouble or outlay of money.

Afterwards the graffy herbage is to be kept clofely fed down when the weather will permit, firft by fheep and then by heavier forts of ftock, until the furface becomes firm and the foil is well bound together by the fibrous roots of the herbage, fo as to be capable of affording corn crops in proper fucceffion.

It has been objected to this fummary mode of bringing the land into the ftate of herbage, that there are no immediate grofs returns for the money laid out in reclaiming and bringing it into the cultivable ftate. But although corn cannot be raifed on fuch raw loofe-textured forts of land at firft, potatoes are found to anfwer well, and rape with ftill more advantage in its culture, the labour attending it, and the profit which it affords. See Moor, Moory-*Land*, Spring and Surface *Draining*, &c. See alfo the Invernefsfhire Agricultural Report.

The reclaiming and bringing lands of thefe feveral different defcriptions into a ftate of cultivation and improvement is evidently a work of very great importance, particularly in a country where the population is getting too numerous for the produce, as by fuch means the extent of agricultural territory may be juftly faid to be increafed. Extenfive improvements of thefe kinds have lately taken place in Cornwall, and fome other fouthern diftricts.

Reclaiming *Plantations and Timber Woods*, in *Rural Economy*, the reftoring of fuch as have grown into a wild, neglected, and improper ftate from fome fort of mifmanagement, or want of attention. The caufes which have a tendency to produce this effect are very numerous, and have been the means of vaft individual as well as national lofs. One material and very frequent caufe is the neglect of their boundary fences; another is the miftaken notion of its being the beft practice to leave them entirely to nature after they are once properly planted; a third is the very abfurd fuppofition, that nothing fhould be done to them for a length of time after planting, in the way of rendering the trees more thin among themfelves, or in their branches; and laftly, an univerfal careleffnefs and difregard of them, frequently from the narrow conception of expence being incurred without the chance of any immediate return of profit. It is, on the whole, much too common to take great care in firft forming the plantations, without ever thinking or taking any fort of intereft in their after-management. But the bufinefs is by no means accomplifhed in the fimple act or operation of planting out the trees. Good examples of this kind of management are indeed few, but they occafionally exift, and much has been written on the matter, fo that information may be readily obtained. And there is every inducement to get it; as well prepared, inclofed, planted, cultivated and managed plantations, will far outgrow others that have exifted for a much longer time, but have been otherwife treated, often affording more than woods of three times their length of ftanding.

In directing the proper management in all cafes of this nature, fome attention muft be paid to the particular kinds of the plantation which they may be, in the firft place; after which, the means of reducing them to their appropriate ftates, or to fome other in the moft eafy and convenient manner,

manner, may be taken into confideration. It may often happen that their proper originally intended ftates cannot be attempted, but that which has been gradually acquired muft be promoted. With a view to the accomplifhment of thofe intentions, plantations may be confidered as confifting either of hard woods only, of evergreen or refinous trees only, or of both thefe forts of trees in mixture.

In the firft of thefe kinds, or thofe which are compofed folely of the hard-wooded forts of trees and plants, where they are to be brought to the ftate of woods, as timber trees and undergrowths, and the latter to be ufed only as fuel, the good trees of fuch kinds as are fuitable to the foil, and the probable demand of the vicinity and other parts, fhould be fixed upon, and left as ftandard trees; the whole of the others being cut over by the furface of the ground, fo that they may become ftools for fupplying the undergrowths. When this has been performed, the ground, where neceffary, fhould be dug, hoed, or trenched over, as circumftances may direct; but where the trees and underwoods have been much crowded, thefe kinds of work will feldom be required. However, if, inftead of the common underwood, oak be required, then after pitching upon the moft proper and fuitable ftandard trees for remaining, the whole of the reft are to be taken up by the roots, the land dug over, and acorns planted out upon it; which, when they are grown up, muft be kept clean and free from weeds for fome years, in order to promote their healthy growths and rifing to the ftate of young trees.

Where the whole is to be reduced to the ftate of copfe wood for fuel only, the beft way is to cut over every part by the furface of the ground; and when for bark, to root out the whole, only referving the oaks, and planting with acorns, as already noticed.

In cafe the grove forms are to be produced, the moft fuitable and appropriate trees are to be left at proper diftances, and the whole of the remainder taken out by the roots; after which the ground fhould have the proper culture, until the trees are incapable of being injured by cattle ftock; at which time the whole may be laid down with natural grafs feeds.

In the fecond forts of plantations, where they have remained, after planting, without being in any way thinned, for a great many years, they are often, in a great meafure, incapable of being remedied, as they are, for the moft part, fo overpowered by each other, that their growth is fufpended; wherever any thinning takes place, the trees all around are deftroyed. In thefe cafes it is the advice of fome to have the whole grubbed up by the roots and replanted, after the ground has been properly prepared by fallowing and repeated corn crops. But as there may fometimes be much lofs in this way, it may be proper to try the cautious thinning of them, which fhould be done during the latter fummer months in a careful manner, as fuccefs has occafionally attended this method.

With natural plantations of this kind under twenty years' growth, and artificial ones under ten, much advantage has been gained by fuitable cautious thinning and retrenching. In all thefe cafes there is no neceffity whatever for the cultivation of the ground, as the trees fuffer few or no plants to rife below them, and befides, injury may be done to their fuperficial roots.

The management in the laft or mixed kinds of plantations, where the evergreen trees are in fuch proportions as not to admit of either of the above modes, is to reduce them to the grove plan only, or to this in fome parts and the wood kind in others; the modes of accomplifhing both of which have been already laid down. However, in each of thefe methods, it will frequently happen that the tree or trees which are the moft advantageous and defirable in the parts where the plantations exift, are either very deficient, or wholly wanting. In all fuch inftances it is probably the beft and moft beneficial practice to grub up nearly the whole of fuch trees, and replant the ground with the proper fort or forts; care being taken to leave fuch a number of the old trees, either in a fcattered manner, or in narrow ftripes and fcreens, for fheltering and protecting the young trees, plants, and feeds, which have been put in, planted, or fown. See PLANTATION and WOOD.

It may be noticed that in reclaiming all kinds of wild and neglected plantations in lands which are inclined to the retention of moifture; the firft thing which is neceffary is invariably that of the removal of the ftagnant wetnefs, as where this is not properly performed, the other operations will be of but little avail, however well they may be executed. In many extenfive tracts of this nature, the injury which is fuftained by this fort of neglect is fcarcely to be calculated. There are many thoufands of acres, in different fituations in this country, which would by this means alone be brought to twenty times and more their prefent value. And as this fort of work in fuch cafes can, for the moft part, be accomplifhed by open cuts or gutters alone, at a very trifling expence in comparifon of that for arable and fome other forts of land, it fhould never be neglected where good management is in the leaft degree attended to. See SPRING and SURFACE *Draining*.

It is a material point in reclaiming all thefe forts of plantations and timber woods, to keep the furrounding ditches and fences well up and in a proper fafe ftate, as large tracts are often completely ruined in a very fhort time by inattention in this refpect, from the cropping, rubbing, and deftruction in other ways produced by the entrance of cattle of different kinds into them. There is hardly any thing fo injurious to the more young timber plantations as cattle being fuffered to get into them. See FENCE.

The retrenching of old ill-managed plantations of thefe kinds fhould conftantly be done in a very gradual manner, having due regard to their length of ftanding, the nature of the trees, the quality of the land, the fituation and expofure, as well as fome other points. Their outfide parts are in general to be left more thick and clofe, than thofe which are more in the interior, and the parts of the foil which are of a bad thin quality, fhould be left lefs thick of trees and plants than where it is of greater depth and richnefs. And open expofures fhould be kept more thick and clofe than where they are more warm and fheltered.

In retrenching the branches of the different trees, the work fhould be performed according to the length of time the trees have been growing, their particular growths and fizes, the difference of kind, and the ufes, purpofes, and intentions for which their wood or other parts are defigned. It is always proper to ftop rather fhort, than to carry it to an extreme, as there is fometimes danger in the latter cafe. See PRUNING.

It is always neceffary and effential to reclaim thefe old wild forts of plantations as foon as poffible, as the forming of new tracts of this kind chiefly benefit pofterity, while the ameliorating and improving of the other, by thefe means, are an immediate and direct gain to the prefent proprietors, of very great national importance at the prefent time, and which would otherwife be complete lofs to both.

No forts of woods of the timber kind fhould indeed ever be fuffered to remain any great length of time without being properly looked over and put into fuch ftates as that they may go on in the moft beneficial and profitable manner, as where

where they are in any way or by any means reftricted or impeded in their growths, there is a conftant and continual lofs taking place, and the ultimate difadvantage is prodigioufly great, as the timber never becomes either fo good or in fuch quantity; of courfe it is of inferior value in both refpects, which makes a difference of much confequence to the proprietors as well as to the nation at large. See Wood.

RECLINATION *of a Plane*, in *Dialling*, the number of degrees which a dial-plane leans backwards, from an exactly upright or vertical plane, *i. e.* from the zenith.

The reclination is eafily found, by means of a ruler, and a quadrant; for having drawn an horizontal line on the plane by a level or quadrant, and to it another line at right angles, apply a ruler, fo that one end of it may hang over, or reach beyond the plane; then will a quadrant, applied to the under edge of the ruler, fhew the degrees and minutes of the plane's reclination; counting from that fide of the quadrant that is contiguous to the edge of the ruler.

RECLINATUM Folium, in *Botany*, a leaf whofe point is curved downwards, below the level of the bafe. See Leaf.

RECLINATUS Caulis, a reclined ftem, is bent towards the earth, as in many fpecies of *Ficus*, *Salix*, *Rubus*, &c.

RECLINER, or Reclining *Dial*, is a dial whofe plane reclines from the perpendicular; *i. e.* leans from you when you ftand before it.

When this reclination is equal to the height of the pole, the dial is faid to be equinoctial. See Dial.

Recliner, *Declining*, or *Declining reclining dial*, is a dial which neither ftands perpendicularly, nor oppofite to one of the cardinal points. See Dial.

RECLUSE, among *Religious*, a perfon clofe fhut up in a very narrow cell of an hermitage, or other religious houfe; and cut off, not only from all converfation with the world, but even with the houfe.

The word is chiefly ufed for fuch as thus imprifon themfelves out of devotion, to do penance. It is fometimes alfo applied to incontinent wives, whom their hufbands procure to be thus kept in a perpetual prifon in fome convent.

Reclufes were anciently very numerous; they were then a kind of folitaries who fhut themfelves up in fome little cell, with a vow never to ftir out of it.

None were admitted to this oath until they had given fufficient proofs of their abftinence, and had leave from the bifhop, or the abbot of the monaftery where they were fhut up; for the cells of the reclufes were always to join to fome monaftery.

The prelate's permiffion being obtained, they were tried for a year in the monaftery; out of which, during that time, they never ftirred.

They were then admitted to their vow of ftability in the church before the bifhop; which being done, and the reclufe having entered his little cell, the bifhop fet his feal on the door.

The cell was to be very fmall, and very exactly clofed. The reclufe was to have every thing within it neceffary to life; and even, if he were a prieft, an oratory confecrated by the bifhop, with a window which looked into the church, through which he might make his offerings at the mafs, hear the finging, fing himfelf with the community, and anfwer thofe who talked to him. But this window was to have curtains before it, both withinfide and without; fo that the reclufe might neither fee, nor be feen.

Indeed he was allowed a little garden in his reclufion, to plant a few herbs, and take frefh air; adjoining to his cell was that of his difciples, which he was very rarely without; with a window, through which they ferved him with neceffaries, and received his inftructions.

When it was judged proper to have two or three reclufes together, their cells were made contiguous to each other with windows of communication; if any woman would confult them, or confefs to them, it was to be in the church, and in the face of all the world.

Where there were two or three reclufes together, they were never to hold any conference, but on fpiritual matters, and to confefs to each other; where there was but one, he was to confefs and examine himfelf.

If the reclufe fell fick, his door was opened for people to come in and affift him; but he was not allowed to ftir out on any pretence whatever.

Thefe articles are extracted from the rule, compiled for the reclufes, by Grimlaic, a prieft in the ninth century.

There were alfo women reclufes, who led the fame life, in proportion. St. Viborade lived a reclufe at St. Gall, and was there martyred by the Hungarians in 825.

RECLUSION, the ftate of a reclufe; or the cell and other appurtenances of it.

F. Helyot gives a particular account of the ceremonies practifed in the reclufion of a woman, in that of mother de Cambray, inftitutrix of the order of the reprefentation of Nôtre Dame. A cell being built for her in 1625, adjoining to the church of St. Andrew, in Tournay, the bifhop waited for her early in the morning at the church-door. Upon her arrival, proftrating herfelf at the feet of that prelate, he gave her his benediction; conducted her to the grand altar; and there bleffing a mantle, veil, and fcapular, he put them on her, and gave her a new name.

Having here made her vow, and the bifhop having harangued the people in praife of the new reclufe, he conducted her proceffionally to her reclufion; the clergy all the way finging *Veni, fponfa Chrifti*, &c.

Here the bifhop, bleffing her afrefh, confecrated the reclufion, and fhut her up in perpetual confinement.

RECOGNISANCE. See Recognizance.

RECOGNITION, Recognitio, denotes an acknowledgment. The word is particularly ufed in our law-books, for the title of the firft chapter of the ftat. 1 Jac. I. by which the parliament acknowledged the crown of England, after the death of queen Elizabeth, to have rightfully defcended to king James.

Recognitions *of Clement*, in *Ecclefiaftical Hiftory*, a fuppofititious or apocryphal book, afcribed to St. Clement, but really compofed by fome learned and eloquent man in the fecond century. Rufinus, who tranflated the ten books of Recognitions out of Greek into Latin, in whofe tranflation only we now have them, plainly fuppofes them to have been written by Clement of Rome; but that the copies, in his time, had been corrupted in fome places. The firft ecclefiaftical writer who has mentioned this work is Origen, by whom it is cited twice; but he does not feem to have held it in high eftimation. Eufebius, who is fuppofed to mention the Recognitions under the title of "The Acts of Peter," which made a part of them, rejects thefe, and owns no work for St. Clement, but his epiftle to the Corinthians. Epiphanius mentions "The Travels of Peter" as written by Clement, but corrupted by the Ebionites, fo that little was left that is genuine. St. Jerome's opinion of the works of Clement coincides with that of Eufebius. This book is, for a large part of it at leaft, fays the learned Dr. Lardner, a fiction or romance, in which divers things concerning the Chriftian religion are reprefented in a philofophical manner, in order to render them more agreeable to the Greeks. It is called the "Circuits," or "Travels and Acts of Peter," from its subject, as it contains an account of the apostle Peter's disputes with Simon Magus, and his discourses to other people, and his miracles. It is called the "Recognitions," from Clement's recognizing his father, and mother, and brethren, who had been long separated from each other.

Mr. Whiston, though he allows that this work was not written by Clement himself, supposes that it was the production of some of the hearers of Clement, and other companions of the apostles; but Dr. Lardner is of opinion, that it must be reckonod to be Clement's, or to be supposititious. With regard to the age of this work, Lardner farther adds, that the arguments here urged against Heathenism seem to imply, that the Christian was not yet the prevailing established religion. And the author often speaks of the power of Christians to heal diseases, and to expel dæmons, as if it was common in his time. That such gifts were enjoyed by many Christians in the second, and in the beginning of the third, century, we are assured by Irenæus, Tertullian, Origen, and others; after which time, or however after the end of the third century, they were not so common, if they did not quite cease. Mr. Whiston's opinion of this book is, that if it be not, in some sense or other, itself a sacred book, yet it ought certainly to be esteemed in the next degree to that of the really sacred books of the New Testament. But in the opinion of many other learned men, it is a worthless piece, of little or no use. It contains, however, as Dr. Lardner suggests, some excellent sentiments, and fine passages, intermixed with very great faults, for which no excuse can be made. This book contains passages of our four gospels, though it has been doubted whether he used the four, or some one gospel containing in it all these. Its author seems to own the first epistle of St. John, and the book of the Revelation. He was also well acquainted with the book of the Acts of the Apostles; but it is not certain how far he owned it. The passages from St. Paul's epistles are not sufficient to prove, that they were esteemed by this writer to be of authority. The author does not seem, indeed, to have any great kindness for the apostle Paul, and on this account he made little use of his epistles, and of the Acts of the Apostles. From his sly insinuations, and injurious reflections upon St. Paul, it may be suspected that he was a mere Ebionite; the ancients assuring us, that this sect of Christians rejected the authority of that apostle and his epistles. The author bears testimony to many principal facts of the New Testament. He gives an account of our Lord's temptation; he mentions the choice of the 12 apostles, and afterwards of other 72 disciples. In one place he speaks of the 12 apostles in such a manner as if he intended to exclude Paul from the honour of the apostleship, and even to deny him the character of a sufficient and faithful "preacher of Christ's word." We have also, in this book, relations of the miracles of our blessed Lord's ministry, and of his death and resurrection, and the extraordinary signs attending these events. Grabe's Preface to the Writings of St. Clement in his "Spicilegium." Coteler apud Patr. Apost. tom. i. p. 484. Lardner's Works, vol. ii. p. 342, &c. See *Clementine* HOMILIES.

RECOGNITION, in the *Drama*. See DISCOVERY.

RECOGNITIONE *adnullanda per vim et duritiem facta*, in *Law*, is a writ to the justices of the common bench for sending a record touching a recognizance, which the recognizor suggests to have been acknowledged by force and hard dealing; that, if it so appear, it may be annulled.

Transcriptio Recognitionis facta coram justitiariis itinerantibus. See TRANSCRIPTIO.

RECOGNITORS, RECOGNITORES. The jury impanelled upon an assize are called recognitors, because they acknowledge a disseisin by their verdict.

RECOGNIZANCE, or RECOGNISANCE, a bond or obligation of record acknowledged to the king; testifying the *recognizor* to owe to the *recognizee* a certain sum of money; with condition to do some particular act, as to appear at the assizes, to keep the peace, to pay a debt, or the like.

It is thus called, because recognized, or acknowleged in some court of record, or before some judge, master in chancery, or justice of the peace.

It is, in most respects, like another bond; the difference being chiefly this: that the bond is the creation of a fresh debt or obligation *de novo*, whereas the recognizance is an acknowledgment of a former debt upon record; the form of which is "A B. doth acknowledge to our lord the king, to the plaintiff, to C. D., or the like, the sum of ten pounds," with condition to be void on performance of the thing stipulated; in which case the king, the plaintiff, C. D., &c. is called the "cognizee," *is cui cognoscitur*, or recognizee, as he that enters into the recognizance is called the "cognizor," or recognizor, *is qui cognoscit*. This, being either certified to, or taken by the officer of some court, is witnessed only by the record of that court, and not by the party's seal; so that it is not in strict propriety a deed, though the effects of it are greater than a common obligation; being allowed a priority in point of payment, and binding the lands of the cognizor, from the time of enrolment on record. Stat. 29 Car. II. c. 3.

There are also recognizances for *bail* (which see), others for appearing at the sessions to prosecute a felon, others for good behaviour, &c. See GOOD *Abearing*.

There are also other recognizances of a private kind, in nature of a STATUTE *Staple*, (which see,) by virtue of the statute 23 Hen. VIII. cap. 6. which are a charge upon real property. This recognizance is a security, acknowledged before either of the chief justices, or (out of term) before their substitutes, the mayor of the staple at Westminster, and the recorder of London: by which the benefit of their mercantile transactions is extended to all the king's subjects in general by the above cited statute 23 Hen. VIII. c. 6. amended by 8 Geo. I. c. 25, which direct such recognizances to be enrolled and certified into chancery. But these, by the statute of frauds, 29 Car. II. c. 3. are only binding upon the lands in the hands of *bonâ fide* purchasors, from the day of their enrolment, which is ordered to be marked upon the record.

RECOGNIZANCE is also used, in our *Ancient Statutes*, for the verdict of the twelve jurors impanelled upon an assize; hence called *recognitors*.

RECOGNIZEE, or COGNIZEE, is he to whom one is bound in a recognizance. He that is so bound is called *recognizor*.

RECOIL, or REBOUND, the resilition of a body, chiefly a fire-arm; or the motion by which, upon explosion, it starts or flies backwards; the cause of which is the impelling force of the powder, which acts equally on the breech and on the ball; so that if the piece and ball were of equal weight, and other circumstances the same, the piece would recoil with the same velocity as that with which the ball is discharged; but the heavier any body is, the less will its velocity be, when the force impelling it continues the same. Therefore so many times as the cannon and carriages are heavier than the ball, just as many times will the velocity of the cannon be less than that of the ball; and the space through which the cannon recoils whilst the ball moves along

along the cylinder, is to the length of the cannon diminiſhed by the ſpace behind the ball, as the weight of the ball is to the weight of the cannon. Let a twenty-four pounder of ten feet be 6400 pounds weight, and when the ball quits the piece, the cannon will have recoiled $\frac{24}{6400} \times 10 = \frac{3}{80}$ of a foot, leſs than half an inch.

The greater the charge, *cæteris paribus*, the greater the rebound. By an experiment made before the Royal Society, and related in the Philoſophical Tranſactions, it was found, that cannons, charged to a certain degree, throw the ball from right to left of their own direction; but that the cannons themſelves recoil from left to right.

Some of the gentlemen of the French academy doubting the juſtneſs of the obſervation, M. Caſſini, the younger, undertook to repeat the experiment; which he did by means of a machine, as like that uſed in England as he could: and that tried over and over again.

The reſult was, that the ball, when the gun had liberty to recoil, was always thrown to the right of the point to which it was thrown when the gun was fixed without a poſſibility of rebounding; but then the recoil was always made the ſame way, *viz.* to the right; and he never found that contrariety of directions between the ball and the rebound, obſerved in the Engliſh experiment. See Hiſt. Acad. R. Scienc. A. 1703. p. 120, &c.

The cauſe of the phenomenon ſeems very difficult to aſſign; for ſuppoſing the guns of a common make, with the touch-hole on the top, we cannot ſo much as gueſs what cauſe ſhould conſtantly determine the ball from right to left; unleſs ſome very material circumſtances be omitted in the recital they have given us in the experiment.

Guns whoſe vents are a little forward in the chaſe recoil moſt. To leſſen the recoil of a gun, the platforms are generally made ſloping towards the embraſures of the battery. See PROJECTILES.

RECOLATION, a method of fining the decoctions of vegetables, &c. by repeated percolation, or ſtraining them ſeveral times ſucceſſively through a linen or woollen-bag.

RECOLLECTION, a mode of thinking, by which thoſe ideas, ſought after by the mind, are with pain and endeavour found, and brought again to view. See MEMORY and IMAGINATION.

RECOLLETS, a congregation of reformed Franciſcans, called alſo *friers minor of St. Francis, of the ſtrict obſervance.* They were eſtabliſhed about the year 1532, when ſome religious of the order of St. Francis being willing to keep his rule to the letter, Clement VII. gave them houſes, whither they might retire, and receive ſuch as were diſpoſed to follow them. The ſame year he approved the reform; and in 1584 it was carried from Italy into France, where theſe religious had already been eſtabliſhed, in the towns of Tulles in Limoiſin, and Murat in Auvergne. They had a convent at Paris in 1603; and ſince they have erected no leſs than a hundred and fifty in the whole kingdom, where they are divided into ſeven provinces.

RECOLOGNE, in *Geography*, a town of France, in the department of the Doubs; eight miles W. of Beſançon.

RECOMMENDATI. See AFFIDAVIT.

RECOMMENDATION, in a *Military Senſe*, denotes a certificate, ſtating an individual to be properly qualified for a ſituation in the army. This certificate muſt be ſigned by a field-officer in the regulars, addreſſed to the commanding officer of the regiment, by whom it is forwarded to the commander-in-chief, who lays the name of the perſon recommended before the king.

RECOMPOSITION, in *Chemiſtry*, the compounding of bodies from their ſeparated parts, or principles, ſo as to compoſe the original whole again. This is extremely difficult to effect univerſally, but in ſome caſes it may be done, and that ſo perfectly, that the recompoſed body ſhall not be diſtinguiſhable by the ſenſes from that which had never been ſeparated by the fire. If the art of chemiſtry were perfect, we ſhould thus be able, at leaſt in ſome degree, to recompoſe all the bodies we divide; but this is far from being the caſe at preſent. We can by no means do this in vegetable and animal bodies, where there is a vaſcular ſtructure, and therefore we are carefully to diſtinguiſh between the regeneration of organized, and that of unorganized bodies.

RECONCILIARI, in our *Law Books*, &c. A church is ſaid *reconciliari*, to be reconciled, when it is conſecrated afreſh, after having been polluted or profaned; as by the poſſeſſion of pagans, heretics, &c.

RECONCILIATION *of Penitents*, in *Church Hiſtory*, See POENITENTES.

RECONNOITRE, in *War*, implies to view and examine the ſtate of things, in order to make a report of them.

The word is French, ſignifying, literally, *to know, recollect.*

We ſay to reconnoitre the coaſts, to reconnoitre a port, &c. A body of horſe was ſent to reconnoitre their camp, the ground, the condition of the roads, rivers, &c.

Parties ordered to reconnoitre, are to obſerve the country and the enemy; to remark the routes, conveniencies, and inconveniencies of the firſt; the poſition, march, or forces of the ſecond. In either caſe, they ſhould have an expert geographer, capable of taking plans readily; he ſhould be the beſt mounted of the whole, that in caſe the enemy happen to ſcatter the eſcort, he may ſave his works and ideas.

All parties that go for reconnoitring only, ſhould be but few in number: never more than twelve or twenty men. An officer, be his rank what it will, cannot decline going with ſo few under his command: the honour is amply made up by the importance of the expedition, frequently of the moſt intereſting conſequence, and the propereſt to recommend the prudence, bravery, and addreſs of any officer that has the fortune to ſucceed.

It is previouſly neceſſary that the officer ordered on this duty ſhould be well acquainted with the country, the roads, and the diſtance of the enemy. His party muſt conſiſt of men of approved fidelity, part of whom ſhould be diſguiſed. This detachment muſt march off in the night. The men muſt have ſtrict orders neither to ſmoke tobacco, make a noiſe, nor ſpeak. The officer muſt be provided with two guides, who are to be ſtrictly interrogated, but are to remain ignorant of the route you intend to take. A detachment of this kind ſhould be furniſhed with ſubſiſtence for two or three days. The horſes are to be fed every two or three leagues, for it is abſolutely neceſſary that they ſhould be always freſh and fit for duty. The officer will take care never to halt, but at a diſtance from any road, and alſo take every precaution to prevent his being ſurpriſed, whilſt his horſes are feeding, &c.

RECONNOITRE is alſo uſed at ſea. To reconnoitre a veſſel, a fleet, &c. is to approach near enough to examine the rate and burden of a veſſel, &c. the force it may have aboard, what nation it is of, &c.

To reconnoitre a land, or ſhore, is to obſerve its ſituation, in order to find what land it is.

RECORD, RECORDIUM, in *Law*, an authentic teſtimony of any thing in writing, contained in rolls of parchment, and preſerved in a court of record. See COURT, and CUSTOM.

Records

Records are said to be *vetustatis & veritatis vestigia*. So early as the Conquest we find the "*præteritorum memoria eventorum*" reckoned up as one of the chief qualifications of those who were held to be "*legibus patriæ optimé instituti.*" For it is an established rule to abide by former precedents, where the same points come again in litigation; as well to keep the scale of justice even and steady, and not liable to waver with every new judge's opinion, as also because the law in that case being solemnly declared and determined, what before was uncertain, and perhaps indifferent, is now become a permanent rule, which it is not in the breast of any subsequent judge to alter or vary from, according to his private sentiments: he being sworn to determine not according to his own private judgment, but according to the known law and custom of the land; not delegated to pronounce a new law, but to maintain and expound the old one. Yet this rule admits of exception, where the former determination is most evidently contrary to reason; much more if it be clearly contrary to the divine law. But even in such cases the subsequent judges donot pretend to make a new law, but to vindicate the old one from misrepresentation. For if it be found that the former decision is manifestly absurd or unjust, it is declared, not that such a sentence was *bad law*, but that it was *not law*, that is, that it is not the established custom of the realm, as has been erroneously determined. An act committed to writing in any of the king's courts, during the term in which it is written, is alterable, being no record; but that term once ended, and the act inrolled, it is a record, and of such credit as admits no alteration, or proof to the contrary.

It is a settled rule and maxim that nothing shall be averred against a record (see COURT,) nor shall any plea, or even proof, be admitted to the contrary. (Co. Litt. 260.) And if the existence of a record be denied, it shall be tried by nothing but itself; that is, upon bare inspection whether there be any such record or no; else there would be no end of disputes. But if there appears any mistake of the clerk in making up such record, the court will direct him to amend it. Courts of record, or repositories for the public records of the kingdom, were first established by Edward I., our English Justinian, some of which are more ancient than the reign of his father, and those were by him collected.

Lawyers reckon three sorts of records; *viz.* a *judicial* record, as attainder, &c.; a *ministerial* record upon oath, as an office of inquisition found; and a record made by *conveyance* and consent, as a fine, or deed inrolled, and the like.

RECORD, *Assurances by matter of*, are such as do not entirely depend on the act or consent of the parties themselves; but the sanction of a court of record is called in, to substantiate, preserve, and be a perpetual testimony of the transfer of property from one man to another; or of its establishment, when already transferred: of this nature are private acts of parliament, the king's grants, fines, and common recoveries.

RECORD, *Court of*. See RECORD, supra, and COURT.

RECORD, *Debt of*, is a sum of money, which appears to be due by the evidence of a court of record. Thus, when a specific sum is adjudged to be due from the defendant to the plaintiff, on an action or suit at law, this is a contract of the highest nature, being established by the sentence of a court of judicature. Debts upon recognizances, together with statutes merchant, and statutes staple, &c. if forfeited by non-performance of the condition, are also debts of record; the contract, on which they are founded, being witnessed by the highest kind of evidence, *viz.* by matter of record.

RECORDS, *Imbezzling of*. See IMBEZZLE.

RECORD, *matter, muster, oyer, prisoner upon matter of*, see MATTER, MUSTER, OYER, and PRISONER, &c.

RECORD, *Trial by*, is used only in one particular instance; where a matter of record is pleaded in any action, as a fine, a judgment, or the like; and the opposite party pleads "*nul tiel record*," that is, there is no such matter of record existing: upon this, issue is tendered and joined in the following form, "and this he prays may be enquired of by *the record*, and the other doth the like;" and hereupon the party pleading the record has a day given him to bring it in, and proclamation is made in court for him "to bring forth his record, or he shall be condemned:" and, on his failure, his antagonist shall have judgment to recover. The trial of this issue is, therefore, merely by the record; for, as sir Edward Coke observes (1 Inst. 117. 260.), a record or enrolment is a monument of so high a nature, and imputeth in itself such absolute verity, that if it be pleaded there is no such record, it shall not receive any trial by witness, jury, or otherwise, but only by itself. Thus, titles of nobility shall be tried by the king's writ or patent only, which is matter of record. (6 Rep. 53.) Also in case of an alien, whether alien, friend, or enemy, shall be tried by the league or treaty between his sovereign and our's; for every league or treaty is of record. (9 Rep. 31.) And also whether a manor be held in ancient demesne or not, shall be tried by the record of Domesday in the king's exchequer. Blackst. Com. book iii.

RECORD, among *Fowlers*. A bird is said to record, when it begins to tune or sing within itself; or to form its notes and dispose its organs for singing.

The cock thrush is distinguished from the hen in recording; the first being more loud and frequent in it than the second.

Instances have been known of birds beginning to record when they were not a month old. This first essay does not seem to have the least rudiments of the future song; but as the bird grows older and stronger, one may perceive what the nestling is aiming at. A young bird commonly continues to record for ten or eleven months, when he is able to execute every part of his song, which afterwards continues fixed, and is scarcely ever altered. The term record is probably derived from a musical instrument, formerly used in England, called a *recorder*, which seems to have been a species of flute, and was probably used to teach young birds to pipe tunes. Lord Bacon describes this instrument (in his second Century of Experiments) to have been straight, to have had a lesser and greater bore, both above and below, to have required very little breath from the blower, and to have had what he calls a fipple or stopper.

RECORDARI *facias loquelam*, in *Law*, a writ directed to the sheriff to remove a cause depending in an inferior court, as hundred-court, county-court, court of ancient demesne, &c. to the king's bench, or common pleas, &c.

It is thus called, because it commands the sheriff to *make a record* of the proceedings either by himself, or others; and then to send up the cause.

RECORDE, ROBERT, in *Biography*, an early English physician, of Welsh origin, commenced his education at Oxford about the year 1525; and in 1531 was elected fellow of All-Souls' College. Directing his studies to physic, but where, or under what masters, we are not told, he was created doctor in that faculty at Cambridge in 1545. Both before and after this period he is said to have taught arithmetic at Oxford, and to have excelled all his predecessors fors in rendering this branch of knowledge clear and familiar. He is likewife mentioned as remarkably fkilled in rhetoric, aftronomy, geometry, mufic, mineralogy, and every part of natural hiftory. He was well acquainted with the Saxon language, and made large collections of hiftorical and other ancient manufcripts. To thefe various ftudies he joined that of divinity, and was attached to the principles of the Reformers. But notwithftanding he was juftly deemed a prodigy of learning and talents, it does not appear that he met with encouragement at all adequate to his merits; fince all that we know further of him is, that he died in the king's bench prifon, where he was confined for debt, in the year 1558.

He was author of feveral works, fome of which were feveral times reprinted, on the following fubjects.

"The Ground of Arts, teaching the Work and Practice of Arithmetic, both in whole Numbers and Fractions," 1540. This was dedicated to king Edward VI. "The Whetftone of Wit," a fecond part of the former. "The Path-way to Knowledge, containing the firft Principles of Geometry." "The Caftle of Knowledge, containing the Explanation of the Sphere." "The Urinal of Phyfick," 1547, which was reprinted in London in 1582, 1599, and 1665; and in the laft mentioned year, the title of "The Judicial of Urines" was given to it. This book contains a defcription of urinary veffels with figures. It is a fhort, but very methodical treatife, full of divifions and fubdivifions relative to the different kinds of urines, and the prognoftics to be deduced from them. Neverthelefs he candidly acknowledges at the beginning, that the judgment to be formed in difeafes from the urine is not fo certain as fome have reprefented; and indeed the perplexity and variety of opinions concerning this fubject are fufficiently apparent from his treatife. His other works were, "Of Anatomy;" "Of Auricular Confeffion;" "Of the Eucharift;" and "The Image of a true Commonwealth." Aikin's Biog. Memoirs of Medicine.

RECORDER, Recordator, a perfon whom the mayor, or other chief magiftrate of any city, or town corporate, having jurifdiction, and a court of record, within their precincts, does affociate with him, for his better direction in matters of juftice, and proceedings according to law. He is ufually a counfellor, or other perfon, verfed and experienced in the law. In fome towns, which have their particular affizes within themfelves, and no mayor, the recorder is the judge.

The recorder of London is one of the juftices of oyer and terminer, and a juftice of peace of the quorum, for putting the laws in execution for preferving the peace and government of the city; and being the mouth of the city, he delivers the fentences and judgments of the courts therein, and alfo certifies and records the city cuftoms, &c. He is chofen by the lord mayor and aldermen, and attends the bufinefs of the city, on any warning by the lord mayor, &c.

Recorder, in *Mufic*. See Record, fupra.

RECORDO & *proceffu mittendis*, in *Law*, is a writ to call a record, together with the whole proceedings in the caufe, out of an inferior court into the king's court.

RECOVERY, in a legal fenfe, an obtaining of any thing by judgment, or trial at law; anfwering to *evictio* among the civilians.

There is a *true* and a *feigned* recovery.

Recovery, *True*, is an actual or real recovery of any thing, or of the value of it, by judgment. As if a man fue for any land, or other thing, and have a verdict or judgment for him.

Recovery, *Feigned* or *Common*, is a fort of *fictio juris*, being a certain form or courfe prefcribed by law to be obferved for the better affuring of lands and tenements to us; the end and effect of which is, to difcontinue and deftroy eftates-tail, remainders, and reverfions, and to bar the intails of them.

Thefe common recoveries were invented by the ecclefiaftics to elude the ftatutes of mortmain; and afterwards encouraged by the fineffe of the courts of law in 12 Edw. IV. in order to put an end to all fettered inheritances, and bar not only eftates-tail, but alfo all remainders and reverfions expectant thereon.

A common recovery is fo far like a *fine* (which fee), that it is a fuit or action, either actual or fictitious; and in it the lands are *recovered* againft the tenant of the freehold; which recovery, being a fuppofed adjudication of the right, binds all perfons, and vefts a free and abfolute fee-fimple in the recoveror.

This recovery is either with a *fingle* or *double voucher*; and fometimes a treble or farther voucher, as the exigency of the cafe may require.

As a recovery is in the nature of an action at law, not immediately compromifed like a fine, but carried through every regular ftage of proceeding, its form and method are not eafily underftood by thofe who are unacquainted with the courfe of judicial proceedings. Judge Blackftone has, therefore, ftated its nature and progrefs as clearly and concifely as poffible; avoiding, to the utmoft of his power, all technical terms and phrafes not before interpreted. Of his luminous ftatement we fhall avail ourfelves in the fequel of this article.

Let us (fays he), in the firft place, fupppofe David Edwards to be tenant of the freehold, and defirous to fuffer a common recovery, in order to bar all entails, remainders, and reverfions, and to convey the fame in fee-fimple to Francis Golding. To effect this, Golding is to bring an action againft him for the lands; and he accordingly fues out a writ, called a *præcipe quod reddat*, becaufe thofe were its initial or moft operative words, when the law proceedings were in Latin. In this writ the demandant, Golding, alleges, that the defendant, Edwards, (here called the tenant) has no legal title to the land; but that he came into poffeffion of it after one Hugh Hunt had turned the demandant out of it. The fubfequent proceedings are made up into a record or recovery roll, in which the writ and complaint of the demandant are firft recited; whereupon the tenant appears, and calls upon one Jacob Morland, who is fuppofed, at the original purchafe, to have warranted the title to the tenant; and thereupon he prays, that the faid Jacob Morland may be called in to defend the title, which he fo warranted. This is called the *voucher*, *vocatio*, or calling of Jacob Morland to warranty; and Morland is called the *vouchee*. Upon this, Jacob Morland, the vouchee, appears, is impleaded, and defends the title. Whereupon Golding, the demandant, defires leave of the court to *imparl*, or confer with the vouchee in private; which is (as ufual) allowed him. And foon afterwards the demandant, Golding, returns to court, but Morland the vouchee difappears, or makes the default. Whereupon judgment is given for the demandant, Golding, now called the recoveror, to recover the lands in queftion againft the tenant, Edwards, who is now the recoveree: and Edwards has judgment to recover of Jacob Morland lands of equal value, in recompenfe for the lands fo warranted by him, and now loft by his default; which is agreeable to the doctrine of warranty. This is called the recompenfe, or *recovery in value*. But Jacob Morland having no lands of his own, being ufually the cryer of the court

court (who, from being frequently thus vouched, is called the *common vouchee*) it is plain that Edwards has only a nominal recompenſe for the lands ſo recovered againſt him by Golding; which lands are now abſolutely veſted in the ſaid recoveror by judgment of law, and ſeiſin thereof is delivered by the ſheriff of the county. So that this colluſive recovery operates merely in the nature of a conveyance in fee-ſimple, from Edwards the tenant in tail, to Golding the purchaſor.

The recovery, here deſcribed, is with a ſingle voucher only; but ſometimes it is with *double*, *treble*, or farther voucher, as the exigency of the caſe may require. And indeed it is now uſual always to have a recovery with double voucher at the leaſt: by firſt conveying an eſtate of freehold to any indifferent perſon, againſt whom the *præcipe* is brought; and then he vouches the tenant in tail, who vouches over the common vouchee. For, if a recovery be had immediately againſt tenant in tail, it bars only ſuch eſtate in the premiſes of which he is then actually ſeiſed; whereas if the recovery be had againſt another perſon, and the tenant in tail be vouched, it bars every latent right and intereſt which he may have in the lands recovered. If Edwards therefore be tenant of the freehold in poſſeſſion, and John Barker be tenant in tail in remainder, here Edwards doth firſt vouch Barker, and then Barker vouches Jacob Morland the common vouchee; who is always the laſt perſon vouched, and always makes default: whereby the demandant, Golding, recovers the land againſt the tenant Edwards, and Edwards recovers a recompenſe of equal value againſt Barker the firſt vouchee; who recovers the like againſt Morland the common vouchee, againſt whom ſuch ideal recovery in value is always ultimately awarded.

This ſuppoſed recompenſe in value is the reaſon why the iſſue in tail is held to be barred by a common recovery. For if the recoveree ſhould obtain a recompenſe in lands from the common vouchee (which there is a poſſibility in contemplation of law, though a very improbable one, of his doing) theſe lands would ſupply the place of thoſe ſo recovered from him by colluſion, and would deſcend to the iſſue in tail. This reaſon will alſo hold with equal force, as to *moſt* remainder-men and reverſioners; to whom the poſſibility will remain and revert, as a full recompenſe for the reality, which they were otherwiſe entitled to: but it will not *always* hold; and therefore, as Pigott ſays, the judges have been even *aſtuti*, in inventing other reaſons to maintain the authority of recoveries. And, in particular, it hath been ſaid, that, though the eſtate-tail is gone from the recoveree, yet it is not *deſtroyed*, but only *transferred*; and ſtill ſubſiſts, and will ever continue to ſubſiſt (by conſtruction of law) in the recoveror, his heirs, and aſſigns: and, as the eſtate-tail ſo continues to ſubſiſt for ever, the remainders or reverſions expectant on the determination of ſuch eſtate-tail can never take place.

To ſuch awkward ſhifts, ſuch ſubtile refinements, and ſuch ſtrange reaſoning, were our anceſtors obliged to have recourſe, in order to get the better of that ſtubborn ſtatute *de donis*. The deſign, for which theſe contrivances were ſet on foot, was certainly laudable; the unrivetting the fetters of eſtates-tail, which were attended with a legion of miſchiefs to the commonwealth: but, while we applaud the end, we cannot but admire the means. Our modern courts of juſtice have indeed adopted a more manly way of treating the ſubject; by conſidering common recoveries in no other light, than as the formal mode of conveyance, by which tenant in tail is enabled to aliene his lands. But, ſince the ill conſequences of fettered inheritances are now generally ſeen and allowed, and of courſe the utility and expedience of ſetting them at liberty are apparent; it hath often been wiſhed, that the proceſs of this conveyance was ſhortened, and rendered leſs ſubject to niceties, by either totally repealing the ſtatute *de donis*; which perhaps, by reviving the old doctrine of conditional fees, might give birth to many litigations: or by veſting in every tenant in tail of full age the ſame abſolute fee-ſimple at once, which now he may obtain whenever he pleaſes, by the colluſive fiction of a common recovery; though this might poſſibly bear hard upon thoſe in remainder or reverſion, by abridging the chances they would otherwiſe frequently have, as no recovery can be ſuffered in the intervals between term and term, which ſometimes continue for near five months together: or, laſtly, by empowering the tenant in tail to bar the eſtate-tail by a ſolemn deed, to be made in term time and enrolled in ſome court of record; which is liable to neither of the other objections, and is warranted not only by the uſage of our American colonies, and the deciſions of our own courts of juſtice, which allow a tenant in tail (without fine or recovery) to appoint his eſtate to any charitable uſe, but alſo by the precedent of the ſtatute 21 Jac. I. c. 19. which, in caſe of a bankrupt tenant in tail, empowers his commiſſioners to ſell the eſtate at any time, by deed indented and enrolled. And if, in ſo national a concern, the emoluments of the officers, concerned in paſſing recoveries, are thought to be worthy attention, thoſe might be provided for in the fees to be paid upon each enrolment.

The *force* and *effect* of common recoveries may appear, from what has been ſaid, to be an abſolute bar not only of all eſtates-tail, but of remainders and reverſions expectant on the determination of ſuch eſtates. So that a tenant in tail may, by this method of aſſurance, convey the lands held in tail to the recoveror, his heirs and aſſigns, abſolutely free and diſcharged of all conditions and limitations in tail, and of all remainders and reverſions. But, by ſtatute 34 and 35 Hen. VIII. c. 20. no recovery had againſt tenant in tail, of the king's gift, whereof the remainder or reverſion is in the king, ſhall bar ſuch eſtate-tail, or the remainder or reverſion of the crown. And by the ſtatute 11 Hen. VII. c. 20. no woman, after her huſband's death, ſhall ſuffer a recovery of lands ſettled on her by her huſband, or ſettled on her huſband and her by any of his anceſtors. And by ſtatute 14 Eliz. c. 8. no tenant for life, of any ſort, can ſuffer a recovery, ſo as to bind them in remainder or reverſion. For which reaſon, if there be tenant for life, with remainder in tail, and other remainders over, and the tenant for life is deſirous to ſuffer a valid recovery; either he, or the tenant to the *præcipe* by him made, muſt *vouch* the remainder-man in tail, otherwiſe the recovery is void: but if he does vouch ſuch remainder-man, and he appears and vouches the common vouchee, it is then good; for if a man be vouched and appears, and ſuffers the recovery to be had againſt the tenant to the *præcipe*, it is as effectual to bar the eſtate-tail as if he himſelf were the recoveree. Salk. 571.

In all recoveries it is neceſſary that the recoveree, or tenant to the *præcipe*, as he is uſually called, be actually ſeiſed of the freehold, elſe the recovery is void. (Pigott, 28.) For all actions to recover the ſeiſin of lands, muſt be brought againſt the actual tenant of the freehold, elſe the ſuit will loſe its effect; ſince the freehold cannot be recovered of him who has it not. And, though theſe recoveries are in themſelves fabulous and fictitious, yet it is neceſſary that there be *actores fabulæ*, properly qualified. But the nicety thought by ſome modern practitioners to be requiſite in conveying the legal freehold, in order

to

to make a good tenant to the *præcipe*, is removed by the provifions of the ftatute 14 Geo. II. c. 20. which enacts, with a retrofpect and conformity to the ancient rule of law, that, though the legal freehold be vefted in leffees, yet thofe who are entitled to the next freehold eftate in remainder or reverfion may make a good tenant to the *præcipe*;—that, though the deed or fine which creates fuch tenant be fubfequent to the judgment of recovery, yet, if it be in the fame term, the recovery fhall be valid in law; —and that, though the recovery itfelf do not appear to be entered, or be not regulaly entered, on record, yet the deed to make a tenant to the *præcipe*, and declare the ufes of the recovery, fhall after a poffeffion of twenty years be fufficient evidence, on behalf of a purchafor for valuable confideration, that fuch recovery was duly fuffered. And this may fuffice to give the ftudent a general idea of common recoveries, the laft fpecies of affurances by matter of record.

For an account of deeds to lead, or declare, the *ufes* of fines, and recoveries; fee Uses.

In fome manors, by fpecial cuftom, recoveries may be fuffered of copyhold (Moor, 637.); but as thefe differ in nothing material from recoveries of free land, excepting only that they are not fuffered in the king's courts, but in the court baron of the manor, we fhall refer this fubject to the article Surrender. In this place we fhall obferve, however, that a fine or recovery had of copyhold lands in the king's court may, if not duly reverfed, alter the tenure of the lands, and convert them into frank-fee, which is defined in the old book of tenures to be "land pleadable at the common law:" but upon an action on the cafe, in the nature of a writ of "deceit," brought by the lord in the king's court, fuch fine or recovery will be reverfed, the lord will recover his jurifdiction, and the lands will be reftored to their former ftate of copyhold. Blackft. Com. b. ii.

Clerk of Inrolments of Recoveries and Fines. See Clerk.

Recovery, *Fort*, in *Geography*, a fort of America, in the Indiana territory, fituated on a branch of the Wabafh river, about 23 miles from Greenville. It confifts of two block-houfes, and barracks with curtains, fufficient for 60 men.

RECOUPE, French; formed of *re*, and *couper*, *to cut again*, in *Law*, to rebate, or difcount.

Thus, if a man have ten pounds iffuing out of certain lands, and he diffeifes the tenant of the land; in an affife brought by the diffeifee, if he recover the land and damages, the diffeifor fhall recoupe the rent due in the damages.

Recoupe alfo denotes a quick, fharp reply, to a peremptory demand. See Repartee.

RECREANT, in our old *Law-Books*, implies cowardly, faint-hearted.

Hence *recreantife*. See Craven and Champion.

Recreant was fo reproachful a word, that Glanville would not defcribe it. *Recreantes equi* is ufed by Fleta, lib. ii. cap. 2. for dull, jaded horfes.

RECREATION Island, in *Geography*, a fertile ifland in the Southern Pacific ocean, difcovered by Roggewin in the year 1722. Some of the fhip's company obtained a quantity of antifcorbutic herbs; but upon venturing into the country, they were affaulted by the natives, who, by cafting ftones at them, killed fome, and wounded almoft all. Many of the iflanders were killed by the fire-arms in return. The foil produces fugar-canes, cocoa-nuts, pomegranates, Indian figs, &c. The inhabitants were well made, robuft, and very lively: their bodies were painted, and they were armed. S. lat. 16°. W. long. 148°.

RECREMENT, Recrementum, in *Medicine*, fome fuperfluous matter feparated from fome other that is ufeful.

In which fenfe, it amounts to much the fame with fæces, or excrement.

Recrements of vegetables are ufeful as manure.

Recrement is fometimes alfo ufed to denote fuch fecreted juices in the body, as are afterwards of ufe in the economy; as the lympha, gall, &c. which are thus called, in contradiftinction to excrements, which are expelled out of the body, as of no farther ufe.

RECRIMINATION, a pofterior accufation brought by the accufed againft his accufer, upon the fame fact.

When two parties have made their mutual complaint at the fame time; the bufinefs is, firft, to determine who fhall be the accufer, and who the accufed, *i.e.* on whom fhall fall the recrimination.

By the French laws, recrimination is of no force till the criminal hath been purged legally.

RECRUDESCENCE, Recrudescentia, in *Medicine*, is a relapfe, when a difeafe that has gone off returns again.

RECRUITS, in the *Military Art*, new men raifed to fupply the places of fuch as have loft their lives in the fervice, or are rendered unferviceable by age or wounds. See Listing.

Recruit-*Horfes*, are the horfes brought up for completing the regiments of horfe or dragoons every year.

RECTANGLE, in *Geometry*, called alfo *oblong*, and *long fquare*, a quadrilateral rectangular figure MLIK, (*Plate* XII. *Geometry*, *fig.* 3.) whofe oppofite fides, ML and IK, as well as MI and LK, are equal.

Or, a rectangle is a parallelogram, whofe fides are unequal, but its angles right.

To find the area of a rectangle, fee Parallelogram.

If from the fame point A, (*fig.* 4.) be drawn two lines, one of which, AD, is a tangent to a circle, the other a fecant AB; the fquare of the tangent AD will be equal to the rectangle under the fecant AB, and that part of it without the circle AC. If two or more fecants, A*a*, AB, &c. be drawn from the fame point A; the rectangles, under their wholes, and their parts without the circle, will be equal. If two chords interfect each other, the rectangles under their fegments will be equal. The rectangles under equal lines are equal. The fum of all the rectangles contained under a given line, and all the parts of another any how divided, is equal to the rectangle contained under the two whole lines. If from any point, within a rectangle, to the angles of a rectangle, four lines be drawn, the fums of the fquares of thofe drawn to the oppofite angles will be equal. The rectangles contained under the correfponding fides of equiangular triangles, taken alternately, are equal. The rectangle under the two fides of any triangle is equal to the rectangle under the perpendicular to its bafe, and the diameter of the circumfcribing circle. The fquare of a line bifecting any angle of a triangle, and terminating in the oppofite fide, together with the rectangle under the two fegments of that fide, is equal to the rectangle of the two fides, including the propofed angle. The rectangle of the two diagonals of any quadrilateral infcribed in a circle, is equal to the fum of the two rectangles contained under the oppofite fides.

Rectangles, *Similar*. See Similar.

Rectangle, in *Arithmetic*, is the fame with product or factum.

RECTANGLED, Right-angled, *Triangle*, is a triangle, one of whofe angles is right, or equal to 90°. See Triangle.

There can be but one right angle in a plain triangle; therefore a rectangled triangle cannot be equilateral.

RECTANGULAR, in *Geometry*, is applied to figures and solids which have one or more angles right.

Such are squares, rectangles, and rectangled triangles, among plain figures; cubes, parallelepipeds, &c. among solids.

Solids are also said to be rectangular with respect to their situation: thus, if a cone, cylinder, &c. be perpendicular to the plane of the horizon, it is called a rectangular or right cone, cylinder, &c.

The ancients used the phrase *rectangular section of a cone*, to denote a parabola; that conic section, before Apollonius, being only considered in a cone, whose section by the axis would be a triangle, right-angled at the vertex. See Conic *Sections*.

Hence it was that Archimedes entitled his book of the quadrature of the parabola, by the name of "Rectanguli Coni Sectio."

Rectangular *Barometer*. See Barometer.

Rectangular *Windmills*. See Windmills.

RECTIFICATION, compounded of *rectus*, *right*, *direct*, and *fio*, *I became*, the act of *rectifying*, *i.e.* of correcting, remedying, or redressing, some defect or error, in respect either of nature, art, or morality.

Rectification, in *Chemistry*, is the repeating of a distillation or sublimation several times, and generally with a less degree of heat than at first, in order to render the substance purer, finer, and freer from aqueous and earthy parts.

Rectification is a reiterated depuration of a distilled matter, *e. gr.* brandy, spirits, or oils, by distilling them over again, to render them more subtile, and exalt their virtues.

That the rectification of spirits may, in all cases, proceed with the greatest exactness, a due regard to it must be had even from the first fermenting the substance from which they are to be made, and continued through all the stages of distillation, the low wines, proof spirit, and alcohol. The management of the fermented liquor, to this purpose, is principally the letting it stand to subside after the fermentation is over, and the drawing it off clear and thin, not too rich for the still. The still is not to be overfilled with this. Great care must be taken to prevent its burning, and the faints that run last must be kept separate. not mixed with the rest of the liquor distilled, which is now called the low wines. In the rectifying of these into proof spirit, great caution must be used that the fire be kept regular, not raised by sudden spirts, which always throw up the oil in large quantities, which is to be left behind. In the succeeding rectification of the proof spirit into alcohol, the same cautious management of the fire is necessary; and, in both this and the last, the faints are not to be suffered to run in among the spirit, but to be saved separate. They may be all mixed together at last, and reduced to a spirit fit for burning in lamps; but the keeping out of the rectified liquor will keep away the coarsest and most stinking part of the oil of the ingredients.

By these easy means, without any additional trouble or charge, we might be furnished with a spirit greatly exceeding what we commonly meet with. And in general, the art and mystery of our sellers of the several sorts of English brandies, seem to consist in this prudent management, and in the adding a little of the *oleum vini*, or oil of wine-lees, to the spirits thus procured pure: this gives the flavour of foreign brandies, and is so extensive in its use, that half an ounce of it is sufficient for a hogshead of pure spirit.

Malt spirit is that which principally requires all this care in the rectification, because its oil is more nauseous and offensive than that of any other spirit; but all others will be greatly the better for being treated in the same manner, and it is indeed necessary that they should for some particular uses.

It is remarkable, that no one method of combinatory rectification, that is, of the rectification performed by means of salt, and other additions, is suited to all the several kinds of spirits; scarcely indeed will any one way serve for any two spirits: but this method, by simple and careful distillation, is equally suited to all. Molasses-spirit, cyder-spirit, wine-spirit, or brandy, rum, and arrack, are all improved by it; and all of them are then known to be perfectly rectified, when, in the state of alcohol, they not only prove totally inflammable in a little vessel floating upon cold waters, but when poured into the purest spring water they have not the least power of making any change in it, nor leave any marks of oiliness, or that unctuosity which, on the mixture of the less pure spirits, floats on the top, and in certain lights gives the rainbow colours. Shaw's Essay on Distillery. See Alcohol and Distillation.

Fixed salts are rectified by calcination, dissolution, or filtration.

Metals are rectified, *i. e. refined*, by the coppel; and reguluses by repeated fusions, &c.

In a word, all rectifications are founded upon the same principle; and consist in separating substances more volatile from substances less volatile; and the general method of effecting this is to apply only the degree of heat which is necessary to cause this separation.

Rectification *of vitriolic Acid*. See Concentration.

Rectification, in *Geometry*, is the finding of a right line equal to a proposed curve, or simply finding the length of a curve line; a problem which, even in the present advanced state of analysis, is attended in many cases with considerable difficulty; and was, *in all*, totally beyond the reach of the ancient geometers, who were not able to assign the length of any curve line whatever; though they could, in a few instances, determine the area of a curvilinear space. See Quadrature.

The first rectification of a curve line was effected by Mr. H. Neal, as we are informed by Dr. Wallis, at the conclusion of his Treatise on the Cissoid. This curve was the semicubical parabola, and Neal's rectification of it was published in July or August, 1657; and two years after, *viz.* in 1659, the same was done by Van Haureat in Holland. See Schooten's Commentary on Descartes' Geometry.

It is, however, to the doctrine of fluxions that we owe the complete rectification of curve lines, in finite terms, when they admit of it; and in others by means of infinite series, circular arcs, logarithms, &c.; of which method we shall give a general view in the present article.

Let AMO (*Plate* XIII. *Analysis*, *fig.* 10.) be a curve of any kind, whose ordinates are parallel to one another, and perpendicular to the axis AH; and let the fluxion of the abscis AP be denoted by Pp or MR, and Rm be taken to represent the corresponding fluxion of the ordinate PM, then will the tangent Mm be the line which the generating point of the curve would describe, if its motion were to become uniform at M; consequently this line will truly express the fluxion of the space AM. Hence putting AP $= x$, PM $= y$, and AM $= z$, we have $\dot{z} = Mm = \sqrt{(MR^2 + Rm^2)} = \sqrt{(\dot{x}^2 + \dot{y}^2)}$; from which, and the equation of the curve, the value of z may be determined. But if all the ordinates of the proposed curve ARM (*fig.*) be referred to a centre C; then, putting the tangent RP, intercepted by the perpendicular CP, $= t$, the arc BN, of a circle described about the centre C, $= x$, the radius

radius C N (or C B) $= a$, &c. (see QUADRATURE *of Curves, Case* 2.) we shall have $\dot{z} : \dot{y} :: y$ (C R) $: t$ (R P); and consequently, $\dot{z} = \frac{y\dot{y}}{t}$; whence the value of z will be found, if the relation of y and t is given.

I. To find the length of the semi-cubical parabola, of which the equation is $a x^2 = y^3$, or $x = \frac{y^{\frac{3}{2}}}{a^{\frac{1}{2}}}$.

Here $\dot{x} = \frac{3y^{\frac{1}{2}}\dot{y}}{2a^{\frac{1}{2}}}$, or $\dot{x}^2 = \frac{9y\dot{y}^2}{4a}$; substituting, therefore, this value of $\dot{x}^2$ in the general expression

$$\dot{z} = \surd(\dot{x}^2 + \dot{y}^2), \text{ we have}$$

$$\dot{z} = \surd\left(\frac{9y\dot{y}^2}{4a} + \dot{y}^2\right) = \frac{\dot{y}}{2a^{\frac{1}{2}}}\surd(9y + 4a);$$

the fluent of which is

$$z = \frac{1}{27a^{\frac{1}{2}}} \times (9y + 4a)^{\frac{3}{2}} + C, \text{ correction.}$$

Now when the arc $= 0$, then $y = 0$; therefore

$$\frac{4a^{\frac{3}{2}}}{27a^{\frac{1}{2}}} + C = 0, \text{ or } C = -\frac{4a^{\frac{3}{2}}}{27a^{\frac{1}{2}}};$$

whence the complete fluent is

$$z = \frac{(9y + 4a)^{\frac{3}{2}} - 4a^{\frac{3}{2}}}{27a^{\frac{1}{2}}},$$

which is the length of the curve, answering to any length of the ordinate y.

II. *To rectify the common parabola;* or to find the length of any parabolic arc A M (*fig.* 11.) Let the parameter $= a$, the abscis $=$ A P $= x$, &c. as above. From the well known property of this curve, $a x = y^2$; and $a\dot{x} = 2y\dot{y}$; consequently $\dot{x} = \frac{2y\dot{y}}{a}$, and $\dot{x}^2 = \frac{4y^2\dot{y}^2}{a^2}$, which substituted for $\dot{x}^2$ in the general expression for the length of the curve, makes $\dot{z} = \left(\frac{4y^2\dot{y}^2}{a^2} + \dot{y}^2\right)^{\frac{1}{2}} = \frac{\dot{y}}{a} \times (a^2 + 4y^2)^{\frac{1}{2}}$; which, thrown into an infinite series, becomes $= \frac{\dot{y}}{a} \times \left(a + \frac{2y^2}{a} - \frac{2y^4}{a^3} + \frac{4y^6}{a^5}, \text{ \&c.}\right)$ *i. e.* $\dot{z} = \dot{y} + \frac{2y^2\dot{y}}{a^2} - \frac{2y^4\dot{y}}{a^4} + \frac{4y^6\dot{y}}{a^6}$, &c.

The fluent of this series is $z = y + \frac{2y^5}{3a^2} - \frac{2y^5}{5a^4} + \frac{4y^7}{7a^6}$ —, &c. $=$ the length of the curve A M required.

Otherwise: the above $\dot{z} = \frac{\dot{y}}{a} \times (a^2 + 4y^2)^{\frac{1}{2}}$ is $= \frac{\dot{y}}{a} \times \frac{a^2 + 4y^2}{(a^2 + 4y^2)^{\frac{1}{2}}} = \frac{a^2y\dot{y} + 4y^3\dot{y}}{a \times (a^2y^2 + 4y^4)^{\frac{1}{2}}} = \frac{\frac{1}{2}a^2y\dot{y} + 4y^3\dot{y}}{a \times (a^2y^2 + 4y^4)^{\frac{1}{2}}} + \frac{\frac{1}{2}a^2\dot{y}}{a \times (a^2 + 4y^2)^{\frac{1}{2}}} = \frac{1}{a} \times (a^2y^2 + 4y^4)^{-\frac{1}{2}} \times (\frac{1}{2}a^2y\dot{y} + 4y^3\dot{y}) + \frac{1}{4}a \times \frac{\dot{y}}{(\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}}$. But the fluent of the first of these two terms is $= \frac{1}{2a} \times (a^2y^2 + 4y^4)^{\frac{1}{2}} = \frac{y}{a} \times (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}$; and the fluent of the last of the two terms is $= \frac{1}{4}a \times$ hyp. log. of $y + (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}$; therefore $z = \frac{y}{a} \times (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}} + \frac{1}{4}a \times$ hyp. log. of $y + (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}$. But when z and y vanish, or become equal 0, as they do at the vertex, this fluent becomes $= \frac{1}{4}a \times$ hyp. log. of $\frac{1}{2}a$; and, therefore, the said fluent being corrected, gives the true value of z, or the length of the curve A M $= \frac{y}{a} \times (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}} + \frac{1}{4}a \times$ hyp. log. of $y + (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}} - \frac{1}{4}a \times$ hyp. log. of $\frac{1}{2}a = \frac{y}{a} \times (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}} + \frac{1}{4}a \times$ hyp. log. of $\frac{y + (\frac{1}{4}a^2 + y^2)^{\frac{1}{2}}}{\frac{1}{2}a}$.

Hence, if A C and D C (*fig.* 12.) be the conjugate semiaxes of an equilateral hyperbola; and A C $= a$, M P $= 2y$, Q M $= x$, then will A P $= x - a$; and $x^2 - a^2 = 4y^2$; therefore $x^2 = 4y^2 + a^2$; consequently $x = \surd(4y^2 + a^2)$. If then $q m$ be supposed infinitely near Q M, we shall have Q $q = \dot{y}$, and therefore the element of the area C Q M A $= \dot{y} \times \surd(a^2 + 4y^2)$. Whence it appears, that the rectification of the parabola depends on the quadrature of the hyperbolic space C Q M A.

III. *To determine the length of an arc of the common hyperbola.* Let the semitransverse axis be represented by b, and the semiconjugate by c, and we shall have $\frac{b^2y^2}{c^2} = 2bx + x^2$, from the nature of the curve (see HYPERBOLA); and therefore $x = \frac{b\surd(c^2 + y^2)}{c} - b$: hence $\dot{x} = \frac{by\dot{y}}{c\surd(c^2 + y^2)}$, and $\dot{z} = \surd(\dot{y}^2 + \dot{x}^2) = \surd\left\{\dot{y}^2 + \frac{b^2\dot{y}^2y^2}{c^2 \times (c^2 + y^2)}\right\} = \dot{y}\surd\left(1 + \frac{b^2y^2}{c^4 + c^2y^2}\right)$; which, by converting $\frac{b^2y^2}{c^4 + c^2y^2}$ into an infinite series, becomes $\dot{y}\surd(1 + \frac{b^2y^2}{c^4} - \frac{b^2y^4}{c^6} + \frac{b^2y^6}{c^8} - \frac{b^2y^8}{c^{10}}$, &c.) But still we have the square root to extract: in order to which, let it be assumed $= 1 + Ay^2 + By^4 + Cy^6 + Dy^8$, &c. Then, by squaring, and transposing, there arises

$$\left.\begin{array}{r} 1 + 2Ay^2 + 2By^4 + 2Cy^6 + 2Dy^8, \text{ \&c.} \\ + A^2y^4 + 2ABy^6 + 2ACy^8, \text{ \&c.} \\ + B^2y^8, \text{ \&c.} \\ -1 - \frac{b^2}{c^4} \times y^2 + \frac{b^2}{c^6} \times y^4 - \frac{b^2}{c^8} \times y^6 + \frac{b^2}{c^{10}} \times y^8, \text{ \&c.} \end{array}\right\} = 0.$$

Hence $A = \frac{b^2}{2c^4}$; $B = -\frac{b^2}{2c^6} - \frac{1}{2}A^2 = -\frac{b^2}{2c^6} - \frac{b^4}{8c^8}$; $C = \frac{b^2}{2c^8} - AB = \frac{b^2}{2c^8} + \frac{b^4}{4c^{10}} + \frac{b^6}{16c^{12}}$, &c. &c. Therefore $\dot{z} = \dot{y}\surd(1 + \frac{b^2y^2}{c^4}$, &c.) $= \dot{y} \times (1 + Ay^2 + By^4$, &c.) $= \dot{y} + \frac{b^2}{2c^4} \times y^2\dot{y} - \left(\frac{b^2}{2c^6} + \frac{b^4}{8c^8}\right) \times y^4\dot{y} + \left(\frac{b^2}{2c^8} +\right.$

$\frac{b^4}{4c^{10}} + \frac{b^6}{16c^{12}}\Big) \times y^5\dot{y}$, &c. And consequently $z = y + \frac{b^2y^3}{6c^4} - \left(\frac{b^2}{c^4} + \frac{b^4}{4c^4}\right) \times \frac{y^5}{10c^4} + \left(\frac{b^2}{c^2} + \frac{b^4}{2c^4} + \frac{b^6}{8c^6}\right) \times \frac{y^7}{14c^6}$, &c.

By the very same way of proceeding, the arc of an ellipsis may be found, the equations of the two curves differing in nothing but their signs.

IV. *To rectify the spiral of Archimedes.* The value of t (A T, *fig.* 13.) being denoted by $\frac{by}{\sqrt{(b^2+y^2)}}$ (see TANGENT *of the Spiral*, &c.) we have $\dot{z}\left(= \frac{y\dot{y}}{t}\right) = \dot{y}\frac{\sqrt{(b^2+y^2)}}{b}$; which fluxion being the same as that expressing the arc of the common parabola (Prob. II.), by inserting in the expression $\dot{z} = \frac{\dot{y}}{a} \times (a^2 + 4y^2)^{\frac{1}{2}}$, b for $\frac{1}{2}$ a, its fluent will, therefore, be truly represented by the measure of the said arc, or by $\frac{\frac{1}{2}y\sqrt{(b^2+y^2)}}{b} + \frac{1}{2}b \times$ hyp. log. $\frac{y + \sqrt{(b^2+y^2)}}{b}$, the value there found, by making the proposed substitution.

V. *To rectify the involute of a circle,* whose nature is such, that the part P R (*fig.* 14.) of the tangent intercepted by the point of contact and the perpendicular C P, is every where equal to the radius C O of the generating circle. In this case $\dot{z}\left(= \frac{y\dot{y}}{t}\right) = \frac{y\dot{y}}{a}$, we obtain $z = \frac{y^2}{2a}$, which, corrected by making $y = a =$ A C, becomes $\frac{y^2 - a^2}{2a}\left(\frac{\text{C P}^2}{2\,\text{C A}}\right)$, the true measure of the required arc A R.

VI. *To find the length of a circular arc.*—This may be expressed either in terms of the sine, cosine, versed sine, or any other trigonometrical line, as follows. First,

Let the versed sine $= x$, the sine $= y$, radius $= r$, and arc $= z$, then, by the property of the circle, $y^2 = 2rx - x^2$

or, putting tangent $= t$ - - $y^2 = \frac{r^2t^2}{r^2+t^2}$

and secant $= s$, gives - - $y^2 = \frac{s^2-r^2}{s^2}r^2$

as are readily deduced from the known properties of the circle.

Now, by means of these values of y^2, or of $2rx - x^2$, and the general equation $\dot{z} = \sqrt{(\dot{x}^2 + \dot{y}^2)}$, we readily draw the following values of $\dot{z}$, *viz.*

$$\dot{z} = \begin{cases} \frac{r\dot{x}}{\sqrt{(2rx - x^2)}} = \frac{r\dot{y}}{\sqrt{(r^2-y^2)}} = \\ \frac{r^2\dot{t}}{r^2+t^2} = \frac{r^2\dot{s}}{\sqrt{(s^2-r^2)}} \end{cases}$$

the fluents of which can only be found in series, which are as follows; making radius $r = 1$, *viz.*

$$z = \left(1 + \frac{x}{2\cdot3} + \frac{3x^2}{2\cdot4\cdot5} + \frac{3\cdot5x^3}{2\cdot4\cdot6\cdot7} + \text{\&c.}\right) \times \sqrt{x}$$

$$z = \left(1 + \frac{y^2}{2\cdot3} + \frac{3y^4}{2\cdot4\cdot5} + \frac{3\cdot5y^6}{2\cdot4\cdot6\cdot7} + \text{\&c.}\right) \times y$$

$$z = \left(1 - \frac{t^2}{3} + \frac{t^4}{5} - \frac{t^6}{7} + \frac{t^8}{9} + \text{\&c.}\right) \times t$$

$$z = \left(\frac{s-r}{s} + \frac{s^3-r^4}{2\cdot3s^3} + \frac{3(s^5-r^3)}{2\cdot4\cdot5s^5} + \text{\&c.}\right) \times r$$

where r is retained in the latter for sake of analogy.

It is obvious, therefore, that the arc may be computed by any of these, in terms either of the sine or versed sine, tangent or secant, and consequently also in terms of the cosine, co-tangent, co-secant, &c.

Thus, in the first, taking $x = \frac{1}{2}$, which is the versed sine of 60°, we have

$$\text{arc } 60° = \left(1 + \frac{1}{2\cdot3} + \frac{3}{2^3\cdot3\cdot4\cdot5} + \frac{3\cdot5}{2^5\cdot4\cdot6\cdot7}\right)\sqrt{\tfrac{1}{2}}.$$

In the second, assuming $y = \frac{1}{2} =$ sin. 30°, we have

$$\text{arc } 30° = \left(1 + \frac{1}{2^3\cdot3} + \frac{3}{2^5\cdot4\cdot5} + \frac{3\cdot5}{2^7\cdot4\cdot6\cdot7}\right) \times \frac{1}{2}.$$

In the third, assuming $t = 1 =$ tang. 45°, we obtain

$$\text{arc } 45° = \left(1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \frac{1}{11} + \text{\&c.}\right) . r$$

In the fourth, assuming $s = 2 =$ sec. 60°, we get

$$\text{arc } 60° = \left(\frac{2-1}{2} + \frac{2^3-1^3}{2^4\cdot3} + \frac{3(2^5-1^5)}{2^6\cdot4\cdot5} + \text{\&c.}\right) . r$$

Then multiplying the numbers obtained from these series by the number of times that the arc is contained in the whole circumference, will give the circumference required.

But no one of these series is sufficiently convergent for ascertaining the circumference of the circle to a great degree of accuracy, and therefore other methods have been contrived, in order to produce series better calculated for this purpose, of which that of Machin has been the most popular; though it does not appear that he employed it in his celebrated quadrature or rectification, in which he found the circumference to one hundred places of figures.

In order to render these series more converging, it is obvious that less arcs must be assumed, and the difficulty consists only in finding the tangents (for example, using that series) of a small arc, which may be expressed in numbers that are tolerably manageable in the general series.

For this purpose Machin, knowing the tangent of 45° to be 1, and that the tangent of an arc being known, any multiple of it is readily found, considered, that if there were assumed some small simple number for the tangent of an arc, and then the tangent of the double arc were continually taken, until a tangent be found nearly equal to 1, the tangent of 45°: by taking the tangent of this small difference between 45° and the multiple arc, there would be had two very small tangents, the one of the first arc, and the other of this difference. Then computing the arc to these tangents, whether the measure of them in degrees, &c. were known or not, the whole arc of 45° would become known; *viz.* by multiplying the first by the assumed multiple, and adding the last arc to the product, if the tangent of the multiple arc were less than 1, or the arc itself less than 45°; but subtracting it if greater.

Having

Having thus laid down his plan of operation, by a few trials he fell upon a number well suited to his purpose, *viz.* knowing the tangent of $\frac{1}{4}$ of 45°, or $11^\circ\ 15'$, to be very nearly $\frac{1}{5}$, radius being 1, he assumed for his first arc that whose tangent is $\frac{1}{5}$; then since $\tan.\ 2a = \frac{2\tan.\ a}{1 - \tan.^2 a}$, he had $\frac{5}{12}$ for the tangent of his double arc, and $\frac{120}{119}$ for the double of this, or of four times the first, which being a little greater than 45°, was well adapted to his views; for by a known trigonometrical property, $\tan.\ (a - 45) = \frac{\tan.\ a - 1}{\tan.\ a + 1}$; that is, the tangent of the small arc, which is equal to the excess of his multiple above 45°, was $\frac{\frac{120}{119} - 1}{\frac{120}{119} + 1} = \frac{1}{239}$. He had, therefore, two arcs to compute, the one having for its tangent $\frac{1}{5}$, and the other $\frac{1}{239}$; and then four times the first of these arcs minus the latter, would evidently give the exact arc of 45°, and both these numbers being such as to converge very well in the general series, the difficulty attending the usual approximation was avoided. Other approximations, however, have since been discovered, which, if not more rapid, their investigation is, at least, more simple, of which, perhaps, that of Euler's is the most deserving of notice. This celebrated geometer observes, that every arc whose tangent is commensurable with the radius, as, for instance, 45°, may be divided into two arcs, of which the tangents, though much smaller, are still commensurable with the radius; for since

$$\tan.\ (a + b) = \frac{\tan.\ a + \tan.\ b}{1 - \tan.\ a \tan.\ b},$$

we have also

$$\tan.\ a = \frac{\tan.\ (a + b) - \tan.\ b}{\tan.\ (a + b)\ .\ \tan.\ b + 1};$$

where it is obvious that if $\tan.\ (a + b)$ and b be rational, $\tan.\ a$ will also be rational; thus, if $\tan.\ (a + b) = \tan.\ 45^\circ = 1$, and $\tan.\ b = \frac{1}{2}$, we have $\tan.\ a = \frac{1}{3}$, and we shall evidently have a similar result, whatever rational fraction we assume for $\tan.\ b$.

We shall find, therefore, by the series which gives the arc in terms of the tangent, each of these arcs, the sum of which will evidently be the measure of the whole arc sought; whether the arcs themselves, which belong to these tangents, be rational or irrational, with respect to the whole arc of which they form the parts. These tangents, substituted in the general series above, give arc to tan. $\left(\frac{1}{2}\right) =$

$$\frac{1}{2} - \frac{1}{3\ .\ 2^3} + \frac{1}{5\ .\ 2^5} - \frac{1}{7\ .\ 2^7} + \frac{1}{9\ .\ 2^9} - \text{\&c.}$$

and arc to tan. $\left(\frac{1}{3}\right) =$

$$\frac{1}{3} - \frac{1}{3 \cdot 3^3} + \frac{1}{5 \cdot 3^5} - \frac{1}{7 \cdot 3^7} + \frac{1}{9 \cdot 3^9} - \text{\&c.}$$

In both which series, the terms diminish much more rapidly than in the original series, and may therefore be computed with tolerable ease.

But it is evident that we may proceed farther in this approximation, by dividing each of these into other two arcs, by which means the convergency will obviously be much more rapid; and though, generally speaking, for every subdivision we double the number of our series, yet the degree of convergency is so much the greater as amply to compensate for the additional number of series. Besides, we may always subdivide our greater arc, so that one of its subdivisions shall be the same as the smaller arc, in which case we do not increase the number of series. Thus; arc to tan. $\frac{1}{2}$ = arc to tan. $\frac{1}{3}$ + arc to tan. $\frac{1}{7}$; therefore arc to tan. $1 = 2$ arc to tan. $\frac{1}{3}$ + arc to tan. $\frac{1}{7}$. Again; arc to tan. $\frac{1}{3}$ = arc to tan. $\frac{1}{7}$ + arc to tan. $\frac{2}{11}$; therefore arc to tan. $1 = 3$ arc to tan. $\frac{1}{7}$ + 2 arc to tan. $\frac{2}{11}$, and so on to any extent required, which might in course be pursued so far as to render the operation as simple and as little laborious as can be expected in such kind of computations. Even with these already mentioned, the circumference of the circle might undoubtedly be computed to 200 places of decimals, with less labour than it cost Vieta to carry them to 10 places, or Romanus to 15.

The reader will observe, that this approximation differs from Machin's in nothing except the simplicity and generality of the investigation; for if we make the successive subdivision of the greater arc, so as always to include in it the smaller one, we shall find in our results the identical formula of Machin.

Let us repeat our former expression

$$\tan.\ a = \frac{\tan.\ (a + b) - \tan.\ b}{1 - \tan.\ a\ .\ \tan.\ b}.$$

Let $\tan.\ (a + b) = \frac{R}{T}$, $\tan.\ a = \frac{R'}{T'}$, $\tan.\ b = \frac{r}{t}$, and we shall have generally $\frac{R'}{T'} = \frac{Rt - Tr}{Rr + Tt}$.

Let now $\tan.\ (a + b) = 1$, answering to arc 45°, so that $R = 1$, and $T = 1$; assume also $r = 1$, then, by constantly substituting, in the general expression, the values found for R', R'', R''', &c. and T', T'', T''', &c. for R and T respectively, we shall have

$$\frac{R'}{T'} = \frac{t - 1}{t + 1}$$

$$\frac{R''}{T''} = \frac{t^2 - 2t - 1}{t^2 + 2t - 1}$$

$$\frac{R'''}{T'''} = \frac{t^3 - 3t^2 - 3t + 1}{t^3 + 3t^2 - 3t - 1}$$

$$\frac{R^{iv}}{T^{iv}} = \frac{t^4 - 4t^3 - 6t^2 + 4t + 1}{t^4 + 4t^3 - 6t^2 - 4t + 1}$$

$$\frac{R^{v}}{T^{v}} = \frac{t^5 - 5t^4 - 10t^3 + 10t^2 + 5t - 1}{t^5 + 5t^4 - 10t^3 - 10t^2 + 5t + 1}$$

$$\frac{R^{(n)}}{T^{(n)}} = \frac{t^n - nt^{n-1} - \frac{n(n-1)}{1 \cdot 2}t^{n-2} + \&c.}{t^n + nt^{n-1} - \frac{n(n-1)}{1 \cdot 2}t^{n-2} - \&c.}$$

So that, generally, arc to tan. $1 = n \times$ arc to tan. $\frac{1}{t}$ + arc to tan. $\frac{R^{(n)}}{T^{(n)}}$. If we take $n = 1$, and $t = 3$, we have arc tan. $1 =$ arc tan. $\frac{1}{3}$ + arc tan. $\frac{1}{2}$. If $n = 2$, and $t = 3$, we have arc tan. $1 = 2 \times$ arc tan. $\frac{1}{3}$ + arc tan. $\frac{1}{7}$. If $n = 4$, and $t = 5$, we have arc. tan. $1 = 4 \times$ arc tan. $\frac{1}{5}$ − arc tan. $\frac{1}{239}$; which is the formula of Machin; and by giving other values to n and t, a variety of other formulæ might be found, though it would, probably, be difficult to find one more convergent than the last. The reader will find more on this subject in vol. i. of Dr. Hutton's Tracts.

We shall conclude this article by giving the circumference of the circle to 155 places, as given by Zach, from a manuscript which he saw in the Ratcliff library at Oxford, distinguishing the periods of the several approximations of different authors mentioned in the preceding part of this article, and the article QUADRATURE.

The diameter of a circle being 1, the circumference will be

* This figure is a 7 in Lagny's approximation, but Vega, in the revision of the computation, asserts that it ought to be an 8, as we have given it.

RECTIFIED SPIRITS, &c. are such as have undergone the operation of rectification, or have been distilled over and over, to separate from them any heterogeneous matter, which might have arisen with them in the former distillations.

Hence we say, spirit of wine twice rectified, thrice rectified, &c.

It is the rectification that makes the difference between brandy and rectified spirits of wine. See SPIRITS.

RECTIFIER, in *Navigation*, is an instrument used for determining the variation of the compass, in order to rectify the ship's course, &c.

It consists of two circles, either laid upon, or let into one another, and so fastened together in their centres, that they represent two compasses, the one fixed, the other moveable: each is divided into thirty-two points of the compass, and three hundred and sixty degrees, and numbered both ways, from the north and the south, ending at the east and west in ninety degrees.

The fixed compass represents the horizon, in which the north, and all the other points, are liable to variation.

In the centre of the moveable compass is fastened a silk thread, long enough to reach the outside of the fixed compass: but if the instrument be made of wood, an index is used instead of the thread.

RECTIFIER, in the *Distillery*, the person whose employment is to take the coarse malt-spirit of the malt-stiller, and re-distil it to a finer and better liquor. The art of the rectifier might be entirely set aside, if the malt-stiller could make his spirit perfect at a second operation; which seems very practicable, if the malt-stillers could be induced to forsake their old practice. The great things to be recommended for the improvement of their art, would be, first, the brewing in perfection; and secondly, the keeping of their wash after the manner of stale beer, till it has entirely lost its malt flavour, and acquired a pungent acid vinosity; and then, thirdly, leaving out the lees, to distil with a well-regulated fire. It is scarcely to be thought how pure a spirit is to be obtained from malt this way; but the great art would be, the finding of a method to make malt liquors artificially stale, bright, and flavourless, though otherwise vinous. Shaw's Lectures, p. 223.

RECTIFYING *of Curves*. See RECTIFICATION.

RECTIFYING *of the Globe* or *Sphere*, is a previous adjusting of the globe or sphere, to prepare it for the solution of problems. For the method of doing it, see *Use of the Celestial* GLOBE.

RECTILINEAR, RIGHT-LINED, in *Geometry*, is applied to figures whose perimeter consists of right lines.

RECTILINEAR *Angle*, *Maps*, and *Superficies*. See the substantives.

RECTITUDE, RECTITUDO, *Rectum*, in matters of philosophy, refers either to the act of judging, or of willing; and therefore, whatever comes under the denomination of rectitude is either what is true, or what is good: these being the objects about which the mind exercises its two faculties of judging and willing.

Rectitude of the mind, considered as it judges, *i. e.* rectitude of the faculty of judgment, consists in its agreement and conformity to the nature and reason of things, and in its determining and deciding about them according to what their constitutions, properties, uses, &c. really are.

Rectitude of the mind, considered as it wills, called also *moral rectitude*, or *uprightness*, consists in the choosing and pursuing of those things which the mind, upon due enquiry and attention, clearly perceives to be good; and avoiding those that are evil.

RECTITUDINES, in *Law*, rights, or legal dues, belonging either to God, or man. See RIGHT.

RECTO, a writ usually called a *writ of right*; of so high a nature, that whereas other writs in real action are only to recover the possession of the lands, &c. in question, lost by the plaintiff, or his ancestor; this aims to recover both the seisin thus lost, and the property of the thing: so that both rights are here blended together; that of *property*, and that of *possession*.

If a man lose his cause upon this writ, he is without all remedy.

There are two kinds of this writ: *breve magnum de recto*, or or *breve de recto patens*, a writ of right patent; and *recto clausum*, a writ of right close.

The first is so called, because sent open. It lies only for him that hath fee-simple in the lands sued for, against the tenant of the freehold at least.

Indeed, the writ of right patent is extended, in practice, beyond its original intention; for a writ of right of dower, which lies for the tenant in dower, is patent; and so in several other cases. Fitzherb.

The writ of right close, called also *breve parvum de recto*, is directed to the lord of ancient demesne, or the bailiff of the king's manors; and lies for those who hold lands and tenements by charter, in fee-simple, or in fee-tail, or for term of life, or in dower, if they be ejected out of such lands, or disseised. In such case a man, or his heirs, may sue out the writ of right close, directed to the lord of ancient demesne, commanding him to do him right in his court. This is called a writ *secundum consuetudinem manerii*. See Possession, Property, Title, and Writ.

Recto *de advocatione ecclesiæ*, a writ of right, lying where a man has right of advowson in fee to him, and his heirs; and, the incumbent dying, a stranger presents his clerk to the church; and he, not having brought his action of *quare impedit*, nor *darrein presentment*, within six months, has suffered the stranger to usurp upon him. See *Disturbance of* Patronage, Quare *impedit*, and Assisa *darrein presentment*.

Recto *de custodia terræ & hæredis*, a writ which lies for him whose tenant dying in his nonage, a stranger enters, and takes the body of the heir.

This writ as to lands holden *in capite*, or by knight's service, is become useless by the stat. 12 Car. II. but not where there is a guardian in socage, or appointed by the last will of the ancestor. See Guardian.

Recto *de dote*, a writ of right of dower, which lies for a woman that has received part of her dower, and proceeds to demand the remnant in the same town against the heir, or his guardian. This extends either to part or the whole, and is a more general remedy than that mentioned in the next article.

Recto *de dote unde nihil habet*, is a writ of right which lies in case where the husband, having divers lands and tenements, has assured no dower to his wife; and she is thereby driven to sue for her thirds against the heir, or his guardian. See Dower, and *Writ of* Entry.

Recto *quando* or *quia dominus remisit*, a writ of right, which lies in case where lands or tenements in the signory of any lord, are in demand by a writ of right.

If the lord hold no court, or, at the prayer of the demandant or tenant, send his writ to the king's court, to put the cause thither for that time; this writ issues for the other party, and has its name from the words comprised, which is the true occasion of it.

Recto *de rationabili parte*, a writ that lies between privies of blood, as brothers in gavel-kind, or sisters, or other coparceners, as nephews and nieces, and for land in fee-simple.

If a man lease his land for life, and afterwards die, leaving issue two daughters, and, after, the tenant for life likewise dies; the one sister entering on all the land, and so deforcing the other, the sister so deforced shall have this writ to recover her part.

Recto *sur disclaimer*, a writ which lies where the lord, in the court of common pleas, does avow upon his tenant, and the tenant disclaims to hold of him; upon which disclaimer the lord shall have this writ. This takes place when the tenant upon a writ of assise for rent, or on a replevin, disowns or disclaims his tenure; whereby the lord loses his verdict; in which case the lord may have this writ, grounded on this denial of tenure, and shall, upon proof of the tenure, recover back the land itself so holden, as a punishment to the tenant for such his false disclaimer. This piece of retaliating justice, whereby the tenant who endeavours to defraud his lord is himself deprived of the estate, as it evidently proceeds upon feodal principles, so it is expressly to be met with in the feodal constitutions: "vasallus, qui abnegavit feudum ejusve conditionem, exspoliabitur."

Recto *folio*. See Folio.

RECTOR of a parish, the parson, or he who has the charge or cure of a parish church. See Parson.

If the predial tythes of the parish be impropriated, or appropriated, *i. e.* either in lay hands, or in those of some ecclesiastical community, then, instead of *rector*, the parson is called *vicar*, (which see). In England are reckoned 3485 rectories.

The name rector denotes him governor or ruler, *quia tantum jus in ecclesia parochiali habet, quantum prælatus in ecclesia collegiata*.

Rector also denotes the chief elective officer in several foreign universities, particularly in that of Paris.

Rector is also used in several convents for the superior, or officer who governs the house.

The Jesuits used it for the superiors in such of their houses as were either seminaries, or colleges.

RECTORY, or Rectorate, *Rectoria*, a parish church, parsonage, or spiritual living, with all its rights, glebes, and tythes.

RECTRICES, in *Ornithology*, denote the strong feathers of the tails of birds.

RECTUM Intestinum, in *Anatomy*; or in English, simply the *rectum*; is the last portion of the large intestine, and of the whole alimentary canal. It begins at the left sacro-iliac symphysis, below the sigmoid flexure of the colon, and ends at the anus. See Intestine.

Rectum, *Abscesses in the Neighbourhood of*. See Fistula *in Ano*.

Rectum, *Concretions and extraneous Substances lodged in.* The concretions formed in the larger intestines, and especially in the rectum, by the accumulation and protracted lodgment of the feces, may become the cause of obstinate constipation, which can only be removed by their extraction. Sometimes these masses of indurated matter include no extraneous substance; in other instances, their nucleus is a biliary calculus; in a vast number of cases, they are merely composed of the feces in a dry hardened state. It is remarked that women, and persons of advanced age, are most subject to the constipation arising from the obstruction thus occasioned in the large intestines. Children and adults in the vigour of life are not, however, entirely exempt from the disorder, though they seldom have it, except when the formation of such concretions in the bowels has been brought on by swallowing a large quantity of hard indigestible bodies, like cherry and plum-stones. Lastly, excessively hardened masses of fecal matter have been noticed in patients who have for a long while been confined to bed in the recumbent posture by severe diseases.

Whatever may be the cause of the disorder, whether the defect itself consists in a mere accumulation of indurated feces, with which the rectum is distended, and behind which the excrement is detained; or whether the constipation is not complete, the concretion allowing the liquid part of the feces to pass out between it and the inside of the intestine; the existence of the hardened mass may be known by by the conſtipation which it produces; by the ſenſe of weight which the patient feels about the fundament; and alſo by the poſſibility of actually touching the indurated obſtructing body, when a finger is introduced up the rectum.

Oily emollient clyſters, and carminative draughts, will ſerve for expelling ſuch concretions as are not of too firm a conſiſtence; but the extraction of them is abſolutely neceſſary when they are particularly hard. The operation is to be done with a ſpoon, or ſuitable forceps, properly oiled; and, after the concretion has been removed, an emollient clyſter is to be adminiſtered, in order to allay any irritation which may have been cauſed by the introduction of the requiſite inſtruments. When the ſphincter ani contracts ſo forcibly, that the operation is attended with extreme pain and difficulty, we are adviſed by ſurgical writers to make a dilatation of the anus, by practiſing an inciſion at its poſterior angle. A wound made in this direction cannot do injury to any part of conſequence, whilſt there would be a riſk of wounding the urethra in the male, or the vagina in the female ſubject, if the cut were made at the anterior angle. An inciſion, carried laterally, would be apt to injure the pudic veſſels. A diviſion of the fibres of the ſphincter ani does not produce any material permanent weakneſs of its action, and a paralyſis of this muſcle, according to Richerand, can never proceed from ſuch a cauſe. Noſographie Chirurgicale, tom. iii. p. 414. edit. 2.

The hard concretions which lodge in the rectum cannot be reached with the finger when they are ſituated high, and, in this circumſtance, the ſurgeon muſt uſe a probe, or ſound, in order to aſſure himſelf poſitively of their preſence, their moveableneſs, and their ſize.

With regard to foreign bodies lodged in this inteſtine, ſome have been ſwallowed, and have paſſed through the whole extent of the alimentary canal; while others have been puſhed up the anus to a greater or leſſer height. The extraction of theſe laſt is generally attended with a great deal of difficulty, and even demands on the part of the operator more than ordinary ſagacity, in conſequence of the various ſhapes, the hardneſs, and the fragility of theſe different bodies. Glaſs phials, inſtrument caſes, ſhuttles, &c. have been introduced into the rectum by maniacs. One perſon of this deſcription put into his rectum a flintſtone, which did not admit either of being extracted, or broken, owing to its hardneſs, and ſlippery ſurface, and which in the end cauſed the patient to die in the greateſt agony, with ſwelling and gangrenous miſchief in the abdomen. Marchetti has recorded an inſtance, in which a pig's tail, hardened by cold, was forcibly thruſt up the rectum of a girl of the town. This extraneous body could not be withdrawn, as the ſhort briſtles, which all inclined outward, immediately came into contact with and pierced the inner part of the bowel. It remained in the part ſix days, and occaſioned a train of alarming ſymptoms, ſuch as fever, vomiting, ſwelling of the abdomen, and obſtinate conſtipation. Marchetti faſtened a ligature to the end of the foreign body, which protruded at the anus, and then paſſed the ligature through a long piece of reed, which he introduced up the rectum, in order that the foreign body might be drawn through this tube without the inteſtine being lacerated. The experiment was completely ſucceſsful. Obſ. Med. Chir. p. 126.

In another example a piece of wood, three inches long, and two in width, was introduced into the rectum. Colic, tenſion of the abdomen, fever, conſtipation, and difficulty of making water, came on, and laſted ſix days. The impoſſibility of removing the extraneous ſubſtance with a pair of forceps, led to the idea of uſing a borer, which, having been paſſed up the rectum under the guidance of the finger, was inſerted deeply enough into the piece of wood to draw it out. The extraction, however, could not be effected without a great deal of pain. See Mélanges de Chirurgie, par M. Saucerotte, p. 484. Mémoires de l'Academie de Chirurgie, tom. v. p. 605. Laſſus, Pathologie Chirurgicale, tom. ii. p. 569, edit. 2.

Rectum, *Congenital and Syphilitic Contractions of its inferior Portion.* A contraction of the lower end of the rectum is ſometimes an original malformation; but more frequently it ariſes from what has been conſidered by various ſurgical authors to be a venereal thickening of the parietes of this inteſtine. If this be really a ſyphilitic diſorder, a circumſtance which is to be doubted, it is certainly as grievous as any of the more common effects of the venereal diſeaſe. Excreſcences grow from the mucous membrane at the rectum, and diſcharge a purulent matter, which is continually oozing from the anus. When a finger is paſſed within this aperture, the irregularities occaſioned by the tumour may be plainly felt. Such writers as believe in the ſyphilitic nature of this complaint inform us, that the truth of this may be known by the antecedent and co-exiſtent ſymptoms of the venereal diſeaſe. They admit, however, that the diſorder almoſt always laſts after the cure of every other mark of ſyphilis, and they caution us not to perſiſt raſhly in adminiſtering mercury any longer for a diſeaſe which cannot be further benefited by it. Theſe circumſtances are quite ſufficient to prove that there is not much reaſon for the doctrine, that this ſort of contraction of the lower end of the rectum is venereal.

Such writers as conſider the complaint to be connected with ſyphilis, of courſe recommend the exhibition of mercury, and they further adviſe the frequent injection into the rectum of a weak ſolution of the oxymuriate of the ſame mineral. Tents, ſmeared with mercurial ointment, are alſo recommended to be paſſed into the bowel. The latter applications are ſtated to have the advantage; 1ſt, of oppoſing, by mechanical preſſure, the further increaſe of the excreſcences; 2dly, of dilating the contracted part; and, 3dly, of acting on the diſeaſe by their medicinal quality.

For our own part, we much doubt the reality of the venereal nature of the foregoing complaint. The language of the advocates for ſuch a doctrine muſt raiſe ſuſpicions, that they are influenced in their judgment more by prejudice than reaſon. "The venereal affection of the coats of the rectum (ſays one of theſe writers) almoſt always laſts after the total extinction of the ſyphilitic virus. Then, we ought to be content with the employment of dilating mechanical means, without perſiſting in the uſe of medicines, which would ſerve only to ruin the patient's conſtitution. An elaſtic gum cannula is to be preferred, and it ſhould be of a conical ſhape, in order that it may be gradually introduced further and further, in proportion as the dilatation of the bowel is effected." Richerand, Noſographie Chirurg. tom. iii. p. 418, edit. 2.

In caſes of congenital contraction of the rectum, the only plan which can be adopted, is that of making an inciſion through the poſterior part of the inteſtine.

Rectum, *Polypi of.* Sometimes, though not often, polypi grow from the mucous membrane of the rectum, and by their ſize obſtruct the paſſage of the feces. Their exiſtence is at firſt manifeſted by an uneaſy ſenſe of heavineſs, and afterwards they are protruded outwardly in the efforts which the patient makes at ſtool. The anus contracting after their expulſion, their roots become ſtrangulated, ſo that they cannot return, and exceſſive agony is produced. In

In this circumstance, the surgeon should take the opportunity of removing them with a knife, after having tied their root, or even without this precaution. The lining of the rectum, freed from the weight of the tumour, immediately retracts, and if the polypus should have received a supply of blood from a large vessel, hemorrhage may ensue. Such accident may be remedied by completely distending the wounded part of the rectum with a large piece of sponge, or with a compress of lint; but as it is easier to prevent the hæmorrhage altogether, than to stop it after it has occurred, we would advise surgeons, whenever the excrescence is of any size, always to tie its root before removing the rest of it with a cutting instrument.

Rectum, *Prolapsus of*. See Prolapsus *Ani*.

Rectum, *Scirrho-contracted*. Scirrhus of the rectum is not uncommon at an advanced period of life. Sometimes it extends over a considerable length of the gut, but generally it is more circumscribed. The coats of the bowel become much thicker and harder than in the natural state. The muscular coat is subdivided by membranous septa, and the internal coat is sometimes formed into hard irregular folds. The surface of the inner membrane is occasionally ulcerated, so as to form a cancerous disease. Every vestige of the natural structure is occasionally lost, and the gut is changed into a gristly substance. The cavity of the bowel is always rendered narrow at the scirrhous part, and is sometimes almost obliterated. When the passage through the gut is much obstructed, the bowel is always a good deal enlarged just above the stoppage, or stricture, from the accumulation of the feces there. As the disease advances, adhesions form between the rectum and adjacent parts, and ulcerations produce communications between them.

The disease is usually not much noticed till somewhat advanced, not being at first very painful. The patient only thinks that he is costive, and that he voids his stools with a little difficulty. In time, a good deal of pain is felt in the part affected, especially at stool, after which some relief is experienced. Pus and blood may sometimes be noticed with the excrement, particularly when the disease has advanced to the ulcerated state. The patient at length becomes sallow, the constitution suffers, and dissolution follows. Severe tenesmus attends the whole course of the disease.

Default has often seen the disease form a communication between the rectum and vagina, and the feces have passed through the latter part. In the latter stage of the affliction, the rectum, bladder, vagina, uterus, and adjacent parts, are all involved in one common ulceration.

When the disease has attained the ulcerated state, it is probably always incurable. Palliatives can now only be resorted to, such as anodyne and emollient glysters, the warm-bath, &c. with the exhibition of medicines like opium, cicuta, uva ursi, &c. Claudius applied his remedies to the inside of the bowel by means of tents, and did not employ the latter as a mode of curing the disease, when less advanced. Valsalva used to introduce a cannula pierced with numerous holes, when his patient got into the bath, so as to let the fluid enter the intestine. Numerous practitioners, among them Morgagni, made mercurials the base of their treatment, from a supposition that the complaint was of venereal origin.

When the disease is not attended with ulceration, the contraction and thickening of the gut may be diminished by introducing bougies, keeping them for a certain time, every day, so introduced, and increasing their size gradually. The pressure of these instruments seems to lessen the disease, and stop its progress; a proof that its nature differs from that of what is usually understood by scirrhus. Default used to employ long tents, made of lint, smeared with cerate, and passed into the bowel by means of a probe, with a forked end. This surgeon gradually increased the size of the tents, so as to continue the compression, to which he conceived all the good was owing. Their length was also augmented by degrees. Fresh ones were, at first, introduced twice every day. When any hardnesses were situated on the outside of the anus, Default cured them on the same principle, *viz.* by making pressure on them with compresses and a bandage. This eminent surgeon effected a cure of a scirrho-contracted rectum by this method. The woman was taught to pass occasionally the tents herself, so as to prevent a relapse. The disease is said to afflict women more frequently than men: from a comparative table kept at the Hôtel-Dieu, this has been the case there in the proportion of ten to one. See Œuvres Chirurgicales de Default, tom. ii. p. 422.

Rectum, *Hemorrhoidal Swellings of*. See Hemorrhoids.

Rectum, in *Law*. See Recto.

Rectum, in our old *Law Writers*, is also used for a trial or accusation.

Rectum, *Commune*, denotes a trial at law, or in the common course of law. *Stare ad rectum*, denotes to stand a trial. *Rectum rogare*, to petition the judge to do right.

RECTUS, in *Anatomy*, a name applied to several muscles, generally, but not invariably, distinguished by the straightness of their fibres, or of their general direction.

Rectus *abdominis*. See Obliquus.

Rectus *abducens*, or *externus*,
Rectus *adducens*, or *internus*,
Rectus *attollens*, or *superior*,
Rectus *deprimens*, or *inferior*, } muscles of the globe of the eye. See Eye.

Rectus *anterior cruris*, or *femoris*,
Rectus *extensor cruris*, or *femoris*, } synonyms of the Rectus *cruris*; which see.

Rectus *capitis anticus major et minor*. See Rectus *internus*.

Rectus *capitis internus major*, rectus anticus major, trachélo-sous-occipitien; a muscle of the head, flattened, broader and thicker above than below, occupying the anterior and lateral part of the neck, and reaching from the transverse process of the sixth cervical vertebra, to the inferior surface of the basilary process of the occiput. Its anterior surface is covered by the carotid artery, the internal jugular vein, the nerve of the eighth pair, the great sympathetic, and the pharynx. The longus colli, the rectus capitis internus minor, the articulations of the occiput and atlas, and of the latter bone, and the second vertebra, are covered by its posterior surface. The inner edge lies on the longus colli, and is connected to it by cellular substance: the outer is fixed to the front of the transverse processes of the sixth, fifth, fourth, and third cervical vertebræ, and is unattached above the latter. The lower end, very thin and pointed, is fixed to the transverse process of the sixth cervical vertebra: it ascends with a little obliquity from without inwards, increasing in breadth and thickness: it approaches the muscle of the opposite side, and is attached by its upper end to the basilary process of the occipital bone, in front of the foramen magnum. At the upper part of this muscle is a broad and thin aponeurosis, which descends on the anterior and inner surface: the attachments to the transverse processes are by small tendons terminating in muscular portions. The muscular fibres run obliquely between the last mentioned tendons and the aponeurosis.

This muscle bends the head forwards on the neck; and restores it after it has been carried backwards. The muscle of of one fide, acting fingly, inclines the head towards its own fide.

Rectus *capitis internus minor*, or rectus anticus minor, trachéli-fous-occipitien; a fmall mufcle of the head, lying under the laft, fhort, narrow, and flattened, and extending from the atlas to the occiput. It is covered in front by the rectus internus major, the internal carotid artery, and the great fympathetic nerve: behind it covers the capfule of the articulation between the atlas and occiput. The outer and inner edges prefent nothing remarkable. Its lower extremity is fixed to the anterior furface of the lateral portion of the atlas, and to the neighbouring part of its tranfverfe procefs. Thence it afcends, increafing fomewhat in fize, and inclined a little inwards, and is fixed to the under furface of the bafilary procefs of the occiput, behind and a little on the outfide of the rectus internus major, and to the cartilaginous mafs filling the fpace between the occipital and temporal bones. It has aponeurofes at its extremities, and very fhort mufcular fibres between thefe.

Its action on the head is exactly the fame with that of the rectus internus major.

Rectus *capitis lateralis*, le premier tranfverfaire anterieur Winflow, atloïdo-maftoïdien, petit droit lateral; a fmall mufcle of the head, fituated at the upper and lateral part of the neck, flattened and quadrilateral, reaching from the tranfverfe procefs of the atlas to the occiput. It is covered in front by the internal jugular vein; and it covers behind the vertebral artery. The two edges prefent nothing remarkable. Below it is fixed to the front of the upper furface of the tranfverfe procefs of the atlas: thence it afcends a little outwards, and is attached above to the rough impreffion behind the jugular foffa. It is mufcular, except juft at the attachments, which are tendinous. Its action, like that of the two laft mufcles, is to reftore the head, when it has been bent backwards; to bend it forwards; and, when one mufcle acts fingly, to incline it laterally.

Rectus *capitis pofticus major*, axoïdo-occipitien; a mufcle of the head, of a triangular flattened figure, placed at the upper and back part of the neck, and extending from the fpinous procefs of the fecond cervical vertebra to the occiput. Its pofterior furface is covered by the complexus, and above by the obliquus fuperior capitis; the anterior furface covers the pofterior arch of the atlas, the rectus pofticus minor, and the occiput. The inferior extremity, narrow, and almoft pointed, is attached to the fpinous procefs of the fecond cervical vertebra, thence it afcends, directed outwards, and a little backwards, and gradually increafing in breadth, to be inferted in the inferior furface of the occiput, at about an equal diftance from the great external tranfverfe ridge, and the foramen magnum, between the complexus, the obliquus fuperior, and the rectus pofticus minor. The extremities alone are tendinous; the reft being mufcular. It reftores the head, when it has been bent forwards; and carries it back on the vertebral column. When one mufcle acts fingly, it will have the power, from the oblique direction of its fibres, of rotating the head, fo as to turn the face towards its own fide.

Rectus *capitis pofticus minor*, atloïdo-occipitien; a fmall flattened mufcle with radiated fibres, and confequently a triangular figure, placed at the upper and back part of the neck, extending from the atlas to the occiput, and lying with its fellow in the interval between the two recti majores. Its pofterior furface is inclined downwards and covered by the complexus; the anterior furface correfponds to the occiput, and to the interval between it and the atlas. The lower extremity is the narroweft part, and is fixed to the rough impreffion in the middle of the pofterior furface of the pofterior arc of the atlas: it afcends parallel to the oppofite mufcle and directed backwards, and is fixed to the external furface of the occipital bone at a fhort diftance from the foramen magnum. It raifes the head when bent forwards; and extends it or carries it back on the neck.

Rectus *cruris*, rectus extenfor or anterior cruris, droit ou grêle anterieur, ileo-rotulien; a mufcle of the thigh, long and flat, broad in the middle, and narrow towards its extremities, occupying the middle and front part of the limb, and reaching from the anterior and inferior fpine of the ilium to the patella. It is covered in front by the iliacus internus, the fartorius, and the fafcia lata; behind it covers the orbicular ligament of the hip, the great extenfors of the knee, and the external or anterior circumflex veffels. The outer and inner margins of the mufcle are unattached in their upper three-fourths; they are confounded, in their lower fourth, with the extenfors of the knee.

The fuperior extremity of the rectus cruris prefents two tendons, one of which is ftraight, the other curved. The former is fixed to the anterior and inferior fpine of the os innominatum: the latter, curved from before backwards, and from above downwards, is fixed to the outer furface of the os innominatum for about an inch, immediately above the edge of the acetabulum. From this upper attachment the mufcle defcends vertically in front of the thigh, growing broader to the middle of the limb; it then becomes narrow towards the lower part, and is fixed to the bafis of the patella.

The rectus is tendinous at its extremities, and flefhy in the middle. The upper tendon has been already defcribed as divided into two portions; the anterior of thefe, attached to the anterior and inferior fpine of the os innominatum, is the thickeft and fhorteft, and has the fame direction as the mufcle; the other is longer and curved, and detaches fome fibres to ftrengthen the orbicular ligament of the hip. The two portions foon unite in a common tendon; this fpreads out into a broad aponeurofis, which defcends about four inches on the front of the mufcle, and then dips into its fubftance. The inferior tendon is broad and flat, and rifes from the bafis of the patella; its pofterior furface is united to the great extenfors of the knee, and the edges are ftrongly connected to the vaftus externus and internus. It is broad at the patella, grows a little narrower as it rifes, then fpreads out again, and forms a broad aponeurofis, covering the back of the mufcle above its middle. The fuperficial fibres of this tendon defcend over the front of the patella, to which they are ftrongly united, and are loft below in the tendon which unites this bone to the tibia. The mufcular fibres are placed very obliquely between the fuperior and inferior tendons: they cover the back of the firft up to the part where its two portions feparate; and they defcend on the front of the fecond to within two inches of the patella.

It extends the knee-joint, either by bringing the leg forwards upon the thigh, or the thigh upon the leg, according as the one or the other part is rendered a fixed point. If the knee be extended, or firmly retained in the bent pofition by its flexor mufcles, the rectus may bend the thigh upon the pelvis: when the leg and thigh are fixed, it can bend the pelvis forwards upon the latter, as in the attitude of ftooping to pick up any object from the ground. In the erect attitude it prevents the pelvis from inclining backwards; and reftores it when it has been carried in that direction.

Rectus *in curia*, in *Law*, one who ftands at the bar, and no man objects any thing againft him.

When

When a man hath reversed the outlawry, and can participate of the benefit of the law, he is said to be *rectus in curia*.

RECULVER, in *Geography*, a village and parish in the upper half-hundred of Blean-Gate, lathe of St. Augustine, and county of Kent, England, is situated at the distance of 10 miles N.E. by N. from Canterbury. It is noted in history as the scite of the Roman *Regulbium*, the station or castle which defended the northern entrance to the celebrated *Portus Rutupensis*. It is remarkable, that while the ocean has receded from the southern entrance, leaving Richborough (Rutupium) considerably inland, it has gradually advanced upon Reculver. This is proved on the authority of several ancient writers, particularly Leland, who states, that in his time it stood about half a mile from the shore, whereas, at present, the tide washes the walls of many of the village houses, and threatens to overwhelm the whole at no distant period. Regulbium was a station of much importance, as it not only commanded an extensive view of the open sea, but likewise of the mouths of the Thames and the Medway. It was therefore used as a watch-post to discover the approaches of an enemy; and also as a lighthouse to guide sailors. In its perfect state the station was of a square form, with the angles rounded off, and was environed by a ditch exterior to the walls, of which a considerable portion still remains. The extent of the inclosed area from east to west is about 190 yards, and from south to north about 198 yards. The ancient town was without the station, and is supposed to have stood towards the north, on that part of the coast long since swallowed up by the waves: "and from the present shore, as far as a place called Black Rock, seen at low water mark, where, according to tradition, a church once stood, there have been found great quantities of tiles, bricks, fragments of walls, tessellated pavements, and other marks of a ruinated town; and remains of the household furniture, dress and equipment of the horses belonging to its inhabitants, are continually met with among the sands; for after the fall of the cliffs, the earthen parts of them being washed away, these metalline substances remain behind." When a part of the cliff here fell down about the conclusion of the seventeenth century, a number of small vaults, arched over, and several cisterns, were discovered. The latter were all of the same figure, namely, square, and measured from ten to twelve feet in length each side, and the same in depth. They were constructed of posts, driven deep into the ground, with planks two inches thick fixed to them. Their use was evidently the reception and preservation of rain water, which the Romans thought more wholesome than spring water. Vast quantities of Roman coins have been discovered both in the fields and along the shore here; and Du Fresne has produced many, which, from the markings upon them, appear to have been struck at a mint in this place. British and Gaulish coins are likewise occasionally found here; also seals, keys, spoons, gold rings, bracelets, fibulæ, bullæ, belts, bridles, harness, beams of scales or stiliards, and many other articles of which the use has not yet been determined.

When Kent was subdued by the Saxons, Regulbium became a principal seat of the monarchs of that dynasty. It was then called *Raculf* and *Raculf-cester*; and hither king Ethelred retired with his court, after his conversion to Christianity by St. Augustine. In the next century it obtained the name of Raculf-minster, from a Benedictine abbey founded here by Bassa, a priest and nobleman, to whom lands were granted for that purpose by king Egbert, as an atonement for the murder of his two nephews. This abbey was dissolved previous to the Conquest, having probably been destroyed by the Danes. The town, however, continued in a flourishing condition for many years after that event, and had the privilege of a weekly market granted to it in 1313; but this right has been long discontinued. The church here is an ancient and spacious edifice, consisting of a nave, with two aisles, a chancel, and two lofty towers, surmounted by spires at the angles of the west front. The nave is separated from the aisles by five pointed arches, rising from short oblong piers; and from the chancel by three small semi-circular arches, springing from tall round columns, with very singular capitals. In this church kings Ethelbert I. and II. are said to have been buried; and a monument erected to the memory of the first is described by Weever in his "Funeral Monuments," though it has now disappeared. On the floor of the chancel are several brasses of great antiquity. (See RICHBOROUGH.) Beauties of England and Wales, vol. vii. by E. W. Brayley. History and Antiquities of Reculver and Herne, by W. Battely, D. D. 8vo.

RECUMPADO, in *Geography*, a town of Hindoostan, in the circar of Rajamundry; 23 miles N.W. of Rajamundry.

RECUPERATORES, among the Romans, were commissioners appointed to take cognizance of private matters in dispute, between the subjects of the state and foreigners, and to take care that the former had justice done them.

It came at last to be used for commissioners, to whom the prætor referred the determination of any affair between one subject and another.

RECURRENS, in *Anatomy*, a name under which the inferior laryngeal branch of the par vagum is often described, from the circumstance of its arising in the chest below the point of its distribution to the larynx, and then going back into the neck in a retrograde course. See NERVE.

RECURRING SERIES, is a series so constituted, that each succeeding term is connected with a certain number of the terms immediately preceding it, by a certain and invariable law; as the sums or differences of some multiples of those terms. Thus the series

$$\begin{array}{ccccccc} \alpha & \beta & \gamma & \delta & \varepsilon & \theta & \&c. \\ 1, & 3x, & 5x^2, & 7x^3, & 9x^4, & 11x^5, & \&c. \end{array}$$

is a recurring series; for these terms being respectively represented by $\alpha, \beta, \gamma, \delta$, &c. we have

$$\begin{aligned} \gamma &= 2x\beta - x^2\alpha \\ \delta &= 2x\gamma - x^2\beta \\ \varepsilon &= 2x\delta - x^2\gamma \\ \theta &= \&c. \qquad \&c. \end{aligned}$$

that is, each term is equal to $2x$ times that which precedes it, minus x^2 times the one preceding the last.

Or, generally, let

$$\begin{array}{ccccccc} \alpha & \beta & \gamma & \delta & \varepsilon & \theta & \&c. \\ a, & bx, & cx^2, & dx^3, & ex^4, & fx^5, & \&c. \end{array}$$

be any series whose terms are denoted as above, by $\alpha, \beta, \gamma, \delta$, &c. Also, let μ, ν, ξ, &c. represent the successive multipliers by which the terms are connected, so that

$$\begin{aligned} \alpha &= \alpha \\ \beta &= \beta \\ \gamma &= \mu x\beta + \nu x^2\alpha + \&c. \\ \delta &= \mu x\gamma + \nu x^2\beta + \&c. \\ \varepsilon &= \mu x\delta + \nu x^2\gamma + \&c. \\ \theta &= \&c. \qquad \&c. \end{aligned}$$

then this series is called a recurring series; and $\mu + \nu +$ &c. De Moivre calls the *scale of relation*, which is said to be of *one*, *two*, *three*, &c. terms, according to the number of

multipliers

multipliers by which it is connected. In the above we have used only two, μ and ν, whence $\mu + \nu$ is called the scale of relation, which is here of two terms; and 1 minus the scale of relation, as $1 - \mu - \nu$, is called by the same author the *differential scale*, which is always equal to the denominator of the fraction from which the series is produced.

If, in the above series, the terms had the relation

$$\begin{aligned}
\alpha &= \alpha \\
\beta &= \beta \\
\gamma &= \gamma \\
\delta &= \mu x \,.\, \gamma + \nu x^2 \,.\, \beta + \varrho x^3 \alpha \\
\varepsilon &= \mu x \,.\, \delta + \nu x^2 \,.\, \gamma + \varrho x^3 \beta \\
\theta &= \mu x \,.\, \varepsilon + \nu x^2 \,.\, \delta + \varrho x^3 \gamma \\
&\text{\&c.} \qquad \text{\&c.} \qquad \text{\&c.}
\end{aligned}$$

then the scale of relation would be $\mu + \nu + \varrho$, which is of three terms; and the differential scale, or the denominator of the fraction, is $1 - \mu - \nu - \varrho$.

The following problems are naturally connected with the doctrine of recurring series; *viz.*

1. Any recurring series being proposed, to find the scale of relation, or the law of the series, which is not always obvious on inspection.

2. To find the sum of an infinite recurring series, or the sum of any number of its terms (n).

3. To find a general expression for any indefinite term of such a series, as, for example, the nth term.

We shall consider each of these problems under their separate heads.

I. *To find the scale of relation in any proposed recurring series.*

Let $\alpha, \beta, \gamma, \delta, \varepsilon, \theta$, &c. be a recurring series, of which it is required to find the scale of relation

Assume
$$\begin{aligned}
\delta &= \mu' \gamma + \nu' \beta + \text{\&c.} \\
\varepsilon &= \mu' \delta + \nu' \gamma + \text{\&c.} \\
\theta &= \text{\&c.} \qquad \text{\&c.}
\end{aligned}$$

Where β, γ, δ, &c. are known, and μ, ν, &c. unknown quantities, whose numeral values are required, and which are readily found by the usual method of elimination. Thus in the above, using only μ and ν, we have

$$\mu' = \frac{\delta\gamma - \varepsilon\beta}{\gamma\gamma - \delta\beta}, \text{ and } \nu' = \frac{\delta\delta - \gamma\varepsilon}{\beta\delta - \gamma^2}.$$

These values of μ', and ν', will obviously contain in them the powers of the indeterminate quantity x, which being taken out, we shall have the required numeral values of μ and ν.

Let it be required to ascertain the scale of relation in the series

$$\begin{matrix} \alpha & \beta & \gamma & \delta & \varepsilon & \theta & \text{\&c.} \\ 1, & 3x, & 5x^2, & 7x^3, & 9x^4, & 11x^5, & \text{\&c.} \end{matrix}$$

Here, by substituting the proper values of β, γ, δ, &c. in the above equation, we have

$$\mu' = \frac{35x^5 - 27x^5}{26x^4 - 21x^4} = \frac{8x^5}{4x^4} = 2x$$

$$\nu' = \frac{49x^6 - 45x^6}{21x^4 - 25x^4} = \frac{4x^6}{-4x^4} = -1x^2$$

when $\mu = 2$, and $\nu = -1$.

The same method may obviously be employed in any other case; but in order to know whether or not we have assumed a scale of relation of a sufficient number of terms, we must repeat the same operation upon three other terms, of which one at least was not before employed; and if both give the same values, we may be assured of the truth of our results: or we may otherwise, instead of repeating the operation, examine the several terms, and see whether they agree with the law we have determined, and if not, we must increase the terms in our scale of relation; for it may be observed, that we can never fail of determining them in consequence of having assumed too many terms, as we shall, in that case, have one of our results zero.

Lagrange has formed a different rule for ascertaining whether a given series be recurring or not, which Mr. Bonnycastle has given at p. 323 of his Algebra; but as it does not seem adapted for detecting the law of formation, we shall not insert it.

II. *To find the sum of any recurring series, of which the scale of relation is known.*

$$\text{Let } \begin{cases} \alpha & \beta & \gamma & \delta & \varepsilon & \theta & \text{\&c.} \\ a, & bx, & cx^2, & dx^3, & ex^4, & fx^5, & \text{\&c.} \end{cases}$$

be a recurring series, of which the scale of relation is $\mu + \nu$, so that

$$\begin{aligned}
\alpha &= \alpha \\
\beta &= \beta \\
\gamma &= \mu x \,.\, \beta + \nu x^2 \alpha \\
\delta &= \mu x \,.\, \gamma + \nu x^2 \beta \\
\varepsilon &= \mu x \,.\, \delta + \nu x^2 \gamma \\
&\text{\&c.} \qquad \text{\&c.} \qquad \text{\&c.}
\end{aligned}$$

Here it is obvious, that the whole sum

$$S = \alpha + \beta + \gamma + \delta + \varepsilon + \text{\&c.}$$
$$S = \alpha + \beta + \mu x(\beta + \gamma + \delta +) + \nu x^2(\alpha + \beta + \gamma + \text{\&c.})$$
$$S = \alpha + \beta + \mu x(S - \alpha) + \nu x^2 \,.\, S$$

$$\text{whence } S = \frac{\alpha + \beta - \mu a x}{1 - \mu x - \nu x^2}$$

which is a general expression when the scale of relation is of two terms.

When the scale of relation is of three terms, so that

$$\begin{aligned}
\alpha &= \alpha \\
\beta &= \beta \\
\gamma &= \gamma \\
\delta &= \mu x \,.\, \gamma + \nu x^2 \,.\, \beta + \varrho x^3 \alpha \\
\varepsilon &= \mu x \,.\, \delta + \nu x^2 \,.\, \gamma + \varrho x^3 \beta \\
\theta &= \mu x \,.\, \varepsilon + \nu x^2 \,.\, \delta + \varrho x^3 \gamma \\
&\text{\&c.} \qquad \text{\&c.} \qquad \text{\&c.}
\end{aligned}$$

it is equally obvious that

$$S = \alpha + \beta + \gamma + \delta + \varepsilon + \theta + \text{\&c. or}$$

$$S = \begin{cases} \alpha + \beta + \gamma + \\ \mu x\ (\gamma + \delta + \varepsilon + \text{\&c.}) + \\ \nu x^2\ (\beta + \gamma + \delta + \text{\&c.}) + \\ \varrho x^3\ (\alpha + \beta + \gamma + \text{\&c.}), \text{ or} \end{cases}$$

$$S = \alpha + \beta + \gamma + \mu x(S - \alpha - \beta) + \nu x^2(S - \alpha)\ \varrho x^3 + S$$

whence we have

$$S = \frac{\alpha + \beta + \gamma - \mu x\ (\alpha + \beta) - \nu x^2 \,.\, \alpha}{1 - \mu x - \nu x^2 - \varrho x^3}$$

which is the general expression for the sum, when the scale of relation is of three terms.

In the same manner we have

$$S = \frac{\alpha + \beta + \gamma + \delta - \mu x(\alpha + \beta + \gamma) - \nu x^2(\alpha + \beta) - \varrho x^3 \,.\, \alpha}{1 - \mu x - \nu x^2 - \varrho x^3 - \sigma x^4}$$

for a scale of relation of four terms; and so on.

But as the terms $\alpha, \beta, \gamma, \delta$, &c. contain in them certain powers of x, we may reduce the above expressions to simpler forms

forms by fubftituting a for α, $b\,x$ for β, $c\,x^2$ for γ, &c. in which cafe the above become

$$S = \frac{a + (b - a\mu)\,x}{1 - \mu x - \nu x^2}$$

$$S = \frac{a + (b - a\mu)\,x + (c - b\mu - a\nu)\,x^2}{1 - \mu x - \nu x^2 - \varrho x^3}$$

$$S = \frac{a + (b - a\mu)\,x + (c - b\mu - a\nu)\,x^2 - (d - c\mu - b\nu - a\varrho)\,x^3}{1 - \mu x - \nu x^2 - \varrho x^3 - \sigma x^4}$$

which are the feveral expreffions for the fcales of relation of two, three, or four terms, and the law of formation is fufficiently obvious for any other fcale.

The fame law might have been otherwife obtained as follows. It is evident, from what is done above, that the fcale of relation fubtracted from unity is always equal to the denominator of the generating feries, and the fame may alfo be demonftrated on other principles. In order, therefore, to find the numerator, we might affume the propofed feries

$$a + b\,x + c\,x^2 + d\,x^3 + \text{ \&c.}$$
$$= \frac{a' + b'x + c'x^2 + d'x^3 + \text{ \&c.}}{1 - \mu x - \nu x^2 - \varrho x^3 - \text{ \&c.}}$$

then multiplying this denominator by the propofed feries, and equating the co-efficients of the products with thofe of the like powers of x in the numerator, we fhould find

$$\begin{aligned} a' &= a \\ b' &= b - a\mu \\ c' &= c - b\mu - a\nu \\ d' &= \text{\&c.} \qquad \text{\&c.} \end{aligned}$$

as in the preceding formulæ.

It is only neceffary to obferve, farther, that if the indices of x do not follow the law we have fuppofed, we muft make the neceffary correction in the general expreffion, and if the propofed feries have no power of x in it, as commonly happens, we muft, in the conclufion, make $x = +1$.

The above formulæ, it will be obferved, give the fum of the infinite feries. When only a certain number of terms are to be fummed, different formulæ are required, which we fhall inveftigate, after having fhewn how to obtain a general expreffion for the nth term of fuch recurring feries. We propofe, however, in the firft place, to illuftrate the above rules by one or two examples.

Exam. 1.—Required the fum of the infinite recurring feries $1 + 6x + 12x^2 + 48x^3 +$ &c. the fcale of relation being $1 + 6$.

Here $a = 1$, $b = 6$, $\mu = 1$, and $\nu = 6$, whence

$$\frac{a + (b - a\mu)\,x}{1 - \mu x - \nu x^2} = \frac{1 + 5x}{1 - x - 6x^2},$$

the fum required.

Exam. 2.—Required the fum of the infinite recurring feries

$$1 + 4x + 6x^2 + 11x^3 + 28x^4 + 63x^5, \text{ \&c.}$$

the fcale of relation being $2, -1, +3$.

Here $a = 1$, $b = 4$, $c = 6$; $\mu = 2$, $\nu = -1$, and $\varrho = 3$; whence

$$S = \frac{a + (b - a\mu)\,x + (c - b\mu - a\nu)}{1 - \mu x - \nu x^2 - \varrho x^3} =$$
$$\frac{1 + (4 - 2)\,x + (6 - 8 + 1)\,x^2}{1 - 2x + x^2 - 3x^3} =$$
$$\frac{(1 + x)^2 - 2x^2}{(1 - x)^2 - 3x^3},$$

as required

III.—*To find the general term of any propofed recurring feries.*

From the preceding part of this article it appears, that every recurring feries may be confidered as arifing from the developement or expanfion of fome rational fraction of the form

$$\frac{a + b\,x + c\,x^2 + d\,x^3 + \text{ \&c.}}{1 - \alpha x - \beta x^2 - \gamma x^3 - \delta x^4 - \text{ \&c.}}$$

Let us, therefore, fuppofe this fraction to be converted into the infinite recurring feries $A + B\,x + C\,x^2 + D\,x^3 + E\,x^4 +$ &c. of which we already know how to determine the co-efficients, and the law of their formation.

Now if this rational fraction be decompofed into its fimple fractions by the method explained under the article RATIONAL *Fractions*, and each of thefe fimple fractions be then converted into a recurring feries, it is evident that the fum of all thefe feries ought to be equal to the original feries

$$A + B\,x + C\,x^2 + D\,x^3 + E\,x^4 + \text{ \&c.}$$

Now each of thefe partial fractions being of the form $\frac{A'}{1 - r\,x}$, the feries thence arifing will have the form

$$A' + A'r\,x + A'r^2x^2 + A'r^3x^3 \;.\;.\;.\; A'r^n x^n$$

of which $A\,r^n x^n$ is the general term. Hence, the feveral feries arifing from the partial fractions may be fuppofed to be

$$\begin{aligned} &A' + A'\,r\,x + A'\,r^2\,x^2 + A'\,r^3\,x^3 \ldots A'\,r^n x^n \\ &A'' + A''\,r'\,x + A''\,r'^2\,x^2 + A''\,r'^3\,x^3 \ldots A''\,r'^n x^n \\ &A''' + A'''\,r''\,x + A'''\,r''^2\,x^2 + A'''\,r''^3\,x^3 \ldots A'''\,r''^n x^n \\ &A^{\text{iv}} + A^{\text{iv}}\,r'''\,x + A^{\text{iv}}\,r'''^2\,x^2 + A^{\text{iv}}\,r'''^3\,x^3 \ldots A^{\text{iv}}\,r'''^n x^n \end{aligned}$$

and fince the fum of thefe feries is equal to the original one propofed, we know that the co-efficients of the like powers of x are alfo equal, whence we have

$$\begin{aligned} A &= A' + A'' + A''' + A^{\text{iv}} + \text{ \&c.} \\ B &= A'r + A''r' + A'''r'' + A^{\text{iv}}r'' + \text{ \&c.} \end{aligned}$$

whence it appears that the co-efficient of any term x^n of the recurring feries is equal to the fum of the co-efficients of the fame power of x, which arife from expanding the feveral fimple fractions into which the given fraction is decompofed; and this co-efficient is always equal to the fum of each of the numerators of the feveral fimple fractions, multiplied into the nth power of the correfponding value of r in the denominator of the fame fraction, at leaft while the denominator contains no equal factor. But if, among the partial fractions, there is any one of the form $\frac{A'}{(1 - r\,x)^2}$, the general term of this will be $(n + 1)\,A\,r^n x^n$; of $\frac{A}{(1 - r\,x)^3}$, the general term is $\frac{(n+1)\,(n+2)}{1\,.\,2}\,A\,r^n x^n$; and univerfally $\frac{A}{(1 - r\,x)^k}$, the general term is

$$\frac{(n + 1)\,(n + 2)\,(n + 3)\;.\;.\;.\;(n + k - 1)}{1\,.\,2\,.\,3\;.\;.\;.\;(k - 1)}$$

we may, therefore, in all cafes wherein the generating fraction of the original feries admits of a rational decompofition, arrive very readily at the general term upon the principles above explained.

Thus,

Thus, as an example, let there be proposed the recurring series

$$1 + 4x + 14x^2 + 46x^3 + 146x^4 + \&c.$$

to find the general term, or the co-efficient of x^n.

The sum of this series is found by the preceding part of this article to be $\frac{1 - x}{1 - 5x + 6x^2}$.

This rational fraction is equal to $\frac{-1}{1 - 2x} + \frac{2}{1 - 3x}$. Now the general term of $\frac{1}{1 - 2x}$ is $- 2^n x^n$; and of $\frac{2}{1 - 3x}$ is $- 2 \cdot 3^n x^n$, as shewn above, therefore the general term of the proposed series will be $(2 \cdot 3^n - 2^n) x^n$.

It may be observed, however, that this method is in some cases very laborious, and not always practicable; it will, therefore, frequently be better to make use of the *multinomial theorem*, which may be done by putting the generating fraction under the form

$$(a + bx + cx^2 + \&c.)(1 - \alpha x - \beta x^2 - \gamma x^3 - \&c.)^{-1}$$

See *Multinomial* THEOREM.

IV.—*To find the sum of any number* (n) *terms of a recurring series.*

For this purpose it is only necessary to find the co-efficient of the $n + 1$th term of the series. Then, from the sum of the entire series subtract the sum of the series beyond the nth term, and the difference will obviously be the sum of the first n terms sought.

Let there be proposed as an example to find the sum of n terms of the series

$$1 + 2x + 3x^2 + 4x^3 + \ldots \ldots n x^{n-1}.$$

The infinite sum of this series is readily found $= \frac{1}{(1 - x)^2}$.

In the second case, *viz.* of the terms beyond $n x^{n-1}$, the series is

$$(n+1) x^n + (n + 2) x^{n+1} + (n + 3) x^{n+2}, \&c.;$$

and in the formula $s = \frac{\alpha + \beta - \alpha \mu x}{1 - \mu x - \nu x^2}$ we have only to substitute $\alpha = (n + 1) x^n$, and $\beta = (n + 2) x^{n+1}$, instead of $\alpha = 1$ and $\beta = 2x$, as in the former. Hence we have

$$s' = \frac{(n + 1) x^n + (n + 2) x^{n+1} - 2(n + 1) x^{n+1}}{1 - 2x + x^2}, \text{ or}$$

$$s' = \frac{(n + 1) x^n - n x^{n+1}}{(1 - x)^2};$$

and, therefore, $s - s'$, or the sum of the first n terms is equal to

$$\frac{1 - (n + 1) x^n + n x^{n+1}}{(1 - x)^2}.$$

2. Required the sum of n terms in the series

$$1 + 3x + 5x^2 + 7x^3 + \ldots \ldots (2n - 1) x^{n-1}.$$

Here, by trial, we find the scale of relation to be $\mu = + 2$, and $\nu = - 1$, as before, therefore the infinite sum is

$$s = \frac{\alpha + \beta - \alpha \mu x}{1 - \mu x - \nu x^2} = \frac{1 + 3x - 2x}{1 - 2x + x^2} = \frac{1 + x}{(1 - x)^2}.$$

After n terms, the series becomes

$$(2n + 1) x^n + (2n + 3) x^{n+1} + (2n + 5) x^{n+2} + \&c.$$

which therefore arises from the fraction

$$\frac{(2n + 1) x^n + (2n + 3) x^{n+1} - 2(2n + 1) x^{n+1}}{1 - 2x + x^2} =$$

$$\frac{(2n + 1) x^n - (2n - 1) x^{n+1}}{(1 - x)^2}$$

whence the sum of n terms is

$$\frac{1 + x - (2n + 1) x^n + (2n - 1) x^{n+1}}{(1 - x)^2}$$

3. Required the sum of n terms of the series

$$(n - 1) x + (n - 2) x^2 + (n - 3) x^3 + \&c.$$

Here again the scale of relation is $+ 2 - 1$, therefore the infinite sum is

$$\frac{(n - 1) x + (n - 2) x^2 - 2(n - 1) x^2}{(1 - x)^2} =$$

$$\frac{(n - 1) x - n x^2}{(1 - x)^2}$$

After n terms, it becomes $- x^{n+1} - 2 x^{n+2} -$ &c. the sum of which is found in the same manner to be $\frac{- x^{n+1}}{(1 - x)^2}$; therefore n terms of the proposed series is

$$\frac{(n - 1) x - n x^2 + x^{n+1}}{(1 - x)^2}$$

Hence, also, n terms of the series

$$\frac{(n - 1) x}{n} + \frac{(n - 2) x^2}{n} + \frac{(n - 3) x^3}{n} + \&c. \text{ is}$$

$$\frac{(n - 1) x - n x^2 + x^{n+1}}{n (1 - x)^2}$$

In a similar manner the sum of n terms of the series

$$1^2 + 2^2 x + 3^2 x^2 + 4^2 x^3 + \&c.$$

is found to be

$$\frac{1 + x - (n + 1)^2 x^n + (2n^2 + 2n - 1) x^{n+1} - n^2 x^{n+2}}{(1 - x)^3}$$

the scale of relation being $3 - 3, 1$.

In all the preceding examples we have determined the infinite sum of the series, as beginning at the first term, and at the $(n + 1)$th term, a more easy method is as follows, which is due to Simpson. Essays, p. 96.

Let $A + B + C + D + \ldots + K + L + M + N$ be any finite recurring series, of which each term depends upon the three which precede it, the scale of relation being p, q, r, so that

$$\begin{aligned} pA + qB + rC &= D \\ pB + qC + rD &= E \\ \&c. \quad \&c. \quad &\&c. \end{aligned}$$

or, which is the same,

$$\begin{aligned} pA + qB + rC - D &= 0 \\ pB + qC + rD - E &= 0 \\ pC + qD + rE - F &= 0 \\ \ldots \ldots \ldots \ldots \\ pK + qL + rM - N &= 0 \end{aligned}$$

whence,

whence, by addition

$$\left.\begin{array}{l} p(A + B + C + ..K) + q(B + C + D + L) + \\ r(C + B + D + ..M) - (D + E + F + N) \end{array}\right\} = 0$$

Or, reprefenting the whole fum by S,

$$\left.\begin{array}{l} p(S - L - M - N) + q(S - A - M - N + \\ r(S - A - B - N) - (S - A - B - C \end{array}\right\} = 0$$

which, by addition and divifion, gives

$$S = \frac{p(L + M + N) + q(A + M + N) + r(A + B + N) - (A + B + C)}{p + q + r - 1}$$

where the fum depends merely upon the three firft and the three laft terms of the feries; and a fimilar expreffion, it is obvious, may be obtained for any other fcale of relation.

It may not be amifs to obferve, that when the propofed feries is wholly numeral, (the fum of which, as we have before obferved, is to be found by making $x = 1$); both this formula and the preceding one fail, in the cafe in which the denominator of the fraction becomes zero, and we muft, therefore, in fuch cafes, have recourfe to other methods of fummation, as given under the article SERIES.

On this fubject the reader fhould confult De Moivre's Mifc. Analyt. and his Doctrine of Chances, and Euler's Analyfis Infinitorum, where he will find an explanation of its application to the approximation to the roots of equations. Colfon's Comment on Newton's Fluxions. Stirling's Methodus Differ. Cramer's Analyfis des Lignes Courbes. Bernoulli de Serieb. Inf. &c. See alfo a chapter on this fubject, in vol. ii. of Bonnycaftle's Algebra.

RECURVIROSTRA, the *Avocet*, in *Ornithology*, a genus of birds of the order Grallæ, of which the generic character is; bill depreffed, fubulate, recurved, pointed, flexible at the tip; the feet are palmate, four-toed, the hind toe not connected, very fhort, and placed high up; the noftrils are narrow, pervious; the tongue is fhort. There are only three

Species.

* AVOCETTA; Scooping Avocet; called alfo in different parts of this country, butter-flip, fcooper, yelper, crooked-bill, &c. This bird is variegated with white and black; the bill is three inches and a half long; irides hazel; crown black; a white fpot behind and beneath the eyes; reft of the head, neck, back, exterior part of the wings, leffer quill-feathers, tail, and under part of the body, white; inner fcapulars and greater quill-feathers without and at the tips black; legs blueifh, and very long; membrane connecting the toes indented. It refides in the temperate parts of Europe, weighing thirteen ounces; and meafuring, from the tip of the bill to the end of the tail, eighteen inches. It breeds in the fens of Lincolnfhire, and on Romney Marfh, in Kent. The female lays two white eggs, tinged with green, and marked with large black fpots. In winter thefe birds affemble in fmall flocks of fix or feven, and frequent the fhores, particularly the mouths of large rivers, in fearch of worms and marine infects, which they fcoop out of the mud or fand. They feem to be particularly fond of the cancer, pulex, or locufta. By means of their long legs, they run over fhores that are covered five or fix inches with water. In their movements they are lively, alert, volatile, and difficult to catch. When the female is frightened off her neft fhe counterfeits lamenefs; and when a flock is difturbed, they fly with their necks ftretched out, and their legs extended behind, over the head of the fpectator, making a fhrill noife, and uttering a yelping cry of twit, twit, all the time.

AMERICANA; American Avocet. The head and neck are reddifh; back black, beneath it is white. It inhabits North America and New Holland; is fourteen inches long. Bill black; front dufky-white; neck above white; primary and tertial wing-coverts black, the middle ones, and fome of the fecondary quill-feathers, white.

ALBA; White Avocet. This fpecies is white; the lower wing-coverts brownifh; bill orange; legs brown. Inhabits Hudfon's Bay; fourteen inches and a quarter long. Bill tipt with black; edge of the wings, greater quill-feathers, and tail, tinged with yellowifh.

RECUSANTS, in a general fenfe, perfons, whether Papifts or others, who refufe to go to church and to worfhip God after the manner of the church of England. Popifh recufants are Papifts, who fo refufe; and a popifh recufant convict is a Papift legally convicted of fuch offence. See PAPIST, PRÆMUNIRE, and TOLERATION.

RECUSATION, RECUSATIO, an act by which a judge is defired to refrain from judging fome certain caufe, on account of his relation to one of the parties; or of fome capital enmity, or the like.

By the French laws, kinfhip within the fourth degree is deemed a legal caufe of recufation; as alfo the judge's being godfather, &c. of one of the parties.

By the laws of England alfo, in the times of Bracton and Fleta, a judge might be refufed for good caufe; but now the law is otherwife, and it is held that judges or juftices cannot be challenged. Co. Litt. 254. See CHALLENGE.

RED, in *Phyfics*, one of the fimple or primary colours of natural bodies, or rather of the rays of light.

The red rays are thofe which are of all rays the leaft refrangible: hence, as fir Ifaac Newton fuppofes the different degrees of refrangibility to arife from the different magnitudes of the luminous particles of which the rays confift, the red rays, or red light, is concluded to be that which confifts of the largeft particles. See COLOUR, LIGHT, and RAY.

Authors diftinguifh three general kinds of red; one bordering on the blue, as colombine, or dove-colour, purple, and crimfon; another bordering on yellow, as flame-colour and orange; and between thefe extremes is a medium, partaking neither of the one nor the other, which is what we properly call *red*.

Acids generally turn black blue, and violet into red; and red into yellow, and yellow into a very pale yellow.

Alkalies change red into violet, or purple; and yellow into feuillemort, or dead leaf-colour.

Terreftrial and fulphureous matters become red by extreme heat; and fome, at length, black, as we fee in brick, red bole, red chalk, flate, &c. All thefe, when vitrified by a burning-glafs, become black.

Lobfters become red by a moderate fire; and by a violent one, black. Mercury and fulphur mixed and heated over a moderate fire make a beautiful red, called *artificial cinnabar*.

An acid fpirit, as lemon juice, being poured on a blue folution of turnfole, turns it into a beautiful red. Alkali reftores it again to its original blue. Filtrating of fome reddifh wines takes from them all their red colour.

M. De la Hire obferves, that a very luminous body viewed through a black one, always appears red; as when the fun is feen fhining through a black cloud. He adds, that fome people who fee all the other colours perfectly well, yet have no idea of red, and only fee it as black.

RED, in *Cofmetics*, a fucus or paint with which the ladies enliven their cheeks and lips.

There

There are two kinds of reds; the one in leaves, called Spanifh red; the other a liquor, which is an extract of a fcarlet dye.

Red, in *Dyeing*, is one of the five fimple or mother colours of the dyers.

Some reckon feven kinds, or cafts of red: *viz.* fcarlet-red, crimfon-red, madder-red, half-grain-red, half-crimfon-red, lively orange-red, and fcarlet of cochineal. But they may be all reduced to three, according to the three principal drugs which give the colours; which are kermes, cochineal, and madder.

The fine fcarlet, called *fcarlet of the Gobelins*, is given with agaric, bran-water, woad, and fcarlet grain, or kermes. Some dyers add cochineal, and others fenugreek; brightening it with bran-water, agaric, tartar, and turmeric. See Kermes and Scarlet.

Crimfon-red is dyed with bran-water, tartar, and meftique cochineal. See Crimson.

Madder-red is dyed with madder; to which fome add realgar, or red arfenic: others, common falt, or other falts, with wheat-flour; or agaric with fpirit of wine, with galls or turmeric. See Madder.

The half-grain is made with agaric and bran-water, half fcarlet grain, half madder, and fometimes turmeric.

The half-crimfon is made of half madder, half cochineal. As to the lively orange-red, the ftuff muft be firft put in yellow, then in a liquor made of goat's hair, (which has been boiled feveral times with madder,) diffolved over the fire with certain faline liquors, as urine, tartar, &c.

The fcarlet of cochineal, or Dutch fcarlet, as the French call it, is made with ftarch, tartar, and cochineal; after firft boiling it with alum, tartar, fal gemma, and aqua fortis in which pewter has been diffolved.

Befides thefe feven reds, which are good and allowed colours, there is alfo a Brafil red; which is difcouraged, as fading eafily.

Of the feven good reds, only four have particular cafts, or fhades; the madder-red, crimfon-red, lively orange-red, and fcarlet of cochineal.

The cafts or fhades of crimfon are flefh colour, peach colour, carnation rofe colour, and apple-tree flower colour. Thofe of madder are flefh colour, onion-peel colour, and flame colour. Thofe of orange are the fame with thofe of crimfon. Scarlet, befides the fhades of all the reft, has fome peculiar to itfelf, as cherry colour, fire colour, &c. See Dyeing.

Red, in the *Manufacture of Glafs*. See *Red* Glass.

To make a deep red in glafs, the following method is that moft practifed by the glafs-men. Take cryftal frit twenty pounds, broken pieces of white glafs one pound, calcined tin two pounds; mix thefe well together, and put them into a pot to melt and purify. When thefe are melted, take fteel calcined, fcales of iron from the fmith's anvil, both powdered very fine, of each an equal quantity; put leifurely an ounce of this mixed powder to the before mentioned metal; mix all well together, and let them ftand fix or eight hours in fufion to incorporate; take out a proof after this, and if there be too little of the powder, it will appear of a dufky yellow; then more of the powder muft be added, and then add three quarters of an ounce of calcined brafs, ground to a fine powder; mix them thoroughly together, and the mafs will be of a blood red; continue ftirring the whole together, and frequently taking out proofs of the colour, when it is right, work it immediately, otherwife it will lofe its colour and become black. The mouth of the pot muft in this procefs be left open, elfe the colour will be loft. Neri's Art. of Glafs, p. 100.

Red, in *Heraldry*. See Gules.

Red, in *Painting*. For painting in oil colours they ufe a red called *cinnabar*, or vermilion; and another called *lacca*. See each in its place.

In limning and frefco, for a violet red, inftead of lacca they ufe reddle, a natural earth found in England; for a brown red, they ufe burnt ochre, which is a native yellow earth, made red by calcination. It is chiefly brought from Oxfordfhire; and burnt by thofe who prepare it in large ovens. The marks of its goodnefs are brightnefs of colour, and a friable chalky texture, without manifefting any gritty roughnefs when rubbed betwixt the fingers.

The common Indian red, which is of a hue verging to the fcarlet, is much ufed, on account of its ftanding and warm though not bright colour, in finer as well as coarfer paintings in oil. It may be prepared by taking of the caput mortuum or ochre left in the iron pots after the diftillation of aqua fortis from nitre and vitriol, two parts; and of the caput mortuum or colcothar left in the long necks after the diftillation of oil of vitriol, one part; breaking the lumps found among them, and putting them into tubs with a good quantity of water: and having left them to ftand for a day or two, frequently ftirring them, then lading off as much water as can be obtained clear from them, and adding a frefh quantity; repeating the fame treatment till all the falts be wafhed out, and the water comes off nearly infipid. The red powder which remains muft then be wafhed over, and, being freed from the water, laid out to dry. When this is defigned for nicer purpofes, it fhould again be wafhed over in bafons.

The true Indian red is a native ochreous earth of a purple colour, brought from the ifland of Ormus, in the Perfian gulf; and called, among the authors on thefe fubjects, *terra Perfica*. At prefent it is very rarely to be found; but it is certainly very valuable (there being no other uncompounded purple colour in ufe with oil) as well for the force of its effect, as for the certainty of its ftanding. In its genuine ftate, it needs no other preparation than grinding or wafhing over. It may be eafily diftinguifhed from any fictitious kind, by its being more bright than any other ochre which can be made fo purple; and if it be rendered artificially purple by any addition, the fire will foon betray it; into which the genuine may be put without any hazard of change.

Venetian red is a native red ochre (fee Veneta *bolus*), not much different from the common Indian red, but fouler; and may be eafily prepared, by mixing common red ochre with the colcothar or caput mortuum taken out of the aqua fortis pots, and wafhed over. As it is generally ufed by the houfe painters in imitation of mahogany, it requires no other preparation than to be well ground with the oil with which it is ufed; but when it is ufed in miniature painting, it fhould be carefully wafhed over.

Red, *Blown*, in the *Porcelain Manufacture*, a name given to a peculiarly coloured china ware, of a fpangled red, or to the colour alone that fpangles it. It is an ornament eafily introduced into ufe in our own manufactories of porcelain ware, and is done in the following manner. The colour is to be prepared of common copperas, calcined to a red colour in a charcoal fire, in a crucible, with another luted on the top of it inverted, and with a hole in its bottom. The fignal of the calcination being finifhed, is, when the black clouds ceafe to come up through the hole, and a fine white thin vapour rifes in their place. The veffels are to be then fuffered to cool, and the red matter in them is to be reduced to a fine powder, while the veffels to be coloured with this are yet wet. The operator is to provide a glafs pipe, and covering one end of it with a piece of fine gauze, he is to dip this into the powder, and taking it carefully out, with what little is fticking to it, he is to blow againft the veffel at fome diftance from it: thus the fineft part of the powder only will reach the veffel, and will be laid on in form of glittering fpangles, very fmall, but all diftinct. This is fort of colouring much efteemed by the Chinefe themfelves, and they have a way of ufing the common blue in the fame manner; but few of the veffels thus painted come over to us.

Red *Clover*, in *Agriculture*, an ufeful artificial grafs for arable lands. It has this name in contradiftinction to the white and fome other forts. There were at firft many and very great prejudices againft and objections made to the introduction of this plant into cultivation by farmers, which were not furmounted without difficulty, and it prevailed for fome length of time in particular diftricts, as Staffordfhire and Worcefterfhire, before it was known in fome other counties, where it is now very predominant and beneficial, as Chefhire, Lancafhire, and many more.

In fome arable counties red clover is found to fail as a crop when long cultivated, dying away in the winter and fpring, which the farmers defignate by faying that the land is fick of it. This is a fevere inconvenience to them in many cafes; and renders fuch variations in the courfes of cropping neceffary, as may prevent the recurrence of it fo frequently as has hitherto been the cafe. It is very liable to fail in every part of the county of Effex, but of the caufe of which there are different opinions, fome thinking that the land becomes fick of the plant, while others do not afcribe it to any fatiety of this nature, but alter their modes of cropping that it may not take place fo often. About the Belcamps and Bofely this is very much the cafe, fome venturing it only once in feven years, and in that cafe it fucceeds well. In all the Tendring hundred it is found to decline little on the ftrong rich lands, but is felt on the lighter forts; on both the cropping is varied in regard to it. In the neighbourhood of Thorndon the lands are fick of it. And at Audley End the land is tired of it, but more in many cafes from want of fufficient feed than any thing elfe. In the vicinity of Hallingbury it is very liable to fail, if fown oftener than once in feven or nine years, though the fyftem thereabouts is crop and fallow.

In the county of Oxford fome fow red clover twice in ten years, the land being new to it; of courfe it never fails. On the gravelly loamy foils about Henly it dies from repetition, fo that it is alternately omitted in cropping, others being fubftituted, as white clover, trefoil, and peas. Nothing of this fort was known forty years ago, but now they fow it only once in two rounds. The loams and ftonebrafh lands around Wood Raton are not in general tired of this plant; fome however find it to fail on the latter fort of foil. About Great Tew, where the lands have been inclofed forty years, they are not yet tired of red clover. At Atterbury, where the lands have been inclofed more years, it does not now fucceed quite fo well as it did fifteen or twenty years ago. In thefe failures other crops are put in, as tares and early peas drilled.

Some fufpect fheep's dung to be deftructive to the red-clover plant, but there are no proofs of the fact.

The moft proper management of red clover as a preparation for wheat is a matter of great importance. Some think feeding it off wholly the beft practice; others mowing and feeding; and a few mowing altogether. The method of feeding off the crops altogether, when done in a clofe even manner, is probably the moft advantageous in this intention, though there may be fome immediate lofs and inconvenience; after which that of mowing the firft crop and feeding the fecond in a ufeful manner; the third mode, or that of mowing twice, is moft to be feared, but upon fome forts of land it may be done and anfwer well for wheat. Thefe methods are all practifed and have their advocates in different parts of Effex; and fome think that they get as good wheat after white as red clover, as well as that feeding the latter does no injury in this refpect.

The farmers in Oxfordfhire follow nearly the fame practices, and hold much the fame opinions in regard to the management of this crop as a preparation for wheat. And the cuftom of mowing and feeding off the firft year, is thought the beft practice in fome other counties.

But in the county of Lancafter, and fome others adjoining it, they know nothing of the land being ever *fick* or *tired* of this fort of crop, though they grow it in more frequent fucceffion and in a more full manner than perhaps any where elfe in the kingdom. Afk the farmers about this, from one end of the above county to the other, they are all of the fame opinion, and appear much furprifed at the queftion, not ever having any conception of fuch a circumftance. What can be the reafon that red clover has been as long and as frequently cultivated in thefe diftricts, as in thofe where it is fo liable to fail? Does it depend upon the difference in the nature or quality of the foils, or the management in regard to the quantity of feed and other matters? The circumftance is worthy of further and more clofe attention and inveftigation, in confequence of its great importance to the farmer.

There is one particular feature of management in the cultivation of red clover in the county of Oxford, which is that of hand-fowing over it from fourteen to fifteen bufhels of Newbury peat-afhes, that are brought into the Thames, by the Reading canal, on the acre, about the end of February or the beginning of the following month; which has an immediate effect upon it, feldom failing to produce a crop, except where it naturally declines. The expence is eftimated at about ten fhillings the acre. Thefe afhes do not, however, feem to be employed in this way to the red clover crop in the diftrict where they are found and prepared.

Seeded red clover undergoes two fucceffive threfhings, the firft, which only beats off the heads and chaffs containing the feed from the ftalks, is called *cobbing* in fome places; the parts thus feparated being denominated the red-clover *cobb*. The work is performed on a thick wooden plank frame for the purpofe, and requires much labour to feparate the feed, which, when done, is cleaned and paffed through different fieves, being ultimately divided into two forts, the primary and fecondary. The coft of thefe operations is very great, amounting to from four to fix fhillings the bufhel, and fometimes much more. It has been concluded by Mr. Middleton, that this plant grows a full crop in all the arable lands of this country, from the fands of Norfolk to the clays of Cleveland and Suffex. And that various foils that have been exhaufted by corn, and not much accuftomed to red clover, have been fo much reftored by it, as to produce a good crop of wheat; but that to do this every means fhould be ufed to fecure a full crop, as that is an excellent preparation for corn, and feldom fails of enfuring a confiderable produce, arifing from fhade, fmother, and putrefaction, the natural and conftant attendants of full-grown red clover. It is fuppofed advifeable, in fome cafes of poor land, to feed both crops off on the land by fheep and other animals, in fome way or other. And fometimes to mow the firft and feed the fecond, or the contrary. In every point of view this is an interefting plant to the farmer. See Clover.

Red *Gum*, an insect disease on wheat, by which the ears of the grain are deprived of their nutrition, and thereby prevented from perfecting themselves. It is described by Mr. Middleton to be a collection of insects, which are visible to the unassisted eye, and which, in the early part of their growth, are of a reddish colour, but become brown with age: the black spots on the straw, blades, and ears of the wheat, are supposed to be the excrement of the insects. The blighted ears are probably rendered so, by the insects piercing the necks of the straw immediately below them, and sucking the saccharine juice, otherwise destined for filling the corn. In those ears which have both perfect and imperfect grains, the insect has perhaps inserted its probe at the connection between the corn and the straw, and by drinking up the food of the grains severally, has starved many of them in such a manner as to cause their destruction and decay. The exact nature of the disease is not, however, yet well ascertained.

Red *Hay*, a term used to signify such as is mow-burnt, in opposition to such as is green from a moderate heat, and *vinny* hay, or such as is mouldy.

Red *Land*, a term used by husbandmen to express a sandy soil of a reddish hue, interspersed for the most part with pieces of sand-stone of the same colour, or somewhat deeper.

It may be noticed that there are several varieties of this soil: one of which is almost entirely made up of sand; another with an admixture of loam with the sand, the whole making a loose loamy earth; and a third full of fragments of a poor sandy iron ore, and often containing shining speculæ of selenite. See Soil.

In some of the more northern parts of the county of Oxford, there is a rich red sandy loam, upon a red grit-stone rock. In some places this land is of a more sandy quality than in others; and, in particular instances, a deep red loam, or red clay. The lands are mostly of an excellent quality, both for arable purposes and those of grass; but the sandy sorts are better than those of the clayey kinds, especially for the former use. The red soiled tracts in this district are considered as the boast and glory of the county, as they are deep, sound, friable, and yet capable of tenacity; being well suited to almost every sort of plant which can be trusted to them, in the way of cultivation. Soils of this nature prevail more or less in a vast number of counties throughout the kingdom, even from the more southern ones to those far advanced towards the north.

Red *Roan*, a term signifying the red tinge in ripening barley, and sometimes other sorts of grain.

Red *Row*, a provincial term, applied to the grains of barley, when in a ripening state, or streaked with red. The crop is then said to be in the red row.

Red *Antimony*, in *Mineralogy*, an ore of that mineral, of a cherry-red colour, containing, according to Klaproth,

67.5 antimony,
10.8 oxygen,
19.7 sulphur.

It occurs most frequently in minute diverging capillary crystals. It melts and evaporates before the blowpipe, yielding a sulphureous odour. See Antimony.

Red *Arsenic*. See Arsenic.

Red *Chalk*. See Reddle, and *Ores of* Iron.

Red *Cobalt*, called *cobalt crust*, and *cobalt bloom* or *ochre*, an ore of cobalt, of a peach blossom red colour. See Cobalt.

Red *Copper*, *Ruby copper*, an ore of copper, of a cochineal red colour, inclining to a lead-grey. It consists, according to Klaproth, of 91 parts copper and 9 of oxygen. See Copper.

Red *Hæmatite*, *Fer oligiste concreticnne* of Haüy, an ore of iron, found in kidney-shaped and globular balls. The structure is fibrous, and divergingly radiated, but arranged in concentric curves; the colour is a blueish-grey, intermixed with red. By friction, it acquires a high metallic lustre. It yields from 60 to 70 *per cent.* of pure iron. (See Iron.) An excellent ore of this kind is procured near Ulverstone, in the north of Lancashire, much valued, as producing an iron of a peculiarly ductile quality, suited for the purposes of the wire-drawers.

Red *Lead*. See Minium and Lead.

Red *Scaly Iron Ore*, *Fer oligiste luisant* of Haüy. It consists of scaly particles slightly cohering; it has an unctuous feel, and stains the fingers. It passes into micaceous iron ore.

Red *Schorl*. See *Ores of* Titanium.

Red, or *Ruby Silver Ore*, *Argent antimonié sulphuré* of Haüy. Werner divides this into two sub-species, dark red silver ore, and light red silver ore, distinguished from each other by their colour, and the situations in which they occur. The dark red ore is commonly accompanied by galena, antimonial sulphuret of silver, quartz, calcareous spar, and pyrites. The colour is between cochineal red and lead-grey. It occurs massive, disseminated, and crystallized in equiangular six-sided prisms, frequently variously truncated. The form of the primitive crystal is an obtuse rhomboid, whose plain angles are 104° 28′ and 75° 32′; the inclination of the faces 109° 28′ and 70° 32′. The external lustre is splendent, and in some specimens metallic; internally it is shining, and sometimes semi-metallic and metallic. The fracture is uneven, and in the crystallized varieties imperfectly small conchoidal. See *Ores of* Silver.

The massive varieties are opaque; the crystallized, semi-pellucid and pellucid. The colour of the streak is a cochineal red. This variety yields easily to the knife: before the blowpipe or charcoal it decrepitates, and melts with a slight effervescence, emitting a dense smoke, which colours the charcoal yellow, and leaves a globule of silver. The specific gravity is 5.563 to 5.608.

The light red silver ore is usually accompanied by native arsenic, white cobalt ore, orpiment, and sulphate of barytes. The colour passes from a carmine red to a medium between cochineal red and lead-grey. In most of its characters it agrees nearly with the dark red silver ore; but when fused, it yields an arsenical vapour. Hence some chemists have conjectured that this ore differs from the dark red ore, by the former containing antimony, and the latter arsenic. According to Klaproth, red silver ore contains nearly

60 of silver,
10.5 sulphur,

$$\text{Combined with 29.4 of antimonial kimes, or}\left\{\begin{array}{l}20.3 \text{ antimony,}\\ 3.2 \text{ oxygen,}\\ 5.9 \text{ sulphur.}\end{array}\right.$$

A variety of red silver ore, probably the light red ore of Werner, analysed by Proust, gave

74 sulphuret of silver,
25 sulphuret of arsenic.
.6 oxyd of iron.

Red silver ore may be distinguished from cinnabar and red copper ore, by its specific gravity, which is considerably less than the former, and greater than the latter; the specific gravity of red silver ore being 5.6 to 5.8.

of cinnabar	7 to 7.5.
red copper	3.9

Red *Vitriol*, a salt found at Neusohl, in Hungary, in the form

form of tranfparent cryftals of a pale rofe-red colour, and more or lefs tranfparent. It was difcovered by Klaproth to be a fulphate of cobalt. Its folution affords a pale blue precipitate, with carbonate of potafh, which tinges borax a pure blue colour.

Red *Charr*, in *Ichthyology*. See Charr.

Red *Eye*, *Erythrophthalmus*, the *cyprinus erythrophthalmus* of Linnæus, called by fome *rothauge*, or *rootang*, which, in the German language, fignifies the fame. It very much refembles the common river bream in fhape, but that it is fomewhat thicker. The fins are all red, and the whole body of the fifh is ftained with a very elegant red, but no part of it fo much as the iris of the eyes. When the fcales are off, the body is of a greenifh hue; and it has a yellow fpot under the tongue. It much refembles the river mullet in fome particulars, but it is of a more beautiful colour, and its eyes are more red. Its largeft fize feems a foot in length. It is a well-tafted fifh; and fpawns in April, under cover of the roots of trees. Ray.

This fifh is called *rudd* by fome Englifh authors; it is alfo called *rutilus latior*, *rubellio fluviatilis*, and *finfcale*. It is very common in many of the rivers of Germany and England, and is in feafon all the year, except in fpawning time, when the male is fubject to a great number of white fpots on its head, and is more rough than at any other feafon. Willughby. See Cyprinus *Erythrophthalmus*.

Red-*Breaft*, in *Ornithology*, a well-known bird, for the characters of which, fee Motacilla *Rubecula*.

The fong of this bird is remarkably fine and foft, and continues through the greateft part of the winter, fpring, and fummer. Many of the autumnal fongfters feem to be the young cock red-breafts of that year. Pennant.

Thompfon, in his Seafons, Winter, line 246, has admirably defcribed the annual vifits of this gueft: and the ancient ballad of " The Babes in the Wood," recording the affection of this bird for mankind, is univerfally known.

Red *Chatterer* of Latham, *Red-bird* from Surinam of Edwards, and *Ampelis carnifex* of Gmelin, a bird of red colours, with an ocular band, and the wing and tail-feathers black at their tips. It is found in New Spain, Guiana, and Surinam.

Red *Game*, an Englifh name of a bird, common in the mountainous parts of Yorkfhire, and fome other of our northern counties. See Gor-*cock*, Grouse, and Tetrao *Lagopus*.

Red-*Pole*, or *Linnet*. See Fringilla and Linnet.

Red-*Pole*, *Yellow*, or *Red-headed Warbler*. See Motacilla *Petechia*.

Red-*Shank*, the name of a water bird, called by authors *gallinula erythropus*, and *callidrys*; the *fcolopax calidris* of Linnæus. It is about the fize of the common plover. The back is of a greyifh or brownifh-green, ufually fpotted with black; its neck grey, and its throat variegated with black and white; the breaft is white, with a few loofe ftreaks of black; the wing-feathers are variegated with black, brown, and white; the bill is two fingers breadth long, flender, and fhaped like the beak of the woodcock; reddifh at the bafe, and blackifh lower down; its legs are of a fine beautiful red, and the hinder toe is very fhort and fmall. It breeds in the fens and marfhes; is found on moft of our fhores; conceals itfelf in winter in the gutters; and is generally found fingle, or at moft in pairs. When difturbed it flies round its neft, making a noife like a lapwing. It lays four eggs, of a whitifh colour tinged with olive, and marked with irregular fpots of black, chiefly on the thicker end. Ray and Pennant. See Scolopax.

Red-*Start*, the Englifh name of the *ruticilla*, or *motacilla phœnicurus* of Linnæus, a very beautiful bird. The bill and legs of the male are black; the forehead white; the crown of the head, hind part of the neck, and the back, are of a deep blue-grey; the cheeks and throat black; the breaft, rump, and fides, are red; the two middle feathers of the tail brown, the others red; the wings brown. In the female, the top of the head and back are of a deep afh colour; the rump and tail of a duller red than thofe of the male; the chin white; the lower fide of the neck cinereous; and the breaft of a paler red.

This bird appears among us only in the fpring and fummer, and is obferved to come over nearly at the fame time with the nightingale. It is fo fhy, that it will forfake its neft, formed with mofs on the outfide, and hair and feathers within, in hollow trees and the holes of buildings, if the eggs are only touched. It has a very fine foft note; and is remarkable for fhaking its tail, and moving it horizontally, as a dog does when fawning. Pennant.

Red-*Start*, *Greater*. See Lanius *Infauftus*. See alfo Turdus *Saxatilis*.

Red-*Start*, *Indian* or *Bengal*. See Lanius *Emeria*.

Red-*Start*, *Small American*. See Muscicapa *Ruticilla*.

Red-*Start*, *Grey*. See Motacilla *Gibraltarienfis* and *Erithacus*.

Red-*Stone Poll*. See Linnet.

Red-*Tail*. See Motacilla *Erithacus* and *Guianenfis*.

Red *Tanager*, and *Summer Red-bird*. See Tanagra.

Red-*Wing*, the name of a bird of the turdus, or thrufh kind, called alfo in fome places the *wind thrufh*, or *fwine pipe*; and by Linnæus and others the *turdus iliacus*, or *ilias*.

It is a little fmaller than the common thrufh, and is lefs fpotted. Its back, neck, and head, are of the fame colour with thofe of the common thrufh; but its fides under the wings, and the feathers which line the wings, are of an orange colour, or dufky red; its belly and breaft are whitifh, and its throat yellowifh, with brown fpots: the wings are of a fort of chefnut colour, a little variegated. It feeds on infects, as worms, and the like; and is a bird of paffage, coming to us in large flocks about the fame time with the fieldfare, and leaving us alfo when that bird does. When the red-wing appears on the coaft in autumn, it is certain the woodcocks are near. It is not well known where they breed, though fome have gueffed it to be in the mountains of Germany and Bohemia. They have a bitterifh tafte, and are lefs valued than the fieldfare. With us they have a difagreeable piping note; but in Sweden, during the fpring, they fing very finely, perching on the top of fome tree among the forefts of maples. They neft in hedges, and lay fix blueifh-green eggs fpotted with black. Ray and Pennant.

Red *Water*, a difeafe in fheep. It has been fuppofed by farmers to be caufed by taking too much watery food, fuch as turnips, clover, rape, eddifh, &c., but it is not peculiar to fheep feeding on turnips or rape, as has been believed by fome. Its removal has been attempted by the ufe of common falt, a tea-fpoonful of elixir of vitriol, and the frequent driving the animal about; and it is afferted, that the difeafe may be wholly prevented by having recourfe to the ufe of dry food, in the night time, while the fheep are feeding upon thefe juicy kinds of food. See Sheep.

In Suffex the fheep are fometimes affected with this complaint on their being firft turned into turnips, which is fuppofed to be caufed by their eating too large a portion of them in wet feafons. The difeafe is alfo believed to originate in the fheep being let out of the fold, when the ground is covered with hoar froſt; and often from feeding in the oat-erſhes about the beginning of the autumn, when the young oats are ſtrong. It is thought here to be readily obviated by allowing a ſmall quantity of hay ſo as to counteract the great waterineſs of the turnip; the quantity of half a pound or even leſs in the courſe of the day is believed to be quite enough for each ſheep in this intention. It is likewiſe ſuſpected, that clover, ſtubble, and folded land, are productive of it in wet weather or moiſt ſeaſons.

Red *Weed*, in *Botany*, a name given to a plant common in the Bermudas, and ſome other places; and called by our firſt travellers to that part of the world, the *Summer Iſland red weed*. Its berry is of a fine red colour, and affords a tincture little inferior to that of cochineal, and poſſeſſing all its virtues in medicine: the only misfortune of this, and ſome other very fine vegetable colours, is, that they fade ſoon. The juice of the fruit of the opuntia, or prickly pear, is as fine a dye as can be procured from the cochineal; but it will not ſtand; the inſect feeding on this, however, we find affords a colour of the ſame nature that will ſtand. The fruit of the red weed is in the ſame manner liable to be eaten by inſects as that of the prickly pear; and it is worthy a trial, whether the colour obtained at ſecond hand from thoſe inſects, will not ſtand as well as the cochineal does, and whether the inſects may not be propagated in a ſufficient abundance to ſerve the markets in the ſame manner. Phil. Tranſ. N° 40.

Red *Weed* is alſo a provincial term, ſignifying the round ſmooth-headed poppy, a pernicious weed in corn-fields. See Weeds.

Red *Worm*, in *Natural Hiſtory*, the name of an inſect very deſtructive to young corn crops. The following deſcription of this worm has been given by Mr. W. Baker: after obſerving, that he has often heard of the havoc which red worms make in young wheat, barley, and oats; and in ſome few writers upon huſbandry has read of them, but never ſaw them till May 1764; when, to his great mortification, in a few days they deſtroyed almoſt totally nine acres of his wheat, for he did not reap above half a barrel *per* acre; and that the ingenious M. de Chateauvieux ſpeaks of an inſect, which is certainly of the ſame kind, if it be not the very inſect which he has now under conſideration; and in noticing the loſs ſuſtained in wheat crops, ſays, they found in it many little white worms, which afterwards became of a cheſnut colour. They poſt themſelves between the blades, and eat the ſtems. They are uſually found between the firſt joint and the roots; every ſtalk which they attacked grew no more, but became yellow and withered. And the ſame misfortune happened to them in the year 1732. The inſects appeared about the middle of May, and made ſuch havoc, that the crops were almoſt deſtroyed; Stillingfleet, alſo, in the ſecond edition of his Miſcellaneous Tracts, ſpeaks of an inſect, which is probably the ſame as in Suffolk and in ſome parts of Norfolk, where the farmers find it their intereſt to encourage the breed of rooks, as the only means to free their grounds from the grub, from which the tree or blind-beetle comes, and which in its grub ſtate deſtroys the roots of corn and graſs to ſuch a degree, that he has ſeen a piece of paſture land where you might turn up the turf with your feet: he adds, that Mr. Matthews, a very obſerving and excellent farmer of Wargrove, in Berkſhire, told him, that the rooks one year, whilſt his men were hoeing a turnip field, ſat down in a part of it, where they were not at work, and that the crop was very fine in that part, whereas in the other part there were no turnips that year; though M. de Chateauvieux deſcribes this worm as being firſt white, and afterwards becoming of a cheſnut colour, he has carefully ſought them at different periods during the paſt year, but always found them of the ſame cheſnut colour, never varying in any particular except that of ſize, which he finds to be the caſe at all ſeaſons in which he has ſeen them; and he obſerves, that the inſect ſpoken of by Stillingfleet as a grub, which, he ſays, deſtroys corn and graſs, induces him to believe that it is the ſame inſect (though the report which he relates from Mr. Matthews ſeems to contradict it), becauſe he has obſerved that the red or cheſnut worm never appears voluntarily upon the ſurface; but when the earth is turned up, either with plough or ſpade, the rooks or crows are very bold in their approach to pick them up, a circumſtance which, he owns, has in ſome degree abated his enmity to theſe birds; he therefore never deſtroys or frightens them off his land whilſt he is ploughing it; but when he ſows, when the corn riſes, and when it is ripe, he deſtroys or baniſhes them as well as he can, becauſe the miſchief which they do at theſe times is intolerable; he has alſo obſerved his lucern to decay in its tops ſoon after it has been up; and upon examining the roots he has found the red worm which had eat them off; and that, in fact, this inſect ſeems to be every where in Ireland called the red worm, but by ſome of the Engliſh writers, who have ſpoken of an inſect which deſtroys the corn in the manner already mentioned, which he thinks undoubtedly the ſame, it is called a grub, by others the large maggot, and the rook worm, becauſe the rooks eat it.

Theſe worms are about half an inch long, and about one-tenth of an inch in diameter; they are jointed in their ſkins, and are of a very firm texture: they have many ſhort legs, two ſmall black ſpecks, which appear to be their eyes; and two ſmall points ſpringing from their heads, with which, he believes, they eat the corn, and which in that work, he apprehends, act like forceps: and all that he has ſeen of this ſpecies are of a bright cheſnut colour. For this reaſon, he ſhould conceive it would be more deſcriptive to call them the cheſnut-worms. When they are expoſed to the air, by turning up earth which is infeſted with them, they will very ſoon cover themſelves again in the ſoil, which they are very capable of doing by the ſtrength which their make gives them, although they appear to be a ſluggiſh inſect, and have not the advantage of a ſlimyneſs upon their ſkins, which the common large creeping worm has, which enables that inoffenſive worm to penetrate the earth, and get under timber and ſtones with eaſe. The red worm, immediately endeavouring to cover itſelf from the air, is certainly, he thinks, from natural inſtinct, as it will ſoon die when expoſed to the air, as will appear by the experiment, N° 10, mentioned below.

It is further ſtated, that theſe worms deſtroy wheat, barley, oats, and lucern, while in an infant ſtate, in the months of March, April, and May. Late ſown barley and oats they will deſtroy as late as June. He has not yet experienced that they deſtroy any other crops. The miſchief done by them is in dry weather. Rain ſufficient to penetrate the ground makes them deſiſt from deſtroying the corn; and he ſuppoſes every thing elſe which they at any time injure. They eat wheat off juſt above the crown of the roots; barley and oats in the ſame place, and alſo higher up, upon any part of the ſtem which is below the ſurface of the earth. And theſe worms ſeem to abound more in ground which is lightly tilled, than in ſuch as hath been well tilled; but in lay ground they ſeem to be more numerous than any where elſe: and the fields upon his farm in which he has found them, are wetter than other fields where they are not; whether that circumſtance contributes to their increaſe, he cannot ſay; but the following

lowing experiments prove that they will live longer in water than they can when expofed to the open air.

Experiments.

N° 1. He put ten red worms into a wine glafs with common falt in it. They were all dead in four hours.

N° 2. Into a glafs with brine in it he put ten red worms. They were all dead in fix hours.

N° 3. Into a glafs with lime in it, which had been flaked for a long time, and expofed to the weather, he put the like number. They were all dead in forty-four hours.

N° 4. Into a glafs with the above lime, and fome water in it, he put the like number. They were dead in twenty hours.

N° 5. Into a glafs with lime newly flaked, and when cold, he put the like number. They were dead in fourteen hours.

N° 6. Into lime water, made with cold water, he put the like number. They were dead in ten hours.

N° 7. Into a glafs with foot in it, he put the like number. They were dead in four hours.

N° 8. Into foot and water he put the like number. They were dead in four hours.

N° 9. Into pure water he put the like number. They were dead in fifty-two hours.

N° 10. Into a glafs, without any thing in it, he put the like number. They were dead in thirty-two hours.

It is ftated that by thefe experiments it is feen that all the articles ufed will kill this infect in a fhort time, particularly the falt and foot. He thought it neceffary to confider different articles, the better to fuit different parts of the kingdom.

Where lime can be conveniently had, and that it is ufed as manure, he is apt to believe, from the experiments, that no injury can be fuftained from thefe worms; but he is afraid a fmall quantity will not effectually deftroy them; befides, he fhould fear, if it were not put on before the fowing of the corn, that it might finge the blades of the corn; for, from thefe experiments, it appears that lime newly flaked is more fuddenly deftructive to them than old lime, and therefore it is to be preferred.

Where lime is ufed for no other purpofe than to deftroy this worm, he fhould conceive, that about eight barrels, regularly fown by hand on an acre of ground, might be fufficient: it muft be firft flaked and cold before a man can poffibly caft it upon the ground with his hand, lime being a very ftrong cauftic; and even when it is cold the man fhould have a thick glove upon his hand.

Where falt may be ufed to deftroy this worm, it muft always be fown upon the ground before the intended crop; for although corn will vegetate, and receive benefit from falt as a manure, when it is ufed antecedent to the fowing of the corn, yet if it be added after the corn is growing it will certainly deftroy it: therefore it fhould never be ufed for this purpofe, but before the corn is fown, or at leaft before it vegetates.

He conceives that where falt is ufed for this purpofe only, about four hundred and a half to an acre will anfwer the purpofe, which is a little more than one ounce to every fquare yard.

It is feen by the experiments, that foot kills this worm as foon as falt; and as in moft places it is to be had at a much lefs price than falt, he thinks there can be no doubt about preferring it; befides which, it may be fafely ufed after the corn is up.

He had fome fmall parcels of barley under experiments, which thefe worms began to deftroy; and in order to convey the foot as foon as poffible to the roots of the plants, he mixed a little of it in water, and poured it on the plants with a garden watering-pot: the confequence was that he did not lofe one plant afterwards.

It will hardly be imagined that he means that the fame method is to be purfued upon a whole farm: no; the method he would recommend to the practice of the farmer is this; to fpread, or caft by hand, as he fows his corn, about fix or eight barrels of foot on an acre, and let him be careful to choofe a calm day for the work, otherwife the wind will carry away a great part of it: and as what remains cannot be regularly difpofed, let him be careful to do it early enough in the fpring, that the rain may wafh in the foot and convey it to the roots of the plants before the worm begins the mifchief; if he does this, he is perfuaded his crop will be preferved.

It is found by the experiments, that thefe worms will live longer in water, by twenty hours, than when expofed to the open air; but at length, that is in fifty-two hours, they died in the water; perhaps this might be from the effect of drowning; but if fo, he might have expected they would have been totally deftroyed in his two fields in the winter of 1763 and 1764, by the immoderate rains which fell at that feafon for a long continuance, which often flooded the lands. But they furvived that winter, as appeared by the great lofs he afterwards fuftained by their deftroying his wheat; and therefore, whether water be an enemy to them or not, it feems not eafy to determine: but if thofe which died in the glafs of water were really drowned, he thinks we may conclude that water is neceffary to their exiftence in the earth, and probably aids them in getting their food from it: and what feems to confirm this notion is, that when the land is wet, they do not touch the corn, but as foon as ever the land is dry, they begin their mifchief. However, this fpeculation he muft fubmit to the confideration of perfons more capable of difcuffing it than he is.

It is feen by experiment N° 10, that they cannot live in the open air, which feems to prove, that, where they abound in land, the oftener it is ploughed, particularly in the fummer, when they cannot penetrate the ground fo eafily as when it is moift, they muft be, by fuch ploughing, greatly diminifhed: befides which, the frequent ploughing gives the crows more opportunities of picking them up, in which, as he has before faid, they are very watchful.

Frequent ploughing has been recommended by fome writers as the only means of deftroying this worm; and they have recommended the ploughs being ftuck with nails, urging, that by thofe nails the worms are cut to pieces; others have recommended walnut leaves being foaked in water, to fprinkle the land, and fteeping feed corn in various liquors, as infallible remedies; but fuch methods as thefe are founded upon miftaken principles; they only miflead the farmer, and muft difappoint him.

Worlidge recommends a ftrong ley made of fixed falts, but that would be impracticable. Mortimer recommends fea-water, which he believes would anfwer very well. He fays, he ufed foot once with fuccefs, but that it did not fucceed with him afterwards. Mr. Baker is perfuaded he did not ufe the foot early enough to have it wafhed into the ground by rain, or perhaps he ufed too fmall a quantity. He concludes by obferving, that he would not be thought to arrogate any merit to himfelf, on account of what he has here offered on this fubject, fince it appears that other perfons have ufed the articles which he has recommended, againft this common enemy; but many perfons have been difappointed in their expectations from thefe remedies,

remedies, which muſt have ariſen, he thinks, from their either having uſed too ſmall a quantity, or not having obſerved the neceſſary precautions; if thoſe which he has recommended ſhall be put in practice and found to anſwer, he ſhall think himſelf amply rewarded.

This worm undoubtedly does great injury to grain crops in many caſes, in particular ſoils and ſorts of land; but a great number of additional facts and experiments are wanting to fully prove its nature, and the ways in which its deſtructive effects on ſuch crops are produced, as well as the beſt, moſt ready, convenient, and effectual ways in which it can be deſtroyed. See Wire-*Worm*.

Red *Deer*, *fiſh*, *ſtar*, *ſtorax*, *tartar*. See the ſubſtantives.

Red *Ink*. See Ink and Printing.

Red *Notes*, in old *Muſic*, before the invention of printing, were uſed for diminution. In the MS. at Paris of the Latin and French poems of Gullaume Machau ſet to muſic, chiefly motets for a ſingle voice, ſome are written in black and red notes, with this inſtruction to the ſingers; "nigræ ſunt perfectæ, et rubræ imperfectæ;" an admonition worth remembering by thoſe who wiſh to decypher muſic of the fourteenth and fifteenth centuries, in which red notes frequently occur. It was an eaſy expedient of diminution till the invention of the preſs, when the uſe of different coloured inks on the ſame page occaſioned the trouble and expence of double printing. See Machau.

In the Pepyſian collection at Cambridge, there are examples of the uſe of red notes for diminution in fragments of muſic by Joſeph Gwinneth and Robert Davie, who flouriſhed in the time of Edward IV. Morley has given ſome examples of the uſe of red notes in his annotations.

Red *Bank*, in *Geography*, a fort of the United States, on the S.E. ſide of Delaware river, in the town of Woodbury, Glouceſter county, New Jerſey; ſeven miles S. of Philadelphia.

Red *Bay*, a bay on the N. coaſt of Spitzbergen. N. lat. 79° 44′. E. long. 10° 42′.—Alſo, a bay on the S.E. coaſt of Labrador. N. lat. 51° 50′. W. long. 56° 10′.—Alſo, a bay on the N. part of Buffaloe's bay, on the S. coaſt of Maſſachuſetts, in America.

Red *Crab Iſland*, a ſmall iſland in the Eaſt Indian ſea, near the coaſt of Arracan. N. lat. 21° 30′. E. long. 91° 50′.

Red *Deer Lake*, a lake of North America. N. lat. 55° 10′. W. long. 112°.

Red *Flaggy Bay*, a bay on the N. coaſt of the iſland of St. Chriſtopher, E. of Ragged Point.

Red *Haven*, a bay of Scotland, on the N. coaſt of the county of Banff; three miles E. of Cullen. N. lat. 57° 39′. W. long. 2° 38′.

Red *Head*, a cape of Scotland, on the E. coaſt of the county of Angus; ſix miles S. of Montroſe. N. lat. 56° 33′. W. long. 2° 26′.—Alſo, the N. point of the iſland of Eda. N. lat. 59° 6′. W. long. 2° 40′.

Red *Hills*, rocks in the German ſea, near the coaſt of Northumberland. N. lat. 55° 26′. W. long. 1° 17′.

Red *Hook*, a town of America, in the townſhip of Rhynebeck, and Dutcheſs county, New York, on the E. bank of Hudſon's river; 21 miles S. of Hudſon.

Red *Horſe*, *Vale of*, a diſtrict of England, in the county of Warwick, which owes its name to a horſe cut in a hill, the ſoil of which is reddiſh.

Red *Iſland*, an iſland near the E. coaſt of Labrador. N. lat. 43° 55′. W. long. 55° 50′.—Alſo, an iſland near the W. coaſt of Newfoundland. N. lat. 48° 35′. W. long. 59° 10′.

Red *Lake*, a comparatively ſmall lake of North America, at the head of a branch of the Bourbon river, ſometimes called "Red river;" its form is nearly round, and its extent is about 60 miles in circumference. It has on one ſide an iſland, cloſe by which a river enters. It lies almoſt S.E. both from lake Winnepeek, and from the lake of the Woods. N. lat. 51° 5′. W. long. 94° 10′.—Alſo, a lake of North America, in N. lat. 47° 40′. W. long. 95° 15′.

Red *Lick*, a ſalt ſpring of the ſtate of Kentucky; 32 miles E. of Stamford.

Red *Point*, a cape on the E. coaſt of New Holland. N. lat. 34° 29′. W. long. 208° 45′.

Red *River*, a river of Louiſiana, which riſes in about N. lat. 35°, and W. long. 96°, and runs into the Miſſiſippi, N. lat. 37° 15′. W. long. 91° 48′.—Alſo, a river of Upper Canada, which runs into lake Superior. N. lat. 47° 51′. W. long. 85° 48′.—Alſo, a river of Tenneſſee, which runs into Cumberland river, about two miles N.W. of Clarkſville. N. lat. 36° 18′. W. long. 87° 46′.—Alſo, a river of Kentucky, which runs into Kentucky river, about nine miles above Boonſborough, N. lat. 37° 45′. W. long. 84° 18′. It is 60 yards wide at the mouth.—Alſo, a river of North America, which riſes from Red lake, in N. lat. 47° 40′, and runs into Winnipeg lake.—Alſo, a river of Canada, which runs into the Utwas; 60 miles W. of Montreal. See alſo Natchitoches.

Red *Sea*, called by the ancients the "Arabian gulph," forms the grand natural diviſion between Aſia and Africa, and extends about 21° or 1470 Britiſh miles from the ſtraits of Babelmandeb to Suez; it terminates in two branches, the weſtern being extenſive, and the eaſtern aſcending a little beyond the parallel of mount Sinai.

This ſea is called, in the Old Teſtament, the ſea of Suph or Zuph, the ſea of weeds, on account of the great quantity of algæ and fuci, and perhaps the madrepores and coralline ſubſtances, anciently ſuppoſed to be of vegetable origin, found at its bottom, and near the ſhores. In ſcripture language it is alſo denominated "the tongue of the Egyptian ſea;" in the Greek and Latin geography, it was called the gulph of Heroopolis; and by the Arabian geographers, the weſtern arm of the ſea of Kolzum, (al Kolzum, with the article,) which ſeems to have ſome affinity with "Clyſma," another name by which this gulph was formerly known; Kolzum in Arabic, and Clyſma in Greek, ſignifying deſtruction, in reference, as it is ſuppoſed, to the deſtruction of Pharaoh's hoſt. Don John de Caſtro, viceroy of the Indies for the king of Portugal, conjectures that it was called the Red ſea from the great quantity of coral that is found in it. Pliny ſays that it obtained this name, in Greek "Erythrea," from a king called Erythros, who reigned in Arabia, and whoſe tomb was ſeen in the iſland Tyrine or Agyris. Several learned men believe, that this king Erythros is no other than Eſau, or Edom; Edom, in Hebrew, ſignifying red or ruddy, as Erythros does in Greek. But Calmet is of opinion, that Edom never dwelt, either on the ſhore of the Red ſea, or the Perſian gulph, which has been ſometimes alſo called the Red ſea. His habitation was eaſt of the land of Canaan, towards Bozra; and he inclines to believe, that the name of the Red ſea was not given to this gulph till after the Idumeans, deſcended from Edom, had ſpread themſelves from eaſt to weſt as far as the Red ſea. At that time it might receive the name of the ſea of Edom, which the Greeks rendered by the Red ſea, or "thalaſſa erythrea."

The famous miracle of the paſſage of the Red ſea by 600,000 Iſraelites, beſides old men, women, and children, recorded in the ſacred writings, is well known. Thoſe who have been deſirous of explaining this paſſage, without

out admitting the miraculous part of the hiſtory, have had recourſe to a variety of conjectures; both as to the place and the manner in which this paſſage was effected. As to the place of the paſſage, there has been a difference of opinion even among thoſe who have not heſitated to acknowledge that it was miraculous. Till of late years it has been generally believed, that the paſſage of the Iſraelites was at Baideah, or Bedea, which, according to Niebuhr, is about ſix German miles from Suez, and where the ſea, ſays Bruce, is ſomething leſs than four leagues broad, by 50 feet deep. In ſupport of this hypotheſis, Dr. Shaw has traced the march of the Iſraelites to their third encampment before Pihahhiroth. Whilſt they were removing from the edge of the wilderneſs of Etham towards this ſtation, they had left the open country and were marching through a narrow paſs, betwixt the mountains of Gewoubee and Attackah. In theſe circumſtances the Egyptians might well imagine, that they could have no poſſible way of eſcape, as the mountains of Gewoubee would obſtruct their progreſs towards the ſouth, and thoſe of Attackah would impede their advancing towards the land of the Philiſtines: the Red ſea lay before them to the eaſt; whilſt Pharaoh cloſed up the valley behind them, with his chariots and horſemen. This valley terminates at the ſea, in a ſmall bay, made by the eaſtern extremities of the mountains above-mentioned; and is called "Tiah Beni Iſrael," *i. e.* the road of the Iſraelites, from a tradition ſtill exiſting among the Arabs of their having paſſed through it; and it is alſo called "Baideah," from the *new* and unheard-of *miracle* that was wrought near it, by dividing the Red ſea, and deſtroying in it, Pharaoh, his chariots and his horſemen. The encampment of the Iſraelites, according to Dr. Shaw, was at this bay, before Pihahhiroth, betwixt Migdol and the ſea, over-againſt Baal-tzephon, Exod. xiv. 2. Baal-tzephon, as this learned geographer ſuggeſts, might have relation to the northern ſituation of the place itſelf, or to ſome watch-tower, or idol-temple that was erected upon it; or it may be taken for the extremity of the mountains of Suez, or Attackah, the moſt conſpicuous of theſe deſerts, as it overlooks a great part of the Lower Thebais, as well as the wilderneſs that reaches towards, or rather which makes part of, the land of the Philiſtines. Migdol might lie to the ſouth, as Baal-tzephon did to the north of Pihahhiroth. The marches of the Iſraelites, from the edge of the wilderneſs, being towards the ſea, *i. e.* towards the S.E., their encampment betwixt Migdol and the ſea, or before Migdol, could not well have any other ſituation. Pihahhiroth, or the mouth of Hhiroth, or a narrow gullet or defile, may denote the mouth, or the moſt advanced part of this valley towards the E., or towards the Red ſea. But as the Iſraelites were delivered at this place from their captivity and fear of the Egyptians (Exod. xiv. 13.) we may ſuppoſe that Hhiroth denotes the place where they gained their *liberty*, *horar* and *hhiroth* being words of the like import in the Chaldee. It may be further urged in favour of this explication, and alſo of the tradition ſtill preſerved, of the Iſraelites having paſſed through this valley, that the eaſtern extremity of the mountain, ſuppoſed to be Baal-tzephon, is called, even to this day, by the inhabitants of theſe deſerts, "Jibbel Attakah," or the mountain of deliverance; which appellation, together with thoſe of Baideah and Tiah Beni Iſrael, could never have been given or impoſed upon theſe inhabitants at firſt, or preſerved by them afterwards, without ſome faithful tradition, that ſuch places had been once the actual ſcene of theſe remarkable tranſactions. The ſea likewiſe of Kolzum, *i. e.* deſtruction, as the correſpondent part of the Red ſea is called in the Arabian geography, is a further confirmation of this tradition. Moreover, the Ichthyophagi, who lived in this very neighbourhood, are reported by Diodorus Siculus (l. iii.) to have preſerved the like traditionary account from their forefathers, of this miraculous diviſion of the Red ſea. There are likewiſe other circumſtances that tend to prove, that the Iſraelites took their departure from this valley, in their paſſage through the Red ſea; for an account of which we refer to Shaw's Travels, ch. v.

This hypotheſis, however, ſays Geddes, (Crit. Remarks on Exod. xiv.) has been fairly given up by our beſt modern critics; and the "Sinus Heroopolitanus," or gulph of Suez, pitched upon as the ſcene of action. The idea was firſt ſuggeſted by Le Clerc, and ſince adopted and defended by Michaelis, Niebuhr, and almoſt all the German commentators. But Mr. Bryant ſtill contends for Bedea (Baideah), and calls the arguments of Niebuhr "prejudice and miſconception." Dr. Geddes, whoſe ſentiments concerning Moſes and his whole hiſtory are ſingular, denies that there was any thing miraculous in the event; and ſtrenuouſly maintains, that Suez or its vicinity was the place of paſſage; for here, he ſays, at this day, are ſhallows fordable at low water, and which might, in former times, have been frequently dry. We all know what changes happen in the bed of ſeas as well as that of rivers, eſpecially where that bed is ſand, which is the caſe with that of the gulph of Suez. The occurrence is thus deſcribed by Dr. Geddes. When Moſes ſaw that the Egyptians had found out that the Iſraelites meant not to return, and were about to purſue him with a force which he could not reſiſt, he wiſely took the only courſe that was moſt likely to afford him an eſcape. Acquainted, as he muſt have been, during his long ſtay in Midian, with the nature of the Red ſea, and its ebbs and flows, he deemed it better to take his chance of paſſing over ſome ſhallow which he knew to be fordable at low water, than to expoſe himſelf to be overtaken in a deſert, where no ſtratagem could ſave him. If he got the ſtart of the Egyptians but for a ſingle day, he would have time to watch the tide, and begin his march as ſoon as the paſſage was fordable; and in the ſpace of a few hours might be ſafe on the other ſide. The width of the ſea at Suez is at preſent, according to Niebuhr's meaſurement, 757 double paces, or 3450 feet. It is common for the Arabs to paſs on foot over this paſſage, although not always without danger, as the ſea ſometimes flows back unexpectedly. At Suez, according to Niebuhr, it is low water, at the full of the moon, at half paſt ſix; but as the paſſage of the Iſraelites muſt have happened ſome days after the full of the moon, the ebb and flow muſt have been conſiderably later, and the former muſt have occurred in the night-time, during which the Iſraelites are ſaid to have paſſed. Michaelis was of opinion, that, as a ſtrong wind is ſaid to have accompanied this event, it might have cauſed a double ebb, as it ſometimes does on the coaſt of Holland and North Germany; but Niebuhr thinks that no ſuch thing is likely to happen in the Red ſea. Be this as it will, the wind might certainly have prolonged the ebb; and, if it happened at the time of the paſſage, might well be conſidered as a providential interference, and readily conſtrued into a miracle. Joſephus, in recording this tranſaction, puts a formal ſpeech into the mouth of Moſes to his terrified and diſcontented people, and a prayer to God before he ſtrikes the ſea with his rod; yet he tells us that all this he has related as he found it in the ſacred books. But he ſeems not ſure, whether to conſider it as a miracle or a natural effect. "Let no one," ſays he, "wonder at this account of a way of ſafety being opened to thoſe old-world innocent folks, even through the ſea, whether by the will of God or naturally; ſince, of later days, the Pamphylian ſea opened a way for Alexander's army, when God through him had decreed to overturn the Perfian empire." (Antiq. l. ii. c. 16. n. 5.) For this he appeals to all Alexander's hiftorians; and, indeed, both Appian and Arrian, who relate the event, feemed to have confidered it as a fort of divine interpofition; but honeft Strabo tells us, that Alexander only took the advantage of low water; and, trufting to his good fortune, paffed through the ftreight with his army; but not on dry land; for the water came up to the navel. (Strab. l. xiv.) The fame was the cafe with Scipio's foldiers, who furprifed New Carthage by taking the advantage of an ebb; although they waded fometimes up to the knee, at other times up to the navel, in water. (Liv. l. xxvi.) Here, fays Geddes, the fame two natural caufes, the tide and a ftrong wind, concurred to make a paffage through the water, as concurred at the paffage of the Red fea; and in both cafes they were converted into a miracle. Jofephus concludes his narrative with thefe words. "Of fuch things, let every one think as he pleafes;" and the author now cited adopts his language. It has been faid, and thus the priefts of Memphis explained the hiftory (fee Eufeb. Præp. l. iv. c. 17.), that Mofes taking advantage of the time of the ebb, led the Hebrews over in fafety; but the Egyptians, not knowing the nature of the fea, and eafily entering it juft before the return of the tide, were all fwallowed up and drowned.

In oppofition to all conjectures for explaining this hiftory, without having recourfe to miracle, we fhall content ourfelves with appealing to the hiftory itfelf, Exod. xiv. 16, 17, &c. from which it appears that the Hebrews traverfed the fea from fhore to fhore, on a large fpace of dry ground, which was left by the retiring waters; and that they were driven back to overwhelm the purfuing hoft of Pharaoh. See alfo Ifaiah, lxiii. 11, &c. Habbakuk, iii. 15. Wifdom of Sol. xix. 7, 8. x. 17, 18.

It is thought, fays Calmet, after Eufebius, that the place where the Hebrews paffed the Red fea, is two or three leagues below its northern point, at the place called Kolfum, or Clyfma. Niebuhr informs us that, every where on the coaft of Arabia, we meet with indications, that the waters are withdrawn; *e. gr.* Mufa, which ancient authors mention as a port of Arabia, is now at many leagues diftance from the fea; near Loheia, and Gidda, we fee great hills filled with the fame kind of fhells and corals, as are now found living in the fea; near Suez, are petrifications of all thefe things. From thefe and fimilar circumftances he infers, that fome thoufand years ago this Arabian gulf was much larger, and extended much farther north, efpecially that arm of it near Suez, for the fhore of this extremity of the gulf is very low. The breadth of the arm of the fea at Suez, he adds, is about 3450 or 3500 feet (in its prefent ftate). Although it would much fhorten the diftance of their way, no caravan now croffes this arm, nor could the Ifraelites have croffed it, without a miracle. The attempt muft have been much more difficult to the Ifraelites, fome thoufand years ago, the gulf being then probably larger, deeper, and longer toward the north, at the loweft time of the tide. Niebuhr croffed, when returning from mount Sinai, that arm of the fea, over to Kolfoum, upon his camel; and the Arabs, who accompanied him, were only immerfed to their thighs in water. The banks of the Red fea are pure fand from Suez to Girondel; but lower to the fouth are banks of coral. If the Ifraelites had croffed the fea upon fuch banks, they muft have been greatly incommoded by them.

The Red fea, notwithftanding the difficulty and danger, and alfo the tedioufnefs of its navigation, was, for many ages before the difcovery of the paffage by the Cape of Good Hope, the channel of communication between Egypt and other countries, bordering on the Mediterranean, and India. Accordingly, Dr. Robertfon obferves, in his "Hiftorical Difquifition concerning Ancient India," that navigation made its firft efforts in the Mediterranean and the Arabian gulf, and that in them the firft active operations of commerce were carried on. Nor are the accounts of the earlieft hiftorians in this refpect at all improbable, if we confider the pofition and form of thefe two great inland feas. They lay open the continents of Europe, Afia, and Africa, and fpreading to a great extent along the coafts of the moft fertile and moft early civilized countries in each, feem to have been deftined by nature to facilitate their communication with one another. We find, accordingly, that the firft voyages of the Egyptians and Phœnicians, the moft ancient navigators mentioned in hiftory, were made in the Mediterranean, and, moreover, by acquiring early poffeffion of ports on the Arabian gulf, they extended the fphere of their commerce, and are reprefented as the firft people of the weft who opened a communication by fea with India. Sefoftris, in the courfe of his reign (if we may give credit to fome hiftorians), was able to fit out a fleet of 400 fhips in the Arabian gulf, which conquered all the countries ftretching along the Erythrean fea to India. The Phœnicians, who, by their fituation on the Mediterranean, and the imperfect ftate of navigation, could not attempt to open a direct communication with India by fea, were prompted by the enterprifing fpirit of commerce to wreft from the Idumeans fome commodious harbours towards the bottom of the Arabian gulf. From thefe they held a regular intercourfe with India on the one hand, and with the eaftern and fouthern coafts of Africa on the other. The diftance, however, from the Arabian gulf to Tyre was fo confiderable, that it became neceffary for them to take poffeffion of Rhinocolura, the neareft port in the Mediterranean to the Arabian gulf. Thither all the commodities brought from India were conveyed over land by a route much fhorter, and more practicable, than that by which the productions of the Eaft were carried at a fubfequent period from the oppofite fhore of the Arabian gulf to the Nile. At Rhinocolura they were refhipped and tranfported by an eafy navigation to Tyre, and diftributed through the world. For an account of the trade which the Jews carried on by the Red fea, we refer to the articles Ophir and Tyre. For the manner in which the Egyptians carried on their trade with India by means of this gulf, fee Alexandria and Berenice.

All the commercial tranfactions of the ancients with the Eaft were confined to the ports on the Malabar coaft, or at the fartheft extended to the ifland of Ceylon. To thefe ftaples, the natives of all the different regions in the eaftern parts of Afia brought the commodities which were the growth of their feveral countries, or the product of their ingenuity, in their own veffels, and with them the fhips from Tyre and from Egypt completed their inveftments. While the operations of their Indian trade were carried on within a fphere fo circumfcribed, the conveyance of a cargo by the Arabian gulf, notwithftanding the expence of land-carriage, either from Elath to Rhinocolura, or acrofs the defart to the Nile, was fo fafe and commodious, that the merchants of Tyre and Alexandria had little reafon to be folicitous for the difcovery of any other. During the period in which this mode of carrying on commerce fubfifted, the price of goods imported from India into Europe was very much enhanced by the various operations to which the conveyance of them was fubject. In Ceylon, or the ports on the Malabar coaft to which they were brought from the various countries of Afia by the natives, they were put

put on board the ſhips which arrived from the Arabian gulf. At Berenice they were landed, and carried by camels 258 miles to the banks of the Nile. There they were again embarked, and conveyed down the river to Alexandria, whence they were diſpatched to different markets. But, after the paſſage to India by the Cape of Good Hope was diſcovered by Vaſco de Gama, at the cloſe of the fifteenth century, its various commodities were purchaſed at firſt hand in the countries of which they were the growth or manufacture; and as the carriage of mercantile goods by water is much leſs expenſive than by any other mode of conveyance, the Portugueſe, as ſoon as they could import the productions of India in ſufficient quantities to ſupply the demands of Europe, were able to afford them at ſuch a reduced price, that the competition of the Genoeſe and the Venetians, who had been actively engaged in this commerce, ceaſed almoſt entirely; and the full ſtream of commerce took its natural direction towards the cheapeſt market. The conſequence was, that early in the ſixteenth century, the ſubjects of the Portugueſe monarchs became poſſeſſed of a monopoly of the trade with India, founded upon the only equitable title, that of furniſhing its productions in greater abundance, and at a more moderate price. From the era of the diſcovery now mentioned, the Arabian gulf or Red ſea loſt its importance as a channel of communication between the weſtern and eaſtern parts of the globe; and from this time both its navigation, and the commerce connected with it, have been partial and reſtricted. An account of its principal ports will be found under their reſpective articles.

REDA, a town of Turkiſh Armenia, in the government of Erzerum; 36 miles N. of Iſpira.

REDANS, or REDANT See REDENS.

REDARIDES, in *Geography*, a town of France, in the department of the Mouths of the Rhone; 16 miles S.S.E. of Orangi.

RED-BOOK *of the Exchequer* (*liber rubeus ſcaccarii*) is an ancient record, in which are regiſtered the names of thoſe that held lands *per baroniam* in king Henry II's. time. It is a manuſcript volume of ſeveral miſcellaneous treatiſes, in the keeping of the king's remembrancer, in his office in the exchequer; and hath ſome things (as the number of the hides of land in many of our counties, &c.) relating to the times before the Conqueſt. There is likewiſe an exact collection of the eſcuages under king Henry I., Richard II., and king John; and the ceremonies uſed at the coronation of queen Eleanor, wife to king Henry III. &c.

REDDAT. *Precipe quod Reddat.* See PRECIPE.

REDDENDIS CHARTIS. See CHARTIS.

REDDENDUM, in *Law*, a clauſe in a leaſe, &c. by which a rent is reſerved to the leſſor; which anciently conſiſted of corn, fleſh, fiſh, and other victuals. 2 Rep. 71.

REDDIDIT SE, is where a man procures bail for himſelf to an action in any court at law; if the party bailed at any time before the return of the ſecond *ſcire facias* againſt the bail, renders himſelf in diſcharge of his bail, they are thereby diſcharged. 2 Lill. Abr. 430. See BAIL.

REDDITARIUM, an ancient law term for a tarrier, roll, or rental, in which the rents and ſervices of a manor are ſet down.

REDDITION, REDDITIO, a ſurrendering or reſtoring. In *Law*, it alſo denotes a judicial acknowledgment that a thing in queſtion belongs to the demandant, and not to the perſons ſo ſurrendering.

REDDITUS ASSISUS, a ſet or ſtanding rent. See ASSISUS.

REDDLE, *Red Ochre*, or *Red Chalk*, in *Mineralogy*, the red oxyd of iron intermixed with earthy matter. It is uſed for crayons, either in its natural ſtate, or pounded and waſhed, and afterwards mixed with gum, and caſt into moulds. The colour of reddle varies from a blood-red to a brown-red; its fracture is earthy; it is ſoft, friable, and ſtains the fingers. See *Ores of* IRON.

This is the common Engliſh name for the ſubſtance called in Latin *rubrica*, and uſed in painting, and for marking ſheep, &c. There are two kinds of it, a harder and a ſofter.

The firſt, or harder kind, is but little in uſe, except among the turners in wood, as it does not mark ſo eaſily, requiring to be firſt wetted, and then preſſed hard upon the ſubſtance to be marked. This is dug in Lincolnſhire, Hampſhire, and Suſſex; and is a hard and dry earth, of a ſomewhat pale red, like the common pale red bricks, and is of a very regular and cloſe texture, and always compoſed of a number of thin laminæ, lying cloſely and evenly on one another. It is of a rough uneven ſurface, adheres firmly to the tongue, is not eaſily broken between the fingers, and ſtains the hands a little; it is of a very aſtringent taſte, and melts pretty readily in the mouth. It is very readily diffuſible in water, mouldering to powder, ſoon after being thrown into it; and makes no efferveſcence with acids.

The ſecond, or ſofter kind, is very common, and put to a number of different uſes. It makes ſimply a very good pale red for the painters, and is very ſerviceable to them in their mixed colours. It is in conſtant uſe in many parts of the kingdom for the marking of ſheep; and when waſhed and ſeparated from its ſandy particles, is, by ſome of our modern druggiſts, ſold under the name of bole armenic.

It is found in many parts of the world: the beſt in England is that from ſeveral parts of Derbyſhire, from whence the colour-ſhops and druggiſts of London are ſupplied; many of the latter thinking this a ſhorter method than the common one of our bole armenic makers, of preparing it from a mixture of tobacco-pipe clay, and the red ochre called Spaniſh brown.

This ſoft, or common reddle, is a looſe ponderous earth, of a lax texture, and very friable; and of a pale, but tolerably bright red, of a ſomewhat ſmooth and gloſſy ſurface, ſoft to the touch, adhering firmly to the tongue, eaſily broken between the fingers, and ſtaining the hands. It is of a rough auſtere taſte, very readily breaks, and falls to powder in water, and makes no efferveſcence with aqua fortis. Hill.

Some call reddle, *lapis hæmatites;* but the real hæmatites is another thing.

REDEEMABLES, in *Law*, are lands, funds, &c. ſold with a reſervation of the equity of redemption.

Crown lands are redeemable for ever; others only for a certain time.

RE-DELIVERY, an yielding or delivery back of a thing: if a perſon has committed a robbery, and ſtolen the goods of another, he cannot afterwards purge the offence by any re-delivery. Co. Litt. 69. H. P. C. 72.

RE-DEMISE. See DEMISE.

REDEMPTION, REDEMPTIO, a faculty or right of re-entering upon lands, &c. that have been ſold, and aſſigned; upon reimburſing the purchaſe-money, with legal coſts.

Bargains in which the *faculty*, or, as ſome call it, the *equity of redemption*, is reſerved, are only a kind of pignorative contracts.

A certain time is limited, within which the faculty of redemption ſhall be exerciſed; and beyond which it ſhall not extend.

REDEMPTION, in *Theology*, denotes the recovery of mankind

kind from ſin and death, by the obedience and ſacrifice of Chriſt, who on this account is called the *Redeemer* of the world. See COVENANT.

REDEMPTIONS, *Redemptiones*, in our old *Law Writers*, denote grievous mulcts impoſed by way of commutation for the head or life of the delinquent.

REDEMPTION *of the National Debt*. See FUND.

REDEN, or REDZYN, in *Geography*, a town of Pruſſia, in the territory of Culm; 20 miles N.E. of Culm.

REDENS, REDANS, or *Redant*, in *Fortification*, a kind of work indented in form of the teeth of a ſaw, with ſaliant and re-entering angles; to the end that one part may flank or defend another.

It is alſo called *ſaw-work*, and *indented work*. The faces in this flank one another.

Redens are frequently uſed in the fortifying of walls, where it is not neceſſary to be at the expence of building baſtions; as when they ſtand on the ſide of a river, a marſh, the ſea, &c. But the fault of ſuch fortification is, that the beſiegers from one battery may ruin both the ſides of the tenaille or front of a place, and make an aſſault without fear of being enfiladed, ſince the defences are mined.

The parapet of the corridor alſo is frequently redented, or carried on by way of redens.

REDES, in *Geography*, a river of South America, which runs into the gulf of Darien, N. lat. 7° 37′. W. long. 76° 40′.

REDHIBITION, REDHIBITIO, in the *Civil Law*, an action allowed a buyer, by which to annul the ſale of ſome moveable, and oblige the buyer to take it back again, upon the buyer's finding it damaged, or that there was ſome perſonal cheat, &c.

The redhibition, or redhibitory action, has a place in ſeveral caſes, in the body of the civil law. If a horſe was ſold that had the glanders, were broken-winded, or foundered, it was a redhibitory caſe; and the ſeller might be obliged to take him again within nine days.

REDI, FRANCIS, in *Biography*, an Italian phyſician, was deſcended from a noble family, and born at Arezzo, in Tuſcany, in the year 1626. He commenced his ſtudies at Florence, and then removed to Piſa, for the proſecution of his philoſophical and medical purſuits, where he received the degree of doctor in both theſe ſciences. He had acquired great reputation both in ſcience and literature, and was induced to ſettle at Florence, where he at length gained the favour of the court, and was appointed firſt phyſician to Ferdinand II. duke of Tuſcany, and ſubſequently to Coſmo III. Theſe appointments and his conſtant profeſſional employment did not, however, prevent him from cultivating his favourite ſtudy of the belles lettres. He devoted much of his time to the language of his country, and contributed not a little to the perfection of the dictionary of the academy of La Cruſca, of which, and of ſeveral other learned bodies, he was a member. Totally free from preſumption, and attached to every cultivator of learning and ſcience, he was always ready to give his aſſiſtance to them in every way he could, and was univerſally eſteemed and beloved. He diſplayed both in his practice, and in the proſecution of his inquiries in natural hiſtory, a ſingular acuteneſs of obſervation, and a complete incredulity as to the marvellous, which was ſo prevalent in his time; and he cautioned his friends and pupils againſt the popular errors in this reſpect. Although he was afflicted with epileptic fits in his latter years, yet he appears neither to have abandoned his ſtudies, nor his profeſſional buſineſs, until his death, which took place in 1697, in his 71ſt year.

Redi was the author of ſeveral Italian poems, which are held in much eſtimation. His other works were all written in Italian, and his ſtyle was deemed ſo pure and elegant, that the authors of the dictionary of La Cruſca have often cited it as a ſtandard. Moſt of his writings on natural hiſtory have been tranſlated into Latin; eſpecially his "Experimenta circa Generationem Inſectorum, cum Figuris Æneis;" his "Obſervationes de Viperis;" his "Experimenta circa diverſas Res naturales, ſpeciatim illas quæ ex Indiis adferuntur;" and his "Obſervationes de Animalibus viventibus, quæ intra Animalia viventia reperiuntur." He alſo publiſhed a letter on the Uſe of Spectacles, and an Eſſay on Styptics. Eloy Dict. Hiſt. de la Med.

Redi, in the notes to his "Bacco in Torcano," a dithyrambic poem, publiſhed in 1685, has given many curious etymologies and explanations of the muſical terms uſed by the Italians in early times.

REDIGOODEM, in *Geography*, a town of Hindooſtan, in the circar of Ellore; 25 miles W. of Ellore.

REDIMICULUM, among the Romans, a girdle, which going about the neck, divided on the breaſt, and paſſing down each ſide, went round, and kept the robe tight to the body.

REDINKA, in *Geography*, a town of Portugal, in the province of Beira; 14 miles S. of Coimbra.

REDINTEGRATED MEDALS. See MEDAL.

REDINTEGRATION, REDINTEGRATIO, in the *Civil Law*, the act of reſtoring a perſon to the enjoyment of a thing, of which he had been illegally diſpoſſeſſed.

In France, where a perſon is deſpoiled of his property, he claims it again by redintegrand, or action of reſtitution. But the redintegrand muſt be demanded within a year and a day, otherwiſe it is precluded.

REDINTEGRATION, in *Chemiſtry*, the reſtoring of any mixed body, or matter, whoſe form has been deſtroyed by calcination, corroſion, ſublimation, or the like, to its former nature and conſtitution.

The redintegration of mercury is properly called *revivification*. Mr. Boyle has an expreſs treatiſe on the redintegration of ſaltpetre; where he ſhews, that after reducing it by fluxion into fixed nitre, which is next of kin to ſalt of tartar in all its properties, he could preſently redintegrate it, by pouring a ſufficient quantity of ſpirit of nitre on it; *i. e.* he could re-produce true cryſtals of the uſual form and virtue of ſaltpetre.

It is a ſtrong objection againſt the chemical principles, that we cannot redintegrate the body they were procured from, by re-mixing them.
